THE PENNY CYCLOPÆDIA

OF

THE SOCIETY FOR THE DIFFUSION OF USEFUL KNOWLEDGE.

BASSANTIN, or BASSINTOUN, JAMES, son of the 'Laird of Bassintin in the Mers,' (Merse?) (*Biog. Brit.*) He was educated at Glasgow, and afterwards travelled, but finally settled at Paris, where he taught mathematics and astronomy. Of his personal life we know nothing, but that he was addicted to astrology, and gave Sir Robert Melville (see his memoirs or *Biog. Brit.*) some predictions a little after the time of Queen Mary's escape into England. He returned to Scotland in 1562 and died 1568. (See ASTRONOMY, and place the date there given, 1557, in brackets; it is the date of publication of a work.) He was of Murray's party, and a zealous Protestant.

He wrote various works, as follows:— 1. *Paraphrase sur l'Astrolabe*, Lyons, 1555, reprinted at Paris, 1617. 2. *Mathematica Genethliaca.* 3. *De Mathesi in Genere.* 4. *Musica secundum Platonem.* 5. *Arithmetica.* To these works we cannot find dates. 6. A work on Astronomy, in French, (presently to be noticed,) translated into Latin by De Tournes (Tornesius), under the title of *Astronomia J. Bassantini Scoti*, &c., reprinted 1613.

There is also a *Discours Astronomique*, published in 1557, at Lyons, and Lalande gives the title of a Latin version published at Geneva in 1599, and again in 1613. Delambre doubts whether this *Discours Astronomique* be any other than the original of No. 6 in the list above; and we incline to think he is right, for, independently of the coincidence of editors and dates, this *Discours Astronomique* appears to be the work of Bassantin's which was best known. It was the only one in De Thou's library, and is the only one in that of the Faculty of Advocates, at Edinburgh. It is the only work mentioned by Weidler, while No. 6 is the only one mentioned by Vossius. Vossius observes that the original was written in very bad French, and that the author knew 'neither Greek nor Latin, but only Scotch.'

The trigonometry of Bassantin uses only sines. His planetary system is that of Ptolemy, and he was much indebted to Purbach. He adopted the *trepidation* of the equinoxes. (See ASTRONOMY.) He used the sphere in actual computations; and, in his treatise on the planisphere, appears to have followed the plan, if not the work, of Apian. (See *Biog. Brit.*; Delambre, *Hist. de l'Astron. Mod.*, &c.)

BASSEIN, a town and port in the province of Aurungabad, situated on the point of the continent of Hindustan opposite to the north end of the island of Salsette, in 19° 20′ N. lat., and 72° 56′ E. long. Bassein was once a city and fortress of importance, but, sharing the fate of many places in India, it has suffered from the wars and revolutions to which that country has been exposed, and is now fallen into decay.

In the year 1531 Bassein was ceded to the Portuguese, under the provisions of a treaty concluded by them with the sultan of Cambay, and for more than two centuries it remained in the undisturbed possession of that nation. In 1750 the town was taken by the Maharattas, from whom it was captured by the British in December, 1774; and in the following March was formally yielded to its conquerors by a treaty made with the Maharatta chief, Ragoba. By the treaty of Poonah, Bassein was, however, again relinquished to the Maharattas. In November, 1780, the fortress was regularly besieged by the British army under General Goddard, and, after sustaining the attack for four weeks, surrendered at discretion. By the treaty concluded in May, 1782, with the Maharatta chiefs, Bassein was once more restored, together with Ahmedabad and our other conquests in Gujerat, and the town long remained in possession of the Maharattas. In 1802 the Peishwa Bajee Rao fled to Bassein from his rival, Holkar, and sought the protection of the British government, with whom he concluded a treaty on the last day of that year. It was hoped that this treaty would have broken up the federal union of the Maharatta chiefs, by separating from it the Peishwa, who had been its nominal head; but this chief having subsequently been induced to join his former rivals and to organize with them a plan of hostility to the English, the whole of his territories were declared forfeited, and were taken into possession by the Company's government in June, 1818, he becoming a stipendiary of that government, and recognizing this appropriation of his territories. Bassein has since that time remained in the hands of the English, under whom the fortifications have been allowed to go to decay, and the town and port have become of little importance. At a recent date, the town contained a great number of houses in ruins.

The state of cultivation exhibited in the surrounding country is, on the contrary, flourishing. To the north and north-east of Bassein are forests of teak-wood, from which the ship-building establishments at Bombay are supplied. A considerable part of the agricultural population are professors of the Roman Catholic religion, which it is probable was introduced among them by the early European settlers from Portugal.

(Rennell's *Memoir of a Map of Hindustan*; Mills's *History of British India*; *Treaties presented to Parliament by command of his Majesty*, 1819; *Report of Committee of the House of Commons on the Affairs of India*, 1832, *political division*.)

BASSETERRE is the capital of the island of St. Christopher's in the West Indies. The town is situated on the south side of the island, at the mouth of a small river. It contains about 800 houses, many of which are very good, a spacious square, and a small church, and is defended by three forts. It was founded in 1623. The district of Basseterre contains 17 square miles, with a population of 6620 souls. It is divided into two parishes, St. George's and St. Peter's, and sends six members to the assembly—the former four, the latter two. This name was given by the French to the district from its being the lower portion of the island. The vale of Basseterre is exceedingly beautiful and well cultivated. The anchorage is in an open bay, and a continual heavy surf beats on the shore, which is a sandy beach. As this prevents any wharf or quay being erected, the goods are shipped in a boat called a 'moses,' manned by expert rowers, who, watching the *lull* of the surf, pull on shore, laying the broadside of the boat to the beach so as to roll out or admit the cargo. Those articles which are packed in water-tight casks, as rum, &c., are generally floated off or on shore. The town lies in 17° 19½′ N. lat., 62° 49½′ W. long. [See CHRISTOPHER'S, ST.]

BASSETERRE (Guadaloupe), the most considerable town of the western island, and the centre of its commerce, lies on the western side, near the south end of the island. It consists of one principal long street, running along the sea-shore, and is defended by Forts-Royal and Matilda. The anchorage is in an open road, quite unsheltered, and very incommodious, and there is a constant swell.

This western island is divided longitudinally into two parts, of which the western division is called Basseterre, and the eastern Cabesterre.

The town lies in 15° 59½′ N. lat., 61° 47½′ W. long. [See GUADALOUPE.]

BASSETERRE, a small town on the south-west point of the island of Marie Galante. It is defended by a small fort, which lies in 15° 52′ N. lat., 61° 22′ W. long. [See MARIE GALANTE.]

(Jefferies's *West Indies ;* Bryan Edwards's *West Indies ; Colombian Navigator.*)

BASSET-HORN, a musical instrument, which, notwithstanding its name, is a clarinet [see CLARINET] of enlarged dimensions and extended scale, said to have been invented in Germany in 1770, but known to have been produced in an improved state twelve years later by M. Lotz of Presburg; and subsequently, in its present perfect condition, by the brothers, Anthony and John Stadler, of the imperial Austrian chapel. The basset-horn is longer than the clarinet, and the bell end is wider. On account of its length, the tube, which consists of five pieces, is bent inwards, forming a very obtuse angle. The scale of this instrument embraces nearly four octaves,—from C the second space in the base, to G in altissimo, including every semitone; but its real notes, in relation to its use in the orchestra, are from F below the base staff,  to C, the second leger line above the treble, 
The basset-horn takes an intermediate place between the clarinet and bassoon, and, on account of its vast compass, may perform the functions of both. Its capabilities and beauty are strikingly displayed in Mozart's *Requiem ;* and in the aria, *Non più di fiore*, in his *Clemenza di Tito ;* as well as in other works of the same great composer, who well understood its value.

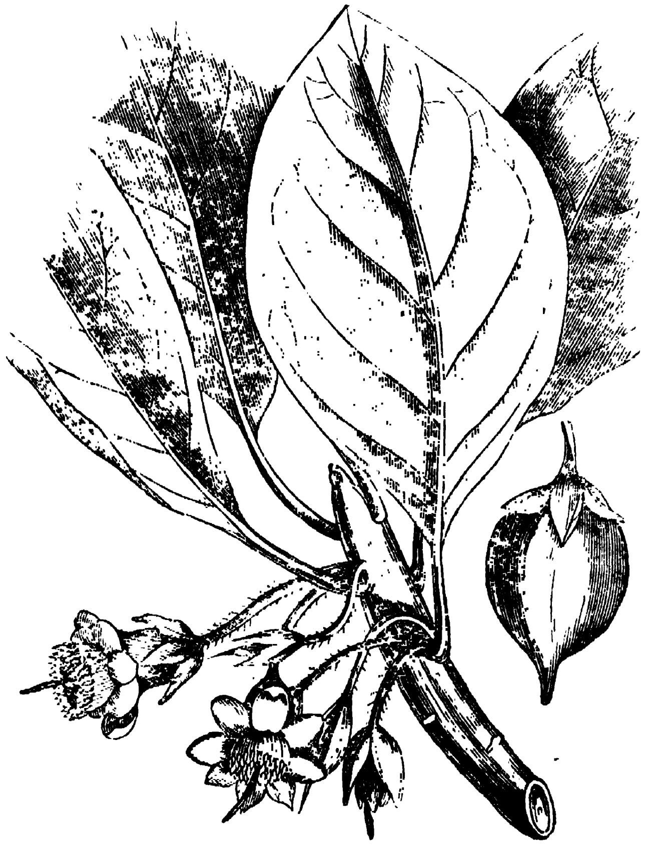
The Italian name for this instrument, and that by which it is generally designated in scores, is *corno bassetto*, or *rather low horn*, the termination *etto* being a diminutive. The unfitness of this term must at once be obvious: but, unhappily, the musical nomenclature abounds in obscurity, absurdities, and contradictions.

BASSEVELDE, a commune and market-town in the province of East Flanders, four leagues north of Ghent. The market occurs weekly, and a fair is held every year in the month of September. The tanning of hides and oil-crushing are carried on here, and lace-making gives employment to the females of the place. The soil consists, for the most part, of clay and sand. Towards the south-east of the commune, the land is marshy, and a considerable number of cattle are kept. The population in 1831 amounted to 3750. (Meisser's *Dictionnaire Geographique de la Flandre Orientale*, 1834.)

BA'SSIA, a genus of tropical plants, belonging to the natural order *Sapoteæ*, containing several interesting species. It has a calyx of four or five leaves, a monopetalous fleshy corolla, with its border generally eight-parted, and a great number of stamens. The ovary terminates in a long taper style, and contains from six to eight one-seeded cells. The fruit has a pulpy rind, with not more than three or four cells, the remainder being abortive.

The species are found in the East Indies and in Africa, where they are of great economical importance on account of the abundance of a sweet buttery substance which is yielded by their seeds when boiled. We shall mention briefly all of which anything useful is known.

Bassia butyracea, the Indian butter-tree, also the *Fulwa*, or *Phulwara-tree*, is found wild on the Almora hills in India, where it grows to a considerable size, its trunk sometimes measuring fifty feet in height, and five or six feet in circumference. It has broad, oval, long-stalked leaves, from six to twelve inches long, smooth on their upper surface, hairy on their under. The flowers, which are large and pale yellow, hang down, near the tips of the branches, from the axils of the leaves, and generally grow three together. They are succeeded by smooth, pulpy fruits, about as large as a pigeon's egg, usually containing two or three roundish light-brown seeds. From these is produced a fat-like substance, which is a kind of vegetable butter, concerning which we find the following information in the *Asiatic Researches*, by Dr. Roxburgh:—'On opening the shell of the seed or nut, which is of a fine chestnut colour, smooth and brittle, the kernel appears of the size and shape of a blanched almond. The kernels are bruised on a smooth stone, to the consistency of cream, or of a fine pulpy matter, which is then put into a cloth bag, with a moderate weight laid on, and left to stand till the oil or *fat* is expressed, which becomes immediately of the consistency of hog's-lard, and is of a delicate white colour. Its uses are in medicine, being highly esteemed in rheumatism and contractions of the limbs. It is also much valued, and used by natives of rank, as an unction, for which purpose it is generally mixed with an *utr* (aromatic oil) of some kind. Except the fruit, which is not much esteemed, no other part of the tree is used. After the oil has been expressed, the dregs are employed by the poor as food. This phulwara butter will keep many months in India without acquiring any bad colour, taste, or smell, and might no doubt be substituted advantageously for animal butter. The timber is of no value, being nearly as light as that of the *Semul*, or cotton-tree (*Bombax heptaphyllum*).



[Bassia butyracea.]

Bassia longifolia, the Indian oil-tree, is a large tree, a good deal like the last, but its leaves are narrower, and its flowers much more fleshy. It is a native of the peninsula of India, and is found in plantations along the southern coast of Coromandel, where it is called the *Illupie-tree.* Its fruit is yellowish, and yields by pressure a valuable oil, which is used by the poorer natives of India for their lamps, for soap, and, instead of better oil, for cookery. The flowers also are roasted and eaten by the Indian peasants, or bruised and boiled to a jelly, and made into small balls, which are sold or exchanged for fish, rice, and various sorts of small grain. The wood is as hard and durable as teak, so that this is one of the most generally useful trees found on the continent of India.

Bassia latifolia, the *Mahwa*, *Madhaca*, or *Madhooka* *tree*, has oblong leaves, and a corolla with a very protuberant tube. It is a native of the mountainous parts of the Circars and of Bengal, where it forms a middling-sized tree. Its wood is hard and strong, and proper for the naves of wheels; its flowers are eaten raw by the natives and by jackals, and they yield by distillation a strong intoxicating spirit. From their seeds a considerable quantity of greenish yellow oil is obtained, which is found useful for the supply of lamps; it is, however, inferior to that of the last species. It is curious that this oil stains linen or woollen cloth as animal oil does, while the fatty substance of the *B. butyracea* possesses no such property, but when rubbed on cloth leaves no trace behind.

A fourth species is believed to be the *Shea-tree*, or African butter-plant, which is so very important an article of African internal commerce; and which it would apparently be extremely desirable to introduce into the West Indies and Bengal, as a new source of internal wealth. This is the plant which is frequently spoken of by Park, particularly at pages 202 and 203 of his *Travels in Africa*:—

'The people were everywhere employed in collecting the fruit of the shea-trees, from which they prepare a vegetable butter, mentioned in the former part of this work. These trees grow in great abundance all over this part of Bambarra. They are not planted by the natives, but are found growing naturally in the woods; and in clearing wood-land for cultivation every tree is cut down but the shea. The tree itself very much resembles the American oak, and the fruit, from the kernel of which, first dried in the sun, the butter is prepared, by boiling the kernel in water, has somewhat the appearance of a Spanish olive. The kernel is enveloped in a sweet pulp, under a thin green rind; and the butter produced from it, besides the advantage of its keeping the whole year without salt, is whiter, firmer, and, to my palate, of a richer flavour than the best butter I ever tasted made of cow's milk. The growth and preparation of this commodity seem to be amongst the first objects of African industry in this and the neighbouring states, and it constitutes a main article of their inland commerce.'

BASSIGNY, in France, a district partly included in the former province of Champagne, and partly in Le Barrois, now forming part of the department of Haute Marne. It was bounded on the north by the district of Vallage in Champagne, on the east by Le Barrois and La Franche Comté, on the south by Bourgogne, or Burgundy, and on the west by Champagne. It was, according to Expilly (*Dictionnaire des Gaules*, 1762), 16 leagues, or 44 miles long and 13 leagues, or 35 miles broad; but he does not state in what direction these dimensions were taken. The superficial contents he gives at 155 square leagues*, or 1184 square miles. In the *Dictionnaire Universel de la France*, the greatest length is given at 20 leagues, or 55 miles, from north to south, and the greatest breadth at 16 leagues, or 44 miles; and these dimensions are independent of a small portion of the district separated from the rest by a part of the province of Burgundy. Several important streams, as the Meuse and the Aube, take their rise in this district. The surface is varied with hills and plains. The air is temperate and healthy, and the soil produces corn, wine, and fruit. There is a considerable extent of wood, and good pasture land. Game, poultry, and fish are abundant.

There are the vestiges of several Roman roads in this country. In the time of the Romans, Bassigny was inhabited by the tribe of the Lingones, from whom the city of Langres derives its name. Langres (population in 1832, 5960 for the town, or 7460 for the commune) was considered as the capital, but Chaumont (population in 1832, 6104 for the town, or 6318 for the whole commune) disputed this title with it. The most important places after these are Montigny le Roi and Nogent le Roi (population in 1832, 2314 for the town, or 2401 for the whole commune), Le Val des Ecoliers, and Bourbon les Bains. The last-mentioned town contains about 3500 inhabitants, and is celebrated for its mineral waters, and its vast military hospital for more than 500 men. [See LANGRES, CHAUMONT, and BOURBON LES BAINS.] (*Dictionnaire Universel de la France*; Expilly, *Dictionnaire des Gaules, &c.*)

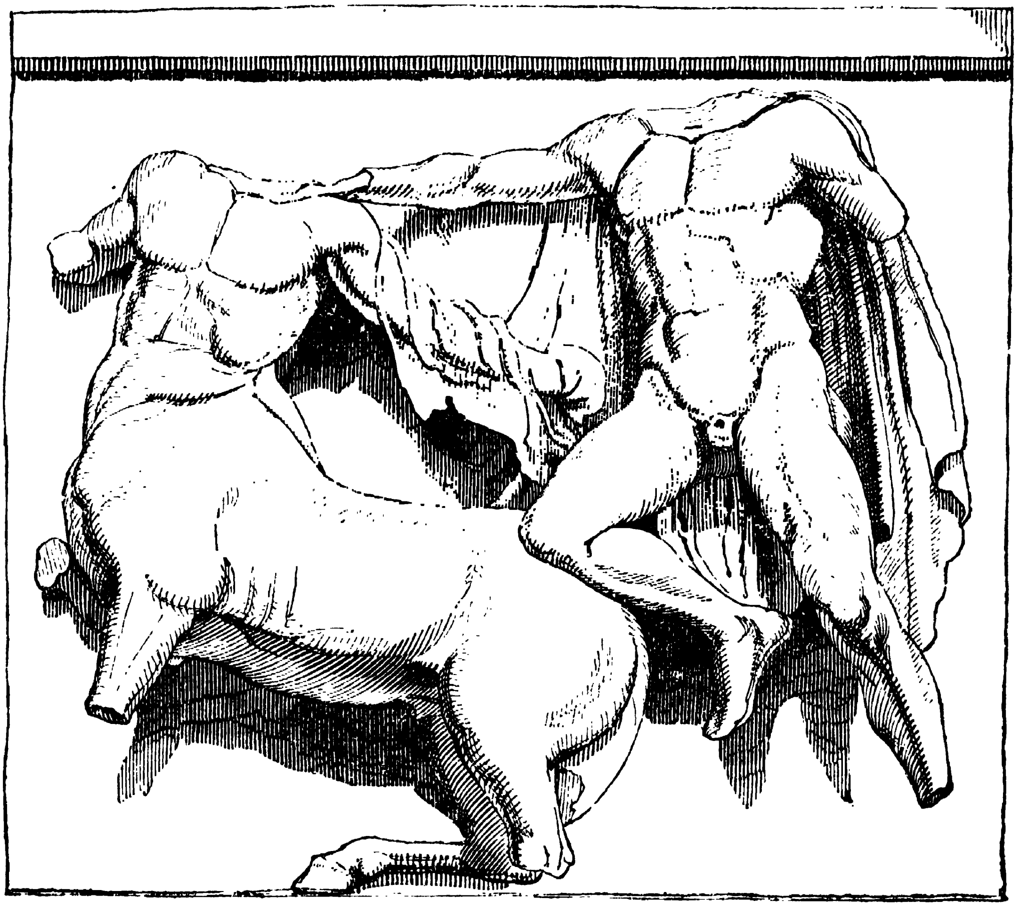
BASSO-RILIEVO. The Italian term basso rilievo, or the French bas-relief, is commonly applied to any work of sculpture connected more or less with a plane surface or background, and in this general sense is opposed to insulated detached figures, or sculpture in the round. In its more particular meaning basso-rilievo, low or flat relief, is usually appropriated to figures which have a very slight projection from the ground. Alto-rilievo, on the other hand, is not only rounded to the full bulk, but has generally some portions of the figures quite detached; and mezzo-rilievo (a style between the two), although sometimes rounded to a considerable bulk, has no part entirely unconnected with the plane surface or ground. A more accurate definition of the styles to which these designations refer will result from the explanations that follow. The terms used by the Greeks and Romans to distinguish these kinds of relief cannot perhaps be determined with complete accuracy; and it may be here remarked, that those writers are mistaken who suppose the word *Toreútike* (τορευτική) to have been applied by the Greeks exclusively to alto-rilievo, since Heyne, and indeed other writers before him, have proved that the term was appropriated to carving, and chiefly chasing in metal, in any kind of relief. The Latin word corresponding with it is *cælatura*. The Greeks seem to have employed the term *anaglypta* to denote works in relief in general; and the *ectypa sculptura* of Pliny (xxxvii. 10) also means work in relief. The term *glypta* (from γλύφω, *to cut into, to hollow out*), with other words formed from the same verb, appears to denote sculpture in the concave sense, intaglio. Herodotus, in a passage of his second book (cap. 138), where we have little doubt that he is speaking of the sunk Egyptian reliefs (which will be mentioned in another part of this article), couples a word formed from the verb γλύφω with the word typus (τύπος): typus itself (perhaps) always means a work in relief properly so called. (See Herod. iii. 88. Cicero ad Atticum, i. 10.) Italian writers of the time of Vasari, it appears, used the term mezzo-rilievo for the highest relief, basso-rilievo for the less prominent, and *stiacciato* for the flattest or least raised. Whatever the origin of this kind of sculpture may have been, and there is no doubt of its being very antient, an idea will be best formed of its style, as practised by the Greeks, by supposing it to be derived from the partial insertion of a statue in a perpendicular plane. Alto-rilievo is often literally nothing more than this. Applied, however, to a flat surface, the disposition of the limbs, and the actions of the figure become necessarily more or less parallel with that surface, in order sufficiently to adhere to it. The attitude is thus, in a certain degree, adapted or selected. In inserting or embedding a figure in a flat ground, it is obvious, that although it may be buried *less* than half its thickness, as in alto-rilievo, it cannot be buried *more*, nor indeed (the structure of the figure strictly considered) quite so much, without ceasing to present the real boundary or profile of the form. In the less prominent kinds of rilievo it is therefore still required that the outline should present the real form, and this principle in its further application excludes, in a great measure, the *unreal* forms of perspective and foreshortening, which would suppose that the objects are no longer parallel with the surface on which they are displayed. Attempts at foreshortening must in most cases fail to satisfy the eye. The work can only be seen in front, and the appearance it presents is therefore required to be at once intelligible, for no uncertainty can be removed by an inspection from another point of view, as in walking round a statue. The bulk, or thickness, need not, however, be real, provided it appear so. The compression of the bulk, which constitutes the various degrees of mezzo and basso rilievo, thus follows the compression or flattening of the action, the characteristic of alto-rilievo. Lastly, the modifications of which this branch of sculpture was susceptible, were adopted, as we shall see, according to the varieties of light, situation, dimensions, and use.

The Greeks, as a general principle, considered the ground of figures in relief to be the real wall, or whatever the solid plane might be, and not to represent air as if it was a picture. The art with them was thus rather the union of sculpture with architecture than a union of sculpture with the conditions of painting. That this was founded on the most rational principles will be evident from a few simple considerations. The shadows thrown by figures on the surface from which they project at once betray the solidity of that surface. In the attempt to represent, together with actual projection, the apparent depth of a picture, or to imitate space, figures which are supposed to be remote are reduced in size; but although thus diminished in form, they cannot have the strength of their light and shade diminished, and if deprived of shadow by inconsiderable relief, they cease to be apparent at all when the work is seen from its proper point of view, that is, at a sufficient distance; having no distinctness whatever in the absence of colour, but by means of light and shade. In short, the art, thus practised, has no longer an independent style, and only betrays its inferiority by presenting defects which another mode of imitation can supply. A passage in Vitruvius proves that the antients were not unacquainted with perspective; and the same author states that perspective scenic decorations were first employed by Agatharcus at Athens, in the time of Æschylus. However greatly the science may have been advanced by the moderns, this may be sufficient to prove that the absence of perspective in Greek bassi-rilievi was not from an absolute ignorance of its principles, but from a conviction that they would be misapplied in sculpture.

---

* The *lieue commune*, or common league of the French, is the twenty-fifth part of a degree.

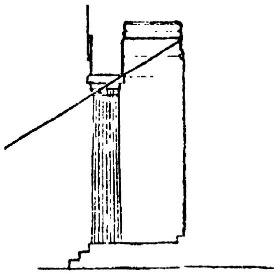
In carefully keeping within the limits, however narrow, which defined the style of rilievo, the great artists of antiquity failed not to condense into that style the utmost perfection compatible with it, while the various applications of the works suggested abundant variety in their treatment and execution. The British Museum contains unquestionably the finest existing specimens of this branch of sculpture in the rilievi which decorated the Parthenon, or Temple of Minerva, at Athens. We have here to consider the judicious adaptation of their styles for the situations they occupied; but in regard to their general excellence as works of imitation, it may also be well to remember that these sculptures were the admiration of the antients themselves. Seven hundred years after they were produced Plutarch spoke of them as 'inimitable works.'



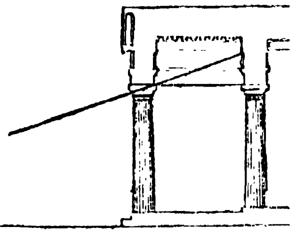
The figures which adorned the pediment are separate statues, although in their original situation, casting their shadows on the tympanum, they must have had the effect of bold alti-rilievi; the circumstance of their being thus completely detached must have given the greatest distinctness to their forms, and as they occupied the highest part of the building, their gigantic size and complete relief made them fully effective at a considerable distance. The sculptures which adorned the metopes, or spaces between the triglyphs, are in alto-rilievo. Those in the British Museum, representing combats with Centaurs, were taken from the south side of the building: the subjects were varied on the other sides, but they mostly related to the warlike exploits of the Athenians. It has been well observed that the subjects of combats, usually chosen for the metopes in Doric temples, afforded opportunities of composing the figures so as to produce diagonal lines, which effectually distinguished the groups from the architecture, and at the same time had the effect of reconciling the vertical forms of the triglyphs with the horizontal lines of the epistylium and cornice. The compositions in question all fully occupy the space destined for them, and are calculated, from their treatment and relief, to produce the utmost possible effect. Those works which received the open light were thus boldly relieved from their ground to insure the masses of shadow which make them conspicuous: the principle, applicable to external architecture, that projection commands shade, was thus extended to external decorations; and care seems to have been taken to keep the light on the figures as unbroken as possible, especially as the whole series of metopes occupying the external frieze was more or less crossed by the shadow of the cornice. This precaution necessarily limits the attitudes, for many actions equally natural with those adopted would have projected shadows on the figure itself, thus tending to confuse the forms. A statue which can be seen from various points, and sometimes in various lights, might thus be unfit as to its composition for that intelligible display in one view and under a constant light which rilievo requires. On the principle that high relief is fittest for the open light, the rilievi of the temple of Phigaleia, which are also preserved in the British Museum, are bold in their projections. These works adorned the interior of the cella, but as the temple was hypæthral, or lighted from the open sky, the principles of external decoration were applicable. Had the temple been imperfectly lighted, a flatter kind of relief would have been preferable, and this leads us to consider the style of basso-rilievo, properly so called, the most perfect existing specimen of which is also in the British Museum. It adorned the external wall of the cella of the Parthenon, within the peristyle or colonnade, and was consequently always in shade: the strongest light it could ever receive would probably be the reflection from the pavement below when the sun was highest; but as reflected lights are uncertain, and may proceed from various points, the sculptures in question were calculated to be equally distinct in whatever direction the light was thrown. Their great elevation, and the peculiar angle at which they were seen, owing to the narrowness of the space between the exterior columns and the cella, may also be mentioned in considering the reasons which rendered projection unadvisable. That this confined view was not, however, the sole reason, may appear from the bold relief of the Phigalcian marbles, which, in the interior of the narrow cella of the temple they adorned, must have been seen, on the side walls, at a very inconsiderable distance compared with their height. The Phigaleian temple was built, according to Pausanias, by Ictinus, the chief architect of the Parthenon; and although the sculptures are inferior, as works of art, to the generality of Greek specimens, their style of relief is precisely the point where the architect may be supposed to have influenced their execution.

As projection commands shade, so flatness commands light, and the flattest relief is hence fittest for an invariably dark situation. The same principle is observable in architecture in the treatment of mouldings in interiors, the form and projection of which differ materially from the corresponding members in the open light, and which are intended to be seen at a distance. The flatness which insures light would, however, be altogether indistinct and formless unless the outlines were clear and conspicuous at the first glance. The contrivance by which this is effected is by abruptly sinking the edges of the forms to the plane on which they are raised, instead of gradually rounding and losing them. The mass of the relieved figure being sometimes very little raised in its general surface, its section would thus almost present a rectangular projection. In many instances the side of this projection is even less than rectangular; it is undercut, like some mouldings in architecture which require to be particularly distinct, and thus presents a deeper line of shade. But if the figure can thus command distinctness of outline, notwithstanding the inconsiderable light it may receive, it is obvious that its lowness or flatness of relief will in such a light greatly aid its distinctness: above all, this contrivance gives the work thus seen in an obscure situation the effect of rotundity. Indeed, it is a great mistake to suppose that the flat style of relief was intended to appear flat, and it is a great mistake to apply it in situations, as in the open air, where it must appear so, and be indistinct besides. The conventions of the arts are remedies, adopted in certain situations and under particular circumstances, and are supposed to be concealed in their results: their ultimate resemblance to nature, and their successful effect in those circumstances, are the test of their propriety and necessity. The absence of all convention in alto-rilievo (as opposed to the flat style), thus fits it for near situations, if not too near to expose it to accidents. The excellent sculptures which decorate the pronaos and posticum of the Temple of Theseus, although under the portico, are in bold relief. They were not only nearer the eye, and seen at a more convenient angle than the flat rilievi of the cella of the Parthenon, but the reflected light which displayed them would necessarily be much stronger.

Lateral portico of the Parthenon.



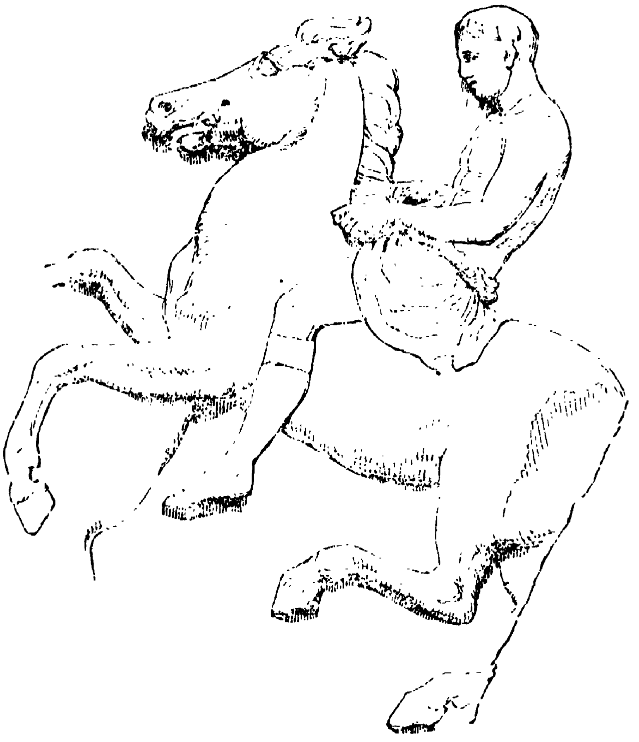
End portico of the Temple of Theseus.

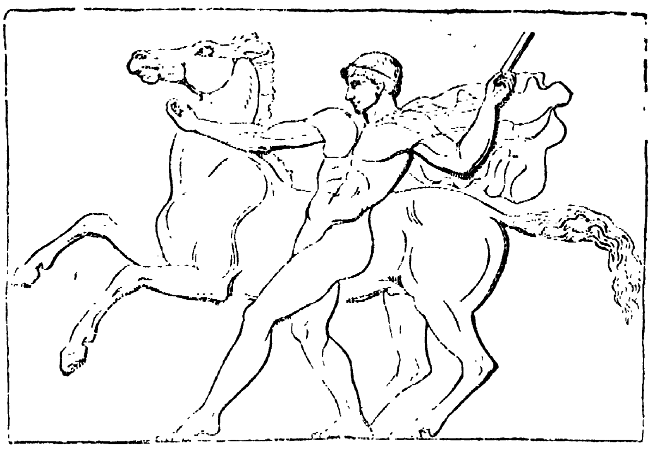


It is also to be remembered that only the end porticoes, where the sculpture could be more conveniently seen and was better lighted, were decorated with rilievi; the side walls of the cella were unornamented, and undoubtedly bold relief would have been less adapted for them. The Temple of Theseus was built about thirty years before the Parthenon; and it is not impossible that the satisfactory effect of the flat rilievi on the cella of the latter might have suggested a similar treatment, or some modification of it, in the Temple of Theseus, had it been erected later. It may be observed in general, that alto-rilievo can seldom be fit for interiors, not only from its liability to accident, but from the difficulty of displaying it by the full light which it requires. A superficial light, especially if in a lateral direction, necessarily throws the shadows of one figure on another. Instances of this occur in some of the palaces in Rome where works of sculpture have been injudiciously placed. A room, for example, lighted in the ordinary way will have its walls (at right angles with that occupied by the windows) adorned with a frieze in considerable relief; the figures nearest the light consequently project their shadows so as to half conceal the next in order.

The conditions of proximity and distance, as well as the quantity and direction of light, were carefully attended to by the Greek sculptors, and suggested new varieties of relief. The end of the art, as far as relates to execution, is accomplished when the work is distinct and intelligible at the distance whence it is intended to be viewed. Hence the conventions which are intended to correct the defects of distance, of material, want of light, &c., are evidently unnecessary where the work admits of close inspection. The style of mezzo-rilievo, which in its boldest examples presents about half the thickness of the figure, is, on many accounts, least fit for a distant effect: the figure is nowhere detached from its ground; at a very little distance its shadowed side is lost in its cast shade, and its light side in the light of its ground; the outline, in short, soon becomes indistinct; but the semi-roundness of the forms is directly imitative, and thus again the absence of all conventional treatment fits the work for near situations. The style was preferred to alto-rilievo in such cases, as the latter would have been more liable to accidents, and would besides in some measure deform the outline or profile of any object which is circular in its plan. The figures which adorn sculptured vases are thus in mezzo-rilievo: these works probably ornamented interiors where any indistinctness in their distant effect or in an unfavourable light might be obviated by closer inspection. Two specimens may be seen in the second room of the Gallery of Antiquities in the British Museum. The celebrated Mediceau and Borghesan vases, the finest known examples, are in like manner ornamented with mezzo-rilievo. The same consideration applies to all works, however unfit for a distant effect, which can, or in their original situation could, only be seen near. Even the mixed style of relief in the sculptures which occupy the internal sides of the Arch of Titus at Rome, would hardly be objected to, since the objects represented are distinctly seen, and can only be seen, at the distance of a few feet. The style of semi-relief (much purer than that of the Arch of Titus) adopted by Flaxman in front of Covent Garden Theatre may be defended on the same principle, since the utmost width of the street is hardly a more distant point than a spectator would naturally retire to in order to see them conveniently. The still flatter style which has been introduced on the exterior of several buildings in London cannot, however, be defended on any grounds; and there can be no doubt, from the reasons adduced, that bold relief is generally fittest for the open light. The mezzi rilievi on the miniature choragic monument of Lysicrates (casts from them are in the British Museum) may be admitted to have been fitly calculated for their situation because they must have been seen near; but there was in this case an additional consideration to be attended to; the building is circular, and alto-rilievo was avoided in order to preserve the architectural profile: on the other hand, the frieze of the small temple of Victory, which was rectangular, was adorned with alti-rilievi; and in this case it appears that they did not even extend to the angles. The objections to sculpture on monumental columns will be obvious from these considerations; it has been observed, that in attempting to preserve the architectural profile, as in the Trajan column, and its modern rival in the Place Vendôme at Paris, the sculpture thus slightly relieved soon becomes indistinct, nor indeed would this indistinctness be obviated at a considerable height even by alto-rilievo, the figures being necessarily small, while the evil is only increased by substituting the dark material of bronze for marble.

We proceed to consider the varieties of style in this art as affecting composition. In rilievo, and in sculpture generally (a colourless material, or a material of only one colour being always supposed), it is evident that shadow is the essential and only source of meaning and effect. In works placed in the open air, and visible in one point only, as in the case of alto-rilievo, a certain open display of the figure is generally adopted; the shadows, or rather the forms which project them, are so disposed as to present at the first glance an intelligible and easily recognised appearance, and the impossibility of changing the point of view, or changing the light, as before observed, limits the attitudes more than in a statue, and, as will also appear, more than in a basso-rilievo. For in the latter, however distinct the outline is in which the chief impression and meaning of the figure reside, the shadows within the extreme outlines are in a great measure suppressed; it is, in fact, by their being so suppressed that the general form becomes so distinct. This is also the case when one form is relieved on another; it will be seen that the nearest object is very much reduced and flattened in order that its shadow may not interfere with the more important shadows of the outlines on the ground, and hence it may often happen that the nearest projection is least relieved. It will thus be evident that, owing to this power of suppressing the accidental shades and preventing them from rivalling or being confounded with the essential ones, the choice of attitudes becomes less limited, and many a composition which in full relief would present a mass of confusion from its scattered and equally dark shades, may be quite admissible and agreeable in basso-rilievo. Accordingly the attitudes of statues, which are generally unfit for alto-rilievo, frequently occur in the flat style. Visconti even supposes that certain figures in the bassi-rilievi of the Parthenon suggested the attitudes of celebrated statues afterwards executed; as, for instance, the Jason, or Cincinnatus, and the Ludovisi Mars. As a remarkable proof how much the attitudes were limited in alto-rilievo compared with the flat style, it may be observed, that the contrasted action of the upper and lower limbs, which gives so much energy and motion to the figure, is perhaps never to be met with in the fine examples of alto-rilievo, whereas in the flat style it is adopted whenever the subject demands it. In the annexed sketch of an early Greek basso-rilievo, representing Castor managing a horse (from the third room of the gallery of the British Museum), the action of the upper and lower limbs is contrasted, as is the case in all statues which are remarkable for energy and elasticity of movement: the statue called the Fighting Gladiator may be quoted as a prominent example. This disposition of the lower limbs, or the alternate action in which one of the arms would cross the body, never occurs in alto-rilievo, because the shadow of the arm on the body or of one of the lower limbs on the other could then no longer be suppressed, as it is in this case, but would rival the shadows of the whole figure on the ground. Among the metopes of the Parthenon, the Phigaleian marbles, and the altirilievi of the Temple of Theseus, there is not a single instance of the contrasted action alluded to; while in the two latter examples, the contrary position, or open display of the figure, repeatedly recurs, even to sameness. It must however be admitted, that this open display of the figure, although not presenting the most energetic action, is as beautiful as it is intelligible, and hence the finest exhibitions of form were quite compatible with the limited attitudes to which the sculptors thus wisely confined themselves. The objections which compelled this limitation being however entirely obviated in basso-rilievo, by the power of suppressing at pleasure the shadows within the contour, we find the fullest advantage taken of the latitude which was thus legitimately gained.

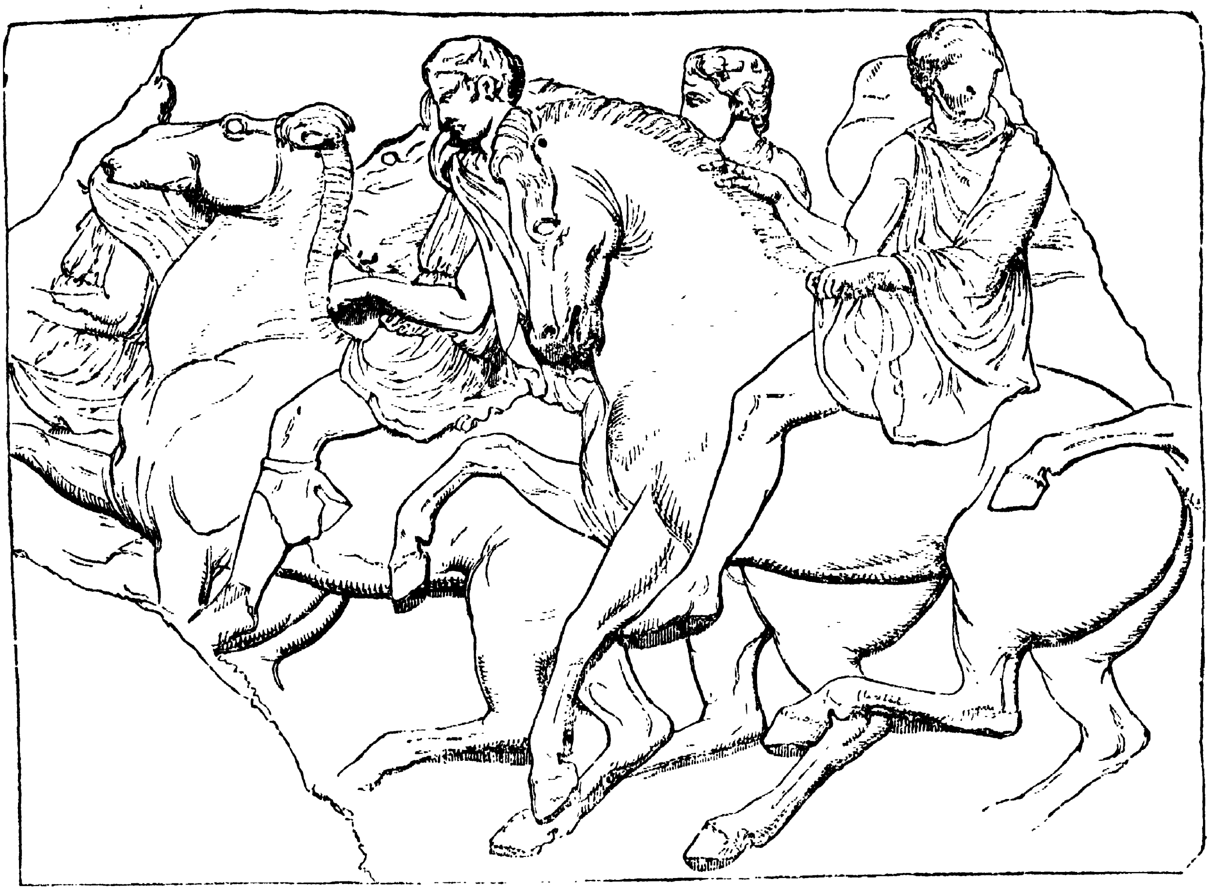




A better example cannot be referred to than the flat rilievi already mentioned from the cella of the Parthenon. (See the next illustration.) The subject represents the Panathenaic procession, and although no perspective diminution is admitted, several equestrian figures are sometimes partly relieved one upon the other. The confusion which results from the number of similar forms in the repetition of the horses' limbs, as well as in the actions of the horsemen, must be admitted; but perhaps the subject is thus better expressed than by a simpler arrangement, and this treatment contrasts finely with the single figures. In a procession of horsemen moving two or three abreast, we are at once aware that the figures are similar, and the eye is satisfied, as it would be in nature, not in searching out each individual figure as if it had a separate principle of action, but in comprehending the movement and the mass, for one indicates the whole. Where the figures thus cross each other they are treated as a mass; the outline of the whole group is distinct and bold, being more or less abruptly sunk to the ground, but the outlines which come within the extreme outline are very slightly relieved. In short, the principle here applied is precisely the same as that observable in a single figure in the same style of relief: the outline of the whole form is distinct, or rather most distinct where it is most important, and the internal markings are seldom suffered to rival it, but are made subservient to this general effect. The relative importance of the objects is, indeed, the only consideration which is suffered to interfere with this principle: thus loose drapery is sometimes slightly relieved on the ground, while a significant form is now and then strongly relieved even on another figure. In comparing the slight varieties of treatment in these rilievi, it is to be remembered that the end porticoes were a little wider than the lateral colonnades. It is undoubtedly to this circumstance that the difference of treatment alluded to is to be referred; the figures in the end friezes are more separated from one another, and consequently somewhat more relieved than the compact processions on the side walls.

The fact that these bassi-rilievi, as well as most of the sculpture of the antients, were partially painted, has been purposely left out of the account, because the very contrivances resorted to are calculated to supply the absence of colour. The custom in the best age of Grecian art of painting architecture and sculpture may be defended or excused elsewhere; it may be, however, here remarked, that while the antient sculptors added colour after having employed every expedient which could supply its want, the moderns, in altogether rejecting it, often fail to make use of those very conventions which its absence demands.

It appears that the principle of suppressing the relief within the extreme contour which, with the strong marking of the outline itself, mainly constitutes the style of basso-rilievo, was employed by the antients in works of considerable relief, in interiors, in particular lights, and probably



at some distance or elevation. The real projection which works thus strictly belonging to the class of bassi-rilievi may sometimes present, points out the essential difference between basso and mezzo rilievo: a work, even if in very slight general relief, which has the parts that are nearest the most relieved, belongs to mezzo-rilievo; while a work which has the nearest parts least relieved, constitutes basso-rilievo, whatever its general projection may be. In the former, the outline is thus less apparent than the forms within it; in the latter, the outline is more apparent than the forms within it. The early Greek and Etruscan rilievi, which, however flat, have the nearest parts the fullest, while the outline is scarcely, if at all, rectangular in its section, have thus the principle of mezzo-rilievo. They are even fitted for near inspection, and cannot be said to present any unsatisfactory convention: for the bulk, however really thin, is proportionate in its relief, and is so far directly imitative: inasmuch as the eye consents to a diminished scale of bulk as easily as to a diminished scale of height, while the indistinctness of the outline has the effect of rounding the form. Such works are besides fitted for near examination, because they can scarcely command any shadow. Various specimens may be seen in the British Museum.

The antique vases of Arezzo were ornamented with figures in this kind of relief. Certain silver vases mentioned by Pliny were of the same description. The Egyptian intaglio, for so it may be called, rather than rilievo, belongs to the same style. The Egyptian artists, instead of cutting away the background from the figure, sunk the outline, and slightly rounded the figure, on the principle of mezzo-rilievo, within. Thus no part of the work projected beyond the general surface, and the architectural profile was preserved. There are, however, many very antient examples at Thebes of figures slightly relieved from the ground, somewhat on the principle of basso-rilievo as practised by the Greeks, that is, with the nearest parts least relieved, and with outlines rectangular in the section. Many of them, probably, in their original situations, and when the buildings were entire, ornamented interiors. Some Persian rilievi, in the British Museum, approach the same style. The Egyptian rilievi were painted in brilliant colours, and would have been ineffective in the open light without such an addition.

The distinctions of the three styles of relief, according to the Greek examples, may now be thus recapitulated. In the highest relief, however decided the shadows may and must of necessity be, on the plane to which the figure is attached, the light on the figure itself is kept as unbroken as possible, and this can only be effected by a selection of open attitudes; that is, such an arrangement of the limbs as shall not cast shadows on the figure itself. In basso-rilievo the same general effect of the figure is given, but by very different means: the attitude is not selected to avoid shadows on the figure, because, while the extreme outline is strongly marked, the shadows within it may be in a great measure suppressed, so that the choice of attitudes is greater. Mezzo-rilievo differs from both: it has neither the limited attitudes of the first, nor the distinct outline and suppressed internal markings of the second: on the contrary, the outline is often less distinct than the forms within it, and hence it requires, and is fitted for, near inspection. Its imitation may thus be more absolute, and its execution more finished, than those of either of the other styles.

Most of the coins of antiquity are executed on the principle of mezzo-rilievo; and though often far bolder in this relief than modern works of the kind, are treated in a mode corresponding with their minute dimensions, which require close examination. The outline thus gradually rounds into the ground, and is never abruptly sunk, while the nearest parts are most relieved. Thus, conventional methods are always wanting in works that admit of close inspection, where the eye can be satisfied without such expedients. The comparatively strong relief of the heads on the antient medals is again a contrivance for their preservation, and presents a new variety in the style of rilievo. Coins are exposed to friction, and the forms they bear are thus liable to be soon effaced. The earliest means adopted to prevent this was by sinking the representation in a concavity, in which it was thus protected. This plan was soon abandoned, for obvious reasons; and the method ultimately adopted was that of raising the least important parts most. Accordingly, the parts that are rubbed away in many fine antique coins are precisely those which can best be spared; the hair has generally a considerable projection, so that the face and profile are often perfectly preserved after 2000 years: a better specimen cannot be adduced than the celebrated Syracusan coin representing the head of Arethusa or Proserpine. In addition to the propriety of its style, this head is remarkable for its beauty; and is classed by Winkelmann among the examples of the highest character of form.

diate cause of his incurring the cardinal's displeasure was, as he tells us in his *Mémoires*, his neglecting to keep an appointment to dinner. On the day preceding the memorable *Day of the Dupes* (la Journée des Dupes), the 30th of November, 1630, Bassompierre met the cardinal in one of the passages of the Louvre. He accosted him, and Richelieu feigned to receive the courtesy as a favour to a 'poor disgraced minister.' Bassompierre, in the fulness of his benevolence, condescended to invite himself to dine with the cardinal, and the offer was accepted. It happened, however, unfortunately that two noblemen, enemies of the cardinal, met Bassompierre in the course of the day, and 'debauched' him to dine with them, and the 'poor disgraced minister' was forgotten.

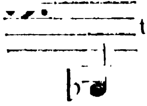
On the 23rd of February, 1631, Bassompierre was arrested, by Richelieu's orders, and sent to the Bastille, where he was confined for twelve years; that is, till the death of the cardinal. He tells us, that the day before he was arrested he burned upwards of 6000 love-letters which he had received at different times from his female admirers—a pretty decisive proof of the reputation which induced Madame de Montpensier, when recalling the brilliant visions of her youth, to designate him as 'cet illustre Bassompierre.' (See the Preface to the translation of *Bassompierre's English Embassy*, ascribed on personal knowledge by Mr. D'Israeli to the Right Hon. J. W. Croker.)

He employed his time during his imprisonment in writing his *Mémoires* and revising his *Ambassades*; but both are so very dull and jejune, that we cannot help regarding him as one of those men whose fame has been mainly owing to the advantages of a good person and address. There is not a single passage in all his writings which would lead us to conclude that he was 'the wittiest man of his time;' and even those anecdotes and *bons mots* which are attributed to him in the French *Ana*, are not calculated to impress us with a high notion of his mental accomplishments.

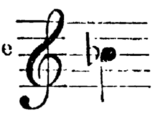
Bassompierre died of apoplexy on the 12th of April, 1646, three years after his liberation from prison. It is alleged that he was offered the guardianship of the young monarch Louis XIV., but age, or, as Mr. Croker conjectures, the wholesome discipline of the Bastille,' had cured him of all ambition as a courtier, and he declined the perilous honour.

(*Mémoires de Mareschal de Bassompierre*, 4 tomes, Amsterdam, edition 1723; Bassompierre's *Embassy to England*, translated, with notes, London, 1819; *Memoirs of Henry the Great of France*, 2 vols. London, 1829; and the works referred to in the text.)

BASSOON, a musical instrument of the pneumatic kind, blown through a reed. It consists of four pieces, or tubes of wood, bound together and pierced for ventages, of a brass craned neck, in which the reed is inserted, and of several keys. The whole length of the tubes is 6½ feet, but by doubling up, this is reduced to four. It may be considered as a base oboe [see Oboe]; and its compass is from B flat below the base staff,



to B flat in the treble staff.



This instrument is used in every kind of music, for the richness of its tone and extent of its scale render it invaluable to the composer. Handel seems to have been the first who gave importance to it, and in the air *Thou didst blow*, in the oratorio of *Israel in Egypt*, exhibited its qualities in so advantageous a manner, that it immediately afterwards began to assume a rank in the orchestra which has ever since been increasing.

The bassoon was invented as early as the year 1539, three years after Luscinius had published his *Musurgia*, who consequently does not mention the instrument. Mersenne describes it and all its varieties; but a long time elapsed before it came into use. The word is derived from the Italian *bassone*, which is now rarely used. The common Italian term is *fagotto*, a fagot, or bundle of sticks, because the tubes of which the instrument is composed are bound together. The Italian word *fagotto* is always employed in musical scores.

BASSOON, DOUBLE, a bassoon of increased dimensions, the scale of which is an octave below that of the ordinary bassoon. The double-bassoon was introduced at the commemoration of Handel in 1784, but not found to answer the intended purpose, and has now fallen into utter disuse, the Serpent [see Serpent] well supplying the place which it was meant to fill.

BASSORAH. [See Basra.]

BASSUS, in entomology, a genus of the order *Hymenoptera*, and family *Braconidæ*. These are four-winged flies, with long and narrow bodies. They frequent the flowers of umbelliferous plants.

BAST, FREDERICK JAMES, a scholar of considerable eminence, was born in the state of Hesse-Darmstadt, about the year 1772. He received his earliest instruction from his father at Bouxviller, but afterwards studied in the University of Jena, under Professors Griesbach and Schütz.

His first literary essay was a commentary upon Plato's *Symposion*, which was followed in 1796 by a specimen of an intended new edition of the Letters of Aristænetus. He lived at this time at Vienna, where he was in the suite of M. de Jan, the resident from Hesse-Darmstadt; and where, in the Imperial Library, he had found a manuscript of Aristænetus, which afforded most important readings for improving the text of that author.

The landgrave of Hesse-Darmstadt afterwards made him secretary of legation at the congress of Radstadt; and finally placed him in the same capacity with the Baron de Pappenheim, his minister at Paris. To mark his approbation of Bast's literary studies, the landgrave also bestowed upon him the reversion of the keepership of the Library of Darmstadt, a post which he preferred to more brilliant honours that he might have claimed, but which were less suited to his literary taste.

Bast, uniting the labours of philology with those of diplomacy, profited very much during his stay in Paris by the collation and copying of a considerable number of Greek manuscripts. It was a most advantageous residence for him, as the best classical treasures of the Vatican had at that time been recently transported to France.

Of the importance of his critical researches some estimate may be formed from his *Lettre Critique à M. J. F. Boissonade sur Antoninus Liberalis, Parthenius, et Aristénète*, 8vo. Paris, 1805. This work, of rather more than 250 pages, was originally intended for insertion in Millin's *Magasin Encyclopédique*, and was on that account written in French, but growing upon the author's hands, it became a book, and stands in the first rank of treatises on verbal criticism. It was in a volume of the Vatican, No. 398 of the Greek manuscripts, which had once belonged to the electoral library at Heidelberg, that he found the manuscripts of Antoninus Liberalis and Parthenius; and the same volume contained seventeen other manuscripts, some of them inedited, of each of which, in the *Letter to M. Boissonade*, Bast has given a notice.

Schæfer's edition of Gregorius of Corinth, and some other grammarians, published at Leipzig, 2 vols. 8vo. 1811, contains Bast's Notes on that author, with a Palæographical Dissertation (accompanied by seven Plates of fac-similes from Greek manuscripts), which is considered to be a master-piece of erudition. The remarks of Bast relative to the various kinds of connections and contractions which he met with in the numerous MSS. which he consulted, have been extracted from the body of his works by John Hodgkin, the editor of the *Calligraphia et Pœcilographia Græca*, and will shortly be published for the use of those who are engaged in the labour of reading or collating Greek MSS.

Bast died of apoplexy at Paris, Nov. 15, 1811. His Notes upon Aristænetus were published in a variorum edition of that author by his friend M. Jo. Fr. Boissonade, 8vo. Lutetiæ, 1822. (See the *Biographie Universelle, Supplem.* tom. lvii. 8vo. Paris, 1834, and the works above quoted.)

BASTAN. [See Baztan.]

BASTARD. The conjectures of etymologists on the origin of this word are various and unsatisfactory. Its root has been sought in several languages:—the Greek, Saxon, German, Welsh, Icelandic, and Persian. For the grounds on which the pretensions of all these languages are respectively supported, we refer the curious to the glossaries of Ducange and Spelman, the more recent one of Boucher, and to the notes on the title Bastard in Dodd and Gwillim's edition of Bacon's Abridgment, vol. i. p. 746.

Among English writers it is applied to a child not born in lawful wedlock; and as such he is technically distinguished from a *mulier* (*filius mulieratus*), who is the legitimate offspring of a *mulier* or married woman.

Our ancestors very early adopted strict notions on the subject of legitimacy; and when the prelates of the 13th century were desirous of establishing in this country the rule of the canon law, by which spurious children are legitimated upon the subsequent intermarriage of their parents, the barons assembled at Merton (A.D. 1235) replied by the celebrated declaration, 'that they would not consent to change the laws of England hitherto used and approved.'

It has been observed that this sturdy repugnance to innovation was the more disinterested, inasmuch as the lax morality of those days must probably have made the proposition not altogether unpalatable to many to whom it was addressed. The opposition, therefore, seems to have been prompted by a jealousy of ecclesiastical influence which was at that time ever watchful to extend the authority of the church by engrafting on our jurisprudence the principles of the Canon Law.

On another point our ancestors were less reasonable; for it was very early received for law not only that the fact of birth after marriage was essential to legitimacy, but that it was conclusive of it. Hence it was long a maxim that nothing but physical or natural impossibility, such as the continued absence of the husband beyond seas, &c., could prevent the child so born from being held legitimate, or justify an inquiry into the real paternity.

Their liberality in the case of posthumous children was also remarkable: for in the case of the Countess of Gloucester, in the reign of Edward II., a child born one year and seven months after the death of the duke, was pronounced legitimate; a degree of indulgence only exceeded by the complaisance of Mr. Serjeant Rolfe, in the reign of Henry VI., who was of opinion that a widow might give birth to a child at the distance of seven years after her husband's decease, without wrong to her reputation. (See Coke upon Littleton, 123, b. note by Mr. Hargrave; Rolle's *Abridgment, Bastard;* and Le Marchant's *Preface to the case of the Banbury Peerage.*)

The law now stands on a more reasonable footing, and the fact of birth during marriage, or within a competent time after the husband's death, is now held to be only a strong presumption of legitimacy, capable of being repelled by satisfactory evidence to the contrary.

Another curious position of doubtful authority is also found in our old text writers; namely, that where a widow marries again so soon after her husband's decease that a child born afterwards may reasonably be supposed to be the child of either husband, then the child, upon attaining to years of discretion, shall be at liberty to choose which of the two shall be accounted his father. It was to obviate this embarrassing state of things that the civil law prescribed an '*annum luctûs*,' or year of grief, during which the widow was prohibited from contracting a second marriage; and our own law provided the now obsolete proceeding on a writ *de ventre inspiciendo.*

The legal incapacities under which an illegitimate child labours by the law of England are few, and are chiefly confined to the cases of inheritance and succession. He is regarded for most purposes as the son of nobody, and is therefore heir-at-law to none of his reputed ancestors. He is entitled to no distributive share of the personal property of his parents, if they die intestate; and even under a will he can only take where he is distinctly pointed out in it as an object of the testator's bounty, and not under the general description of 'son,' 'daughter,' or 'child,' by which legitimate children alone are presumed to be designated. He may, however, acquire property himself, and thus become the founder of a fresh inheritance, though none of his lineal descendants can claim through him the property of his reputed relations. If he dies without wife, issue, or will, his lands and goods escheat to the crown, or lord of the fee. In the former event it is usual for the crown to resign its claim to the greater part of the property on the petition of some of his nearest *quasi* kindred.

Strictly speaking, a bastard has no surname until he has acquired one by reputation, and in the meantime he is properly called by that of his mother.

The first English statute which provides for the maintenance of illegitimate children, is the 18th of Elizabeth, cap. 3, which confers on justices of the peace the power of punishing *the parents, and of requiring from one or both of them* a weekly or other payment for their support. Under this and later acts of parliament, the usual practice has been for the mother to apply for relief to the parish officers, by whom she is carried before certain magistrates to be interrogated respecting the paternity of the child. An order of filiation is then made, in which the male offender is adjudged to be the reputed father, and is ordered to contribute a weekly payment, or is bound to indemnify the parish against the future expenses of maintenance.

In this state of things, the commissioners lately appointed by his Majesty to inquire into the administration of the poor-laws, recommended the total abolition of punishment, and the exemption of the reputed father from all liability to the support of the child. The proposal was supported by arguments not devoid of plausibility, and is said to be sanctioned by the favourable experience of other countries; it was however strenuously opposed in both Houses of Parliament, and was eventually so modified as to leave the law nearly as it stood before the passing of the late act. (See the *Report of the Commissioners*, p. 165, 343, 8vo. ed., and stat. 4 and 5 Will. IV., chap. 76.)

According to late official tables, the proportion of illegitimate to legitimate births was in the year 1830 as one to twenty in England; the proportion in France is as one to thirteen, and in Paris alone as one to three. The proportion in Wales was as one to thirteen in the year 1830; but in no city or town in the British islands is the proportion comparable with that of Paris. In Denmark the illegitimate are one in ninety-six; in Norway one in fourteen; and in Hamburgh one in five. (*Reports of Poor-Law Commissioners.*)

The civilians and canonists distinguish illegitimate children into four or five classes not recognised in the English law; it may however be worth while to remark, that the familiar term *natural*, applied by us to all children born out of wedlock, is in that classification confined to those only who are the offspring of unmarried parents, living in concubinage, and who labour under no legal impediment to intermarriage. Children of the last-mentioned class are, by the civil and canon law, capable of legitimation by the subsequent union of the parents, or by other acts which it is needless here to particularize. (See Heineccius, *Syntag*, vol. i., p. 159; Ridley's *View*, &c., p. 350, ed. 1675; Godolphin's *Repertorium Canonicum*, chap. 35.)

By the Athenian law (passed in the archonship of Eucleides, B.C. 403), as quoted by Demosthenes (*Against Macartatus*, cap. 12), illegitimate children were cut out from all inheritance and succession: nor could a man, who had legitimate male offspring, leave his property to other persons, and consequently not to his illegitimate children. A previous law of Pericles (see his *Life* by Plutarch, cap. 37) declared that those only were legitimate and Athenian citizens who were born of two Athenian parents. This law, which was repealed or violated in favour of a son of Pericles, was re-enacted in the archonship of Eucleides. (Athenæus, xiii. 577. Demosthenes *Against Eubulides*, cap. 19.)

The repute in which spurious children have been held has varied in different ages and countries. In some they have been subjected to a degree of opprobrium which was inconsistent with justice; in others the distinction between base and legitimate birth appears to have been but faintly recognised, and the child of unlicensed love has avowed his origin with an indifference which argued neither a sense of shame nor a feeling of inferiority. When the Conqueror commenced his missive to the Earl of Bretagne by the words, 'I, William, surnamed the Bastard,' he can have felt no desire to conceal the obliquity of his descent, and little fear that his title would be defeated by it. Accordingly, history presents us with many instances in which the succession not only to property, but to kingdoms, has been successfully claimed by the spurious issue of the ancestor. It is, however, very improbable that in any state of society where the institution of marriage has prevailed, children born in concubinage and in lawful wedlock should ever have been regarded by the law with exactly equal favour. (See Ducange, *Glossary*, tit. *Bastardus.*)

Those who may be curious to learn what fanciful writers have urged in proof of the superior mental and physical endowments of illegitimate issue, may refer to Burton's *Anatomy of Melancholy*, vol. ii., p. 16 (ed. 1821); Pasquier *Recherches*, chap. 'De quelques memorables bâtards;' and Pontus Heuterus *de Liberâ Hominis Nativitate.* See also Shakspeare's *Lear*, act 1, scene 2; and the observations of Dr. Elliotson in his edition of Blumenbach's *Physiology*, in notes to chap. 40.

BASTARDY. The Scottish law of Bastardy differs considerably from the English, chiefly in consequence of its having adopted much of the Roman and pontifical doctrines of marriage and legitimacy.

Thus, in England, in the case of a divorce in the spiritual court, '*à vinculo matrimonii,*' the issue born during the coverture are bastards. But agreeably to the judgment of the canons, *Decret. Greg.*, lib. iv., tit. 17, c. 14, the Scottish writers, proceeding on the *bona fides* of the parties, incline to a different opinion, *in favorem prolis;* and it will be recollected that when Secretary Lethington proposed to Mary Queen of Scots a divorce from Darnley, James Earl of Bothwell, to quiet her fears for her son, 'allegit the exampill of himself, that he ceissit not to succeid to his father's heritage, without any difficultie, albeit thair was divorce betwixt him and his mother.' The point has not, however, received a judicial determination, and cannot therefore be regarded as settled, though of the tendency of the law there can be little doubt. Even in the case of a marriage between a party divorced for adultery and the adulterer, which by stat. 1600, c. 20, following the civil law, is declared 'null and unlawful in itself, and the succession to be gotten of sik unlawful conjunctions unliable to succeid as heires to their said parents;' the issue are not accounted bastards, 'though,' as Stair adds, b. iii., tit. 3, sect. 42, 'they may be debarred from succession.' Of course, the issue of every legal marriage are lawful, and therefore the children not only of marriages regularly solemnized, but also of every union acknowledged by the law as a marriage, are alike legitimate. The same may be said of children legitimated by the subsequent intermarriage of their parents; but the situation of these is, as we shall immediately see, somewhat anomalous.

The Scottish law has adopted two species of legitimation, which, in the language of the civil law, they call legitimation *per subsequens matrimonium*, and legitimation *per rescriptum principis*.

The former of these was introduced into the Roman jurisprudence by a constitution of the Emperor Constantine the Great, but did not become a permanent method of legitimation till the time of Justinian. It was afterwards taken up by the Roman pontiffs and disseminated by the ecclesiastics throughout Europe. At the parliament of Merton, however, the doctrine met with a repulse from the barons of England.

Though the English law was preserved inviolate, yet the ecclesiastics did not cease to press the point among the people, and to this day we may remark traces of the custom in some of the remoter districts of the island. The doctrine was certainly no part of the antient common law of Scotland any more than of England; but it is now settled law there, and its rise and establishment are at once accounted for, when we consider the former strong or rather paramount influence of the canon and civil laws in that country. The principle on which the doctrine rests is the fiction of law that the parents were married at their child's birth. If therefore the parents could not have then legally married, or if a mid impediment has intervened between the birth and the intermarriage, the fiction is excluded, and previous issue will not be legitimated by marriage. Further, it is held that if the child was born, or if the intermarriage took place, in a country which does not acknowledge the doctrine of legitimation by subsequent marriage, the child will remain a bastard; the character of bastardy being in the one case indelible, and the marriage in the other ineffectual to create legitimacy. On the other hand, a child legitimated *per subsequens matrimonium* is entitled to all the rights and privileges of lawful issue, and will, as respects inheritance and the like, take precedence of subsequent issue born in actual wedlock: yet in England the judges have held, that a child born in Scotland before marriage and legitimated in Scotland by subsequent marriage, though in point of fact the first-born son, and in status and condition, by comity, legitimate in England, will not succeed to land in England. (See Doe dem. Birtwhistle *v.* Vardill, 5 Barn. and Cress. 438; and opinions of the judges in dom. proc. 10th June, 1830.)

Legitimation *per rescriptum principis* proceeds on a less abstract and more generally-acknowledged principle than the preceding. Though therefore it is said to have been invented by Justinian, and copied by one of the popes of Rome, yet concessions in the nature of letters of legitimation are not peculiar to the Roman law. The form of these letters seems to have been borrowed by the Scots immediately out of the old French jurisprudence: their clauses are usually very ample, capacitating the grantee for all honours and offices whatsoever, and to do all acts in judgment or outwith, and, in short, imparting to him all the public rights of lawful children and natural born subjects, together with a cession of the crown's rights by reason of bastardy; but as the crown cannot affect the rights of third persons without their consent, letters of legitimation do not carry a right of inheritance to the prejudice of lawful issue.

As, in the Mosaic law, a bastard was debarred from the congregation, so, according to the canons, he is, in strictness, incapable of holy orders; and, indeed, it has been the policy of most nations to incapacitate bastards in divers ways, that if men will not be deterred from immorality by a sense of the injury accruing to themselves, they may by a consideration of the evils resulting to their offspring. But whatever may be the operation of those incapacities, they are felt by all to be wrongs inflicted on the innocent, and as Justinian properly observed when he made legitimation *per subsequens matrimonium* a perpetual ordinance, 'indigni non sunt qui alieno vitio laborant.' Accordingly the doctrine is now obsolete in England and nearly so in Scotland. The only remaining incapacity in Scotland seems to be want of power to make a testament in the particular case of the bastard having no lawful issue. Letters of legitimation were formerly necessary in all cases; but it is now held that as the crown's right of succession is excluded by the existence of issue, a bastard who has lawful issue may dispose of his goods by testament in any way he thinks fit. With the above exception only, then, there is no distinction between a bastard and another man; and so he may dispose of his heritage *in liege poustie*, and of his moveables *inter vivos*, and (if he has lawful issue) by testament, and he may succeed to any estate, real or personal, by special destination. To his lawful children also he may appoint testamentary guardians; and his widow has her provisions like other relicts. It is to be noted, however, that in the eye of law a bastard is *nullius filius;* and being thus of kin to nobody, he cannot be heir-at-law to any one, neither can he have such heirs save his own lawful issue. Where a bastard dies, leaving no heir, the crown, as *ultimus hæres*, takes up his property, which, if it be land holden in capite, is at once consolidated with the superiority; but if it be holden of a subject, the crown appoints a donatary, who, to complete his title, must obtain decree of *declarator of bastardy*, a process in the nature of the English *writ of escheat*, and thereupon he is presented by the king to the superior as his vassal.

But though bastards are legally *nullius filii*, yet the law takes notice of their natural relationship to several purposes, and particularly to enforce the natural duties of their parents. These duties are comprised under the term *aliment*, which here, as in the civil law, comprehends both maintenance and education; including under this latter term, as Lord Stair says (b. 1, tit. 5, sec. 6), 'the breeding of them for some calling and employment according to their capacity and condition.' These were at least the principles on which the courts proceeded in awarding aliment to children. In determining who is the father of a bastard, the Scots courts again proceed on the principles of the civil law. In Scotland there must first be semi-plenary evidence of the paternity, and then, when such circumstantial or other proof of that fact is adduced as will amount to *semiplena probatio*, the mother is admitted to her oath in supplement. The whole aliment is not due from one parent but from both parents. This is the principle; and therefore in determining what shall be payable by the father, the ability of the mother to contribute is also considered. The absolute amount of aliment, however, is in the discretion of the court, as is likewise its duration. Where the parties are paupers, the bastard's settlement is not the father's but the mother's parish, and if that is unknown, the parish of its birth.

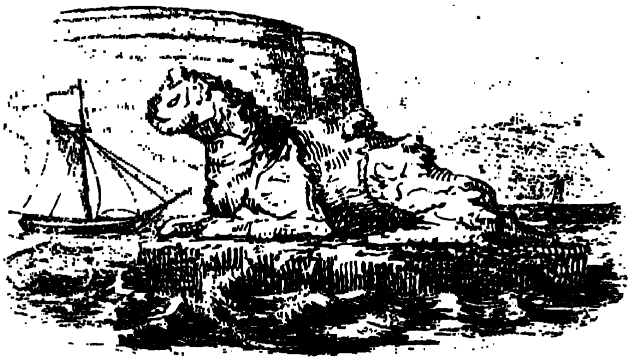
The mother of a bastard is entitled to its custody during its infancy; and it would seem that afterwards the father may take the rearing of the child into his own hand, and also, perhaps, nominate to it tutors and curators. This last power has been denied: if it does not exist it ought to be now bestowed by act of parliament, and by the same means the last remnant of a bastard's civil incapacity removed by his being permitted to make a testament, though he have no lawful issue.

BASTENNES, a village in France, in the department of Landes and in the canton of Amou, which is a small town near the southern boundary of the department, on the Luy de Bearn.

This village is remarkable for a kind of earth which has the property of bitumen when used with wood, and which forms an excellent cement for stone. It is easily worked, as warm bitumen is worked, without attaching itself to the fingers; and as it is impervious to water, it is used for sealing bottles of liquor: but it is chiefly as a cement for stone that it is valuable. It acquires, when exposed for some time to the air, such hardness, that the stones joined by it cannot be parted, but must be broken when it is required to demolish the structure in which they have been used.

This bituminous earth is found on the slope of two hills, which extend in a direction N.E. and S.W. It is covered with common earth, which is easily removed; for the slope of the hills being pretty steep, the earth, when disturbed, rolls down by its own weight, leaving the surface of the bituminous substance bare. This bitumen has the appearance of a hard black stone, and considerable labour is requisite to detach pieces of it from the mass. (*Encyclopédie Méthodique*, Géog. Physique; Expilly, *Dictionnaire des Gaules et de la France.*)

BASTI'A is the principal town in the island of Corsica, and was formerly the residence of the governor, but of late years the prefect of the department of Corsica has resided at Ajaccio. Bastia is situated on the eastern coast of the island, in 42° 43′ N. lat., and 9° 26′ E. long. Its port is not very safe, nor adapted for vessels of large burden: a singular rock at its entrance has very much the appearance of a lion in repose. The natives call it 'Il Leone;' it is of very considerable dimensions, and lies completely isolated in the sea. Its shoulders and neck are covered with creeping plants, which invest them with the appearance of a bushy mane; the fore-legs are thrown forward, the neck is raised, and the head has an air of fierceness about it. This singular object has every appearance of being the work of nature; indeed there is no evidence at all to show that art was in any way concerned in giving the rock this singular form. The composition of the rock is a calcareous stone, of the same character as the rock on which the citadel of Bastia is built; and there can be little doubt that they are parts of the same mass, though the sea appears to cut off the connexion. This lion is of much use as a breakwater when the north winds drive the waters before them. The town is fortified with walls and bastions, but it has large suburbs outside the fortifications. High hills rise behind the town, above which the higher range which runs through the island from north to south is seen. The view from Bastia over the Tuscan Sea is very fine. It embraces the islands of Elba, Capraja, and Monte Cristo, and the distant coast of Tuscany. The streets of Bastia are narrow, and the houses lofty, and built after the Italian fashion. The population of Bastia is about 10,000. The Cour Royale, or court of justice, civil and criminal, for the whole department, sits at Bastia. There is also a society of instruction which has been for some years actively employed in spreading information, especially among the country-people. Bastia has also a college, or superior school. The cathedral of Bastia contains nothing remarkable, but there is a new small church called Cappella di Santa Croce, the construction of which is remarkably elegant. The people of Bastia speak Italian, but most of them are also acquainted with French. Bastia carries on a little trade, chiefly with Leghorn. It exports wine, timber, and cattle. Tobacco and English manufactures are smuggled into Corsica from Leghorn. A road leads from Bastia to Ajaccio across the island, and another leads along the eastern coast to Bonifacio, at the southern extremity of Corsica. Bastia is 32 miles W. by S. from the nearest point of the island of Elba, and 56 from Piombino on the coast of Tuscany. (Benson's *Sketches of Corsica.*)



[Rock called the Lion of Bastia.]

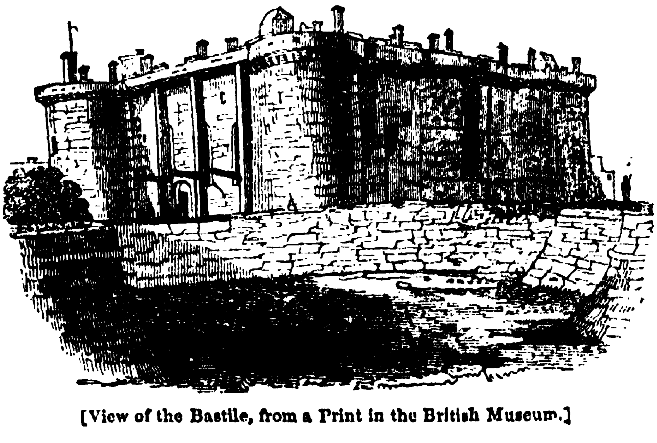
BASTIDE, LA, the name of a number of places in France, all of them in the southern departments. The *Dictionnaire Universel de la France* enumerates sixty-one villages and three towns, of greater or less importance, bearing this designation; and in the *Dictionnaire des Gaules*, &c. of Expilly fifty-six are enumerated. The word bastide is derived from the verb *bâtir*, to build (which was formerly written *bastir*), and is applied to a gentleman's country seat. The most considerable places bearing this name are as follows:—

La Bastide de Clarence, or Clairence, a town in the department of Basses Pyrénées (Lower Pyrenees), a little way S.E. of Bayonne: 43° 25′ N. lat., 1° 15′ W. long. It is on the right bank of the little river Joyeuse, that flows into the Adour. It was built by Louis X. (Hutin) before he ascended the throne of France, while he was yet only King of Navarre. The district belonging to the town contains two mines, one of copper, the other of iron. This last yields spathose ironstone (*fer spathique*—see Aikin's *Dict. of Mineralogy and Chemistry.*) The population, as given in the *Dictionnaire Universel de la France*, 1804, our latest authority, was 2071.

La Bastide de Seron is in the department of Arriège, between St. Girons and Foix, a short distance W.N.W. of the latter town. It had, in 1832, a population of 1652. The whole commune contained 2911 inhabitants. Several of the small streams in the neighbourhood bring down particles of gold. A grey argillaceous earth is found near this place, which, from the goodness of the colour, is used in colouring the houses. It is also used to make crucibles for glass-works: 43° 1′ N. lat., 1° 28′ E. long.

La Bastide, St. Amans, or St. Amand, in the department of Tarn, S.E. of Castres, near the bank of the Tauré, had a population in 1804 of 2140: 43° 29′ N. lat., 2° 27′ E. long.

BASTILE, or BASTILLE, the name used in France to denote a fortress or state-prison. There have been three of that name at Paris, the Bastile du Temple, the Bastile of St. Denis, and that of the Rue St. Antoine. We shall only treat of the last, which has obtained historical celebrity, and is usually denominated The Bastile. This fortress stood at the east end of Paris, on the north side of the Seine. It was originally intended for the protection of the city, but afterwards was used as a state-prison. Hugues d'Aubriot, Prevost des Marchands in the reign of Charles V., laid the first stone on the 22nd of April, 1369, by the order of that king. There had previously been a fortified entrance to Paris on the same spot, on a small scale, which was built by Etienne Marcel, the predecessor in office of Hugues d'Aubriot. The Bastile consisted at first of two round towers, with an entrance between them: afterwards, to render it stronger, two additional towers, parallel to the two first, were built, and the whole connected by walls. The building, however, was not completed till 1383, in the reign of Charles VI., when four more towers were added, of the same dimensions, and at equal distances from the first four, and the whole eight were united by masonry of great thickness, in which were constructed a great number of apartments and offices. The entrance to the city by the original



[View of the Bastile, from a Print in the British Museum.]

gate was closed, and the road carried without the building. In 1634 a fosse, 120 feet wide and 25 feet deep, was dug all round; and beyond that a stone wall, 36 feet high, was built all round. Thus the Bastile became, from a fortified gate, one of the strongest fortresses of the kind in Europe. The towers contained several octagonal rooms one above the other, each having one window pierced in the walls, which were rather more than six feet thick. This window was without any glazing, was wide internally, but narrow like a loop-hole on the outside: in the centre was a perpendicular bar of iron, and two cross-barred gratings between that and the internal part. The entrance to each of these rooms was secured by double doors eight inches thick, strapped with iron, and placed at the distance of the thickness of the walls from each other. There were no fire-places or chimneys in these rooms. The only article of furniture, if it may be so called, was an iron grating raised about six inches from the floor, to receive the prisoner's mattress, and prevent its decay from the damp of the stone floor. To each tower there was a way by a narrow winding staircase. The apartments constructed in the walls, connecting the towers, were larger and more commodious than the others, and were provided with fire-places and chimneys, but with similar precautions for preventing the escape of prisoners. They were usually assigned to persons of some importance, or to those who were treated with indulgence. The rest of the Bastile consisted of two open courts: the larger, 102 feet by 72, called the Great Court; the smaller, 72 by 42 feet, French measure, called the Court of the Well, was separated from the first by a range of buildings and offices, having a passage through them. The height of the building within was 73 feet, but greater on the outside next the fosse. (See the plan in the British Museum.)

In modern times the establishment of the Bastile consisted of a governor, a deputy-governor or lieutenant du roi, a major, an aide-major, a physician and surgeons, a certain number of invalid soldiers and Swiss in the pay of France to perform the military duty of the fortress, with turnkeys to watch over the prisoners, and cooks and other domestics. The office of governor was very lucrative, and the pay and perquisites supposed to amount to 60,000 francs per annum. The other officers were but indifferently remunerated. No officer or soldier could dine out without permission of the governor, or sleep out without an order from the prime minister. The invalids were usually about 100 men, with two captains and a lieutenant, who were well paid. The men had ten sols per diem, with wood, candles, washing, and other allowances. The average expense of the Bastile is said to have been 60,000 francs per month. The governor and deputy-governor superintended the general management of the fortress, the major and his deputy kept all the accounts, including a particular list of all the prisoners, in seven columns, containing, 1. Name and quality of the prisoner; 2. When he entered; 3. By whom the order for his detention signed; 4. When discharged; 5. By whom the order of discharge signed; 6. Cause of detention; 7. Observations or remarks. The last is said to have been filled up only under the direction of the minister or of the lieutenant of police. Prisoners were almost always taken to the Bastile by an exempt of police and two or three armed men in a hackney coach, to avoid observation, and were conducted direct to the governor at his house, to whom the exempt delivered the *lettre de cachet* and took a receipt for it. The prisoner was then led into the body of the fortress, a sign being first made to all the soldiers on duty to cover their faces with their hats during his passage. This was invariably done whenever a prisoner entered or left the Bastile. On his arrival at his room the prisoner was requested to empty his pockets. A list was made of the contents by the major, and signed by the prisoner. His watch, rings, and every other article were taken from him. He was then left for some days without the means of writing; after which he underwent an examination before the lieutenant of police, or some other officer. The interrogators usually began by informing the prisoner that his life was in great danger, and that to save it depended on himself; that if he would freely confess, they were authorised to promise his discharge, otherwise he would be given over to an extraordinary commission; that they had written and oral testimony against him; that his accomplices, his friends, his relatives, had owned every thing; that the king was indulgent; and that they advised him, as his friends, not to conceal the least particular. If by these means they succeeded in extracting the evidence they wished, they then informed him that they had not yet a precise authority for his discharge, but that they hoped shortly to obtain it, would even solicit it, and that he should shortly hear more about it. According to circumstances these examinations were repeated, and no means which cunning could suggest were omitted to entrap and intimidate the prisoner, to draw from him his secret if he had one, or to make him commit himself, or his family, or friends, by dangerous admissions or indiscreet replies. The treatment of the prisoners depended entirely on the will of the governor, who was interested in their being detained, as he contracted with the government for their maintenance, and derived a profit from it; and he being the only channel by which the prisoners could communicate with their friends or with the government, he could suppress their applications if he thought fit. We have the concurrent testimony of almost all the prisoners who have written their memoirs, that the food was bad and scantily supplied, and that all other necessaries were of the worst description. The duration of a prisoner's detention was arbitrary. No term was ever specified. The longest we have been able to discover, from the registers published after the taking of the Bastile is that of Isaac Armet de la Motte, who was removed to Charenton (a lunatic asylum and prison), after a confinement in the Bastile of fifty-four years and five months. In this registry there are several others of thirty years and upwards. The first historical mention of any imprisonment in this fortress is that of Hugues d'Aubriot himself, who having given offence to the clergy, and being accused by them of blasphemy and impiety, was sentenced to be imprisoned for life, but being transferred to another prison, he regained his liberty in the insurrection of a faction called the Mailliotins. The only prisoners who ever effected their escape from the Bastile were two persons of the name of De la Tude and D'Aligre. They were confined together in one of the apartments constructed in the walls of the Bastile. By unravelling their linen, stockings, and other parts of their clothes, and by saving from time to time the billets of wood allowed for their firing, they contrived to make two ladders, one a rope-ladder, near 180 feet long, with rounds of wood covered with flannel to prevent any rattling noise against the walls: the other a wooden ladder, about 30 feet long, consisting of a centre piece, in joints, to be fastened by tenons and mortices, and through which passed wooden pegs to hold it together. The first was to enable them to descend from the platform, or the top of the Bastile, into the fosse; the second to ascend the rampart into the garden of the governor. The ladders, as well as the tools they had formed for making them, were concealed, when the turnkeys visited them, under the floor of their apartment. They cut through the iron gratings in the chimney, which they ascended, and taking advantage of a dark night, got upon the platform. Having first lowered their wooden ladder, they fastened that of rope to one of the cannons of the fortress and descended into the fosse. Finding a patrole with a light in the governor's garden, they altered their plan, and with a handspike formed of one of the iron bars of the chimney grating, made a hole in the wall next the Rue St. Antoine, through which they effected their escape on the 26th of February, 1756. After the revolution of 1789 La Tude claimed and received these ladders, and they were publicly exhibited at Paris in the autumn of that year. Of all the prisoners in the Bastile none have excited curiosity so strongly as the person usually called the Man with the Iron Mask. The extraordinary secrecy observed with respect to this person, and the attention said to have been shown him, have given rise to a variety of conjectures concerning him, more especially as no person of importance was at that time missing in Europe. He has been supposed to have been a twin-brother of Louis XIV., the celebrated Duc de Beaufort, the unfortunate Duke of Monmouth, the Intendant Fouquet, and Ercolo Matthioli, prime minister to the Duke of Mantua. Our space does not permit us to investigate these opinions, or to enter into details respecting them, further than to observe that the last mentioned seems to rest on the best foundation.

The Bastile was besieged and taken three times: in 1418, by the Bourgignons; in 1594, by Henry IV.; and on the 14th July, 1789, by the Parisians, from which day the French Revolution may be dated. Its demolition was decreed by the Permanent Committee of Paris on the 16th, and carried into immediate effect. The materials were employed in the construction of a new bridge, called the Bridge of Louis XVI., and there is not now remaining the smallest vestige of this edifice.

(Dulaure, *Histoire de Paris; Remarques Historiques sur la Bastille; La Bastille dévoilée; Mémoires de Linguet; Mémoires de la Tude.*)

BASTIMENTOS, a port in Colombia, in the department of Istmo, to the north-east of Porto Bello, and near this harbour, 10° 10′ N. lat., and 79° 40′ W. long. It is formed by some islands which line the coast at a distance of about 500 paces: two of them are tolerably large, but the rest so small that they rather deserve the name of rocks. They are all uninhabited, the soil being in general barren, but in some places it is overgrown with wood, in which fine timber occurs. The harbour formed by them is safe, and resorted to by vessels in distress, and in time of war by cruisers. The bottom of the narrow sea between the islands and the shore is quite level, and affords excellent anchoring ground. (Alcedo.)

BASTINA′DO is derived from the Italian *bastone*, a stick, *bastonare*, to beat with a stick, &c. The word would have been more correct in the form baston*áta*, but long use has confirmed our etymological error.

The bastinado is the chief governing instrument of a great part of the world, from Corea and China to Turkey, Persia, and Russia. It is administered in different ways, and called by different names, as the bamboo in China, the knout in Russia, &c.

According to our modern acceptation, the term bastinado does not include all these methods of stick-beating, but is confined to the Turkish and Persian method, which is to beat the soles of the feet with sticks. This excessively painful punishment is thus inflicted. Two men support between them a strong pole which is kept in a horizontal position: about the middle of the pole are some cords with two running knots or nooses; through these the naked feet of the sufferer are forced, and then made tight in such a manner that the soles are fairly exposed; the sufferer is then thrown on his back, or left to rest on his neck and shoulders with his feet inverted, which are forthwith beaten by a third man with a heavy tough stick. When the presiding officer or magistrate gives the word, the heavy blows cease, the maimed feet are cast loose from the cords and pole, and the victim is left to crawl away and cure himself as best he can.

According to the letter of the penal code of the Ottoman Empire, this punishment can only be inflicted on the *men* of the fourth and last class of society, which comprises the slaves, and the rayahs or tributary subjects of the empire, as Jews, Armenians, Greeks, &c. The other three classes, viz.: 1. The Emirs, or issue of the race of the prophet Mohammed, and the Oulemas, or men of the law; 2. Public functionaries, civil and military; 3. Free citizens and private individuals who live on their rents or the proceeds of their industry, were all exempted by law from this cruel and degrading punishment. By the original code the number of blows to be given was from three to thirty-nine; but a later clause permitted them, in certain cases, to be carried to seventy-five, and in practice, when the passions are inflamed, the Turks seem to dispense with the ceremony of keeping any account of the blows, and the men lay on till they are tired, and the sufferer's feet reduced to an unsightly jelly. As late as 1828, it was a very common thing to see a poor Greek or Jew crawling about the streets of Constantinople on his hands and knees, in the greatest agony, and unable to use his wounded feet many days after the infliction; at times they were crippled for life.

The punishment, called *zarb* in Turkish, was generally inflicted in a summary manner, without examination or any form of trial, at the will or caprice of the sultan, his representatives, and the officers of justice and police. The most frequent dispensers of it were probably the Meuhtessibs, or the commissaries of police at Constantinople, each of whom, from time to time, and always unexpectedly, made the round of the quarter of the city assigned him, to see that the provisions were sold at the exact prices despotically and most absurdly fixed by the government, and to ascertain whether the weights and measures in use by the dealers were all just. This officer generally went on horseback, followed by an armed mob of irregular soldiers, and preceded by his bastinado-men (*falacadjis*), whose office was to execute the sentence the moment it was uttered. If the offending dealer were absent, then his shopman or journeyman was punished as his substitute, the commissary only requiring a victim *ad terrorem*, and not having patience to await the return or arrest of the master. The punishment was always inflicted on the spot, in front of the shop in the open street. Sometimes, instead of being bastinadoed, the offender or his journeyman (accomplice or not as it might be) was nailed by the ear to the door-post of his shop, and so exposed till sun-set; at other times there was substituted the punishment of the portable pillory, called khang or cang by the Chinese (who make great use of it as well as of the bamboo), and styled tahtakulah by the Turks, who probably derived the instrument from the Tartars, who may either have borrowed the invention from or given it to the Chinese. [See CANG.]

Under the old system the greatest violence, caprice, injustice, and corruption prevailed in the administration of justice. The man with money in his hands could always save the soles of his feet by bribing the authorities, and the pain of the bastinado was seldom inflicted except on the very poorest of the *baccals*, or shop-keepers, and destitute and unprotected rayah subjects of the Porte. Sultan Mahmoud is said to have recently introduced some improvements; but under a despotic government, like that of Turkey, a summary and rapid mode of proceeding will always obtain more or less.

Although the privileges of the free Turks, or Osmanlis, civil and military, were not always respected, yet their pashas and men of authority or dignity were never subjected to the bastinado like the khans, begs, and others in Persia, where the shah would frequently have his vizier, or prime minister, cudgelled on the feet in his presence, and the vizier would do the like with the highest of the ministers and officers under him. The Osmanlis were always a more sturdy and proud-spirited people than the Persians, and thought that only Jews, Christians, and other tributary subjects could be beaten with propriety. It appears, however, that in the time of Busbequius the Janissaries were 'basted with clubs.' That excellent old traveller says—'Their lighter offences are chastised by the club. . . . . And here let me acquaint you with the patience of the Turks in receiving that punishment: they will receive sometimes a hundred blows on their legs, their feet, and buttocks, so that divers clubs are broken, and the executioner cries out, "*Give me another!*" Yea, sometimes the chastisement is so severe, that several pieces of torn flesh must be cut off from the wounded parts before anything can be applied to cure them. Yet, for all this, they must go to the officer who commanded them to be punished; they must kiss his hand, and give him thanks; nay, they must also give the executioner a reward for beating them. . . . . . As some relief to their misery, they count those parts wounded with the rod or club to be free from any purgations and expiations after this life.'

(See D'Ohsson, *Tableau Géneral de l'Empire Othoman*; Busbequius, *Embassy to Solyman the Great*; and *Modern Travellers in Turkey*, &c.)

BA′STION. This term is applied to a species of tower which constitutes the principal member of the fortifications immediately surrounding a town, or position to be defended. The rampart by which it is formed is disposed on four sides of a pentagon, two of which, technically called the *faces*, meet in an angle whose vertex projects towards the country; the other two, denominated the *flanks*, connect the opposite extremities of the faces with the *curtain*, or that part of the rampart which coincides in direction with the sides of a polygon supposed to inclose the town: the fifth side of the pentagon is generally unoccupied by a rampart, and is called the *gorge* of the bastion.

From the infancy of the art of war the defenders of a fortress must have felt the necessity of having the walls disposed so as to afford means of observing the enemy when very near their foot; for, when these means were wanting, the enemy was enabled to plant his scaling-ladders against, or even to make a breach in the wall itself, with almost perfect security. This was inevitably the case when the ground-plan of the *enceinte*, or inclosing rampart, was a simple polygon, since the men stationed on the rampart for its défence, behind the parapet by which they were protected, were incapable of seeing the exterior ground which lay near the base of the walls. Thus, according to the old story in Pausanias (iv. 20), when the Messenians were besieged in their hastily erected fort on Mount Ira, the guards being driven from their posts by violent rains, and there being no towers or projections from the walls to shelter them, the Spartans gained possession of the parapets by escalade. To avoid such a surprise, it was the practice of the antient engineers to construct either *machicoulis* on the top of, or projecting towers at certain intervals along, the walls of fortresses, that from thence the besieged might get a view of and be able to annoy the enemy, when at the latest and most critical period of the siege the latter should have gained the otherwise undefended ground. The walls of Messene, built by Epaminondas (Paus. iv. 31), which were all of stone, and furnished with battlements and towers, were reckoned by Pausanias among the best specimens of Grecian fortification.

From the accounts given by antient writers of their fortified places, and particularly from the precepts of Vitruvius (*Architectura*, lib. i. cap. 5), we learn that the projecting towers were sometimes square or polygonal, but generally circular, and that their distance from each other along the walls was regulated by the range of the weapons employed in the defence. In the fortifications of cities this distance seems to have varied from 80 to 100 paces, according to local circumstances, and the power of annoying the enemy by the arrows and javelins discharged from the towers; but, from the greater distance at which modern arms will take effect, the bastions, measuring from the vertices of their projecting angles, are now generally, and agreeably to the rules of Vauban, placed at 360 yards from each other. It was a maxim with the antient engineers that the projecting quoins of walls were detrimental to the defence, from the facility with which they might be destroyed by the battering-ram; and it is on this account that Vitruvius recommends the towers to be circular, or to have faces forming with each other obtuse angles. These towers were placed indifferently at the angles, or at any part on the line of the inclosing rampart: in the latter case, when they were of a square form, one side was parallel to the length of the rampart, and in the former, one face was almost always perpendicular to a line bisecting the angle between two adjacent sides of the polygon surrounding the town; that is, to what would be now called the *capital* of the bastion. It must have frequently happened, therefore, that this face was nearly unseen from any other part of the rampart, and that the enemy made his assault against it in order to avoid, as much as possible, being exposed to annoyance from the defenders of the neighbouring works. It is true that the smallness of the towers rendered it impossible for the enemy to be wholly concealed at their front; but the desire of entirely depriving the enemy of the benefit arising from the undefended nature of that ground probably induced engineers to dispose the faces of their towers like those of a modern bastion, so that two of them might form a projecting angle, whose vertex was on the capital.

There is no reason to believe that any material change took place in the manner of constructing the towers of fortresses during all the long period in which the antient arms were employed; but it is easy to conceive that the invention of fire-arms would render it necessary to enlarge the tower for the purpose of receiving the guns, and to increase the thickness of the rampart, that it might be able as well to resist the concussion produced by the discharge of the ordnance placed upon it, as the shock of the enemy's artillery when fired against it. On this account, also, the ramparts were constructed of earth, and their exterior surface was formed at such an inclination to the ground as would enable it to stand unsupported, except where it became necessary to prevent an escalade; in which case a facing of stone, brick, or timber was made sufficiently high and steep to create a serious impediment to any attempt of that nature. An opinion that the bastions are the weakest parts of a fortress remained in force, however, long after the modern artillery was introduced in sieges. On this account they were at first made very small, when compared with the extent of the wall between them; and the line of each face, when produced towards the town, was made to intersect that wall, in order that the fire from the part intercepted between this produced line and the flank of the next bastion might cooperate with that made from the latter in defending the ditch in front of the former bastion. But when the ramparts of a town were found to disappear almost instantly under the weight of shot discharged from large ordnance, it became necessary to employ ordnance of corresponding size on the walls; and the dimensions of the bastions were finally augmented to those at present assigned. The lengths of the faces vary from 100 to 120 yards, and the flanks are usually about 50 yards long; but the magnitude of the projecting angle in front, called the *salient* or *flanked* angle, to distinguish it from the angles formed by the faces and flanks which are denominated *shoulder angles*, evidently depends upon the kind of polygon on which the *enceinte* is constructed. Each face of a bastion, if produced towards the town, now falls at the interior extremity of the flank of the collateral bastion, so that the defence of a bastion depends wholly upon the fires from those on its right and left.

It is to Italy that we must look for the invention of the modern bastion: the wars which raged in that country from the commencement of the twelfth century, and which were more systematically conducted there than in any other part of Europe, gave rise to this, as well as to many other inventions for military purposes. The precise date of its first formation is quite unknown; but if we omit the improbable story related by Folard, that the Turkish commander, Achmet Pacha, caused bastions to be constructed about Otranto, when he took that place in 1480, we may observe that it is spoken of under the name of *Balvardo*, as an improvement of great importance in the military art, by Tartaglia, in his *Quesiti ed inventi diversi*, which was published in 1546; and in the same work is given a plan of the fortifications of Turin, which exhibits a bastion at each of the four angles of the rampart. Both Vasari, in his *Lives of the Architects*, and Maffei, in his *Verona Illustrata*, ascribe the invention to San Michaeli of Verona: one of the bastions of this city has on it the date 1527, and its construction is still ascribed to that engineer, who, in fact, was about that time employed in the erection or repair of several of the fortresses in Italy. From the word Balvardo, denoting a stronghold, the earliest French engineers gave to this work the appellation of *Boulevard*; and such is its designation in the treatise of Errard, which was published in 1594. The term *Bastion* appears to have been taken from the Italian writers, for Maggi, in his treatise *Della Fortificatione delle Citta*, applies the term *Bastioni* to redoubts constructed of earth; and, according to Pere Daniel, the French subsequently gave to such works the name of *Bastilles*, or *Bastides*. Froissart also uses these terms in speaking of the forts executed during the siege of Ventadour by the Duc de Berri, under Charles VI. It should be remarked, however, that Errard applies the name of *Bastion* indifferently to works in the situation of those now so called, and to those to which the name of *Ravelin* is generally given; and doubtless it denoted originally any work of earth constructed on the exterior of one more antient.

It appears that it had been the practice from the earliest times to form a rampart, or bank of earth, in front of the walls of fortresses, in order to secure the latter from the destructive effects of the ram; and it is easy to conceive that, by forming such a bank in front of the old towers of a place, so as to connect those previously existing in front of the adjacent curtains, the work would assume a figure like that of a modern bastion; and indeed would very much resemble one of the detached bastions in what is called the second system of Vauban; the original tower of the fortress occupying the place of the interior bastion of that system, and constituting a sort of *retrenchment* to the new work. The construction was proposed in 1584 by Castriotto, seemingly as if it had been his own idea; but probably he meant only to recommend the adoption of a kind of work which must have been then a novelty.

The Italian engineers, immediately after the invention of the bastion system of fortification, became celebrated for their skill in military architecture, and they seem to have been extensively employed in the construction or repair of fortresses beyond the Alps: one of the first of their labours in the north of Europe was the fortification of Landreci, with bastions, for Francis I.; and the like works were executed about New Hesdin, on the frontiers of Artois, for Charles V. In 1568, the Duke of Alva employed Pacciotto in the construction of the citadel of Antwerp, a regular fortress, whose bastions still exist within those subsequently erected at that place; and, during the reign of Elizabeth, Genebella was brought from Flanders to this country in order to superintend the formation of a bastioned *enceinte* about the antient castle of Carisbrook, in the Isle of Wight.

Albert Durer, the celebrated engraver, proposed, in 1527, to fortify places with circular towers only, like those of the antients, but of larger dimensions; and in most of the plans published during the sixteenth century by Italian engineers, there appears to be a union of the old and new methods: for the angles of the polygons are furnished with round towers, and these are protected exteriorly by bastions.

The guns mounted on the flanks of a bastion, by firing along the ditch in front of the curtain and of the neighbouring bastions, created a serious impediment to the passage of the enemy across the ditch in attempting an assault, and it became necessary for him to silence that fire by a battery placed for the purpose in the direction of the ditch; but the establishment of this battery necessarily compelled the defenders to augment the number of guns in their bastions. To get room for these guns, engineers were induced to form their bastions with a double and even a triple flank on each side, the flanks receding from each other, from below upwards, in the manner of terraces, towards the interior of the bastion; and, to prevent the enemy from dismounting the guns in the lower flanks by other batteries raised in the prolongations of those flanks, it became necessary to mask them by extending the rampart of the face beyond them, and giving it a return towards the curtain; this return was frequently rectilinear, but generally in the form of an arc of a circle, like a portion of a round tower, and the projection with its return received the name of *orecchione* or *orillon*. Besides masking the lower flanks from the effect of any enfilading, or lateral fire, it concealed one or more guns on the upper flank from the fire of an enemy's battery directly opposed to that flank, while it permitted those guns to defend the main ditch and the breach made by the enemy in face of the collateral bastion.

The desire of avoiding the exposure of the flanks of the bastions gave rise to the practice of making them form a right, and even an acute, angle with the curtain; but a better judgment subsequently rejected this disposition, as the musketry fire from the defenders of the flank was thereby liable to injure the men stationed on the curtain. The lower flanks, also, were eventually suppressed, because they contracted too much the interior of the bastion to which they belonged; and because the enemy's fire, soon destroying the parapets of those above, masses of brickwork fell among the defenders below, and obliged them to quit their guns at the very time that their service was most required. The *orillons*, moreover, are now considered useless, as they contract the length of the flank; and the guns which they protect from a fire in their front are liable to be dismounted by a fire from their rear.

In what are called the second and third systems of Vauban, the principal bastions are detached from the *enceinte* by a ditch in their rear, and consequently the capture of those works would not immediately compel the surrender of the fortress. In these systems, a small bastion of brickwork, closed by a parapet wall at its gorge, is constructed at each of the angles formed by the polygonal wall surrounding the place. The fire from the parapets of these tower bastions, as they are called, would have a powerful effect in preventing the enemy, after he has breached and stormed the great bastions, from erecting batteries in them to destroy the interior walls; and, in order to preserve the artillery of their flanks uninjured till the end of the siege, engineers placed it in casemates [see CASEMATE], from whence the guns might pour a destructive fire upon the assailants when crossing the ditch of the *enceinte*. In one of the systems of Coehorn, each principal bastion is attached to the *enceinte*, and contains an interior one for the purpose of prolonging its defence. At the shoulders of the former are constructed towers of masonry, serving as *orillons* and containing galleries whose front walls are pierced with loopholes, to allow a fire to be directed along the interval between the parallel faces of the two bastions.

Bastions are now made either solid or hollow: that is, either the interior is filled with earth up to the level of the platforms of the guns, or it is left coincident with that of the natural ground. Of the two methods, the former is generally preferred, because it affords some facilities for the formation and defence of interior parapets or retrenchments. In almost every system of fortification the ramparts of the faces and flanks of bastions have been made rectilinear on the plan; a few cases, however, occur in which the flanks have been curved, with their convexity towards the interior of the work. This seems to have been devised to allow room for a few more men to fire over their parapets than a straight wall could afford, and to prevent the distant batteries of the enemy from easily dismounting their artillery by firing along the interior side of the parapet. On some occasions these advantages may be worth obtaining, but as the soldier placed behind a parapet always fires nearly in a direction perpendicular to its length, it is evident that the curved flank may cause the lines of fire to tend towards the right or left of the main ditch, and thus endanger the safety of the defenders stationed in the neighbouring works.

The desire of lessening the effect of what is called the enfilading fire, or that which an enemy may direct along the interior side of any parapet, has led Bousmard to give a small curvature to the faces of his bastions, the concave part being towards the interior; but it is evident that, by this construction, the lines of fire directed from the collateral flank for the defence of the face, instead of grazing the latter in its whole length, can only be tangents to the curve, each line of fire meeting it in but one point. It is therefore probable that the injury inflicted on the enemy would be found so much less than that arising from the usual construction, as to neutralize entirely the advantage of the diminished enfilade fire of the enemy.

This last mode of firing would be most effectually prevented by the formation of semi-circular bastions, detached from the *enceinte*, in the manner lately proposed by Mr. Bordwine; but the ingenious author of that system is, in consequence, compelled to abandon, in a great measure, the advantage of having the exterior of his walls well defended from those which are in collateral situations. The batteries however which he proposes to raise in the interior of his bastions cannot fail to produce a powerful defence towards the rear, for the rampart of his *enceinte*.

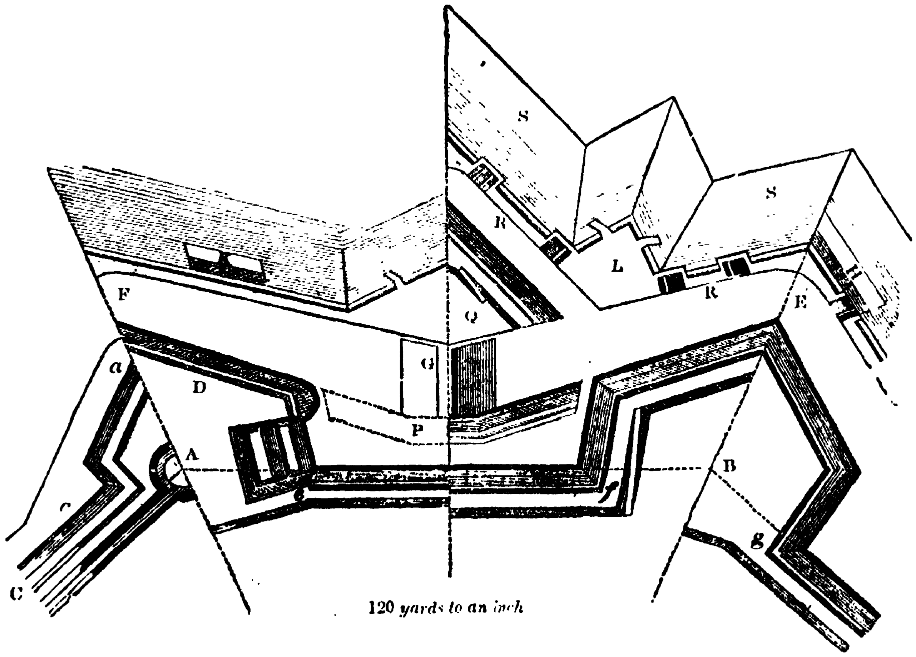


Fig. 1. The line A B represents one side of the polygon supposed to inclose the town fortified. The semicircular work at A is half a round tower; and A C is part of the curtain, or connecting wall between two such towers, according to the antient manner of fortifying places; *a c* represents a sort of *fausse braye*, or elevation of earth protecting the antient walls of a place. D represents half a bastion constructed at the angle, A, of the polygon, according to the method of the first Italian and French engineers, with an orillon and triple flank. The pentagonal figure about B is the plan of a modern bastion, of which the part on the left of the *capital*, B E, represents what is called a hollow, and that on the right a solid bastion. An imaginary line from *f* to *g* is the gorge, and the rampart, *e f*, is the curtain joining the right flank of one bastion to the left of the next. The space, F G E, is the main ditch; and H and K are respectively the positions of a counter and enfilading battery which might be constructed by the enemy to silence the fires from the triple flank of D. The outworks, P, G, Q, R, S, [Tenaille, Caponniere, Ravelin, Covered-way, and Glacis] will be described under those words.

Fig. 2.

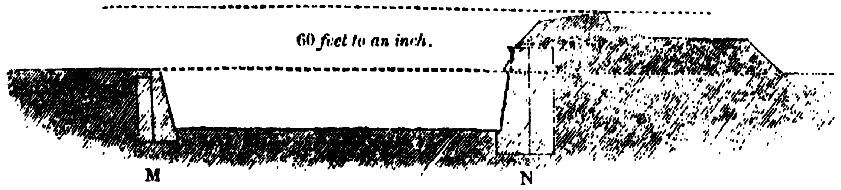

Fig. 2 represents a section supposed to be made from B to L, perpendicularly across the rampart on the left face of B, and the main ditch in its front. M and N are sections through the revetments, or walls which support the earth on the sides of the ditch.

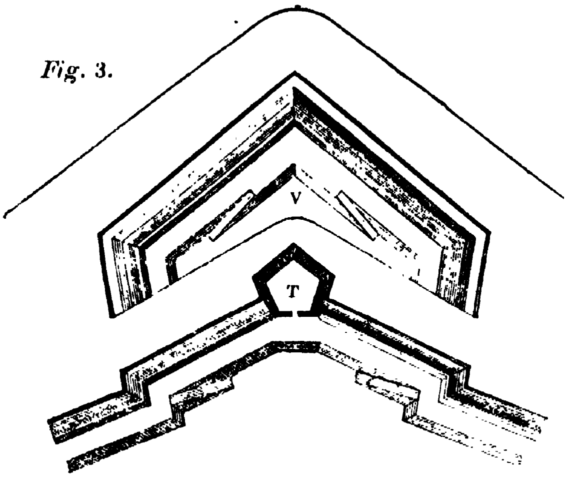
Fig. 3.



In *fig*. 3, V represents the plan of a detached bastion; T is a tower bastion at an angle of the polygon which surrounds the place.

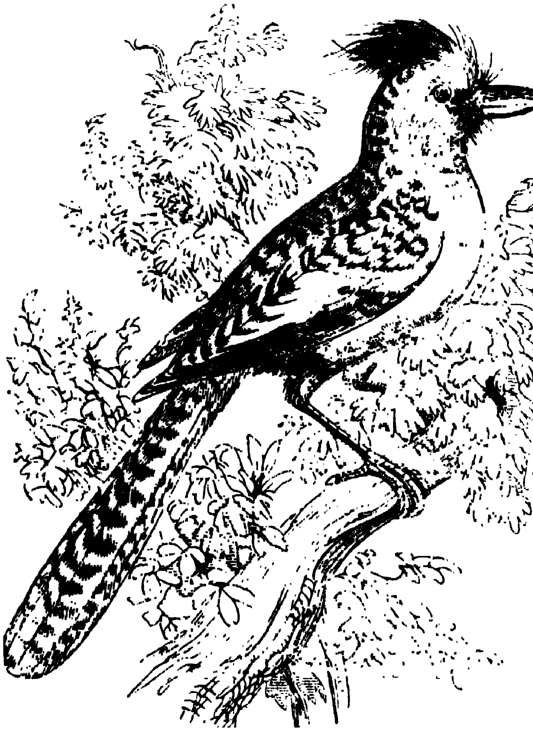
BAT. [See Cheiroptera.]

BATA'RA (Zoology), D'Azara's name for the *Bush-shrikes*, forming the genus *Thamnophilus* of Vieillot. A very good account of these birds, which appear to have been found between the northern and southern points of Canada and Paraguay, will be found in the *Memoirs* of Dr. Such and Mr. Swainson, published in the *Zoological Journal*. The latter zoologist considers the typical group to consist of the species with long tails; and of this division, *Thamnophilus Vigorsii*, Such (*Vanga striata*, Quoy and Gaimard), may be taken as an illustration.

Dr. Such states this to be the largest species yet known, and gives thirteen inches as the length of the body. The bill is black and very much compressed. In the male (which is the sex here figured) the back, wings, and tail are black, broadly banded with fulvous, and the under part of the body is a dirty whitish-brown. On the head is a rufous crest which is blackish at the apex. In the female the



[Thamnophilus Vigorsii.]

[Thamnophilus nævius.]

bands are whitish and the crest blackish, and the under part of the body ash-colour.

Thamnophilus nævius, the *spotted shrike* of Latham, is an example of the round and comparatively short-tailed division.

Leach thus describes it from a specimen in the British Museum: Black; back and belly ash-coloured; the former anteriorly spotted with white; quills of the wings externally, and the tips of those of the tail, white; under part of the body ash-colour, of which colour the back partakes in a considerable degree.

BATA'TAS, the Malayan name of a convolvulaceous plant, the root much eaten in the south of Europe before the cultivation of the potato, which both became a substitute for it and appropriated its name. It has generally been considered a species of convolvulus; but Professor Choisy, in his recent classification, has erected it and a few others into a peculiar genus, distinguished by having an ovary with four cells, in each of which there is only one seed.

[Batatas.]

The only species of any general interest is the *Batatas edulis*, the *Convolvulus Batatas* of authors. This plant, originally found wild in the woods of the Malayan archipelago, has been gradually dispersed over all the warmer parts of the world, where it is still an object of culture for the sake of its roots, which, when roasted or boiled, are mealy, sweet, and wholesome, but slightly laxative. It is a perennial plant, with long creeping stems, leaves variously lobed and angled, and pale purple flowers about an inch long. It is impatient of cold, and consequently unfit for cultivation in the northern parts of the world; but it is a productive agricultural plant in many warm countries. It is partially cultivated in the south of Spain and of France, whence its roots are sent to the markets of Madrid and Paris, where they are held as a delicacy. They, however, have the great fault of keeping badly, being very apt to become mouldy and to decay, unless extraordinary pains are taken to preserve them dry. Sometimes they are raised in the hothouses of curious persons in this country, by planting them in rich soil in a bark-bed, when plenty of roots weighing from one to two pounds are easily obtained.

BA'TAVI, or BATA'VI (the forms Badai and Betavi also occur in inscriptions), the name of the antient inhabitants of South Holland, and some adjacent parts. The Batavi were a Germanic tribe of the race of the Catti, who, some time before the age of Cæsar, left their native district, and settled on the banks of the Vahalis, the present Waal, a branch of the Lower Rhine. They occupied the district between the Vahalis and the Mosa above their junction, and also the island formed by the northern arm of the Rhine (or Rhine of Leyden), the Vahalis and Mosa after their junction, and the ocean; which island now constitutes part of the province of South Holland. Cæsar (*De Bell. Gall.* iv. 10), who mentions their country by the name of Insula Batavorum, appears to consider it as belonging to Germany, and not to Gaul; the limits of Belgic Gaul on that side being placed at the southern branch of the Rhine, or Waal, after its junction with the Mosa, or Maas. They seem to have occupied also a small portion on the banks of the Rhine, and not within the island. Cæsar did not carry the war into the country of the Batavi. Under Augustus the Batavi became allies of the Romans. Drusus, the brother of Tiberius, resided for a time among them, and dug a canal, Fossa Drusiana, which connected the Rhine with the modern Yssel. Besides the Batavi there was another people on the same island, probably in its north-western extremity, called by the Roman historians Canninefates. They were of the same origin as the Batavi (Tacitus, *Hist.* iv. 15.), but not so numerous, and their name became gradually lost in that of the larger tribe.

The chief place of the Canninefates was Lugdunum Batavorum, now Leyden; and that of the Batavi was Batavodurum, afterwards called Noviomagus, and now Nymegen. This is Mannert's opinion, though others have placed Batavodurum at Duurstede, and made it a different place from Noviomagus. The other towns of the Batavi were Arenacum, generally supposed to be Arnheim, but placed by others near Werthuysen; Carvo, on the northern branch of the Rhine, probably near Arnheim; Grinnes, near the junction of the Waal with the Maas; Trajectum, the modern Utrecht; and Forum Hadriani, in the western part of the island near the sea. The name of the Batavi can be traced even now in that of Betuwe, which is a district of the antient Batavorum Insula, between the Rhine, the Waal, and the Lek. [See Betuwe.] Beyond the northern branch of the Rhine, and between that and the Flevium, or Yssel, in the province now called North Holland, were the Frisii and the Frisiaboni, tribes belonging to the great Frisian stock which inhabited the land north-east of the Yssel. Pliny places two other tribes, the Sturii and the Marsucii, on the islands off the western coast at the mouth of the Mosa, which islands now form part of Zealand.

After the death of Galba, the army of the Rhine having proclaimed Vitellius, and followed him on his way to Italy, the Batavi took the opportunity of rising against the Romans, whose alliance had become very burthensome to them. Claudius Civilis, a man belonging to one of their principal families, though bearing a Latin name, acted as their leader. At one time the insurrection seems to have spread among the neighbouring tribes of Germans as well as of Belgian Gauls, but the speedy return of the legions suppressed the movement. Civilis resisted for a time, but the Batavi were at last subdued. Still it would appear that they obtained conditions, for we find them afterwards restored to their former state of free allies of Rome. (Mannert, *Geschichte der alten Deutschen.*) It appears, however, that subsequently, under the reigns of Trajan and Hadrian, the Romans had completely established their dominion over the Batavi; for we find in the Antonine Itinerary and the Peutinger Table, two Roman roads across the country, one from Lugdunum eastward to Trajectum, and following the course of the northern Rhine to its separation from the Vahalis, and another from Lugdunum southward across the island to the Mosa, and then eastward along the bank of that river and the Vahalis to Noviomagus. We also find places named after the emperors, such as Forum Hadriani, and fortified camps, such as Castra Batava, which some, however, suppose to have been the same as Batavodurum. (See Mannert, *Geographie der Griechen und Römer.*) There was another place in Upper Germany, or, more properly, in Noricum, called also Castra Batava, near the confluence of the Inn and the Danube, which was colonized by Batavi, apparently in conformity with the policy which led the R transplant their subjects and allies from their foreign countries. [See Army.] The Batav ployed by Agricola in his wars in Britain. (Tacit. *Agric.* xxxvi.) In some inscriptions they are called 'friends and brothers of the Roman people,' or of the 'Roman emperors.' The date of one of these inscriptions is determined by the name of the Emperor Aurelius. (Gruter. lxxi.)

In the latter part of the third century, during the civil war which desolated the empire, the Salian Franks invaded the country of the Batavi, and established themselves in it. They armed pirate vessels, which were encountered and defeated at sea by Carausius. Constantius and Constantine waged war against the Franks of the Batavian island, but could not drive them out of it. The Franks lost it, however, under Julian, by an irruption of Frisians, who came from the northern country near the Zuiderzee, and drove the Salian Franks beyond the Maas. After this the Insula Batavorum formed part of the country called Fresia, which, in the time of the Merovingians, extended southward as far as the Scheldt. Under Charlemagne it formed a duchy bearing allegiance to the empire, 'Ducatus Fresiæ usque ad Mosam.' It afterwards became divided into Western Frisia, called Fresia Hæreditaria, which was subject to hereditary counts; and Eastern Frisia, or Fresia Libera, which remained independent. The Yssel formed the division between the two. About the eleventh century we first find Western Frisia called by the name of Holland, some say from *hohl land*, 'a low hollow land,' and its counts took the name of Counts of Holland. The country of the antient Batavi formed the southern part of their dominions; but the islands at the mouth of the Maas, and between it and the Schelde, were the subject of frequent contentions and wars between them and the Counts of Flanders. (D'Anville, *Etats formés en Europe après la Chûte de l'Empire Romain*; Meyer, *Res Flandricæ*.) Although the name Batavi has fallen into disuse, it has always been employed by modern authors writing in Latin to signify the Dutch or Hollanders generally.

BATA'VIA, one of the districts, or residences, of the island of Java. It is bounded on the north by the Java Sea, on the west by the regency of Bantam, from which it is divided by the river Tjikandé, on the south by the residence of Buitenzorg, and on the east by the river Tjitarum, which forms the western boundary of the district of Crawang. The dimensions of the district of Batavia are about twenty-four leagues from east to west, and about six and a half leagues from north to south, the capital being situated nearly in the middle of the northern boundary.

The district of Batavia is divided politically into four departments, one of which consists of the city and its suburbs. Near to the sea-shore the country is flat, but rises with a gentle acclivity towards the south to the mountain-range, which intersects the island from the western to the eastern extremity. This district is well watered. The river Jaccatra, which joins the sea at the town of Batavia, dividing it into nearly equal parts, has a bank or bar at its mouth which prevents the entrance of any but the smallest boats. This disadvantage generally attends all the rivers on the north coast of Java, which, as they have their sources on the north side of the mountain-range, and flow in a pretty direct line to the sea, are not of great length. They serve, however, together with numerous rivulets, to irrigate the lands, and this is of the greater benefit, as one of the chief productions of the district is rice. There are many sugar plantations in the district of Batavia, and their number has been very greatly increased of late years since the island was restored to the Dutch. This species of cultivation has been encouraged by the local government, as affording the means of remitting to the parent state the surplus revenue of the colony. Cotton, pepper, and coffee (the last to a considerable extent), are likewise produced in this district. The population, according to the census taken in 1821, was 182,654.

Stavorinus's *Voyages*; Count Hogendorp's *Coup d'Œil sur l'Ile de Java, &c.*, 1830.)

BATA'VIA is a city on the north coast of Java, situated at the bottom of an extensive bay, about 60 miles E.S.E. of the Straits of Sunda. It was formerly a native village called Jacatra, and though probably visited by the Portuguese, they did not form any commercial settlement here. The English and Dutch had factories, the former of which was established in 1618, and the latter in 1612; but the Dutch, having conquered the country, founded the present town under the name of Batavia, and removed the government from Bantam in 1619. It finally became the capital of their East Indian empire, and the residence of the governor general; and the English, having taken part with the natives in opposing the Dutch, retired from the place. Being called in to aid various parties in their civil wars, the Dutch obtained still more power on the island, but they did not enjoy undisturbed possession for several years, and were frequently attacked by the natives. The town rose rapidly to importance, and became the emporium of all the produce of India, China, and Japan, as no ship was allowed to proceed direct to Holland without first touching at this port, except the coffee ships from Mocha. It remained uninterruptedly in the hands of the Dutch till 1811, when Holland having become a province of the French empire, Batavia fell into the hands of the French, from whom it was taken by the English, and by the treaty of 1815 was restored to the Dutch, who returned to the government in the following year.

Batavia is an important place, from its excellent bay and its advantageous position for European commerce. It stands at the mouth of the river Jacatra, in the midst of swamps and marshes, surrounded by trees and jungle, which prevent the exhalations from being carried off by a free circulation of the air, and render the town peculiarly obnoxious to marsh miasmata. Besides this, all the principal streets are traversed by canals, planted on each side with rows of trees, over which there are bridges at the end of almost every street. They have also booms, which are drawn across at sunset to prevent the passage of boats in and out. These canals are the common receptacles for all the filth of the town. In the dry season their stagnant and diminished waters emit a most intolerable stench, while in the wet season they overflow their banks, and leave a quantity of offensive slime From these united causes it is not surprising that Batavia has been considered the most unhealthy spot in the world, and has been designated the storehouse of disease. According to Raynal, the number of sailors and soldiers alone who died in the hospitals averaged 1400 annually for sixty years, and the total amount of deaths in twenty-two years exceeded a million of souls; but this looks very like an exaggeration. During the French occupation, the walls of the town were removed by General Daendels with the view of admitting a freer circulation of air, and with the materials the cantonment of Weltevreeden was built, a short distance from the town inland.

The city is about three quarters of a mile in length, north and south, and about half a mile wide. It was enclosed by a wall of coral rock, with a stream of water on each side, within and without. There are now only three churches in the town, and one theatre: at the southern part is a large square where the stadthaus stands, in which the courts of law are held, and all public business transacted. The streets are generally at right angles to one another, and the houses mostly of brick stuccoed. They are well built, clean, and spacious, and their construction is suited to the country. The doors and windows are lofty, and the ground floors are covered with flags of marble, which are kept constantly wet, and impart a coolness to the dwelling. Few Europeans, however, sleep within the town, as the night air is considered very baneful. The inhabitants (possibly as an antidote against the noxious effluvia arising from the swamps and canals) continually burn aromatic woods and resins, and scatter about a profusion of odoriferous flowers, of which there are great abundance and variety. During the prosperity of the Dutch East India Company, Batavia obtained the title of Queen of the East, as the resources of all other districts were sacrificed to its exclusive commerce; but its splendour has greatly decreased, owing chiefly to the increase of the British empire in India. Whole streets also have been pulled down in consequence of the European settlers removing their residences from the town to the high grounds in the neighbourhood.

In the north-east quarter of the town is the citadel, a large square inclosure with a bastion at each angle, but without any outworks; within the citadel are residences for the Governor-General and chief officers, with warehouses for the most valuable of the Company's goods in case of danger. In addition to these defences there are several small batteries and redoubts in and around the town, besides fortified houses, so placed as to command the navigation of the principal canals. Most of these works are merely for the purpose of keeping the natives in awe, and are ill-calculated to withstand an invading army, as was proved in 1811. But if the fortifications of Batavia are not formidable in themselves, they become so from their situation among swamps and morasses, where, by the destruction of a few roads that cross them to the town, the approach of heavy artillery would be impracticable; and towards the bay the water is too shallow to admit even of a boat coming within gunshot-range of the castle, except by the narrow entrance to the river, which may be closed by booms.

The diversified population of Batavia and its suburbs within two miles, according to the census of 1815, amounted to 47,417, and consisted of Dutch, English, Portuguese, Chinese, Moors, Arabs, Malays, Javanese, and negro slaves: of these classes the Chinese are by far the most numerous and important. In 1824 another census was taken, when the number was 53,861, of whom 14,708 were Chinese. This does not include the military establishment at Weltevreeden. The Chinese farm the revenues, are the principal artisans, and exclusively manufacture the sugar and arrack. They have a separate quarter outside the town, the suburbs of which occupy a larger space than the city itself: they suffer greatly from disease, and the mortality among them is very great, owing to the closeness of their apartments and their gross manner of living. Many junks arrive annually from China, bringing about 1000 settlers. In 1742, in consequence of a supposed organised plan of insurrection on the part of the Chinese, the Dutch government perpetrated a most cold-blooded massacre, in which more than one half of the Chinese were murdered.

The country around Batavia is very beautiful and fertile, though flat in the vicinity of the town. Markets are regularly held, one within and the other outside the city, which are remarkably well supplied with fruit, which is the most abundant article of vegetable luxury: the principal sorts are, pine-apples, oranges, shaddocks, lemons, limes, mangoes, bananas, grapes, melons, pomegranates, custard-apples, papaws, mangosteens, and rombusteens, wih many others mostly unknown in Europe. Fowls, ducks, and geese, are plentiful and cheap; turkeys, pigeons, and wild-fowl are, in general, very scarce, and butcher's meat inferior and dear: of fish there is an abundant supply, and turtle are sometimes found. The chief imports are opium and piece goods; the exports sugar, coffee, and spices: salt also forms an important article of colonial commerce; near Batavia there are some very extensive works for making salt from sea-water.

The anchorage of Batavia is a bay, about eleven miles long and six deep, capable of containing any number of vessels of the largest size; it is studded with coral knolls and protected by several small islands, averaging half a mile in diameter, all of which are occupied, and have their different appropriations; one is a convict establishment; another an hospital; a third is covered with warehouses for articles of small value; a fourth (Onrust) is the naval arsenal, which is well fortified.

These islands protect the bay from any heavy swell; and, as the bottom is very tenacious, it becomes a perfectly safe anchorage. But when the sea-breeze blows strong it causes a cockling sea, which renders the communication with the town unpleasant, and sometimes dangerous, as the only landing-place is up the river; the channel of which is formed by wooden piers, projecting half a mile into the sea, and across it is a shallow bar. The river Jacatra abounds in large alligators. During the easterly monsoon, which blows from April to October, the weather is uniformly fine and warm; but the north-west monsoon is always accompanied by heavy rains and strong winds. The summer range of the thermometer is from 70 to 74 in the mornings and evenings, and 80 at noon. The rise of tide is about six feet.

Batavia lies in 6° 9′ S. lat., and 106° 52′ E. long.

(Raffles's *History of Java*; Staunton's *Embassy to China*; Cook's *Voyages*; Crawfurd's *History of the Indian Archipelago*; Horsburgh's *East India Directory*; Hogendorp's *Coup d'Œil*, &c. There is a plan of Batavia, for the year 1669, in Mandelslo's *Travels*.)

BATAVIAN REPUBLIC. [See HOLLAND.]

BATH, the chief city of Somersetshire, celebrated for its natural hot springs, is about 108 miles from London, in 51° 22′ 32″ N. lat., and 2° 31′ 30″ W. long. The town lies in a valley, divided by the river Avon. Geologically it is placed upon the great western oolitic range, which attains its greatest elevation on Lansdown, above Bath, where its summit is 813 feet above the level of the sea. This range is intersected in the neighbourhood of the city by deep transverse valleys, but re-appears on the south of the Avon, where its elevation is so broken that its continuity is destroyed. Its section near Lansdown is a bed of upper, or great oolite, varying from 40 to 150 feet in thickness, forming the brow of the hill; then a gradual slope of fullers-earth-clay; next a terrace of inferior oolite with its underlying sand and sandstone, which falls with a precipitous slope and rests on lias clay, or blue marl, and then on lias rock. The freestone or oolite, worked from quarries situated to the east and south of Bath, has furnished almost entirely the chief building materials for the city. The soil upon the declivities of the hills is generally rich, and the lower grounds afford very fine pasturage. The country about is wooded; and from the inequality of the ground presents a great variety of agreeable landscape. From the sheltered position of the city, its temperature is mild. The following table is made-up from observations continued through fifteen years, the temperature being noted from a thermometer placed in a north aspect, and fifteen feet from the ground, compared with tables given by Dr. Clark in his work on climate

	Nov.	Dec.	Jan.	Feb.	Mar.
Near London .	40·93	37·66	34·16	39·78	41·51
Oxford . .	43·60	37·00	36·90	37·10	42·10
Bath . .	45·35	42·25	37·75	41·25	44·40

In the summer months, the same observations give the mean temperature of Bath at 61·20 in June, 64·20 in July, and 62·70 in August. The mean annual depth of rain which falls there is 35·30 inches, and the number of days on which rain or snow falls is 162, every day being noted wet on which sufficient rain fell to mark the pavement.

This city was a Roman station, mentioned by Ptolemy, under the name of *Aquæ Calidæ*, and by him placed with *Venta* and *Ischalis* in the country of the Belgæ. It is also placed in the 14th Iter of Antoninus, in connexion with other stations, thus, Ab Isca Venta Silurum, M.P. ix. Abone, M.P. ix. Trajectus, M.P. ix. *Aquis Solis*, M.P. vi. Verlucione, M.P. xv. Cunetione, M.P. xx. Spinis, M.P. xv. Calleva, M.P. xv. The stations preceding and following that of Bath are much disputed, and their actual position is very doubtful. In the *Notitia*, Bath is not mentioned. It was intersected by the antient Roman road leading from London into Wales, and by the road called the Fosse, which ran from Lincolnshire to the south coast of England. These two roads joined near the bridge crossing a small stream in the parish of Bath Easton, about two miles from Bath. They then continued in one course through a great portion of the parish of Walcot, separating again near Walcot church. The Fosse entered the north gate of the city from Walcot street, passed through the town, up Holloway and on to Ilchester. The other road ran up Guinea Lane, and on to the station of Abone. Close to the spot where these roads separated, and towards the river, numerous coins, vases, and sepulchral remains have from time to time been found. The Roman remains discovered in Bath and in its neighbourhood have been considerable. At Box a tessellated pavement of large dimensions is at this time lying open, proof of the existence of a villa on the spot. Several such remains have been found in the country around Bath, especially at Bath-Ford, Ditheridge, Horsland near Warley, and at Wellow. In the city of Bath itself, the foundations of extensive buildings have often been traced. On the eastern side of the Fosse, near the north end of Stall-street, portions of a large temple were discovered, and are still preserved in the Bath Institution. Its front was towards the west, and consisted of a portico with fluted columns, crowned with Corinthian capitals. Towards the east of this building stood the principal baths, the remains of which were discovered in 1755. In other parts of the city, altars with inscriptions, tessellated pavements, ornamented bricks, urns, vases, lachrymatories, fibulæ, coins, &c., have been turned up, but none of the inscriptions throw any light upon the history of the place. No city in England can produce such a collection of local Roman remains as is now deposited in the Bath Literary and Scientific Institution: there is nothing like it in the kingdom, except at Newcastle-upon-Tyne, where the collection is from the whole of the northern field. The new town is many feet above its antient level; in some places more than twenty. The walls, as they existed until a late period, are presumed to have been built, to a great extent, upon the base of the Roman walls. There are accounts and engravings of Roman inscriptions and sculptures incorporated in the walls, none of which are now existing.

The modern city of Bath is of great beauty. Its streets are very regular, clean, and, at night, well-lighted. Its best buildings, such as the Upper Rooms, the north side of Queen-square, the Crescent, and Circus, were built about the middle of the last century, from designs of the two Woods. The last forty years have hardly produced a building of any architectural value, though the materials for building are cheap, and the stone is worked with great ease. The architecture of the later buildings is generally of a bald character.

The city is governed by a corporation, under charters granted by Queen Elizabeth, Sept. 4, 1590, and by George III., 1794. The first of these charters directs that the corporation shall consist of a mayor, aldermen, not exceeding in number ten, nor fewer than four, and a common council of twenty members. There are also a recorder, town-clerk, and two sergeants-at-mace. The local court of record has cognizance of all personal actions whatsoever arising within the city and its suburbs or precincts, without restriction as to the amount of the sum in dispute. The non-residence, however, of the recorder, the legal adviser of the magistrates and one of the presiding judges; the attorneys of the court being the two sergeants-at-mace and unprofessional persons; and the ease with which a cause may be removed to any of the superior courts, by writ of *certiorari* or *habeas corpus*, destroy all its advantages. A court-leet, and court of quarter-sessions are also held by the magistrates, who, though without power to try persons charged with felonies under the charter of the city, are perhaps enabled to try them under the 4 and 5 Will. IV. c. 27, sec. 3. By the charter of 1794, eleven instead of two members of the corporation are empowered to act as justices of the peace within the city. The members of the corporation, though self-elected, must be chosen from the freemen; and as the freemen by purchase were considered to have a claim to be elected before the freemen by servitude, the price of the freedom, shortly before the Reform Act passed, was 250*l*. The property of the body is very extensive, including lands and houses in the best part of the city; all the hot-springs but one; nearly all the cold-springs which supply the town with water; and the tolls of the market; altogether producing, in 1832, a rental of more than 12,000*l*. per annum. In 1832 the public debt of the corporation amounted to 55,863*l*.

The charter boundaries of the city include part of the parishes of Walcot and Bathwick, and the parishes of St. Peter and St. Paul, St. James, and St. Michael. The parliamentary boundaries of the city, under the Boundary Act, include, in addition, the remaining parts of the parishes of Walcot and Bathwick, and the parish of Lyncombe and Widcombe. The new limits comprised, in 1831, a population of 50,800 persons (21,035 males and 29,765 females), charged with assessed taxes to the amount of 62,000*l*. a-year; 3310 acres of ground, and above 7000 houses, more than 5000 of which were taxed at the annual value of 10*l*. The power of electing the parliamentary representatives of the city was formerly in the corporation only. Under the Reform Act, the number of registered electors, in each of the last three years, has been about 2800. The inhabitants of Bath are exempt from serving on the juries of the county.

A community of Religious existed here from the earliest ages of Christianity in Britain, who had their house near to the springs and baths. The constitution of the society underwent several changes, and at last the house and all its possessions, which were extensive and valuable, were surrendered to the crown by William Holloway, the last prior, June 29, 1539. What is now called the Abbey Church was the church of this community, and was connected, on the south side, with the conventual dwellings. An older church having fallen into decay, the building of the present edifice was begun by Bishop Oliver King, in the reign of Henry VII., at the time of whose death it was unfinished, and continued to be so when the priory was dissolved. After having been in a dilapidated state for many years, its repair was undertaken by Chapman, in 1572, continued by the munificence of Thomas Bellot, steward of the household of Queen Elizabeth, and was nearly completed by Bishop Montague, about the year 1609. This edifice is of the shape of a cross, with a very handsome tower rising from the centre. Its length from east to west is 210 feet, and from north to south 126. The west front is decorated with numerous figures, now much impaired by time, intended to represent Jacob's dream. The east window is remarkable for being square, and was until very lately appropriately supported by two square towers, which have been converted into ill-designed octagonal pinnacles. The building itself is an example of the pointed style at the latest period in which it prevailed, and was completed with great simplicity and taste. In 1834 its whole design and character were materially changed, and its most peculiar features destroyed. The interior is entirely disfigured by the multitude of monuments with which it is covered. It is the parish church of the parish of St. Peter and St. Paul.

The ecclesiastical division of Bath is into the parishes already named, each of which has its parochial church. There are also the following chapels connected with the Established Church:—Queen Square, Margaret's, All Saints, Kensington, Octagon, Laura, St. Mark, Trinity, St. Saviour, Christ Church, Magdalen's, St. John's Hospital. Records also exist of eleven chapels which have been destroyed. The Independents, Quakers, Moravians, Methodists, Unitarians, Roman Catholics, Jews, and Baptists, have all places of worship in the city, the majority of which are large and handsome buildings.

There are charitable institutions in this city of antient and modern date of every kind. The oldest is the hospital of St. John, founded in 1180 by Reginald Fitzjocelyne, as it is said, for the benefit of the sick poor resorting to Bath. The beneficiaries now are a master, six brethren, and six sisters. The patronage of the mastership was granted by Queen Elizabeth to the corporation of Bath. Its endowments are large, and the annual value of its property in 1818, chiefly leased on lives, in consideration of fines, was 11,395*l*. The master receives two-thirds of the fines and income, and the brethren and sisters the remainder. The chief establishment, however, for the sick poor is called the General Hospital. It was opened in 1743, and is regulated by act of parliament. No patient can be admitted unless his case has been certified as proper for the trial of the hot waters, previous to his coming to Bath, and no inhabitant of Bath is admitted into it. This last regulation, though wisely framed, is to some extent evaded by the admission of persons dwelling in the suburbs, but beyond the charter limits of the city. The charity is well endowed, and its records have had the character of having been kept with great care, fidelity, and exactness. There is also another large hospital called the United General Hospital, or Casualty and Dispensary, which affords to the sick poor of the city the advantages of the use of the hot waters, and gives assistance in cases of ordinary illness and casualty. It is well governed, and the whole of its arrangements are good.

There is a small collection of books in the vestry of the abbey church and some antient MSS. In the year 1826 a literary and scientific institution was founded, comprising, partly by purchase and partly by benefactions, an extensive and well-selected library of reference both in science and literature. The institution also contains a small museum and laboratory, with rooms for the delivery of lectures. There is also a Mechanics' Institute, which has a tolerable collection of books, and which has been almost entirely supported for some years by the class for whose use it was designed.

The chief institution for instruction is the free grammar-school, founded by Edward VI., and endowed with part of the lands of the dissolved priory of Bath. It was designed for the gratuitous instruction of the children of the inhabitants of the town without distinction. The school-house is a large and handsome building with spacious premises. The schoolmaster may be a layman; but if in holy orders, must be presented to the rectory of Charlcombe, the value of which was, in 1834, about 300*l*. a-year. His salary, as master, is 84*l*. a-year; but as the school is well attended, and only ten free scholars are admitted, the value of the office is much increased by the payments of day-scholars and boarders. The lands of the school are very badly let, producing, in 1834, a rent of only 376*l*. a-year, though their annual value, in 1822, was about 1238*l*. There are several other schools which afford the elements of education, such as reading, writing, and arithmetic, supported chiefly by voluntary subscriptions.

The 'ever memorable' John Hales, of Eton, was born in St. James's parish, and Benjamin Robins, said to have been the actual writer of *Anson's Voyage round the World*, was a native of this city, which also claims Adelardus de Bathonia, who passed some time in the east during the reign of Henry I., and brought to England, among some Arabic MSS., a translation of Euclid, being the first copy of the work known in this country.

The gaieties of Bath are celebrated, but have much declined during the last twenty years. The Assembly Rooms are a handsome suite, the ball-room being nearly 106 by nearly 43 feet, and 42 feet 6 inches high, and the tea-room 70 by 27 feet: they were erected by Wood. The theatre is probably one of the best of its size in England; for it Mr. Palmer obtained the first act of parliament passed in this country for the security of theatrical property. It is justly remarked by Seneca, 'Ubicunque scatebunt aquarum calentium venæ, ibi nova diversoria luxuriæ excitabuntur:' 'wherever warm springs abound, new places of amusement are sure to arise up.'

There is no manufacture of importance in this city. It was formerly celebrated for its cloth, and at the Restoration no less than sixty broad looms were employed in the parish of St. Michael's. The paper-mills in the neighbourhood are of some note, and paid, in 1832, to the excise 10,575*l.* The city is well-supplied with coal from extensive beds lying a few miles distant. The river Avon was made navigable to Bristol under an act of the 10th Anne, and there is a water-communication with London by the Kennet and Avon Canal, which joins the Thames at Reading.

The remarkable peculiarity of Bath is its natural hot springs. They are four in number, and rise near the centre of the city; and, with the exception of a spring belonging to Lord Manvers, are vested in the corporation. The temperature of three of the springs is as follows:—Hot Bath 117°, King's Bath 114°, and Cross Bath 109° of Fahrenheit, yielding respectively 128, 20, and 12 gallons a minute. The specific gravity of the water is 1·002. As it flows from the earth it is transparent, but in a short time yields a slight precipitate and loses its transparency. When fresh drawn it has a slight chalybeate taste. The King's Bath is 60 feet 11 inches in length, and 40 feet in breadth, and the Queen's Bath, a square of 25 feet, is supplied from it. The daily quantity of water discharged into these basins is 184,320 gallons. There are private baths attached to the Hot and the King's Bath, admirably arranged and constructed, and capable of having their temperature regulated. Bathing is far from being a practice among the inhabitants. The public baths are not much frequented, and the private baths, though they occasion few charges for their support, but that of linen and attendance, are expensive. The encouragement of their general use, and the effect of low prices, as connected with the advancement of local interests, are not yet understood. The baths yielded to the corporation, in 1831, a rent of 1442*l.*, and the pump-room a rent of 416*l.* a-year. The waters have been very accurately analyzed by Drs. Falconer and Gibbes, and by Mr. R. Phillips. According to the last of these writers, whose experiments were very carefully made, a quart of water taken from the hot springs contains—

Carbonic acid . . .	2·4	in.
Sulphate of lime . .	18·	grains.
Muriate of soda . . .	6·6	„
Sulphate of soda . .	3·0	„
Carbonate of lime . .	1·6	„
Silica	·4	„
Oxide of iron . . .	·00394	
	29·60394	
Loss . . .	39606	
	30	

Estimating the muriate and sulphate of soda in a crystallized state, a pint of water contains—

Carbonic acid	1$\frac{1}{5}$	in.
Sulphate of lime	9	grains.
Muriate of soda . . .	3$\frac{1}{2}$	„
Sulphate of soda	3$\frac{1}{2}$	„
Carbonate of lime	$\frac{8}{10}$	„
Silica	$\frac{1}{5}$	„
Oxide of iron	$\frac{1}{68}$	„

A considerable quantity of carbonic acid gas escapes through the water.

Taken internally the water acts as a stimulant. Its use is most successful in cases of palsy, rheumatism, gout, leprosy, cutaneous disease, and especially in cases of scrofula affecting the joints, such as the knee, elbow, hip. It cannot be used without danger in cases accompanied with fever, cough, or pain in the chest, open sores or ulcers, or in cases where there is reason to suspect internal suppuration, hemorrhage, rupture, mania, or plethora. From its improper internal use mischievous results are frequently produced.

The earliest work on the hot springs is by W. T dated 1562. The writer, a divine and doctor of medicine, and the first English writer on natural history, was born at Morpeth, and was imprisoned for preaching the doctrines of the Reformation. Obtaining his liberty, he went abroad, where he continued during the greater part of the reign of Henry VIII. On his return he was preferred, and received from Edward VI. the deanery of Wells. Other treatises have been written by Venner, 1617; Guidott, 1691, 1708; Pierce, 1697; Oliver, 1716; Cheyne, 1725; Wynter, 1728; Quinton, 1734; Kinnier, 1737; Randolph, 1752; Charleton, 1754; Lucas, 1756; Steven, 1758; Sutherland, 1763; Falconer, 1770, 1789; Gibbes, 1800; Wilkinson; Phillips, 1806; Daubeny, 1834.

Communication from Bath.*)

BATH, a town in Lincoln county, state of Maine, in the United States of North America, situated in 43° 54′ N. lat., and 69° 47′ W. long. This town is built on the west side of the river Kennebec, at the head of the ship-navigation on that river, and sixteen miles from the sea. It is distant thirty-five miles north-east from Portland, which town was, until 1832, the seat of government in the state. With the exception of Portland, Bath has more shipping belonging to its port than any other town in Maine; the amount of registered and licensed tonnage in 1831 was 26,237 tons: the population, according to the census of 1830, was 3773.

BATH, KNIGHTS OF THE, so called from the antient custom of bathing previous to their installation. The origin of this order of knighthood has been described as of very remote antiquity; but as Camden and Selden agree that the first mention of an order of knights, distinctly called Knights of the Bath, is at the coronation of Henry IV. in 1399, there can be little doubt that this order was then instituted. That bathing had been a part of the discipline submitted to by esquires in order to obtain the honour of knighthood from very early times, is admitted; but it does not appear that any knights were called Knights of the Bath till these were created by King Henry IV.

Froissart (see Lord Berners's *Translat.* edit. 1812, vol. ii. p. 752), speaking of that king, says, 'The Saturday before his coronation he departed from Westminster, and rode to the Tower of London with a great number: and that night all such esquires as should be made knights the next day, watched, who were to the number of forty-six. Every esquire had his own bayne (*bath*) by himself; and the next day the Duke of Lancaster made them all knights at the mass-time. Then had they long coats with strait sleeves, furred with mynever like prelates, with white laces hanging on their shoulders.'

It became subsequently the practice of the English kings to create Knights of the Bath previous to their coronation, at the inauguration of a Prince of Wales, at the celebration of their own nuptials or those of any of the royal family, and occasionally upon other great occasions or solemnities. Fabyan (*Chron.* edit. 1811, p. 582) says that Henry V., in 1416, upon the taking of the town of Caën, dubbed sixteen Knights of the Bath.

Sixty-eight Knights of the Bath were made at the coronation of King Charles II. (see the list in Guillim's *Heraldry*, fol. Lond. 1679, p. 107); but from that time the order was discontinued, till it was revived by King George I. under writ of Privy Seal, dated May 18, 1725, during the administration of Sir Robert Walpole. The statutes and ordinances of the order bear date May 23, 1725. By these it was directed that the order should consist of a grand-master and thirty-six companions, a succession of whom was to be regularly continued. The officers appropriated to the order, besides the grand-master, were a dean, register, king of arms, genealogist, secretary, usher, and messenger. The dean of the collegiate church of St. Peter, Westminster, for the time being, was appointed *ex officio* dean of the Order of the Bath, and it was directed that the other officers should be from time to time appointed by the grand-master.

The badge of the order was directed to be a rose, thistle, and shamrock, issuing from a sceptre between three imperial crowns, surrounded by the motto *Tria juncta in uno;*

to be of pure gold, chased and pierced, and to be worn by the knight-elect, pendant from a red riband placed obliquely over the right shoulder. The collar to be of gold, weighing thirty ounces troy weight, and composed of nine imperial crowns, and eight roses, thistles, and shamrocks issuing from a sceptre, enamelled in their proper colours, tied or linked together by seventeen gold knots, enamelled white, and having the badge of the order pendant from it. The star to consist of three imperial crowns of gold, surrounded with the motto of the order upon a circle gules, with a glory or ray issuing from the centre, to be embroidered on the left side of the upper garment.

The installation dress was ordered to be a surcoat of white satin, a mantle of crimson satin lined with white, tied at the neck with a cordon of crimson silk and gold, with gold tassels, and the star of the order embroidered on the left shoulder; a white silk hat, adorned with a standing plume of white ostrich feathers; white leather boots, edged and heeled; spurs of crimson and gold; and a sword in a white leather scabbard, with cross hilts of gold.

Each knight was to be allowed three esquires, who are to be gentlemen of blood, bearing coat-armour; and who, during the term of their several lives, are entitled to all the privileges and exemptions enjoyed by the esquires of the sovereign's body, or the gentlemen of the privy chamber.

In 1815, the Prince Regent, being desirous to commemorate the auspicious termination of the long and arduous contests in which the empire had been engaged, and of marking, in an especial manner, his sense of the valour, perseverance, and devotion manifested by the officers of the king's forces by sea and land, thought fit to advance the splendour and extend the limits of the Order of the Bath: upon which occasion his Royal Highness, by virtue of the royal prerogative, was pleased to ordain that thenceforward the order should be composed of three classes, differing in their ranks and degrees of dignity.

The first class to consist of knights grand crosses, which designation was to be substituted for that of knights companions previously used. The knights grand crosses, with the exception of princes of the blood-royal holding high commissions in the army and navy, not to exceed seventy-two in number; whereof a number not exceeding twelve might be nominated in consideration of services rendered in civil or diplomatic employments. To distinguish the military and naval officers upon whom the first class of the said order was then newly conferred, it was directed that they should bear upon the ensign or star, and likewise upon the badge of the order, the addition of a wreath of laurel encircling the motto, and issuing from an escrol inscribed *Ich dien*; and the dignity of the first class to be at no time conferred upon persons who had not attained the rank of major-general in the army, or rear-admiral in the navy.

The second class was to be composed of knights commanders, who were to have precedence of all knights bachelors of the United Kingdom: the number, in the first instance, not to exceed one hundred and eighty, exclusive of foreign officers holding British commissions, of whom a number not exceeding ten may be admitted into the second class as honorary knights commanders; but in the event of actions of signal distinction, or of future wars, the number of knights commanders may be increased. No person to be eligible as a knight commander who does not, at the time of his nomination, hold a commission in his Majesty's army or navy; such commission not being below the rank of lieutenant-colonel in the army, or of post-captain in the navy. By a subsequent regulation in 1815 no person is now eligible to the class of K.C.B. unless he have attained the rank of major-general in the army or rear-admiral in the navy. Each knight commander to wear his appropriate badge or cognizance, pendent by a red riband round the neck, and his appropriate star, embroidered on the left side of his upper vestment. For the greater honour of this class, it was further ordained that no officer of his Majesty's army or navy was thenceforward to be nominated to the dignity of a knight grand cross who had not been appointed previously a knight commander of the order.

The third class to be composed of officers holding commissions in his Majesty's service by sea or land, who shall be styled companions of the said order; not to be entitled to the appellation, style, or precedence of knights bachelors, but to take precedence and place of all esquires of the United Kingdom. No officer to be nominated a companion of the order unless he shall previously have received a medal or other badge of honour, or shall have been specially mentioned by name in despatches published in the *London Gazette* as having distinguished himself.

The bulletin announcing the re-modelling of the Order of the Bath was dated Whitehall, January 2, 1815.

By another bulletin, dated Whitehall, January 6, 1815, the Prince Regent, acting in the name and on behalf of his Majesty, having taken into consideration the eminent services which had been rendered to the empire by the officers in the service of the Honourable East India Company, ordained that fifteen of the most distinguished officers of that service, holding commissions from his Majesty not below that of lieutenant-colonel, might be raised to the dignity of knights commanders of the Bath, exclusive of the number of knights commanders belonging to his Majesty's forces by sea and land who had been nominated by the ordinance of January 2. In the event of future wars, and of actions of signal distinction, the said number of fifteen to be increased. His Royal Highness further ordained that certain other officers of the same service, holding his Majesty's commission, might be appointed companions of the Order of the Bath, in consideration of eminent services rendered in action with the enemy; and that the said officers should enjoy all the rights, privileges, and immunities secured to the third class of the said order.

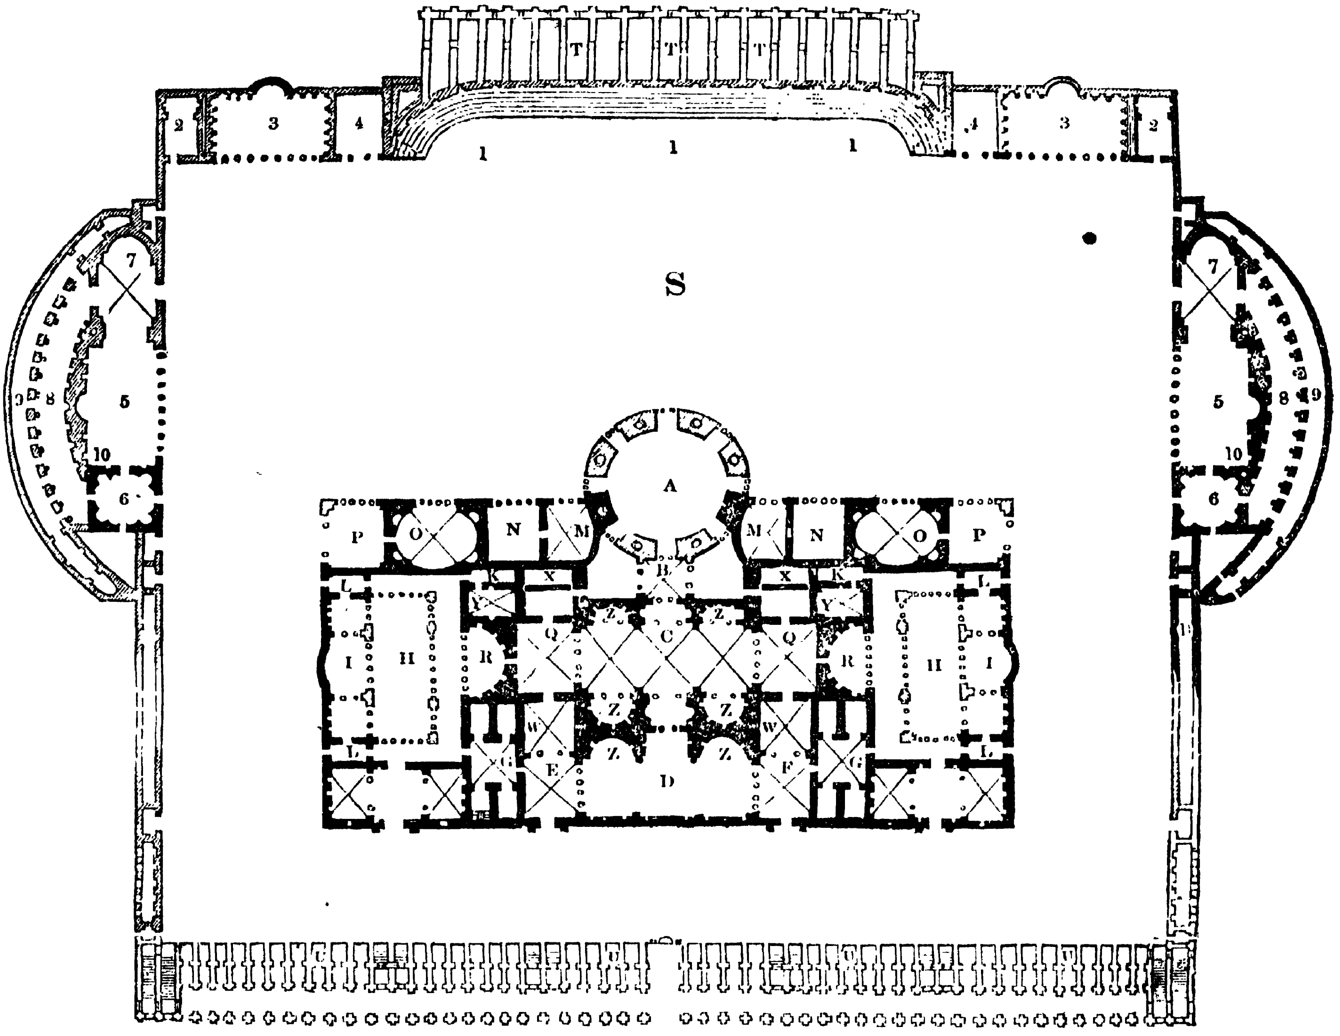
Mus.; *Statutes of the Order of the Bath*, 4to. Lond. 1725, repr. with additions in 1812; *Bulletins of the Campaign* 1815, pp. 1-18.)

BATH, a place for the purpose of washing the body, either with hot, warm, or cold water: the word is derived from the Saxon bað. The Greek name is balaneion (*βαλανεῖον*), of which the Roman balineum, or *balneum*, is only a slight variation: the elements *bal* and *bad* in the Greek and English words are evidently related. The public baths of the Romans were generally called *Thermæ*, which literally means 'warm waters.'

The bath was also in common use among the Greeks, though we are not well acquainted with the construction and economy of their bathing-places. At Athens there were both private and public baths: the public baths appear to have been the property of individuals, who kept them for their own profit or let them to others. (See Isæus, *On the Inheritance of Dicæogenes*, cap. vi.; *ditto of Philoctemon*, cap. vi.) Lucian, in his *Hippias* (vol. iii. ed. Hemsterh.), has given a description of a magnificent bath. Though he does not tell us whether it was built in the Roman or the Greek style, we may safely conclude that he is speaking of a bath in a Greek city. His description is not precise enough to render it certain that this bath in its details agrees with those of Rome and Pompeii; but the general design and arrangement appear to be nearly the same.

We learn from Seneca that the Roman baths were very simple, even mean and dark, in the time of Scipio Africanus; and it was not until the age of Agrippa, and the emperors after Augustus, that they were built and finished in a style of luxury almost incredible. Seneca (*Epist.* lxxxvi.), who inveighs against this luxury, observes that 'a person was held to be poor and sordid whose baths did not shine with a profusion of the most precious materials,—the marbles of Egypt inlaid with those of Numidia; unless the walls were laboriously stuccoed in imitation of painting; unless the chambers were covered with glass, the basins with the rare Thasian stone, and the water conveyed through silver pipes.' These it appears were the luxuries of plebeian baths. Those of freedmen had 'a profusion of statues, a number of columns supporting nothing, placed as an ornament merely on account of the expense: the water murmuring down steps, and the floor of precious stones.' (Sen. *Epist.* lxxxvi.) These baths of which Seneca speaks were private baths.

Ammianus Marcellinus reckons sixteen public baths in Rome. The chief were those of Agrippa, Nero, Titus, Domitian, Antoninus Caracalla, and Diocletian. These edifices, differing, of course, in magnitude and splendour, and in the details of the arrangement, were all constructed on a common plan. They stood among extensive gardens and walks, and were often surrounded by a portico. The main building contained large halls for swimming and bathing, some for conversation, others for various athletic and manly exercises, and some for the declamation of poets and the lectures of philosophers; in a word, for every species of polite and manly amusement. These noble rooms were lined and paved with marble, adorned with the most valuable columns, paintings, and statues, and furnished with collections of books for the studious who resorted to them. (See *Pompeii*, published by the Society for the Diffusion of Useful Knowledge, vol. i.) These baths, which were called *Thermæ*, are now all in ruins. The best preserved are those of Titus, Diocletian, and Antoninus Caracalla. (See *Life of Anton. Caracall.* by Æl. Spartianus.) We here subjoin a plan of the baths of Caracalla, which were finished, according to Eusebius, in the fourth year of that emperor's reign. The most complete and elegant baths had generally the following apartments:—An apodyterium, or room for undressing; an unctuarium, for the ointments; a sphæristerium, or large room for exercises; a calida lavatio, or warm bath; a laconicum, or hot room for sweating; a tepidarium, or warm room with a tepid bath; and a frigidarium, which contained the cold bath: to these may be added rooms for feasting and conversation. (Cameron *On Roman Baths*.)



[Plan of the Baths of Caracalla from the measurements of Palladio.]

Scale of English Feet.

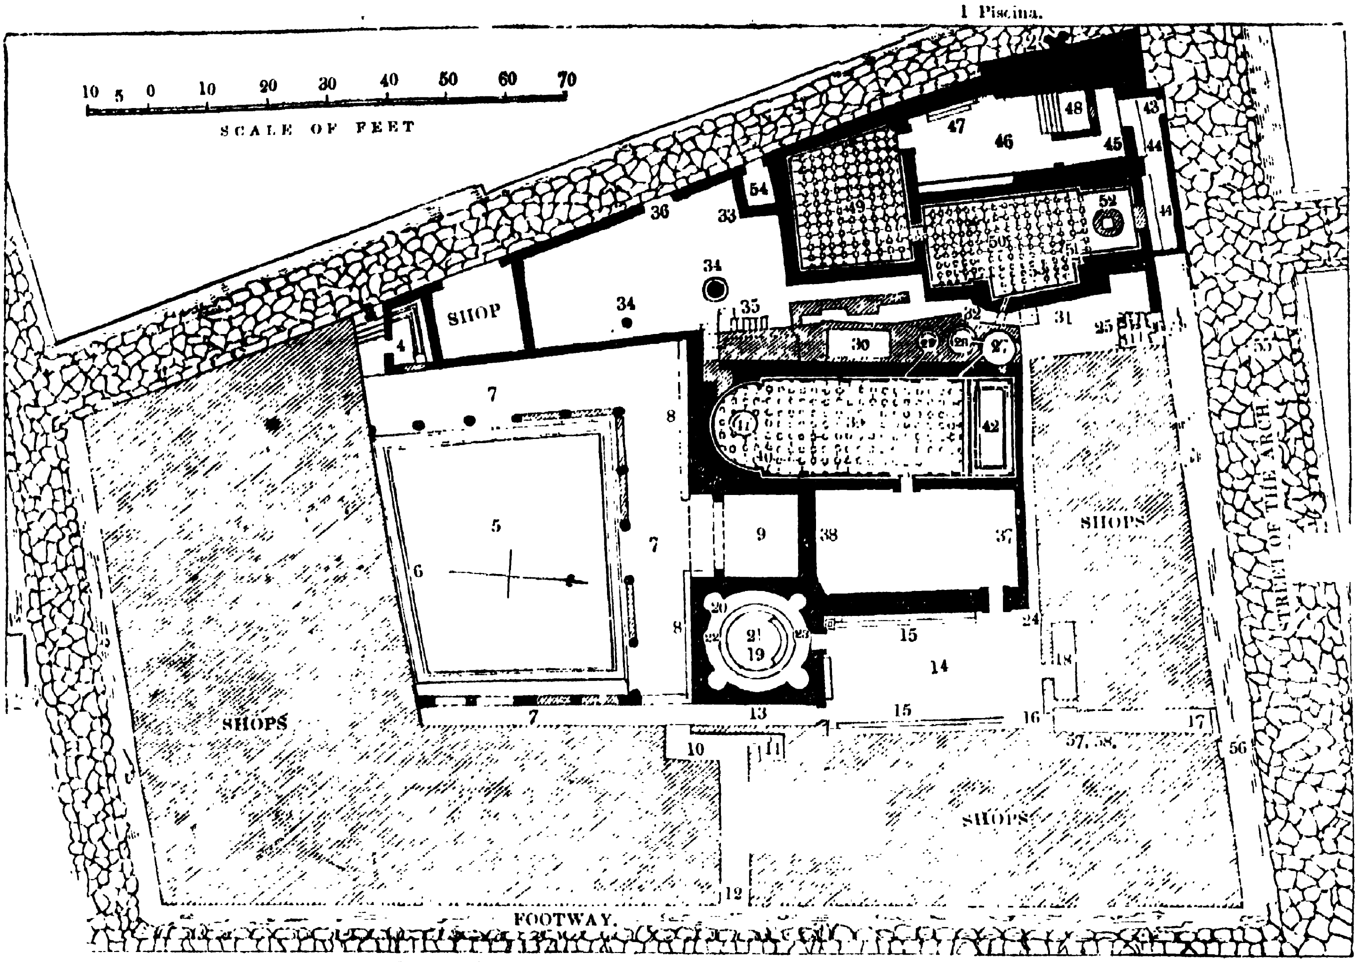
0 100 200 300 400 500

A, a circular room, over which was a roof of copper; B, the Apodyterium; C, the Xystus; D, the Piscina: E, Vestibules on the side of the Piscina, which served for the spectators and to contain the clothes of those who bathed; F, Vestibules at entering the Thermæ; on each side were libraries; G, G, Rooms where the wrestlers prepared for the exercises of the Palæstra, with a staircase to ascend to the upper story; H, H, the Peristyles, which we find in all the Roman Thermæ, having in the middle a Piscina for bathing; I, I, the Ephebium or place of exercise; K, K, the Elæothesium, or Elæothekium (Ελαιο-ϑέσιον-ϑήκιον); L, L, Vestibules, over which there is another room with a Mosaic pavement; M, M, Laconicum; N, N, Warm Bath; O, O, Tepidarium; P, P, Frigidarium; Q, Q, Rooms for the spectators and for the use of the wrestlers; R, R, Exhedræ for the philosophers; S, Stadium; T, T, Places for heating the water; U, U, Cells for bathing; W, W, Rooms for conversation; X, X, Cisterns of three stories to receive rain-water; Y, Y, the Conisterium; Z, Z, Recesses for ornament, and which served for the spectators to sit in; 1, Theatre for the spectators to see the exercises in the open air; 2, Apartments of two stories for the use of those who had the care of the baths; 3, 3, Exhedræ, where the gymnastic exercises were taught; 4, 4, Rooms for those who exercised in the Stadium; 5, 5, Atria to the academies; 6, 6, Temples; 7, 7, Academies; 8, 8, Arcades for the masters to walk in, detached from the noise of the Palæstra; 9, 9, Covered Baths; 10, 10, Stairs, &c., which led to the top; 11, 11, Stairs by which you ascended to the Palæstra.

Flaminius Vacca informs us that in 1471 there was to be seen in these baths an artificial island formed of marble, full of the remains of figures which had been carved on it. Near the island was a ship, with many figures in it, much broken. There was also a bathing vessel of granite. Two labra of granite, found in the same place, are now employed as fountains in the great square before the Farnese Palace at Rome. In these baths were also found the Farnese Hercules and the great group of statues known by the name of the Farnese Bull. Besides the great granite column now in the palace of S. Lorenzo at Florence, Piranesi tells us that he saw, in the peristyle, two fountains enriched with the remains of bas reliefs.

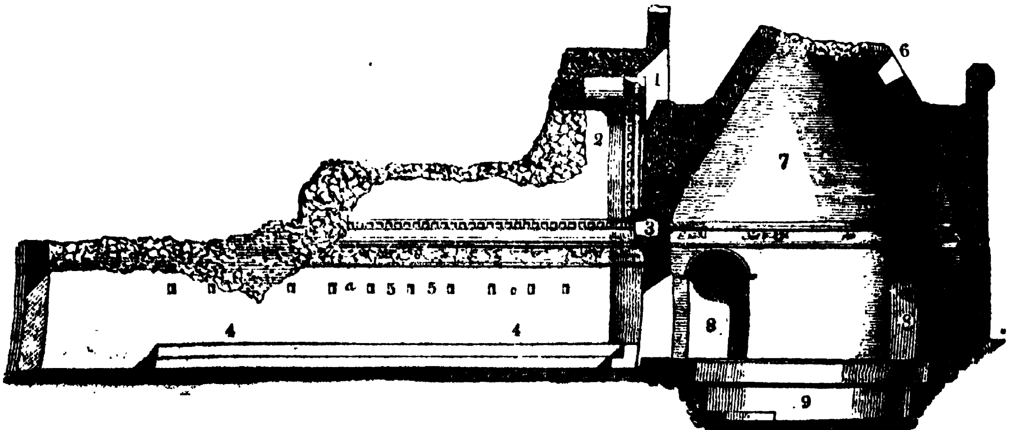
The provincial towns had also their baths, both public and private. The public baths of Pompeii, which were discovered in 1824, in a very perfect state, throw much light on what the Roman writers, and especially Vitruvius, have written on the subject. The following description of them is taken from the second volume of the *Pompeii*, (published by the Society for the Diffusion of Useful Knowledge), with a few verbal alterations, and some omissions. These baths occupy a space of about 100 feet square, and are divided into three separate and distinct parts. One of them was appropriated to the fire-places and to the servants of the establishment; the other two were occupied each by a set of baths contiguous to each other, similar, and adapted to the same purposes, and supplied with heat and water from the same furnace, and from the same reservoir. The apartments and passages are paved with white marble in mosaic. It is conjectured that the more spacious of the two sets of baths was for the use of the men, the smaller for the women.

Vitruvius (lib. v. cap. 10) says that the caldarium for the women should be contiguous to that for the men, and be exposed to the same aspect; for thus the same hypocaustum, or stove, may suffice for both. Annexed is the plan of these Pompeian baths, situated near the Forum.



[Plan of the Baths discovered in Pompeii, from the *Museo Borbonico.*]

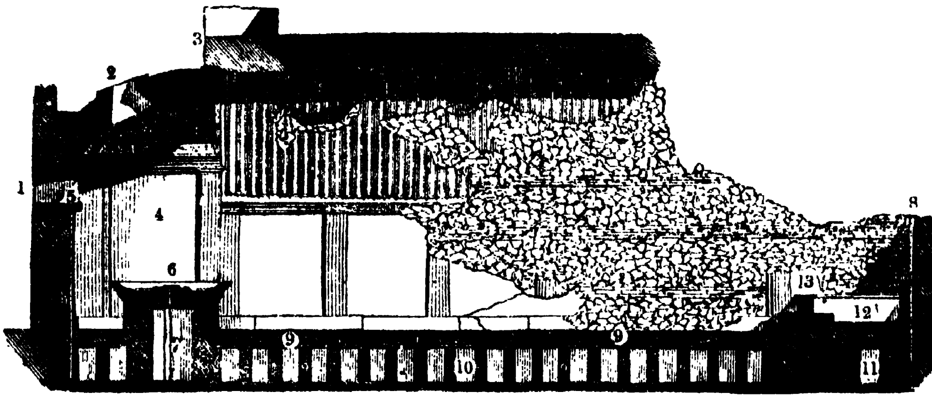
1, Piscina; 2, Street, over which was an aqueduct to convey the water from the Piscina to the baths; 3, Entrance to the baths of the men; 4, Watercloset; 5, Cortile, court, or vestibule to the baths; 6, Channel to collect the rain-water from the portico; 7, Colonnade round three sides of the vestibule; 8, Seats under the colonnade (*Scholæ*); 9, Oecus or exhedra; 10, Passage leading out of the baths; 11, Watercloset; 12, Entrance from the street of Fortune; 13, Passage leading into the Apodyterium; 14, Apodyterium; 15, Seats; 16, Passage leading to the street; 17, Entrance from the street of the arch; 18, Wardrobe; 19, Frigidarium; 20, Niches in the Frigidarium; 21, Alveus or vase of the Frigidarium; 22, a bronze spout, through which the water ran into the Alveus; 23, Pipe out of which the water escaped; 24, Passages which lead from the Apodyterium to the furnaces; 25, Apartment for the stokers; 26, Doorway leading from this apartment to the street of the arch; 27, Furnace; 28, Calidarium, or boiler for hot water; 29, Tepidarium, or receptacle for tepid water; 30, Frigidarium, or reservoir for cold water; 31, Stairs leading to the boilers; 32, Passage which leads from the boilers to the court, where the fuel for the stoves was kept; 33, the court for fuel; 34, Columns which supported the roof of the court; 35, Stairs which lead to the arched roofs of the baths; 36, Door opening into the street of the Forum; 37, Tepidarium; 38, Place where the bronze brazier was found; 39, Caldarium, having a suspended or hollow floor; 40, Laconicum; 41, Labrum; 42, Hot Bath; 43, Entrance to the baths for the women; 44, Vestibule with seats; 45, Passage leading to the Apodyterium; 46, Apodyterium; 47, Seats in the same; 48, Frigidarium; 49, Tepidarium; 50, Caldarium with a hollow pavement; 51, Laconicum; 52, Labrum; 53, Hot Bath; 54, a small room, use unknown; 55, Street, called the street of the arch; 56, Stairs; 57, 58, Two small voids without any communication.



[Section of the Apodyterium and Frigidarium of the Men's Baths.]

1, Window closed with one great pane of glass; 2, Decorated Archivolt; 3, a place for a lamp; 4, Seats of the Apodyterium with a raised step, serving as a footstool; 5, Holes in which were pegs for the dresses; 6, a Window; 7, Conical Ceiling of the Frigidarium; 8, Niches; 9, Alveus or marble vase.

The piscina or reservoir was separated at Pompeii from the baths themselves by the street which opens into the forum. The pipes which communicated between the reservoir and the bath passed over an arch thrown across the street. There were three entrances to the furnaces which heated the warm and vapour-baths. The chief entrance opened upon a court of an irregular figure, fit for containing wood and other necessaries for the use of the establishment, covered in part by a roof; the rafters of the roof rested at one end on the lateral walls, and at the other on two columns, constructed with small pieces of stone. From hence a very small staircase led to the furnaces, and to the upper part of the baths. Another led to the small room, called the præfurnium, into which projects the mouth of a furnace. In this room were the attendants on the furnace, or stokers (fornacarii), whose duty it was to keep up the fires. Here was found a quantity of pitch, used by the furnace-men to enliven the fires· the stairs in the room (25) led up to the coppers. The third entrance led from the apodyterium of the men's baths by means of a corridor (23). There is no communication between these furnaces and the bath of the women, which was heated *from* them. The furnace was round, and had in the lower part of it two pipes, which transmitted hot air under the pavements, and between the walls of the vapour-baths, which were built hollow for that purpose. Close to the furnace, at the distance of four inches, a round vacant space still remains, in which was placed the copper (*caldarium*) for boiling water; near which, with the same interval between them, was situated the copper for warm water (*tepidarium*); and at the distance of two feet from this was the receptacle (30) for cold water (*frigidarium*), which was square, and plastered round the interior, like the piscina or reservoir. A constant communication was maintained between these vessels, so that as fast as hot water was drawn off from the caldarium, the void was supplied from the tepidarium, which being already considerably heated, did but slightly reduce the temperature of the hotter boiler. The tepidarium in its turn was supplied from the piscina, and that from the aqueduct. The terms frigidarium, tepidarium, and caldarium were applied to the apartments in which the cold, tepid, and hot-baths were placed, as well as to the vessels already described under these respective names. The furnace and the coppers were placed between the men's baths and the women's baths, as near as possible to both, to avoid the waste of heat consequent on transmitting the fluids through a length of pipe. The coppers and reservoir were elevated considerably above the baths, to cause the water to flow more rapidly into them.



[Section of the Caldarium of the Men's Baths.]

1, Window; 2, a circular aperture by which the temperature was regulated; 3, another window; 4, Laconicum; 5, a place for a lamp; 6, Labrum; 7, Leaden pipe through which the water of the Labrum was either introduced or made its escape; 8, Hollow walls of the Caldarium; 9, Hollow pavement covered with Mosaic; 10, Small piers which support the pavement; 11, The communication between the hollow pavement and the furnace; 12, Hot Bath; 13, Steps to ascend the bath. (*Museo Borbonico*, vol. ii.)

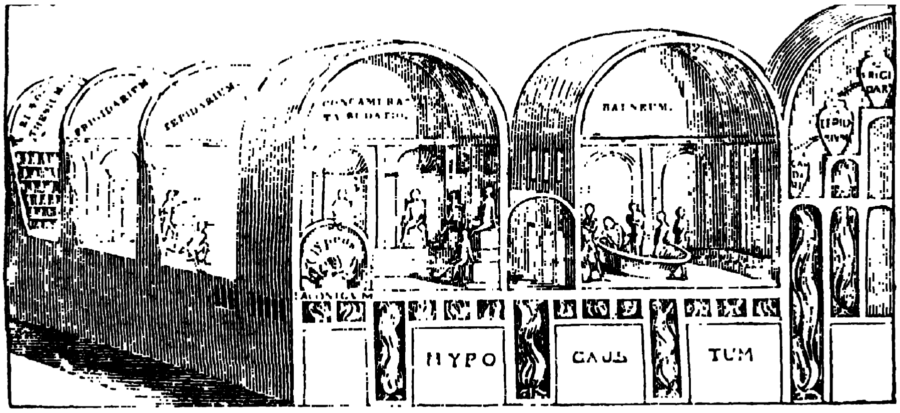
The men's bath had three public entrances (3,12,17). Entering at the principal one (12), which opens to the street leading to the forum, we descend three steps into the (5) vestibule, cortile, or portico of the baths, along three sides of which runs a portico (ambulacrum). The seats (8), which are arranged round the walls, were for the slaves who accompanied their masters to the baths, and for the servants of the baths themselves, to whom also the apartment (9) appears to have been appropriated. In this court was found the box for the quadrans, or piece of money, which was paid by each bather. Another door (17) leads to the same vestibule by means of a corridor. From the Street of the Arch (55) we proceed through the passage (17) into the apodyterium, or undressing-room (14), which is also accessible by another corridor (13) from a street called the street of the arch: a vast number of lamps were found here. The ceiling of this passage is decorated with stars. The apodyterium has three seats, made of lava, with a step to place the feet on; holes still remain in the wall, in which (it is conjectured) pegs were fixed for the bathers to hang their clothes upon. This room is highly decorated with stuccoed ornaments, relieved by colour. In the centre of the end of the room is a small opening or recess, once covered with a piece of glass; in this recess, as is plain from the appearance of smoke, a lamp has been placed. In the archivolt, or vaulted roof, immediately above, is a window two feet eight inches high, and three feet eight inches broad, closed by a single pane of cast glass two-fifths of an inch thick, fixed into the wall, and ground on one side: the floor is paved with white marble worked in mosaic, and the ceiling divided into pannels. In this room there are six doors, one leading to the præfurnium, another into a small room, perhaps designed for a wardrobe, the third by a narrow passage into the street; the fourth to the tepidarium; the fifth to the frigidarium; and the sixth, along the corridor to the vestibule or portico of the bath.

The frigidarium (19), or cold-bath, is a round chamber, with a ceiling in the form of a truncated cone; near the top is a window from which it was lighted. The plinth, or base of the wall, is entirely of marble, and four niches are disposed round the room at equal distances; in these niches were seats (scholæ) for the convenience of the bathers. The basin (alveus) is twelve feet ten inches in diameter, two feet nine inches deep, and entirely lined with white marble; two marble steps facilitate the descent into the basin, and at the bottom is a sort of cushion (pulvinus), also of marble, to enable those who bathed to sit down. The water ran into this bath in a copious stream, through a spout or lip of bronze four inches wide, placed in the wall three feet seven inches from the edge of the basin. At the bottom of the alveus is a small outlet, for the purpose of emptying and cleansing it; and in the rim there is a waste pipe to carry off the superfluous water: like the apodyterium, the frigidarium has been highly decorated, and is remarkable for its preservation and beauty. The tepidarium (37), or warm-chamber, adjoining the apodyterium, was so called, from a warm but soft and mild temperature, which prepared the bodies of the bathers for the more intense heat of the vapour and hot-baths, and *vice versâ*, softened the transition from the hot-bath to the external air. This apartment is decorated with niches, divided by telamônes [see ATLANTES]. The room was highly enriched, both with stucco ornaments and colour, and was lighted by a window two feet six inches high and three feet wide, in the bronze frame of which were found set four very beautiful panes of glass, fastened by small nuts and screws, very ingeniously contrived with a view to their being removed at pleasure. In this room a large bronze brazier and three bronze benches were found. A doorway led from the tepidarium into the caldarium, or vapour-bath (39); at one end was the laconicum, where a vase (41) for washing the hands and face was placed, called labrum; on the opposite side of the room was the hot-bath, called lavacrum. Vitruvius, in explaining the structure of the apartments, says, (cap. xi. lib. v.) 'Here should be placed the vaulted sweating-room, twice the length of its width, which should have at one end the laconicum, made as described above, at the other end the hot-bath.' This apartment is exactly as described, twice the length of its width, exclusively of the laconicum at one end, and the hot-bath at the other. The pavement and walls of the whole were made hollow, to admit the heat. Vitruvius never mentions the laconicum as being separated from the vapour-bath; it may therefore be presumed to have been always connected with it in his time, although in the thermæ constructed by the later emperors it appears always to have formed a separate apartment. In the baths of Pompeii they are united, and adjoin the tepidarium, in this respect exactly agreeing with the description of Vitruvius.

The laconicum is a large semicircular niche, seven feet wide, and three feet six inches deep, in the middle of which was placed a vase, or labrum. The ceiling was formed by a quarter of a sphere; and it had on one side a circular opening one foot six inches in diameter, over which, according to Vitruvius, a shield of bronze was suspended, which, by means of a chain attached to it, could be drawn over, or drawn aside from the aperture, and thus regulate the temperature of the bath.

The laconicum at Pompeii does not exactly correspond with the laconicum painted on the walls of the baths of Titus, and the laconicum described by Vitruvius. In the laconicum of Pompeii there is no cupola, such as we see represented in the painting of the baths of Titus, nor aperture in the floor, although the flue in the hypocaustum runs beneath it. The brazen shield also is applied to regulate the escape of heat through the roof, not to admit or exclude the smoke and flame coming direct from the furnace, as appears to have been the case in the baths of Titus. The latter was a clumsy and dirty way of heating a room, and strangely at variance, if it were really practised, with the finished elegance and luxury prevailing in every part of the Roman baths. The cupola in the baths of Titus might, however, have been a contrivance similar to our modern stoves for heating with hot air. Where this cupola did not exist, the room probably was heated, as at Pompeii, by a large brasier. The proper meaning of the word laconicum, whether it should be applied to the cupola and clypeus, or to the room in which they were placed, has been much disputed. It seems pretty certain that the name laconicum, which meant, in the first instance, the small cupola with the clypeus, became afterwards the name for that part of the room for which it was originally placed, even after the cupola had fallen into disuse, possibly from the discovery of a better method of heating the room.

Where the ceiling of the laconicum joined the ceiling of the vapour-bath, there was immediately over the centre of the vase, or labrum, a window three feet four inches wide; and there were two square lateral windows in the ceiling of the vapour-bath, one foot four inches wide, and one foot high, from which the light fell perpendicularly on the labrum as recommended by Vitruvius, 'that the shadows of those who surrounded it might not be thrown upon the vessel.' (Vitruv.)

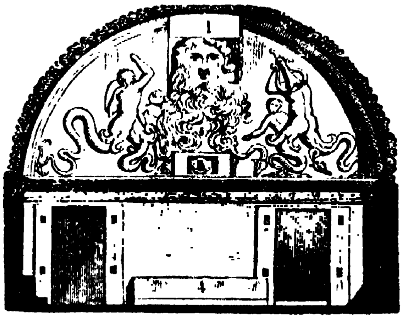


[Representation of Baths, from the paintings discovered in the Baths of Titus.]

The labrum was a great basin, or round vase of white marble, rather more than five feet in diameter, into which the hot water bubbled up through a pipe in its centre; it served for the partial ablutions of those who took the vapour-bath. It was raised about three feet six inches above the level of the pavement, on a round base, built of small pieces of stone or lava, stuccoed and coloured. In the Vatican there is a magnificent porphyry labrum, found in one of the imperial baths; and Baccius, a great modern authority on baths (see his work *De Thermis*, Venice, 1588, and Rome, 1622), speaks of labra made of glass. This apartment, like the others, is highly enriched. The hot bath (12) on the plan, occupied the whole end of the room opposite the laconicum and next to the furnace. It was four feet four inches long, and one foot eight inches deep, constructed entirely of marble, with only one pipe to introduce the water, and was elevated two steps above the floor, while a single step led down into the bath itself, forming a continuous bench round it for the convenience of the bathers.

The Romans, who, according to Vitruvius, called their vapour-baths caldaria, or sudationes concameratæ, constructed them with suspended or hollow floors, and with hollow walls communicating with the furnace, that the smoke and hot air might be spread over a large surface, and readily raise them to the required warmth. The temperature was regulated by the clypeus or bronze shield already described, which acted as a ventilator.

In the baths of Pompeii, the hollow floors are thus constructed: upon a floor of cement, made of lime and pounded bricks, were built small brick pillars, nine inches square, and one foot seven inches high, supporting strong tiles, fifteen inches square; the pavement was laid on these tiles, and incrusted with mosaic. The hollow walls, the void spaces of which communicated with the hollow of the suspended pavement, were constructed in the following manner. Upon the walls large square tiles were fastened, by means of iron clamps. These tiles were made in a curious manner; while the clay was moist, some circular instrument was pushed through the tiles, so as to make a hole, at the same time forcing out the clay, and forming a hollow projection or pipe, about three inches long, on the inside of the tile: these being made at the four corners, iron clamps passed through them, and fastened them to the wall. The sides of the apartments being thus formed, were afterwards carefully stuccoed and painted. The hollow space in the walls of the bath at Pompeii reaches to the top of the cornice; but the ceilings are not hollow, as in the baths which Vitruvius described, and which he distinguishes, for that reason, by the name of concameratæ. The ceilings of the apodyterium, tepidarium, and the caldarium are arched.



[Transverse Section of the Apodyterium.]

The women's bath resembles very much that of the men, and differs only in being smaller and less ornamented: for an account of it, we refer to Gell's *Pompeii*, the *Museo Borbonico*, and *Pompeii* published by the Society for the Diffusion of Useful Knowledge.

Vitruvius recommends a situation for baths, which is defended from the north and north-west winds, and he says that the windows should be opposite the south, or, if the nature of the ground will not permit this, at least towards the south, because the hours of bathing among the Romans being from after mid-day till evening, those who bathed could by these windows have the advantage of the rays and the heat of the declining sun. Accordingly the baths just described have the greater part of their windows turned to the south, and are constructed in a low part of the city, where the adjoining buildings served as a protection from the north-west winds.

The baths at Rome were on a much larger scale. The public baths of Caracalla were 1500 feet in length, and 1250 in breadth · 'at each end were two temples, one to Apollo, and another to Esculapius, as the tutelary deities of the place (*genii tutelares*), sacred to the improvement of the mind, and the care of the body; the two other temples were dedicated to the two protecting divinities of the Antonine family, Hercules and Bacchus. In the principal building were, in the first place, a grand circular vestibule, with four halls on each side, for cold, tepid, warm, and steam baths; in the centre was an immense square for exercise, when the weather was unfavourable to it in the open air; beyond it a great hall, where 1600 marble seats were placed for the convenience of the bathers; at each end of this hall were libraries. This building terminated on both sides in a court surrounded with porticos, with an odeum for music, and in the middle a spacious basin for swimming. Round this edifice were walks shaded by rows of trees, particularly the plane; and in its front extended a gymnasium for running, wrestling, &c. in fine weather. The whole was bounded by a vast portico, opening into exhedræ or spacious halls, where the poets declaimed, and philosophers gave lectures to their auditors. This immense fabric was adorned, within and without, with pillars, stucco-work, paintings, and statues. The stucco and paintings are yet in many places perceptible. Pillars have been dug up, and some still remain amidst the ruin; while the Farnesian bull and the famous Hercules, found in one of these halls, announce the multiplicity and beauty of the statues which once adorned the Thermæ of Caracalla.' (Eustace's *Classical Tour*, vol. i. p. 226.) For an account of the baths of Titus and Diocletian, see the same author.

On entering these baths the bathers first proceeded to undress. They next went to the elæothesium (the oil-chamber), as it was called in Greek, or unctuarium, where they anointed themselves all over with a coarse cheap oil before they began their exercise. (Plin. xv. c. 4 & 7.) Here the finer odoriferous ointments which were used on coming out of the bath were also kept (Plin. l. ii. *Epist.* 41.) and the room was so situated as to receive a considerable degree of heat. This chamber of perfumes was full of pots, like an apothecary's shop; and those who wished to anoint and perfume the body received perfumes and unguents. In the representation of a Roman bath, copied from a painting on a wall forming part of the baths of Titus, the unctuarium, called also elæothesium, appears filled with a vast number of vases. The vases contained a great variety of perfumes and balsams. When anointed, the bathers passed into the sphæristerium, a very light and extensive apartment, in which were performed the various kinds of exercises to which this part of the baths was appropriated. (Plin. lib. i. *Epist.* 101.) When its situation permitted, this apartment was exposed to the afternoon sun, otherwise it was supplied with heat from the furnace. (Plin. l. 11. *Epist.* 41.) After the exercise, they went to the adjoining warm-bath, wherein they sat and washed themselves. The seat was below the surface of the water, and upon it they scraped themselves with instruments called strigiles, which were usually made of bronze, but sometimes of iron or brass. (Martial, lib. xiv. *Epig.* 51.) This operation was performed by an attendant slave. The use of the strigil is represented on a vase, found lately on the estate of Lucien Buonaparte at Canino. The vase is large and shallow, and painted within and without. (Vol. i. p. 183. *Pompeii.*) From the drawings on it we learn that the bathers sometimes used the strigils themselves, after which they rubbed themselves with their hands, and then were washed from head to foot, by pails or vases of water being poured over them. They were then carefully dried with cotton and linen cloths, and covered with a light shaggy mantle, called gausape. Effeminate persons had the hairs of their bodies pulled out with tweezers. When they were thoroughly dried, and their nails cut, slaves came out of the elæothesium, carrying with them little vases of alabaster, bronze, and terracotta, full of perfumed oils, with which they had their bodies anointed, by causing the oil to be slightly rubbed over every part, even to the soles of their feet. After this they resumed their clothes. On quitting the warm-bath they went into the tepidarium, and either passed very slowly through or stayed some time in it, that they might not too suddenly expose their bodies to the atmosphere in the frigidarium; for these last rooms appear to have been used chiefly to soften the transition from the intense heat of the caldarium to the open air.

'It is probable that the Romans resorted to the baths, at the same time of the day that others were accustomed to make use of their private baths. This was generally from two o'clock in the afternoon till the dusk of the evening, at which time the baths were shut till two the next day. This practice however varied at different times. Notice was given when the baths were ready, by the ringing of a bell; the people then left the sphæristerium, and hastened to the caldarium, lest the water should cool. (Martial. lib. xiv. *Epig.* 163.) But when bathing became more universal among the Romans, this part of the day was insufficient, and they gradually exceeded the hours that had been allotted for that purpose. Between two and three in the afternoon was, however, the most eligible time for the exercises of the palæstra. Hadrian forbade any but those who were sick to enter the public baths before two o'clock. The thermæ were by few emperors allowed to be continued open so late as five in the evening. Martial says, that after four o'clock they demanded a hundred quadrantes of those who bathed. This, though a hundred times the usual price, only amounted to nineteen-pence. We learn from the same author, that the baths were opened sometimes earlier than two o'clock. He says that Nero's baths were exceeding hot at twelve o'clock, and the steam of the water immoderate. (Mart. lib. x. *Epig.* 48.) Alexander Severus, to gratify the people in their passion for bathing, not only suffered the thermæ to be opened before break of day, which had never been permitted before, but also furnished the lamps with oil, for the convenience of the people.' (See Cameron *On Roman Baths*, p. 40.)

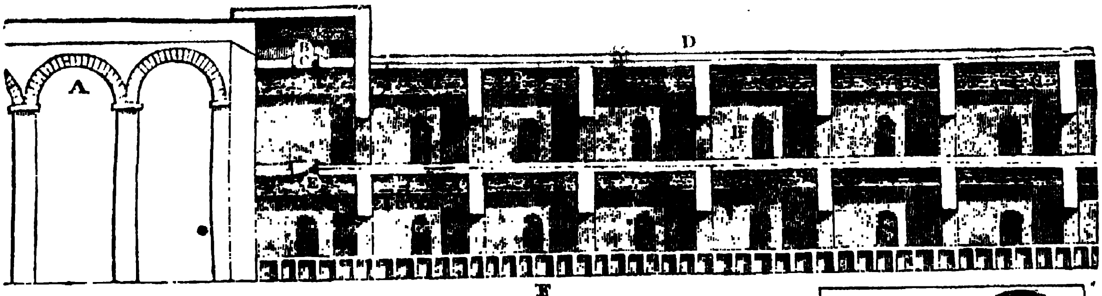
[Coin representing the Baths of Alexander Severus.]

The thermæ were constructed at a vast expense, and principally for the use of the poorer classes, though all ranks frequented them for the sake of the various conveniences which they contained.

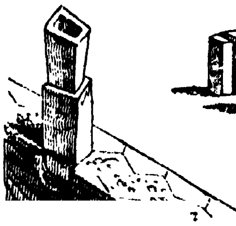
'Nothing relating to the thermæ has more exercised the attention of the learned than the manner of supplying the great number of bathing vessels made use of in them with warm water. For, supposing each cell of Diocletian's baths large enough to contain six people, yet, even at that moderate computation, 18,000 persons might be bathing at the same time; and as no vestiges remain of any vessels in the thermæ, to give the least foundation for conjecturing in what manner this was performed, it has been generally referred to the same process described by Vitruvius on a similar subject.

'Baccius has more professedly treated this subject than any modern author. He imagined that the water might be derived from the castella, which he observed to be situated without the thermæ; but as these castella were upon a level with the thermæ themselves, he thinks for that reason they were obliged to make use of machines to raise the water to such a height, as he observed it to have been by the ruins of Diocletian's baths. What led Baccius into this way of thinking was the number of pipes which he saw dug up under the open area, where there had never been any buildings, all of them surrounded with flues from the hypocaustum. He therefore imagined that the water was heated on the outside of the thermæ; but this supposition appeared so full of difficulties, as, upon reflection, to discourage him from inquiring any further into the subject.' (Cameron.) By the assistance of two sections of the castella of Antoninus, drawn by Piranesi, Cameron endeavours to show the method adopted by the Romans to heat the large bodies of water which their extensive thermæ must have required.

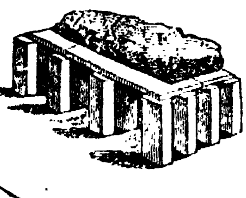
'To have a clear conception of the manner in which this was executed, it will be necessary to refer to a plate of these two sections.



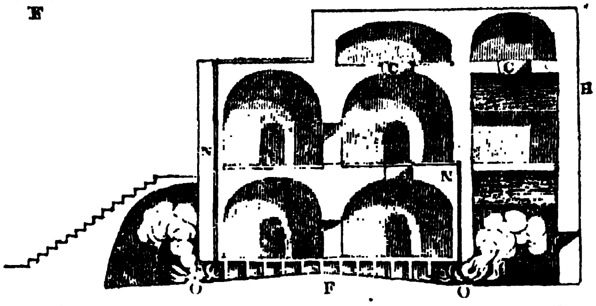
Longitudinal Section of the Castellum, placed at T, T, on the Plan, p. 25.



[Flues in the Floors and Walls.—From Cameron.]



[Specimen of Hollow Pavement.—From Cameron.]



Transverse ditto.

[Sections of the Castellum of Antoninus Caracalla.—From Cameron.]

'The castellum of the thermæ of Antoninus Caracalla was supplied with water by the aqueduct of Antoninus. Two of the arches of this aqueduct are represented at A: B is a cistern which received the water from the aqueduct; C is an aperture for permitting the descent of the water from the receptacle to the chamber below; D is a receptacle with a mosaic pavement, wherein the water was exposed to the heat of the sun; E is another aperture through which the water passed into the lowest chambers placed immediately over the hypocaustum; F, the hypocaustum; O O, doors for introducing the fuel. A transverse section through the middle of the same castellum is given at H.

'By the plan of this castellum, it appears that there were twenty-eight of these vaulted rooms placed over the hypocaustum: they were placed in two rows, fourteen on a side, and had all a communication with each other. The sections show, that over these were twenty-eight other rooms, having likewise a communication with each other, although only one of them had any communication with the chambers below, through the aperture at E. Upon the top of all was a spacious receptacle, not very deep, but extending the whole length of the castellum, in which the water was considerably heated by the influence of the sun, before it passed into the several chambers. This receptacle received its water from the cistern B, and not immediately from the aqueduct. The use of this cistern appears to have consisted in promoting a more gentle flow of the water into the receptacle, that its surface might not be ruffled by the least agitation, as that would very much have counteracted the purposes to which the receptacle was applied, nothing contributing so much as tranquillity in the water to acquire all the advantages from the influence of the sun its situation would permit. When there was no efflux from the inferior chambers, there could be no demands for water from the receptacle, which would have been liable to overflow were there not an aperture in the side of the cistern, through which the water ran off in different directions from that which was used for bathing. During all this time the water in the receptacle would be in the most perfect state of rest. The cistern, therefore, answered two material purposes, as it prevented any agitation in the water of the receptacle, and likewise carried off what was superfluous. The twenty-eight vaulted chambers, placed immediately over the hypocaustum, would now begin to be heated, which heat they would acquire so much the quicker, as only one of them had any communication with the external air by the apertures C and E. They therefore evidently were constructed upon the same principle as Papinius's digester, the strength of the walls and of the roof being sufficient to resist the force of the rarefaction of the air in the water, and consequently to prevent any loss from evaporation. Flues were still necessary to give the water a heat sufficient for bathing. The arched chambers were also supplied with flues, N N, from the hypocaustum, and served as a reservoir of tepid water for those below. The water they received was likewise heated by the sun. When the time for bathing was come, the cocks were turned to admit the hot water from the lower chambers into the labra of the baths, to which it would run with great velocity, and ascend a perpendicular height in the thermæ, equal to the surface of the receptacle in the castellum. The current would be accelerated by the great tendency the water would have to expand itself after having been confined in the chambers. The pressure of the column of tepid water was equal to, if not greater than the diameter of the column of hot water which ran out from the chambers below. To prevent the water cooling as it passed through the tubes underground, they were all carefully surrounded with flues from the præfurnium, so that these tubes were in the centre of a funnel, and always considerably heated before the water entered them. Each of these chambers was, within the walls, forty-nine feet six inches long, by twenty-seven feet six inches wide, and about thirty high; the number of superficial feet in the bottom of the rooms being 38,115. If we allow thirty feet for the mean height, the whole quantity of water in these lower rooms will amount to 1,143,450 cubic feet, and the like quantity must be allowed for the upper rooms; allowing, therefore, eight cubic feet of warm water as sufficient for one man to bathe in, and that water preserved in a bathing heat in the labrum half an hour, the whole consumption of hot water, in this given time, for 18,000 people, would be 144,000 cubic feet. By this calculation there would be a sufficient quantity of water for three hours, or until five in the evening, for 108,000 people. The water, however, would gradually cool as it flowed in from the higher chambers.

'We have no intimation from the antients when they first fell upon this expedient for heating such large bodies of water, whether it was the invention of the Romans or brought from the East. We may reasonably suppose, that as it was not necessary before the public warm-baths were built in Rome, it was not more antient than the time of Augustus, in whose reign we are told by Dion Cassius (lib. lv.) that Mecænas first instituted a swimming-bath of warm water, or a calida piscina.' (Cameron.)

But few Roman citizens in easy circumstances were without the luxury of a private bath, which varied in their construction according to the taste or prodigality of their owner. 'Amongst many articles of luxury for which Pliny censures the ladies of his time, he takes notice of their bathing-rooms being paved with silver. Even the metal flues of the hypocaustum were gilt.' (See Cameron *On Roman Baths*. For an account of the private baths, see *Pompeii*, vol. i. p. 199.)

The Persian manner of bathing, in some respects, is not unlike that adopted by the antient Romans. Sir R. Ker Porter describes it in the following terms:—'The bather having undressed in the outer room, and retaining nothing about him but a piece of loose cloth round his waist, is conducted by the proper attendant into the hall of the bath; a large white sheet is then spread on the floor, on which the bather extends himself; the attendant brings from the cistern, which is warmed from the boiler below, a succession of pails of water, which he continues to pour over the bather until he is well drenched and heated; the attendant then takes his employer's head upon his knees, and rubs in with all his might a sort of wet paste of henna plant into the mustachios and beard; in a few minutes this pomade dyes them a bright red. Again he has recourse to the little pail, and showers upon his quiescent patient another torrent of warm water; then, putting on a glove of soft hair, yet possessing some of the scrubbing-brush qualities, he first takes the limbs and then the body, rubbing them hard for three-quarters of an hour: a third splashing from the pail prepares the operation of the pumice stone; this he applies to the soles of the feet. The next process seizes the hair of the face, whence the henna is cleansed away, and replaced by another paste called *rang*, composed of the leaves of the indigo plant. To this succeeds the shampooing, which is done by pinching, pulling, and rubbing with so much force and pressure as to produce a violent glow over the whole frame. This over, the shampooed body, reduced again to its prostrate state, is rubbed all over with a preparation of soap confined in a bag till it is one mass of lather. The soap is then washed off with warm water, when a complete ablution succeeds by his being led to the cistern and plunged in. He passes five or six minutes enjoying the perfectly pure element; and then, emerging, has a large dry sheet thrown over him, in which he makes his escape back to the dressing room.' (Sir R. Ker Porter's *Travels*, vol. i. p. 231.) For a representation of shampooing in a Turkish bath, see the first volume of plates belonging to the great French work on Egypt. (*Etât Moderne.*)

The Russian baths, as used by the common people, bear a close resemblance to the laconicum of the Romans. 'They usually consist of wooden houses, situated, if possible, by the side of a running stream. In the bath-room is a large vaulted oven, which when heated makes the paving-stones lying upon it red hot, and adjoining to the oven is a kettle fixed in masonry, for the purpose of holding boiling water. Round about the walls are three or four rows of benches, one above another, like the seats of a scaffold. The room has little light, but here and there are apertures for letting the vapour escape; the cold water that is wanted is let in by small channels. Some baths have an ante-chamber for dressing and undressing, but in most of them this is done in the open court-yard, which has a boarded fence, and is provided with benches of planks. In those parts of the country where wood is scarce they sometimes consist of wretched caverns, commonly dug in the earth close to the bank of some river. In the houses of wealthy individuals, and in the palaces of the great, they are constructed in the same manner, but with superior elegance and convenience. The heat in the bath-room is usually from 32° to 40° of Réaumur, and this may be much increased by throwing water on the glowing hot stones in the chamber of the oven. Thus the heat often rises to 44° of Réaumur. The bathers lie quite naked on one of the benches, where they perspire more or less, in proportion to the heat of the humid atmosphere in which they are enveloped; while, to promote perspiration, and more completely open the pores, they are first rubbed, then gently flagellated with leafy bunches of birch. After remaining for some time in this state, they come down from the sweating-bench and wash their bodies with warm or cold water, and at last plunge overhead in a tub of water. Many persons throw themselves immediately from the bath-room into the adjoining river, or roll themselves in the snow in a frost of 10° or more. The Russian baths are therefore (*concameratæ sudationes*) sweating-baths; not of a moderate warmth, like the Roman tepidaria or caldaria, but very violent sweating-baths, which, to a person not habituated to the practice, bring on a real, though a gentle and almost voluptuous swoon.' (Tooke's *Russia.*) [See Bathing.]

The savage tribes of America are not wholly unacquainted with the use of the vapour-bath. Lewis and Clarke, in their voyage up the Missouri, have described one of them in the following terms:—'We observed a vapour-bath or sweating-house in a different form from that used on the frontiers of the United States or in the Rocky Mountains. It was a hollow square of six or eight feet deep, formed in the river bank by damming up with mud the other three sides, and covering the whole completely, except an aperture about two feet wide at the top. The bathers descend by this hole, taking with them a number of heated stones and jugs of water; and, after being seated round the room, throw the water on the stones till the steam becomes of a temperature sufficiently high for their purposes. The baths of the Indians in the Rocky Mountains are of different sizes, the most common being made of mud and sticks like an oven; but the mode of raising the steam is exactly the same. Among both these nations it is very uncommon for a man to bathe alone; he is generally accompanied by one, or sometimes several, of his acquaintance; indeed it is so essentially a social amusement, that to decline going in to bathe when invited by a friend is one of the highest indignities that can be offered to him. The Indians on the frontiers generally use a bath which will accommodate only one person, and is formed of wicker-work, about four feet high, arched at the top and covered with skins. Almost universally, these baths are in the neighbourhood of running water, into which the Indians plunge immediately on coming out of the vapour-bath, and sometimes return again and subject themselves to a second perspiration; and the bath is employed by them either for pleasure or health, being in esteem for all kinds of disease.'

In France there are baths in all the towns; and bathing is practised more than in Germany or England, where baths are rare. There are but few baths in London, and those established there would not suffice for a small fraction of the population, if bathing were a common practice. Still of late years baths have increased both in London and England generally.

Antient Roman baths have been found in several of the Roman villas in England; that at Northleigh in Oxfordshire, near Blenheim, is the most perfect. (See the account of the villa at Northleigh, Oxfordshire, by Mr. Hakewill.) Baths have been discovered also at Wroxeter in Shropshire, and near Arundel in Sussex. In the former, the suspended pavement was very perfect: in the centre of a chamber in that near Arundel is an octagon bath sunk in the floor, the pulvinus of which is quite perfect. There are also some curious Roman baths at Vallogne in Normandy.

(See Montfaucon, *Antiq.* t. iii. pl. 2; Cameron's *Roman Baths*; Gell's *Pompeii*; *Museo Borbonico*; *Pompeii*, by the Society for the Diffusion of Useful Knowledge; Eustace's, *Classical Tour.*)

BATHGATE, a burgh and parish in the county and presbytery of Linlithgow, 18 miles west of Edinburgh, 24 east of Glasgow, and 6 south of Linlithgow. The great road between Edinburgh and Glasgow passes by the southern extremity of the town. This road is distinguished for its singular levelness and firmness, and it may also claim a not inconsiderable antiquity, it being no doubt the same passage which was travelled by the monks of the abbey of Newbotle under the grant made to them in 1333, by Walter the Steward of Scotland, that they might freely pass with their carriages through his barony of Bathgate from their monastery to the monkland. (Chalm. *Caled.* vol. ii. p. 865.) Bathgate has been on the increase for many years past, which may be ascribed to a branch of the Glasgow cotton manufactures being established in it; to extensive coal and lime works in the immediate vicinity; to its admirable situation for grain and cattle markets (both well attended); to the great intercourse through it between the two cities above mentioned; and to other causes. It is a very healthy place, has a fine southern exposure, and is seen at a considerable distance to the west and south. The streets of the town are well-paved, the houses generally well-built and covered with slates or tiles, and the inhabitants are copiously supplied with excellent water, brought from the neighbourhood in leaden conduits. Gas-works were lately erected for lighting the town. The public buildings are, the parish church, a very plain edifice; three chapels for Dissenters (Relief and Burghers); a fine academy; parish school; jail; two masonic lodges, &c. The Earl of Hopetoun is patron of the parish. The academy, which stands on an elevation, a little to the south-east of the town, overlooking the great road, was erected about two years ago from funds bequeathed by the late John Newlands, Esq., of Kingston, Jamaica, a native of the town. These are vested in the parish minister, and three neighbouring proprietors (Sir William Baillie, Bart., Mr. Majoribanks, and Mr. Gillon, M.P.), whose attention to the trust reposed in them is deserving of much praise. The system of education adopted in this institution is of the most approved kind, and the manner in which it is conducted reflects great credit on the rector and other teachers. Instruction, in all the useful and learned branches, is obtained *gratis;* ample funds, for paying the teachers' salaries, being placed by Mr. Newlands in his trustees' hands for that benevolent purpose. All the youths of the parish, with the exception of such as have not been three years resident, enjoy the benefit of it. The railway, between Edinburgh and Glasgow, is to pass close to the town, and will, when completed, be of incalculable advantage to the district. The population of the town in 1831 was 2492, and it has increased since; the population of the parish was 3593. Under the Reform Act, the voters in the burgh join those in the county in electing a representative in parliament. This circumstance has tended much to raise the place into importance.

Bathgate has been a 'free burgh of barony' since 1663, in which year King Charles II. granted its charter; and in 1824 an act of Parliament was obtained, erecting it into a 'free and independent burgh,' and vesting the magistracy in a provost, three bailies, a treasurer, twelve councillors, town clerk, and procurator fiscal. These are chosen by the free votes of the burgesses: the qualification is less than that fixed by the Reform Act. Nowhere, in so short a space (ten years), have the benefits of popular and annual election of magistrates been so well exemplified. At a small expense to the inhabitants, the streets and wells are now kept in the best order, and the police of the town properly preserved. Bathgate has been a sheriffdom from a remote period. In 1530-1 Sir James Hamilton, of Finnart, obtained a charter of the office of sheriff of Renfrew, within the parish and barony of Bathgate, on the resignation of William Lord Sempil, hereditary sheriff of Renfrewshire; and in June, 1663, King Charles II. granted the barony to Thomas Hamilton of Bathgate, with the office of sheriff of Bathgate. In 1747, when the heritable jurisdictions were bought up, the sheriffship of Bathgate was hereditary in the noble family of Hope of Hopetoun, heritable sheriff of the shire of Linlithgow; and since the Jurisdiction Act the two shires have been under the same sheriffs, whose commission from the Crown styles him 'Sheriff of the Sheriffdom of Linlithgow and Bathgate.' In the immediate vicinity, and near to the new academy, is the site of an antient castle, traditionally said to have been given by King Robert the Bruce to his daughter Marjory, along with extensive possessions in the neighbourhood, as part of her dowry, upon her marriage with Walter, the Great Steward of Scotland. From these illustrious persons the Stuart race sprung; and from them the present royal family of Great Britain. (*Communication from Bathgate.*)

(Further particulars will be found in Sir John Sinclair's *Statistical Account of Scotland;* Penney's *Linlithgowshire;* Chambers's *Gazetteer, &c., &c.*)

* **BATHING**, means the temporary surrounding of the body, or a part of it, with a medium different from that in which it is usually placed. The means employed for this purpose are generally water, watery vapour, or air of a temperature different from that of the common atmosphere. The objects for which these are employed are usually the prevention of disease, the cure of disease, or the pleasure derived from the operation. To understand in what way these ends are accomplished, we must observe that the human frame is endowed with a power of maintaining, within certain limits, a nearly uniform temperature in whatever circumstances it is placed. The general temperature of an adult in a state of perfect health is from 97° to 98° of Fahrenheit's thermometer; that of a new-born infant about 94°. In some cases of disease the temperature rises far above this standard, even to 106°, while in others it sinks far below it. The power by which the body maintains a uniformity of temperature is the property of developing *animal heat*, the perfection of which function is intimately connected with the state of the nervous system, and through that, with the circulation. When the body is well nourished and the circulation vigorous, the temperature is high, and nearly equal over all parts of the body, provided the supply of nervous energy be adequate. If anything impairs the vigour of the circulation generally, or of an artery going to a particular limb (as when it is tied in the operation of aneurism), the temperature of the whole or of the part will be low. On the other hand, if the whole nervous system be impaired, a lower temperature will prevail generally, and especially at the extremities; or if a particular limb, such as a paralysed limb, have an imperfect share of nervous energy, a lower temperature of the part will exist. The respiratory function is also intimately connected with the development of animal heat, and the skin assists in regulating it, especially in reducing it when too high. When the body is placed in a medium of a temperature much lower than itself, the heat is abstracted from the surface with more or less rapidity, according to the difference of temperature, and, if the medium be air, according to its state of humidity or dryness; the effect of which would be a reduction of the temperature of the whole body, were it not counteracted by an increased development of animal heat. Again, when the body is surrounded by a medium much higher than itself, the exhalation from the surface, both of the skin and lungs, is greatly augmented: that from the former being thrown off in the form of perspiration, that of the latter in the form of vapour. The evaporation attending these processes causes a reduction of temperature. As illustrations of the truth of these two positions, we need not do more than allude to the nearly equal temperature of the body maintained by Sir Joseph Banks, Sir Charles Blagden, Drs. Fordyce and Solander, in their experiments, when the heat of the room was 260° of Fahrenheit (see *Animal Physiology, Library of Useful Knowledge*, part i. p. 3), and that maintained during the winter by the members of the expeditions under Captains Ross, Parry, and Franklin, when the thermometer frequently fell to 51° below zero of Fahrenheit.

In a moderate temperature the animal heat is generally prevented from rising too high by means of the *insensible* perspiration, the quantity of which varies with circumstances. According to the experiments of Seguin, the largest quantity from the skin and lungs together amounted to thirty-two grains per minute, or three ounces and a quarter per hour, or five pounds per day. The medium quantity was fifteen grains per minute, or thirty-three ounces in twenty-four hours. The quantity exhaled increases after meals, during sleep, in dry warm weather, and by friction, or whatever stimulates the skin; and it diminishes when digestion is impaired, and the body is in a moist atmosphere. These last-mentioned circumstances prove the sympathy which subsists between the skin and the internal organs. The skin must not, therefore, be regarded as a mere covering of the body, but as an organ, the healthy condition of which is of vast importance to the well-being of the whole frame, but especially of the stomach and lining membrane of the lungs, with which, as mucous membranes, it has the closest sympathy. It also sympathizes with the kidneys, the quantity of discharge from which is regulated by the action of the skin. Hence in summer, when the perspiration from the skin is abundant, the secretion from the kidneys is less; and when, in winter, the secretion from the skin is diminished, that from the kidneys is increased.

The perspiration is the channel by which salts and other principles, no longer useful in the system, are removed from it. According to Thenard, it consists of a large quantity of water, a small quantity of an acid, which according to circumstances may be either the acetic, lactic, or phosphoric; and some salts, chiefly hydro-chlorates of soda and potass. Taking the lowest estimate of Lavoisier, the skin appears to be endowed with the power of removing from the system, in the space of twenty-four hours, twenty ounces of waste; the retention of this in the system is productive of great injury, and the inconvenience is only lessened by the increased action of some internal organ, which becomes oppressed by the double load thus cast upon it. Even the retention of the perspired matter close to the skin, from neglect of changing the clothes, is the source of many cutaneous diseases, particularly in spring and summer.

The great vascularity of the skin, and the manner in which the vessels of this part are influenced by affections of the mind, as in blushing, when it becomes red from more blood being sent to it, and during fear when less blood goes to it, and more to the vicarious organs, as the kidneys, point out how an exposure to a cold and damp atmosphere and how mental emotions are concerned in producing morbid action of this organ. The skin must also be regarded as a net-work of nervous filaments, and the most extensive organ of sensation: in this way it enables us to judge of heat and cold, though not with absolute certainty, as the sensation conveyed will depend upon the temperature of the medium in which the body or any of the limbs may have been placed immediately before. To understand this doctrine, it is necessary to be acquainted with the action of heat and cold on the human system; in our explanation of which, we will endeavour to be as concise as possible. We treat first of cold; in doing which it is necessary to distinguish between the immediate *primary* action of cold on the organ or part with which it is brought into contact, and the *secondary* action, depending upon the organic activity residing in the part, or that train of effects usually denominated *reaction*. The primary effect is always the same, consisting in the abstraction of heat from the part, and the consequent reduction of its temperature, while the internal development of heat becomes greater, so that the organic life strives ever to maintain an equilibrium between the conflicting powers, in order that it may not be limited or disturbed in its healthy action. Yet it must be remembered, that both the external and internal degree of the primary action of cold, as also the period in which it slowly or suddenly shows itself, and the time, whether longer or shorter, that it lasts, occasion a variety of effects, both in the part to which it is applied, and those more immediately sympathizing with it, as well as in the whole system. The degree of primary action of cold can vary in endless degrees, from the lowest, where it scarcely affects the sensibility, to the highest, when it utterly destroys life. This difference of degree depends upon the concurrence of several circumstances, partly relating to the action of the cold itself, and partly to the nature of the organic life upon which the cold operates. The essential conditions which must be here borne in mind are, that the continual evolution of animal heat is closely connected with the development or exercise of animal life; and that the power or extent of action of external media, having a lower temperature than that of the animal they surround, depends less on the absolute degree of their temperature than upon the quantity of caloric which they can abstract in a given time.

The relative power and quickness of abstracting heat, with which different external media are endowed, depend upon different properties, such as their density, conducting power, capacity for heat, &c., and display themselves through the diversity of sensations which, at the same absolute temperature, they occasion. Thus, air at the temperature of 65° Fahr. feels pleasant, while water at the same degree feels somewhat cold. The organs of the body also differ in their power of sustaining the same temperature; hence, in the employment of vapour-baths, it is of importance to know whether the watery vapour is to be breathed or not, since, where it is to be breathed, the temperature must be much lower. The following table is given by Dr. Forbes as an approximation to what may be deemed correct as a measure of sensation in the cases where water and vapour are used.

	Water.	Vapour.	
		Not breathed.	Breathed.
Tepid Bath .	85° to 92°	96° to 106°	90° to 100°
Warm Bath .	92 „ 98	106 „ 120	100 „ 110
Hot Bath .	98 „ 106	120 „ 160	110 „ 130

As a full exposition of the subject of the temperature of animals will be given under the article **Heat, Animal**, we must refer to it for further details, confining ourselves here to remark that the ultimate action of cold, when extreme, is a sedative to the nervous system, and alters the circulation from external to internal; and that moderate cold continued causes the same consequences as severe cold of short duration (See Beaupré *On Cold*, Edinb. 1826.) Heat, on the other hand, is a stimulant to the nervous system, and alters the distribution of the blood from internal to external. Taking these principles as our guide, we proceed now to consider the different kinds of baths, and their action on the system in different states both of health and disease.

First, of water-baths. The common division is into cold and warm; but various subdivisions are formed, marked by a certain range of temperature, which are designated

1. The cold-bath, from 40° to 65°
2. The cool „ 65 „ 75
3. The temperate „ 75 „ 85
4. The tepid „ 85 „ 92
5. The warm-bath „ 92 „ 98
6. The hot-bath „ 98 „ 112

We shall treat first of the cold-bath, as applied to the whole surface of the body.

A healthy person upon entering a cold-bath experiences a sensation of cold, followed by slight shuddering, and if the immersion has been sudden, a peculiar impression on the nervous system, called a shock. The skin becomes cooler and paler, the respiration hurried and irregular, the action of the kidneys increases and the bladder contracts. In a few moments the colour and warmth return to the skin, and a glow is felt, especially if assisted by rubbing the surface. If the person remains more than five or ten minutes in the bath, the glow disappears, and paleness returns, which again gives place, though less quickly and perfectly, to a renewed glow. During the existence of the primary action of the cold, the bulk of the whole body, but especially of the more contractile parts, diminishes. Should the stay in the water be greatly prolonged, no reaction ensues, but a general feeling of chilliness prevails, with quick feeble pulse, convulsive breathing, cramps of the limbs, or fainting. If the person quit the bath after the few first minutes, as in prudence he should, the blood returns to the surface, accompanied with a sensation of pricking, itching, and sometimes throbbing of the arteries: the elasticity of the muscles being increased, more animal power is felt, accompanied with a general feeling of enjoyment.

Very young or feeble individuals are either incapable of bearing the shock, or the reaction is so slight that they cannot endure to stay in the bath beyond a very short time. If they unwisely stay or are held in the bath longer than one or two minutes, the heat never regains its proper height, the extremities remain contracted, and they, as well as the lips, nose, &c., are of a livid hue. In such cases either artificial means must be used to bring about reaction, or the bath must be relinquished, as improper for such persons, as we shall show at a future part of our observations.

The phenomena just described generally accompany cold bathing; and it is clear that we can recognize in them a series of three or even four distinct actions; viz., 1st, The shock; 2nd, The cooling effect; 3rd, The contraction or astringent effect; and, 4th, The re-action. Cold bathing may be employed, therefore, in such a way as to ensure the predominance of one action over any of the rest, according to circumstances, where all are not desired. They vary with the degree of cold and the suddenness of the application, as well as from the body being plunged into the water, or the water dashed against the body. Where the shock, as a stimulus to the nervous system, is desired, the water should be very cold, and where practicable should be dashed against the body, or, if the contrary, the stay in the bath should be momentary. This mode of using it may be either general or local. It has been employed generally, *i.e.* the whole body exposed to the action of the water, in mania, with occasional success, and in the early stage of the common continued fever (under certain regulations, for which see Currie's *Medical Reports*), sometimes with great success, cutting short the train of morbid actions which constitute the fever. It has been employed also in nervous affections, accompanied with a convulsive action, or deficient action of the muscular system, as in hysteria, in lock jaw (see *Paper* by Dr. Wright, *London Medical Observations and Inquiries*, vol. vi. p. 143): in some cases of obstinate constipation, dashing cold water on the person, or the cold bath frequently repeated, has been of great service.

Its stimulating effect is sometimes best procured by a local application, in the form of a stream of water falling on the head, from a considerable height. The simplest example of this is the common practice of sprinkling the face with cold water in case of a tendency to faint; and in many diseases of the most dangerous character, it is a remedy superior to any other. It is called the *cold dash*, or *douche*, or *douse*, and is beneficially employed in fever, particularly when the brain continues the seat of inordinate action of the blood-vessels, after depletion has been carried as far as prudence will allow. (See the instructive case of Dr. Dill in Dr. Southwood Smith's *Treatise on Fever*, p. 398.) It requires to be used with the greatest caution. Also in the state of stupor or *coma* which occurs in the last stage of *hydrocephalus acutus*, or water in the brain, it often succeeds in rescuing the patient from imminent danger. (See Abercrombie *On Diseases of the Brain*, first edit. 1828, p. 157.) Its utility is well known in the East in rousing drunken soldiers from their stupor so effectually as to enable them to rise up and appear immediately on parade.* In the melancholy and mania which overtake habitual drunkards it is of great efficacy, and also in cases of loss of nervous power from excessive mental exertion. In apoplectic stupor it has also been very advantageously employed. In the sinking stage of croup, when all other remedies have failed, cold affusion has sometimes restored the functions of life to new action.

The cooling or refrigerating effect of cold bathing is most desired in diseases where the animal heat rises above the proper standard, as in fevers, both continued and eruptive, especially scarlet fever; also in some local inflammations, particularly of the brain. For the principles which should regulate our practice in this application we must refer to Dr. Currie and other writers, only remarking that in the hot and restless stage of scarlet fever, when the heat is steadily above the natural standard, the skin hot and dry, and neither sleep nor perspiration can be procured, a plunge into cold water will be followed by both, to the relief and often recovery of the patient. (See Bateman *On Cutaneous Diseases*, edit. 1829, p. 120.) In applying cold locally, as in inflammation of the brain, one rule is of the utmost importance to be observed, viz., that the application of the cold shall be continuous; therefore a second set of cold cloths or bags of ice should be applied before the former has become warm. This plan, especially pursued during the night, along with judicious internal treatment, will save many children from perishing under the most insidious and fatal disease of childhood—water in the brain.

The cases already mentioned are mostly acute diseases, where the cold affusion is employed to avert an imminent but temporary danger. It is generally in chronic diseases that the cold bath is employed for a length of time, and in these it is chiefly the secondary effect, the glow or reaction, which is desired. The rules to be observed in order to obtain this effect are founded upon the strength, which is generally inferred from the age, of the individual. The degree of reaction is, for the most part, dependent upon the coldness of the water and the length of time the person remains in the bath. Very cold water, in which the person remains but a short time, will, in general, produce a greater degree of re-action than a more moderate temperature in which he remains longer. But here everything depends upon the general power of the individual, the state of the system, especially of the skin at the moment of immersion, and the nature of the bath, according as it is fresh or salt water, and also the season of the year. As the immersion of infants and young children in tubs of water must be considered as bathing, we deem it necessary here to explain the principles upon which the temperature of the bath for them should be regulated, especially during winter. The experiments of Dr. Edwards (see Edwards *On the Influence of Physical Agents on Life*, London, 1832) have proved that 'the power of producing heat in warm-blooded animals is *at its minimum at birth*, and *increases successively to adult age*.' It is clear, therefore, that water of a higher temperature than what feels cool to the hand of the nurse should be used, particularly in winter, when the power of regaining a proper degree of heat is necessarily less. The attempt to harden children by exposure to too great a degree of cold is of the most injurious nature; it either produces acute disease of the lungs, which are then very sensible to external impressions, or disease of the digestive organs, leading to disease of the mesenteric glands, scrofula, water in the brain, or, if they survive a few years, to early consumption. Delicate and feeble persons of all ages require a higher temperature of the bath, and a shorter stay in it than others. If the re-action does not speedily take place, means must be employed to ensure its so doing, or the use of the cold bath must be abandoned. A tepid or temperate bath may be used in the early treatment of feeble persons, and the cold bath gradually substituted for it, or a glass of wine, or, what is far preferable, strong coffee or chocolate may be taken before entering the bath. Where the arrangements are such as to admit of it, a brief stay in a warm bath before going into the cold has a good effect. Nor, in general, is danger to be apprehended from such a proceeding. Though in most cases moderate exercise is advantageous before bathing, unless the person has an opportunity of springing out of bed into the bath, still he should never think of undressing and going into the water when fatigued, or when the skin is covered with perspiration. It is a good rule to wet the head before taking the plunge. For a person in good health, early in the morning is the best time to bathe; for one more delicate, from two to three hours after breakfast is preferable; but no one should bathe immediately after a full meal, particularly if there be a tendency of blood to the head, and a disposition to apoplexy.

Exercise while in the bath, such as friction of the limbs and chest, or swimming, is advisable, but not even this can prevent evil consequences if the bather remain too long in the water. To say nothing of the risk of cramps and convulsive action of the respiratory muscles, from the blood being pent up in the large internal vessels, which may occur while the person is in the water, the foundation may be laid for future internal disease if the blood do not soon revisit the surface, either from the natural powers of re-action, or from friction with coarse dry cloths. Friction should follow the use of the bath in most instances, except where the bath has been in the sea, in which case the salt particles, if allowed to remain in contact with the skin, stimulate it more.

The cases of disease for which cold bathing is a valuable remedy are, morbidly increased irritability and sensibility, accompanied with general debility. If the sensibility be extremely high, it is best to begin with the tepid or cool bath, and pass gradually to the cold. Where there is a tendency to colds and rheumatism, the cold bath is an excellent preventive; for this purpose it should be used continually throughout the year, and the chest should be sponged with cold water, or vinegar and water may be substituted in winter, when there are not facilities for using the complete bath. Before beginning this practice, careful investigation of the state of the mucous membranes of the chest and intestinal canal should be made, as it will certainly prove hurtful where chronic inflammation of these organs exists. If tubercles are suspected to exist in the lungs, cold bathing should be dispensed with. Though cold bathing is very useful in a tendency to scrofulous diseases, it is very hurtful when these are really developed, though tepid and warm bathing are allowable.

Where the increased irritability shows itself in the mental functions or in the muscular system, as in hypochondriasis or hysteria, cold bathing is very useful; and especially in the hypochondriasis of literary persons, accompanied with a disposition to indigestion, and a dry harsh skin. In actual indigestion, especially if complicated with sub-acute inflammation of the mucous membrane of the stomach or intestines, cold bathing is very injurious.

In cases of torpor and loss of power, cold bathing is of much service; in a relaxed state of the skin, subject to debilitating perspirations, it is often the most effectual remedy; in weakness of the limbs, or of any member, and after sprains or paralysis, the local cold bath is very useful. The astringent as well as tonic effect of the cold bath is employed to prevent the prolapsus or descent of different parts: hence, in a tendency to hernia (or even when it has occurred, ice laid upon the tumor, and frequently renewed, has restored the bowel to its place, or at least warded off the inflammation till other means could be tried); in loss of power of the sphincter muscles, or of the contractile power of the bladder, pumping cold water on the back is very useful; but it should be used only for a minute at a time. In chronic hæmorrhages, cold applied locally or generally has a good effect.

The cold bath, like every other powerful agent, when improperly used, is capable of producing much mischief; in some states of the system it must be carefully avoided. In infancy and very advanced age it is less admissible than at other times, and even quite improper if the debility be great. It is inadmissible during, or immediately before, certain conditions of the female system; also when there is congestion of blood in the veins or internal organs: hence it is not suited to chlorosis. In any organic affection of the heart, or aneurism, it is altogether improper.

Of the cold shower-bath and douche we shall only observe here, that their effects are more speedy, and extend more to the internal organs: consequently they are only to be used for a very short time, whenever recourse is had to them. A glow of the surface is sooner felt after the shower than the common bath; and as soon as this is perceived the person should withdraw himself from the stream. If the douche falls upon the head, it produces almost instantaneous and most powerful effects. If its use be prolonged, it quickly lowers, then destroys, the sensibility, induces faintings, and places the patient in the most imminent danger. Medical superintendence is therefore required through every stage of its employment.

When the body is surrounded by media of a temperature in some cases lower, and in some higher than its own, it receives caloric, instead of parting with it. The difference of density and humidity is the cause of its receiving it from some media which are of a lower temperature than its own, as well as from most which are higher. This depends upon the capacity for caloric, and the conducting power of the surrounding medium. Thus, dry air at 70° Fahr. will impart heat to the body, while water at 92° will abstract it, though water at 96° may impart heat. The tepid bath, therefore, being so close upon the limit of abstracting or imparting heat, cannot exercise a very powerful effect upon the function of the development of animal heat; neither does it much affect the circulation, which it rather retards than quickens; but its influence is mostly confined to the skin, which it cleanses, softens, and renders more fit to execute its duties. The cases in which the tepid bath is to be preferred to that of a different temperature, are those of a febrile character joined to an irritability of the skin, which is generally dry and harsh; some cutaneous diseases, where, by friction, the scales are removed and a new surface presented; and, lastly, as preparatory to the cold bath in delicate persons, or for those whose peculiarities of system render them unable to bear a warm bath of a high temperature. It is of much use in the form of tepid sponging of the surface in the advanced stage of fevers, and in convalescence from acute diseases. In this case vinegar is often added to the water with increased good effect.

The primary effect of the application to the surface of the body of water of a temperature varying from 93° to 98°, is, in consequence of the communication of warmth, the same as that of dry heat, viz., a stimulating, enlivening, and expanding effect. Hence there is a quickening of the circulation and respiration, as well as the direction of a greater quantity of fluid to the surface, manifested by the swelling and redness of the part. There results also a freer and more lively action of the muscular system, and increased sensibility and activity of the nervous system. Diminished exhalation from the skin takes place, while a greatly increased absorption occurs; the exhalation from the lungs, however, is increased. An increased quantity of heat is thus introduced into the system, felt first in the superficial, but afterwards in the most internal parts of the body.

The secondary or ultimate effect is somewhat different. The increased action of the arteries gradually subsides, the pulse becomes fuller and slower, and the greatest quantity of the blood lodges in the veins, particularly in the great venous centres, such as the *vena porta* and the *liver*, which it stimulates to increased secretion of bile. Corresponding changes occur in all the other organs; and if the application of the warmth be continued for a longer time, the increased energy and elasticity of the muscles disappear, and a sense of fatigue, with atony, and a tendency to sleep, succeeds.

The final result of the action and re-action is an augmented secretion from the skin, and a corresponding diminution of urine, and of the secretion from the mucous surfaces.

The warm bath may be employed to effect two opposite ends, to stimulate, or calm and soothe. It accomplishes the first when its temperature is high (98°), and its use is confined to five or ten minutes; the second when it is about 93°, and continued for three-quarters of an hour, or an hour. Employed in this last way, Marcard found that it always diminished the velocity of the circulation, and that the longer the bath was continued the slower the pulse became; also, that the more the pulse deviated from a state of health, the more it is diminished by the warm bath. The bath may even be prolonged till it induce fainting and other consequences of a depressed circulation. Short of actual fainting it may be beneficially employed to produce great relaxation of the muscular system, so as to enable dislocations or hernias to be more easily reduced. The state of relaxation bordering upon fainting is very favourable to the process of absorption; it may, therefore, be advantageously employed in dropsy arising from weakness of the absorbents. As the warm bath has generally the effect of equalizing the circulation, and relieving internal congestion, it is much resorted to as a remedy in spasmodic and convulsive diseases; but here the utmost caution and discrimination are necessary. If the spasmodic actions result from an inflammatory state of any of the nervous centres, more harm than good will be done by a bath. The inflammatory condition must first be removed or greatly lessened by bleeding, purgatives, and other appropriate means, before the bath can be safely used. These cautions do not so strictly apply to the convulsive excitement which often precedes the eruption of small-pox, or even measles, which is often greatly relieved by the warm bath, which may also be repeated during the early stages of the eruption. (See Marcard, *Uber die Bäder*, Hanover, 1793, or Duncan's *Med. Comm.* 2nd Decade, part x. p. 153.) The convulsions of infants during teething are almost invariably attempted to be removed by the warm bath, but in many instances more harm than good is done. The condition of the brain must be carefully inquired into by the medical attendant, and the state of the gums investigated before this measure should be had recourse to. If there be congestion of blood in the brain this must be removed before any good can result from a bath, and after its removal the convulsive actions will generally subside. The same good effect will follow free scarification of the gums, if a tooth be preparing to protrude. [See ANTISPASMODICS.] Even when the bath is properly applied, the good which might be derived from it is often frustrated by inattention or ignorance. The bath is prepared at random, and the temperature is never sufficiently regarded. If above 96° it cannot fail to be injurious.

During the existence of all active inflammation, at whatever age, the warm bath may be pronounced an unfit measure; and even after the acuteness may have been reduced by active antiphlogistic means, the warm bath is a doubtful remedy, if we except a very few cases. Of these, inflammation of the peritonæum is the best marked exception; but even here the bath is a very secondary means towards lowering the action of the system, though it may assist the flow of blood from leech bites, and may be continued till a tendency to faint show itself.

In acute rheumatism, after venesection, the warm bath may perhaps be employed, if we can ensure its being followed by copious perspiration. For this purpose the patient should have the bath close to his bed, remain in it for half or three-quarters of an hour, be well rubbed with warm flannel cloths, replaced in bed between warm blankets, take diaphoretic medicines, and drink bland, warm fluids, such as gruel or weak tea, and maintain the perspiration for twenty-four or forty-eight hours.

In a disposition to gout or rheumatism the warm bath is more proper than when a paroxysm of these diseases occurs. In such cases the natural warm baths are preferable: those of the Queen's Bath, or Cross Bath at Bath, the temperature of which is from 94° to 96°, are well calculated for such cases.

In few chronic inflammatory diseases are warm baths allowable, if we except some of those of the digestive organs, especially sub-acute inflammation of the mucous membrane of the stomach and intestines. Indigestion is often the most common symptom accompanying this state, and it is almost always benefited by a course of warm or tepid bathing.

The other states to which warm bathing is unsuited are great general torpor, but especially of the skin; also when there is a tendency to profuse secretion from the skin; when there is great plethora or fulness of the vascular system, especially of the veins; in tendency to active hæmorrhage; in aneurism, or any disease of the heart; also in cases of a tendency to apoplexy: lastly, in extreme atony, or excessive irritability of the nervous system. In the very extreme cases of derangement of the nervous system the warm bath is unfit; in more moderate derangements of it, a more applicable or useful remedy cannot be found. In cases of nervous exhaustion from intense literary employment, or official or parliamentary duties, the warm bath is of great service, more particularly when, in addition to the warm bath, the cold douche is employed, directed upon the head for a few seconds, while the patient is in the bath. In the milder cases of mania it has been found of great use.

In cases of contractions of the joints from rheumatic or gouty inflammation, the warm bath, or, what is better, the local vapour bath, is of service in restoring the flexibility of the limb.

It may be briefly stated that the warm bath is much more serviceable when there is a tendency to disease, constitutional or accidental, or in convalescence, than in any other circumstances. It is therefore rather to be considered as a preventive than remedial measure. But its value in this point of view is very great; and it is to be regretted that it is not sufficiently appreciated and used. It is exceedingly beneficial as a means of allaying the irritation of the vascular system, which occurs in young persons disposed to consumption, when the disease is beginning slowly to impair the integrity and healthfulness of the lungs or other important organs. To prevent the development of the morbid deposit in the lungs is of infinite importance; and this will be best accomplished by keeping up a more vigorous action of the skin. The bath must be persevered in for a length of time. Proper bathing-rooms should exist in every well-constructed house; but as this is rarely the case in this country, a good substitute may be obtained by using some of the recently-invented bathing-machines, which combine facilities for using the different kinds of bath in the same apparatus. The best which we have seen is that made by Read, Regent Circus, which possesses an apparatus for applying the douche while in the warm bath, and may be used as a cold, a shower, a warm, a douche, or a vapour-bath: it is therefore called *The Universal Bath.* Baths should be attached to all large manufactories, as a refreshment for the workmen, to ensure cleanliness, and as a means of warding off many diseases: in lead-works, painters' and plumbers' establishments, they would protect the men from painters cholic; and in other establishments, they would preserve the workmen from many cutaneous diseases. 'A multitude of chronic inflammations of the skin are produced by uncleanliness, or other agents, which directly irritate the skin; and it is to the want of cleanliness in the inferior classes that Willan attributes the frequency of cutaneous diseases in London. In France, advantages are placed within the reach of the poor to which the rich alone aspire in other countries. The number of gratuitous baths which are given at the hospitals of St. Louis and La Charité is truly prodigious: in 1822 it amounted to 127,752 for the out-patients only of the hospital of St. Louis.' (Rayer *On Diseases of the Skin.*) Why some portion of the funds of hospitals and dispensaries in London, and other large towns, should not be applied in a similar way, we can see no good objection. There is as much philanthropy and benevolence in preventing disease as in curing it.

A partial warm bath, such as the foot-bath, is of much service in warding off many complaints. After getting the feet wet, plunging them into warm water will often prevent any ill consequences; and even when the first chill and slight shiverings, which usher in colds, fevers, and other inflammatory complaints, have been felt, the disease may be cut short by the use of a foot-bath, continued till free perspiration occurs. In inflammatory diseases where the head and throat are much affected, the employment of a foot-bath, at a later period, often gives great relief, by causing a revulsion of the blood from the upper to the lower part of the body.

Water of a temperature from 99° to the highest which can be endured, is termed the hot-bath. When a person in health enters such a bath, it greatly excites the nervous system, and, through that, the heart and arteries; causes heat and constriction of the skin, with disturbance of the internal organs generally, but especially those of secretion. This state of uneasiness is lessened by the breaking out of perspiration, which is succeeded by great languor, torpor, and disposition to sleep. In such a bath little absorption takes place through the skin, and the body is found to have lost weight. The hot-bath is a powerful stimulant, and can never be used by persons in a state of health. The same cautions which were stated under the head of the warm-bath apply to it in a greater degree. The few cases to which it is suited are chronic affections of the nervous system, such as paralysis, when all vascular fulness of the brain or spinal chord has been removed. The waters of the King's bath at Bath, and some of the hot-baths on the continent, are very beneficially employed in such cases; but careful discrimination must be made to suit the temperature to the degree of sensibility remaining in the paralysed part. Where the power of motion is lost, the sensation is sometimes increased. Here the hot-bath would be very hurtful. On the other hand the sensation may be lost, while the power of motion remains. Here equal care must be observed not to use too high a temperature. Erythema, erysipelas, mortification, or death may follow the use of too high a temperature or a stay too prolonged even in a proper temperature.

Sudden retrocession or repulsion of some cutaneous or eruptive diseases is relieved by the use of a hot-bath for a few minutes, the eruption often coming out favourably after it. Some chronic cutaneous diseases, in which great thickening or torpor of the skin exists, are benefited by the hot-bath.

Vapour-baths are either natural or artificial. Several natural vapour-baths exist in the Neapolitan States, in Switzerland (Pfeffers in the country of the Grisons), and in Ischia. The artificial vapour-baths are much in use in the East and in Russia, where they are public, or intended for several persons to use at the same time: and occasionally in Britain, where they are always solitary or for a single individual. The Russian baths are described in Lyall's *Character of the Russians*, p. 112—115. The bathing-room contains tiers of benches, like an amphitheatre, the seats nearest the bottom being the coolest, those higher up hotter. The temperature varies from 112° to 224°. Persons commencing the use of such baths occupy the lower seats, and ascend as they become accustomed to them. While exposed to the vapour, the body is washed or rubbed with soap or bran, and beaten with fresh birch-twigs. The head is surrounded with a cold cloth, or cold water is dashed over the head. When the person does not wish to breathe the heated vapour, a sponge which has been dipped in cold water is held to the mouth and nose. On first employing the vapour-bath, the person usually remains about fifteen minutes, but afterwards three-quarters of an hour, and at Pfeffers the temperature of which is only 100, sometimes four, eight, ten or sixteen hours. After coming out of the bath, the bather goes into a room heated with dry air, where he is rubbed, puts on a flannel dress, and then reposes upon a couch for some time, where he may drink warm drinks to promote the perspiration.

'As soon,' says Dr. E. D. Clarke, 'as the inhabitants of these northern nations have endured the high temperature of their vapour-baths, which is so great that Englishmen would not conceive it possible to exist an instant in them, they stand naked, covered with profuse perspiration, cooling themselves in the open air. In summer they plunge into cold water, and in winter they roll about in the snow, without sustaining injury, or even catching cold. When the Russians leave a bath of this kind, they moreover drink copious draughts of mead, as cold as it can be procured.' (*Travels in Russia,* part i. p. 143.) The absence of all risk in exposing the person to such extremes of temperature is explained by the experiments of Dr. Edwards, who found that 'after an exposure to cold, sufficient to diminish the power of producing heat, continuance in a high temperature tends to the recovery of this power; for, in exposing animals to successive applications of cold, their temperature will fall the more slowly the longer they shall have been subjected to the influence of warmth. It follows, therefore, that the effect of the application of a certain degree of heat is continued after the cessation of the cause. Hence, we see that those who are liable to frequent exposure of severe cold are rendered more capable of supporting it, by subjecting themselves in the intervals to a high temperature,—a practice adopted by northern nations, and justified by facts.' (Edwards on the *Influence of Physical Agents on Life,* p. 125.)

The vapour-bath is distinguished from all other means of introducing more heat into the body, chiefly by the circumstance, that as a portion of the vapour is converted into water, by coming in contact with the surface of the body, it communicates a quantity of sensible caloric to it. It is without doubt the most powerful means of supplying a great heat to the greatest portion of the surface of the body, internal as well as external; for when breathed, the extensive surface forming the interior of the lungs is influenced by it in the same way as the skin. On the skin it exerts a peculiar influence. It does not cause that constriction of the skin, which follows the application of dry air, nor does it exert that pressure upon the surface, which, in the case of warm water, retards the breaking out of the perspiration. On the contrary, moisture of the skin, followed by profuse perspiration, occurs immediately upon entering the vapour-bath.

In Russia, where such baths are used on a large scale, their employment is not found to be productive of weakness. The subsequent exposure to cold restores the tone of the skin which had been lost, and the process leaves the person with a general sense of good health, strength, and power, both of the internal organs and of the skin. 'These practices,' says Dr. Clarke, 'seem to delight them, and to add strength to their constitution.'

The vapour-bath, by attracting the blood more speedily to the surface, and by being followed by more profuse perspiration, is more powerful than the warm water-bath. It is employed as a remedy in gout and rheumatism, and in the numerous consequences of these when they have assumed the chronic form. Many cases of rheumatic and gouty contraction of the joints have been removed by persevering in the use of vapour-baths, as employed by the continental nations. In scrofulous diseases, especially when they affect the skin and the glands, benefit is derived from the vapour-bath, unless there be a manifest tendency to active inflammation, and great irritability of the nervous system. In some chronic affections of the nervous system, especially when connected with the repulsion or imperfect development of cutaneous diseases, the vapour-bath is of great use: and also in some affections of the respiratory organs, such as dry catarrh, asthma, spasms of the muscles of respiration, if these are not complicated with inflammation or organic disease of the lungs or heart.

The use of the vapour-bath would be found to ward off many acute diseases resulting from exposure to cold, if had recourse to immediately after exposure to the exciting cause; as after travelling, or falling into the water in winter.

The local application of warm vapour is very serviceable in many recent diseases. Catarrhs, sore throats of an inflammatory kind, inflammations of the eyes and ears, are greatly alleviated by such means. But when the lungs are inflamed, though Mudge's or other inhaler is much recommended, yet the effort required to draw in the vapour is injurious. The head, from which a flannel cloth may fall down, in such a way as to hinder the vapour from escaping, should be held over a bason full of warm water, and the vapour inhaled in the ordinary mode of respiration. The vapour-bath is very improper for plethoric persons, those predisposed to congestion, or to apoplexy, and also for individuals in a state of great debility.

The employment of heated air, as an application to the body, causes the primary action of heat to manifest itself more than the secondary. The hot air-bath is therefore powerfully stimulant to the skin and nervous system, and is of great service in all cases where the production of animal heat is less than natural, as in the cold stage of fevers, and exhaustion of the nervous power. It has been employed beneficially in congestive fever, and after great and continual mental exertion. It proved less useful in the Asiatic cholera than was anticipated. A convenient apparatus for applying it was invented by the late Dr. Gower, called a *Sudatorium*, and also others by Jones of the Strand, London.

Medicated baths rarely possess greater power than that possessed by the water alone; but there are a few exceptions. The admixture of common salt makes the water more stimulating and tonic.

Sulphurous vapour-baths fall under the head of medicated baths, and a few remarks may be here made respecting them. Nightmen, and other individuals who live much in an atmosphere charged with sulphurous exhalations, are rarely affected with chronic diseases of the skin, while other trades seem to predispose to their development, such as the baker's itch and grocer's itch. It is chiefly for the cure of cutaneous diseases that the sulphurous vapour-baths are employed. In many of these they are very useful, especially those belonging to the genus scabies and genus impetigo of Bateman. A caution is requisite for their safe employment, that the vapour should not be applied to more than a fourth part of the body at one time, lest the disease should be suddenly cured, and the internal organs suffer by the repulsion. The person who uses the sulphurous vapour-bath must be careful not to breathe any of the vapour. This kind of bath has been used in rheumatic affections, some diseases of the stomach, and in chronic paralysis. It may sometimes be a useful addition to internal treatment, but alone can be of little avail, till the state of the internal organs be improved, especially the liver, the action of which is almost always faulty in gout and rheumatism.

The nitro-muriatic bath of Scott is of use in chronic inflammation of the liver, such as occurs in warm climates. The iron-baths in Nassau and the Hartz are more tonic than the simple cold-bath: but none of the iron can be absorbed at the low temperature of these baths; it is only therefore by their direct action upon the skin, and the sympathies of this with the internal organs, that they are more beneficial. We have no knowledge of the effects of the mineralized mud baths, called by the Italians *Lutatura*. (See Gairdner *On Mineral Springs*, p. 404.)

Though unacquainted with the results of employing hot sand or ashes, as done by the Turks, we can conceive them useful in allaying cramps and neuralgic pains, as heat generally does in whatever way applied. A collection of the opinions of antient writers on the subject was published in the sixteenth century. (*De balneis omnia quæ extant apud Græcos, Latinos, et Arabes*, fol. Venet. apud Junt. 1553.) The best modern treatise is that of Marcard, in German, an abstract of which may be found in Dr. Beddoes's *Treaties on Consumption*. A French translation of it was published in 1802. The natural baths will be treated of under the article WATERS, MINERAL. (See Osann, *Encyclopædisches Wörterbuch der Med. Wissenschaft*, art. 'Bad,' vol. iv. Berlin, 1830, and Osann, *Darstellung der Heilquellen Europas*, 1829.)

BATHURST, ALLEN, EARL BATHURST, eldest son of Sir Benjamin Bathurst, governor of the East India Company in the years 1688-9, and treasurer of the household to the Princess Anne of Denmark, was born at Westminster in November, 1684. His descent was from an antient family of Luneburg, who resided at a place called 'Batters,' and settled in England in very early times at 'Batters Hurst' in Sussex. Of their property at this place the family of Bathurst were deprived, and the castle demolished during the civil wars of York and Lancaster. In 1699 Allen Bathurst was entered at Trinity College, Cambridge, of which his uncle, Dean Bathurst, was then master; and, six years after, commenced his political life as representative for the borough of Cirencester. As a member of the legislature he actively promoted the union of the two kingdoms, and concurred in the opposition to the Duke of Marlborough and his adherents, of which Harley and St. John were the leaders. In pursuing this course he probably acted from conviction and not as a political partizan, since, upon the dismissal of the Whig ministry, he accepted no place under government, though his abilities and connexion with some of the principal Tories entitled him to notice. He was, however, in 1711, made a peer of Great Britain by the title of Lord Bathurst, Baron Bathurst of Battlesden, in the county of Bedford. In the upper house he exerted himself in the debates on many of the important questions that were there agitated. In 1716 he opposed, as a violation of the constitution, the Septennial Bill. He distinguished himself in 1723 as a zealous defender of Bishop Atterbury, when the bill for 'inflicting pains and penalties' on that prelate was discussed in the House of Lords. In 1727 he opposed a war with Spain which then threatened the country; and in 1731 supported the bill to prevent pensioners from sitting in the House of Commons. On other occasions also of public interest,—in moving the address to the king for discharging the Hessian troops in the pay of Great Britain; in resisting the undue taxation of the poor, on the bill for the revival of the salt duty: in advocating the motion of the Earl of Oxford for the reduction of the forces, and in the debate on the mutiny bill, Lord Bathurst took an active and decided part; and, during the whole period of which this narration is a brief review, he showed himself a steady opponent of Sir Robert Walpole's administration.

Lord Bathurst was married, in 1704, to Catherine, daughter and heiress of Sir Peter Apsley, by whom he had four sons and five daughters. In 1742 he was made captain of his majesty's Band of Gentlemen Pensioners, which post he resigned in 1744. He was appointed treasurer to George III., then Prince George of Wales, in 1757, and this office he held till the death of George II, in 1760, when he declined the acceptance of any further employment, on account of his age. In consideration, however, of his previous services, he received a pension of 2000*l.* per annum on the Irish establishment, and was advanced to an earldom in 1772. He died at his seat near Cirencester on the 16th September, 1775, aged ninety-one.

In his private character Lord Bathurst was generous and affable; that he possessed knowledge and acquirements as a man of letters may be inferred from his long and intimate acquaintance with Pope, Swift, Prior, Rowe, Congreve, Arbuthnot, Gay, and Addison; and the sincerity of his political friendships was manifested in his firm and strenuous opposition to the attainder of Bolingbroke and Ormond. Mr. Pope acknowledged his obligations by dedicating to Lord Bathurst the 3rd Epistle of his *Moral Essays*, and in the following lines pays a happy compliment to the judgment and integrity of his patron:—

> The sense to value riches, with the art
> T' enjoy them, and the virtue to impart,
> Not meanly nor ambitiously pursued,
> Not sunk by sloth, nor raised by servitude;
> To balance fortune by a just expense,
> Join with economy magnificence;
> With splendour, charity; with plenty, health;
> O teach us, Bathurst! yet unspoil'd by wealth,
> That secret rare, between the extremes to move
> Of mad good-nature, and of mean self-love.'

The only surviving son of Lord Bathurst, Henry, the second earl, born in 1714, was made Chief Justice of the Common Pleas in 1754, and in 1771 was appointed Lord Chancellor with the title of Baron Apsley. He resigned the seals in 1778, and died in 1794. He was the author of a pamphlet in 4to. entitled *The Case of Miss Swordfeger*, and of a work on the *Theory of Evidence*, 8vo.

BATHURST, a settlement of the English on the west coast of Africa, is situated on the south-eastern extremity of the island of St. Mary, at the mouth of the river Gambia, in 16° 6′ W. long., and 13° 28′ N. lat. The greatest length of the island is about four miles, but its general breadth does not exceed one mile and a half, and in some places it is much less. The surface of the island is a low plain, with a slight descent from the north and east sides towards the centre, which during the season of rain is much inundated. The town itself does not stand more than twelve or fourteen feet above the level of high-water mark. The settlement, although in its infancy, has made rapid advances in improvement. Many fine and substantial government buildings have been erected; and the merchants residing there have vied with each other in the elegant and convenient arrangement of their dwellings and warehouses, all of which are built with stone or brick, and roofed with slates or shingles. The population of this settlement has been greatly increased, not only by British merchants, but by a large influx of the inhabitants of Goree, who have emigrated to Bathurst. This emigration was caused by the people not finding employment under the French government, and also by their being excluded from the trade of the Gambia, except through the medium of St. Mary's, or of the small factory belonging to the French at Albreda, beyond which they were not allowed to ascend the river. The inhabitants are abundantly supplied with beef, mutton, poultry, fish, fruit, milk, butter, palm-wine, and all the African vegetables, by the natives of the surrounding towns, who, sensible of the advantages they derive from the settlement, flock to it in great numbers, and consume a large proportion of the European articles imported into the colony. Gold, ivory, bees'-wax, and hides are brought to Bathurst in considerable quantities by the native traders, and by the inhabitants of Goree who have settled there. These products are annually shipped for England by the British merchants. (Gray's *Travels in Western Africa in* 1818, 1819, 1820, and 1821.)

BATHURST, in New South Wales, one of the counties into which that part of the territory of the colony which lies west of the Blue Mountains has recently been divided. At first the whole of this part of the country was distinguished by the name of Bathurst, but it is now divided into several counties, of which one only retains the original denomination. The country west of the mountains was not discovered until 1813, but has since rapidly risen into notice on account of its excellent cool climate, and its fine rich pastures, flats, and downs. The climate and soil are in many parts well adapted to agriculture, which has partially been attended to, with the very best results in some places; but the distance from a market, and the want of easy access to the coast, prevents any settler from raising produce beyond the wants of his own establishment. As all the rivers beyond the Blue Mountains run westerly, and terminate in the immense interior swamps, the outlet of which is yet unascertained, the absence of a water communication with Sydney and the eastern coast has obliged the settlers to confine their attention chiefly to the rearing of sheep and cattle. By far the greater proportion of the wool exported from the colony comes from this territory, and, with cheese, forms the only article which interior settlers have to give in exchange for tea, sugar, clothing, and other things which they require. This must be understood as applying generally to the appropriated territory beyond the Blue Mountains, including, besides Bathurst properly so called, the counties of Westmoreland and Roxburgh at least. The census of 1833 seems to include the entire transmontane population under the head of Bathurst, as no mention is made of other counties. The result gives a population of 3454, of whom 2000 are convicts. The total number of females, free and convicts, does not exceed 523. In the restricted sense, Bathurst is the westernmost county of the colony, extending 55 miles in length from N.N.W. to S.S.E., with 42 miles of extreme breadth from E. to W.

The small town of Bathurst is 744 yards above the level of the sea, on the west bank of the Macquarie river, at the distance of 122 miles from Sydney, to which there is a carriage road. It is yet in its infancy; but as no situation west of the Blue Mountains can be preferable, it will, no doubt, ultimately become a place of considerable importance—a sort of capital to the interior. Its healthiness may be estimated from the fact, that only one death took place in the first twelve years of the settlement. It now possesses a very fair proportion of respectable settlers in comfortable circumstances, who have established a society, called 'The Bathurst Literary Society,' with the view of forming a library for the use of the members, and of promoting the improvement of the community by the discussion of interesting topics. A hunt, called 'The Bathurst Hunt,' was established several years since by the gentlemen of the place, for the purpose of coursing the native wild dog. The recent accounts of the ravages of these animals in the pastoral districts of New South Wales show the great importance of this object beyond the mere purposes of sport. Mr. P. Cunningham mentions among the signs of the rapid progress which Bathurst has made, that it possessed several years ago a boarding-school, in which Greek, Latin, and other branches of education, were professed to be taught.

(Cunningham's *Two Years in New South Wales;* Breton's *Excursions in New South Wales;* Strutt's *Expeditions in Australia;* Dawson's *Present State of Australia; New South Wales Calendar*, 1834.)

BATHURST INLET is a deep bight on the eastern shores of George the Fourth's Coronation Gulf. It runs to the S.E. about 76 miles, and was explored by Captain Franklin in his overland journey to the Polar Sea in 1819. (Franklin's *First Journey to the Polar Sea.*)

BATHURST ISLAND, one of the North Georgian group, in the Arctic Seas, was so called by Captain Parry, who first discovered it in his passage to Melville Island in 1819. Its appearance was high, barren, and rugged, the highest part exceeding 600 feet, and the shores generally steep. There was no opportunity of landing on it. The southern coast only was traced for a distance of 75 miles from 97° 50′ to 103° W. long., lying in an E.S.E. and W.N.W. direction, on the parallel of about 75° N. lat. (Parry's *First Voyage in* 1819-20.)

BATMAN (pronounced BAWMAN), a person allowed by the government to every company of a regiment on foreign service. His duty is to take charge of the cooking utensils, &c., of the company. There is in the charge of the batman a bathorse (pronounced bawhorse) for each company, to convey the cooking utensils from place to place. For the purchase of this horse the officer commanding the company is allowed a sum of money, and forage is also provided at the government expense for the horse. For regiments on duty in the kingdom the batmen and bathorses become unnecessary, as the soldiers are billetted on the inns, public-houses, and beer-houses.

BATMAN, a weight used in Persia, and at Aleppo, Constantinople, Smyrna, and other places in the Levant. In the Turkish dominions a batman contains six okes, each weighing 400 drachms. At Constantinople, silks from Persia are weighed by the batman of six okes. In Persia, there are two sorts of batman: the batman of Cherray, and the batman of Tauris. The former is exactly double the latter. The batman of Cherray weighs 88,771 English grains. (See Kelly's *Universal Cambist*, 4to. Lond. 1831, vol. i. pp. 4, 72, vol. ii. pp. 226, 278.)

BATN-EL-HAJAR (*i. e.* 'the Womb of Rocks'), or *Dâr-el-Hajar* ('the Mansion of Rocks'), is the name of a stony wilderness, stretching along the Nile from the district of Succot in the south, to Wâdi Halfa in the north. In the map of the course of the Nile, drawn by Col. W. M. Leake, which accompanies Burckhardt's *Travels in Nubia*, it is laid down between 21-22° N. lat. and 30° 35′-31° 10′ E. lon. of Greenwich; in Rüppell's map, between 21° 10′-50′ N. lat., and 30° 40′-31° 10′ E. long. The Nile, during its progress through the upper part of this district, as far as Wâdi Mershed, is often forced into a narrow channel by the close approach of the mountains on both sides; and towards the north of Wâdi Mershed navigation is interrupted by frequent cataracts, rocks, and small islands. A few spots only admit of cultivation, which consist of narrow strips of land situated along the Nile: but even here the banks are generally so high, that the annual inundations of the river do not reach the plains, and the soil must be irrigated by means of water-wheels. The mountains of Batn-el-Hajar consist of primitive rocks, principally of greenstone and grauwacke, and towards the south of Seras, of granite; they differ in this respect from the hills accompanying the Nile below Wâdi Halfa, where the prevailing rock is sandstone. The mountains on the eastern side of the Nile reach their greatest elevation towards the south: the Jabal Lamoule, above Wâdi Ambigo, is noticed by Burckhardt as one of the highest. Another group of high hills called Jabal Bilingo, is found farther towards the north, between Wâdi Attar and Seras. In his route from Wâdi Attar to Wâdi Ambigo, Burckhardt had to cross over a high mountain pass in the hills, named Jabel Doughe.

The small strips of level land on the banks of the river were formerly populous and well cultivated, but are now thinly inhabited. The number of the present male inhabitants of the whole district of Batn-el-Hajar is estimated by Burckhardt not to exceed 200. They consist partly of Beduins of the tribe Kerrarish; partly of Arabs, who pretend to be Sherîfs, or descendants of the family of Mohammed, from Mecca. The chief of the latter, who is distinguished by the title of *melek*, or king, is tributary to the governors of Nubia, and resides at Wâdi Attar, or Attyu, the principal village of Batn-el-Hajar. In consequence, however, of the frequent incursions of the Sheygya Arabs (who live on the southern banks of the bend of the Nile in Dongola, at a distance of eight days' journey from Succot across the desert), the greater part of the Sherîfs have now quitted this neighbourhood, and have settled partly in the district of Succot, and partly in Dongola. Most of the Sherîfs speak a little Arabic. They are described as being remarkably well made, with fine features, and of a dark brown colour. They go naked, and the women are in the habit of wearing leather amulets round the neck, and copper ornaments on their arms and wrists. They dwell chiefly upon the little islands of the river, where they are less exposed to the attacks of the predatory Arabs than on the banks of the river.

Rüppell, who in 1823 passed through the part of Batn-el-Hajar situated on the western side of the Nile, describes that district as consisting of a chain of syenite hills along the banks of the river, and beyond them, as far as the eye could reach, a tract of moveable sands, the dreary uniformity of which was but seldom interrupted by projecting dark cliffs of primitive rock. On the western bank of the river, towards the south of Wâdi Halfa, Rüppell found many deserted villages and monasteries: the local appellation of the latter is *Sulli*. Nearly the whole of the western part of Dâr-el-Hajar is now uninhabited. At Semne (in 21° 30′ N. lat.) Rüppell saw the ruins of a large and apparently antient village or town, with several temples in a mixed Roman and Egyptian style of architecture. (See Edward Rüppell's *Reisen in Nubien*, &c., Frankfurt, 1829. 8vo. pp. 12, 13.)

The vegetable productions of Batn-el-Hajar are few. Date-trees are occasionally found in the *wâdis* or valleys that intersect the hills and slope towards the Nile. At Wâdi Seras Burckhardt saw a few cotton-fields and bean-plantations. *Dhourra* is scarce. The principal food of the inhabitants consists of beans, and the grains of a shrub called *kerkedan*, which grows wild here. Another leguminous plant, the *symka*, is used as food for camels, and from its grains an oil is prepared which the natives use instead of butter.

At the southern extremity of Batn-el-Hajar, the village of Wâdi Okame, or Ukme, is situated: this place is often visited by pilgrims who perform their devotions at the tomb of a Mohammedan saint, Sheikh Okashe, who is buried here. At a distance of two hours' ride S.S.W. of Okame is the island of Kolbe, the residence of the chief of Succot. (J. L. Burckhardt's *Travels in Nubia*, Lond. 1819. 4to. p. 42-50.)

BATOLI'TES, in zoology, a genus of fossil shells established by Montfort, and placed by him among his *coquilles univalves cloisonnées*. Cuvier, however, who quotes the observations of M. Deshayes and of M. Audouin, considers them as cylindrical and straight hippurites, and places them under his family of ostracés or ostraceans, among those fossil bivalves which are supposed to have had their valves connected by no ligament but by mere muscular adhesion, and immediately before the oysters. Montfort states that these shells acquire a very great length, and that they constitute masses of rock in the High Alps. [See Birostrites and Hippurites.]

BATRA'CHIANS. [See Frogs.]

BATRACHOMYOMA'CHIA (Βατραχομυομαχία), *the battle of the frogs and mice*, is the title of a Greek poem, consisting of 294 hexameter verses. This poem, though generally ascribed to Homer, and printed with the editions of the Iliad and Odyssey, undoubtedly belongs to a late age, and is attributed by Plutarch and Suidas to Pigres, of Halicarnassus, in Asia Minor. Pigres is called by Suidas the brother of that Artemisia who was the wife of Mausolus. [See Artemisia.] This poem, however, is probably the composition of some still later writer of the Alexandrine school. Some critics consider it a satirical poem: as it is not very long, the reader may form his own opinion without much trouble. (See Parnell's *Translation into English verse.*)

BATTA, an allowance made to military officers in the service of the East India Company, in addition to their pay. As the officers of King's regiments serving in India receive their pay according to the scale fixed by his Majesty's regulations, and which pay is below the emoluments derived by officers of similar rank in the regiments of the East India Company, the allowance of batta is made also to them by the Company, and is so adjusted as to preserve an equality of income between the two services.

The scale of allowance under the name of batta varies not only with the circumstance of the regiments being in the field or in cantonments, but also according to the part of the country in which they are stationed.

Batta was originally given with the intention of enabling officers to provide for field-equipment, and for those extra expenses which they must incur when marching, but it early lost this character when it was continued to officers in cantonments. In November, 1828, the distinction was made between the amount allowed when in actual service, and when in cantonments: before that time no difference was made. The effect of the alteration is this: that at particular stations of the army, where an officer formerly got full batta, he now gets half that batta, with an allowance for house-rent, which is inferior to what the other half of the batta would be. The half-batta of a lieutenant-colonel is 304 rupees (about 30*l.*) per month; his allowance for house-rent is 100 rupees. A major's half-batta is 228, and for house-rent 80 rupees per month; captain's half-batta, 91, and house-rent, 50 rupees; lieutenant's, 61, and 30 rupees; ensign's, 46, and 25 rupees. Colonels of regiments, not being general officers on the staff, nor holding offices specially provided for, are allowed the full batta of 750 rupees per month at any station, but they have not any allowance for house-rent. It was estimated, that by carrying into effect the regulation of November, 1828, the government of the East India Company would save 12,000*l.* per annum. (*Report of Committee of the House of Commons on the Affairs of India*, 1832, part 5, *Military.*)

BATTALION. This name is applied to a certain division of the infantry in an army, corresponding, nearly, to the *chiliarchia* in a Greek phalanx, and to the *cohort* in a Roman legion. The number of men composing a battalion is variable, but in the British service, according to the present establishment, it is, in general, about 750. One battalion in most cases constitutes a regiment, but some regiments, as those of the guards, consist of two battalions, and the regiment of artillery consists at present of eight, besides the brigade of horse artillery. It seems, therefore, that, originally, the name of regiment was applied to the body of men organized for a particular district, or a particular branch of service; and that, when the numerical strength of the regiment exceeded what was considered convenient, it was divided into two or more battalions.

The phalanges of the Greeks, and the legions of the Romans, with their respective constitutions and divisions, will be described under the words Phalanx and Legion.

The destructive effects of fire-arms among dense bodies of men necessarily caused the close order of battle used in antient warfare to be abandoned: though, down to the middle of the eighteenth century, an opinion that the troops could not otherwise resist effectually a charge of the enemy, and the desire to form them with facility into a column for attack, induced commanders of armies to draw up the battalions in a line from four to six files deep. But the numerous casualties which still occurred, led subsequently to the practice of forming the line in three ranks; and in the latest regulations for the disposition of the British army, it is prescribed that the battalions are to be drawn up in two ranks only. The argument in favour of this method, which, it may be observed, was recommended, in 1783, by Turpin, the commentator of Vegetius, is, that in action two ranks of men only can fire at once, and as the third rank can be no otherwise employed than in loading, and handing the muskets to the men in their front, this service scarcely compensates for the loss occasioned by the exposure of so many men to the enemy's fire. A foreign writer, however, contends that with soldiers as well disciplined as those of Russia, three ranks would be more advantageous than two: since the men in the middle rank are enabled to fire a second time with the muskets obtained from those in the third rank, immediately after they and the front-rank men have made their first fire, so that a much less interval takes place between the vollies than that which occurs when the line consists of only two ranks.

During the wars which arose out of the Revolution in France, the armies of that nation became habituated to a formation in close columns instead of a line of small depth. This practice, which seemed to be a return to the tactics of the antients, possesses some advantages when an attack is to be directed against an enemy's line which is too far extended to allow the divisions to succour each other in time; and the great merit of Napoleon consisted in manœuvring so as to lead his opponent to fall into this error, and then overwhelming him by numerous consecutive and powerful attacks directed against the weaker part of his line. The system, however, seems to have been persevered in too tenaciously by the French generals; for, against steady troops, their columns not only suffered serious losses in making the assaults, but were incapable of keeping up a fire equal to that which might have been produced by a more extended order. Such was the error committed by Marshal Soult at the battle of Albuera. According to Napier (*History of the Peninsular War*), 'that general persisted beyond reason in fighting with dense columns, and thus lost the fairest field ever offered to the arms of France. Had the fifth corps of the French opened in time,' the historian observes, 'nothing could have saved the British army from a total defeat.'

A battalion is now generally divided into ten companies; and, for convenience in performing the movements which may be required, each company is subdivided into two equal parts, and each of these into sections. The battalion is commanded by its own colonel; and several battalions or regiments are, on service, united under one general officer: these constitute a brigade, and may be considered as a small legion. According to the present regulations each man occupies in line twenty-one inches, and, as no intervals exist between the companies, the extent of a battalion formed two deep is about 219 yards. Six paces are left between every two battalions, and the same interval only separates one brigade from another.

The company of grenadiers occupies the extreme right, and the light infantry company the extreme left of the battalion: these are called the flank companies, and the others take their places from right to left, according to the numbers by which they are designated. The captain, or officer commanding each company, is stationed in the front line on the right of his company; and immediately behind him, in the rear rank is his covering serjeant. The lieutenants, ensigns, and the serjeants of the companies form a third, or what is called a supernumerary, rank in rear of the others, at the distance of three paces. The two regimental colours are placed in the front rank between the two centre companies, and two non-commissioned officers are in the rear rank behind them; a serjeant is stationed in the front, between the colours, another stands opposite to him in the rear rank, and a third in a line with both, in the supernumerary rank. These last-mentioned serjeants serve to direct the march of the battalion when it moves parallel to its front; for which purpose, on that occasion, they form themselves in a line in that direction, and march before the battalion at the distance of six paces.

The commander of the battalion places himself in front when he has to superintend the ordinary exercises, otherwise his station is in the rear. The lieutenant-colonel is behind the colours in rear of the supernumerary rank; the majors are in rear of the second battalion companies on the right and left flanks respectively, and the adjutant in a line with them, opposite to the centre. The situations of the *Staff* of the battalion, the musicians, &c., together with the particulars above briefly stated, are fully described in the treatises on the field exercises and evolutions of the British army.

Originally the grenadiers performed the duty of throwing hand-grenades, or small iron shells charged with powder, among the enemy; and the firelocks of the fusileers and light infantry were different from those of the other troops; but, except the riflemen, who use pieces with barrels *rifled*, or grooved, all the infantry of the line carry the same kind of musket.

The principal evolutions of a battalion consist in reversing the front of the line, taking a position at right-angles to its actual front; forming a column by bringing the different companies or their subdivisions parallel to, and directly in rear of each other, either at open or close intervals; forming a column *en échelon*, or with the divisions parallel to, but in positions receding from, each other towards the right or left, in the manner of steps; or, lastly, forming a hollow square. By changing the front, a retrograde movement in line may be made; by forming the line perpendicularly on either flank, an attempt of the enemy to turn it may be opposed. Columns are formed for the purpose of marching along roads or through defiles, or advancing in a body towards an enemy's position; a movement en échelon allows troops to gain ground obliquely towards the front or rear; and a hollow square is formed in order to resist an enemy in every direction, when the battalion is in danger of being surrounded.

A regiment of cavalry now consists of three squadrons; each squadron of two troops, and the numerical strength of each of these is about 80 men: but from that number one-sixth is to be deducted for the men not under arms. The cavalry are formed two deep, and each file occupies three feet in front; no interval is left between the troops, but that between every two squadrons is one-fourth of the actual strength of each. A regiment of cavalry, when complete, will thus occupy about 233 yards in front.

(Turpin de Crissé, *Commentaires sur les Institutions Militaires de Végèce*; Daniel, *Histoire de la Milice Françoise*; Okounef, *Examen Raisonné des Propriétés des Trois Armes*; Bismark on the *Tactics of Cavalry*, translated by Major Beamish; *Regulations for the Formations, Field Exercises, and Movements of his Majesty's Forces*, corrected to 1833. For many particulars relative to the present state of the British army, the *Monthly Lists* may be consulted.)

BATTARDEAU. [See COFFERDAM.]

BATTAS. The large portion of the island of Sumatra which is known as the Battas country, is situated between the equator and about 2° 30′ N. lat. With the exception of the principality of Siak on the north-east coast, and of some settlements at the mouths of rivers, which are in possession of Malays, this country includes the whole of the space between those parallels. On the south-east it is bounded by the principalities of Rawa and Menancabow, and on the north-west by the kingdom of Atcheen.

The Battas country, which by the inhabitants is called *Batak*, is divided into several provinces, which are subdivided into districts. The names of the principal provinces are Toba, Mandeling, Angkola, Humbang, Si Nambila, Looboo, Manambin, Palampungan, Barumim, Sama Jambu, Pangaran, Lambung, Silendung, Butur, Holbang, Linton, Dairi, Alas, Karaw, and Ria.

The most populous of these districts are those situated about the centre of the country, and particularly Toba, Silendung, Holbang, and Linton. The great Toba Lake, which lies in a direction nearly north-east from the Dutch settlement of Tapanooly (which is in 1° 40′ N. lat., and 98° 50′ E. long.), has never yet been visited by any European. Messrs. Burton and Ward, Baptist missionaries on the island, to whom this lake was pointed out from some high land at a considerable distance, describe it as being from 60 to 70 miles long, with a breadth of from 15 to 20 miles. The surface of the lake was described to those gentlemen as being sometimes so rough as to prevent the passage of boats to and from an island in the middle, on which a periodical market is held. Several streams, one of them of considerable size, flow into the Toba Lake, and if it be true, as their guide stated to Messrs. Burton and Ward, that its waters rise and fall twice in the course of the twenty-four hours, it is probable that further examination would show it to be an arm of the sea.

Our information with regard to the people forming the Battas tribes is so scanty, that any statement we can give respecting their system of government must be liable to uncertainty. It is said that the supreme government over the whole of the districts is exercised by one chief, who lives at the north-western extremity of the Toba Lake. By this chief a deputy is appointed for each district, who, assisted by a council composed of the leading inhabitants, conducts the political affairs of the district; he frames laws, declares war, makes peace, and administers justice. The authority of these deputies is very much controlled by the councils with whom they act, so that the different districts may be considered as so many oligarchies. The more minute functions of government are otherwise performed, each village forming, in this respect, a distinct community, and possessing within itself the power of framing regulations for its own municipal government. The inhabitants of the different districts are so little held together by the authority of the chief governor, that it is not unusual for two or more villages to be engaged in war against each other, while the rest of the nation is at peace. It is probably owing to their system of government, as well as to their inland situation, and to the ease with which their few natural wants can be supplied, that these people have retained unaltered their primitive habits and character. Compared with the Malays of the coast, although they are less enterprising, the Battas are more industrious. A great part of the necessaries of life required at such of the Malayan settlements as are within their reach is supplied from the Battas country.

These people consider themselves to have been the earliest settlers on Sumatra, and they have a tradition that their forefathers came from a country lying to the east of that island, but their belief upon this subject is very vague, and they exhibit so many points of resemblance to Hindus, that it appears more probable they must originally have come from India. The resemblance here spoken of is shown in their persons: they are of middle stature, well made, and have prominent noses. Their religious notions, likewise, savour strongly of Hindu origin. They believe in the existence of a Supreme Creator of the world, who has committed the charge of its government to three sons, who, in their turn, have delegated to inferior gods the duties of their office. The names of these gods are said to have a strong resemblance to those of the Hindu mythology. This system of faith is burthened with numerous superstitions. The people believe in the constant interposition of good and evil genii in their worldly affairs, and every village has its peculiar demons or spirits, chiefly composed of the souls of the deceased inhabitants. As might be supposed, under the influence of such a belief, the person who exercises the office of priest, and who is frequently the head man or rajah of the village, is a person of great consequence, to whose advice and assistance recourse is had upon all occasions. The Battas do not appear to have any idea of an existence beyond the present, and their religious prejudices and fears being thus limited to merely the objects of sense have little or no influence over their moral conduct.

The well-ascertained fact of their cannibalism has occasioned them to be considered brutal and ferocious in their nature, an opinion which appears to be by no means well founded; they are, on the contrary, quiet and timid to a greater degree than even Hindus. Their principal food is rice and batatas. Meat they seldom or never taste, but when they do indulge in it they are not particular as to the description or condition of the animals they eat. According to Marsden, their indulgence in anthropophagy is limited to the devouring of persons slain or taken prisoners in war, and of certain classes of criminals. Robbers, if taken in the fact, are publicly executed and eaten forthwith, but if they elude immediate detection, a slighter punishment than loss of life is awarded. Men taken in adultery are subjected to the same revolting punishment, with this additional circumstance, that they may be eaten piecemeal without being previously put to death. It is not considered lawful to eat the bodies of persons taken or slain in the wars or feuds which occur between different villages or districts, but only such as fall into their power in what may be considered as national contests. An account has very recently (1835) been received in Europe of the killing, and probably also the eating by the Battas, of two English missionaries, who were proceeding through the country in the direction of the great Toba Lake. It appears that the tribe among whom the missionaries fell were at the time engaged in war with another tribe, and they might easily, under those circumstances, put a wrong construction upon the unusual appearance of strangers among them. It is said to be the opinion of persons near to the spot, and therefore better able than we can be to form a correct judgment on the case, that if the two missionaries had taken the precaution to send a messenger before them, to explain the pacific object of their journey, they would have met with hospitable welcome, instead of the melancholy fate that has befallen them. Dr. Leyden, in his work on the languages and literature of the Hindo-Chinese nations, states that the Battas frequently also eat their aged or infirm relations, as an act of pious duty. When, among them, a man becomes infirm and tired of life, he is said to invite his children to eat him: he ascends a tree, round which his friends and descendants assemble, and the whole of them join in singing a dirge, the burthen of which is 'The season is come, the fruit is ripe, and it must descend.' The victim then descends, is deprived of life, and his remains are devoured in a solemn banquet. This practice of the Battas eating their aged parents has been compared with the usage of the Padæi of India mentioned by Herodotus (lib. iii. 99); and Dr. Leyden has conjectured, perhaps rather hastily, that the Padæi and the Battas are the same people. A similar practice prevailed amongst the Massagetæ (Herod. i. 216), and among the antient Tupis of Brazil.

Slavery exists among the Battas. The classes who are reduced to this state of degradation are their own countrymen, and generally orphans, prisoners taken during their intestine wars, or debtors. To satisfy a debt, no matter how contracted, and probably the result of a game of chance (for these people are great gamesters), not only the man himself, but his whole family also, may be sold into slavery.

The custom of the country authorises every man to have as many wives as he can purchase; and, as usually is case where such a custom prevails, the wives perform all the drudgery, and are in fact considered to be little better than slaves. It is not often that a man has more than two wives at the same time.

The Battas have a written language, which bears a considerable resemblance, both in sound and construction, to that of the Malays: it has by some persons been considered a dialect of the Malayan tongue. The spoken language is somewhat different—a circumstance which may very naturally arise, in progress of time, among a people of whom only a very small proportion are able to use or understand the written characters. It is said that not more than two persons in one hundred among the Battas are able to read. Such books as they have are chiefly upon astrology, omens, and other subjects of a superstitious nature. Many persons among them show skill in poetry; and it forms part of their social amusements to undertake contests in improvising, which they keep up for hours together with considerable spirit.

It is principally in the Battas country that the camphor-trees of Sumatra are found: none, it is said, grow south of the equator. The camphor which these trees yield is considered to be so good in quality, that it sells in the markets of China for more than ten times the price paid for that produced in Japan, and which is yielded by a different plant. The camphor-tree of Sumatra grows without cultivation, and attains to a size equal to that of the largest timber trees, being frequently above fifteen feet in circumference. Camphor in the Battas language is called *Kapūr*, of which the European name is a corruption. In Eastern markets it is known as *Kapūr Baroos*, the latter word being the name of the town on the coast of Sumatra whence it is shipped.

Benjamin, or benzoin, is almost exclusively a product of the Battas country. Marsden says that large plantations of the trees by which it is yielded (the *Styrax benzoin*) are cultivated by the natives. The other vegetable productions of this part of Sumatra are common to the whole island. [See Sumatra.]

The entire population of the Battas country has been estimated at 1,500,000 souls, but this computation must be altogether conjectural.

(Marsden's *History of Sumatra*; *Asiatic Researches*; Porter's *Tropical Agriculturist*; *Library of Entertaining Knowledge*, *Vegetable Substances used in the Arts*.)

BATTENS, pieces of wood of various lengths, 7 inches wide and generally not exceeding 2½ inches in thickness when imported. They are used for floors, and are also placed upright against walls to fix the laths on which the plastering is set. East-country battens, as imported, are nches wide and 2½ inches thick, which, when planed up d shot, are cut into two boards each 1¼ inch thick. uch battens are used for the best floors; but in attics, and oms of less importance, for economy, the batten is cut into ree boards. When used for walls, the 7 and 2½ inch battens are cut into six pieces lengthways, being then something less than 2½ inches wide and 1¼ inch thick, allowance being made for the sawing. Battens are usually placed at the distance of seven inches asunder, but sometimes eleven or twelve, which is, however, considered slight work; if double laths are used, it will then be sufficiently strong to carry the plaster. The battens are nailed to the bond-timbers of the wall; or, if there are no bond-timbers, to wooden plugs placed at equal distances. Walls of brick and stone, when not sufficiently dry to be finished in the usual way, require battens for the lath and plaster; and it is of the utmost importance to employ battens in exposed situations, especially on the sea coast, where the driving rains will often penetrate the walls.

Battens from the British possessions in North America, when 6 and not exceeding 16 feet long, nor above 7 inches wide and not above 2¾ inches thick, pay a duty of 1*l.* per 120. Battens of the same dimensions from foreign countries pay 10*l.* per 120. The duty increases with the length, and also with the thickness, of the battens. The net revenue from battens in 1833 was 116,215*l.* The difference between battens and deals is this: battens are never, and deals are always, above seven inches wide. Battens are always at least six feet long, and batten-ends always under that length. The duty on battens and batten-ends is different: battens, 1*l.* British North American, 10*l.* foreign; batten-ends, 7*s.* 6*d.* American, 3*l.* foreign. (*Government Statistical Tables*, 1834.) The best battens are from Christiania; the worst, from America.

BATTERING-RAM. [See ARTILLERY.]

BATTERSEA, a parish in the county of Surrey, situated four miles south-west of St. Paul's Cathedral, and forming one of the suburbs of the metropolis. In Domesday Book it is called *Patricesy*, and as the same survey mentions that it belonged to the abbey of St. Peter, Westminster, this probably indicates the true etymology of the name. The parish comprehends an area of 3020 acres, pretty equally divided between arable land and pasture. Much of the former is occupied by market-gardeners, Battersea being specially noted for the quantity of vegetable produce which it raises for the London market. The manor of Battersea was given by the Conqueror to Westminster Abbey in exchange for Windsor; after the dissolution of monasteries the manor passed through various hands, and in the year 1627 it was granted by the king to Oliver St. John, Viscount Grandison, from whom it descended to the celebrated St. John, Viscount Bolingbroke, and in 1763 was purchased of the St. John family in trust for John Viscount Spencer, and is now the property of the present Earl Spencer. A church is mentioned in Domesday Book, but the existing parish church is a modern structure, opened in 1777. It is situated on the banks of the Thames, and is of brick, with a tower and small conical spire. It has neither aisles nor chancel. A new church has recently been erected by the commissioners for building churches. The living of Battersea is a vicarage in the diocese of Winchester, rated in the king's books at 13*l.* 15*s.* 2½*d.* The tithes which accrue from the gardens render the living one of the most valuable in the neighbourhood of London. Battersea lies too low on the Thames to be one of the most agreeable suburbs of London for residence; it nevertheless contains a large number of respectable houses and neat villas. Lord Bolingbroke was born and died in the family mansion at Battersea, of which Pope was a frequent inmate. The house was very large, having forty rooms on a floor; but it has long since been taken down and the site otherwise appropriated. The village possesses a free school, which was endowed by Sir Walter St. John, in 1700, for twenty boys; and both he and his lady afterwards left further sums for apprenticing some of the number. Battersea is connected with Chelsea by a wooden bridge across the Thames, erected in 1771. The population of this extensive parish was 5540 in 1831, of whom 3021 were females. (Lyson's *Environs of London.*)

BATTERY, in Law. [See ASSAULT.]

BATTERY. This name is given to any number of pieces of ordnance placed behind an *Epaulement*, or elevation of earth, either to destroy the works or dismount the artillery of an enemy.

It may be said that the antients made use of a species of ordnance in the operations of attack and defence; and the battering-rams, the balistæ, and the catapultæ, which, when placed on the natural ground, or in buildings of timber, or elevated on mounds of earth, served the besiegers to demolish the walls of fortresses, or to drive the defenders from them, may be considered as corresponding to the guns, mortars, &c., which constitute the armament of a modern battery.

Vitruvius states (*De Architecturâ*, lib. x.) that Cetras of Chalcedon was the first who covered the *ram* with a shed, in order to secure the men who worked it from the arrows, darts, and stones thrown by the enemy; and he adds, that the construction of the shed was subsequently improved by the engineers of Philip and Alexander. The *testudines* and *helépoles* were buildings of this nature, for the protection of the men and military engines, and in this respect they correspond to the *épaulemens* which cover the ordnance at present employed in the attack of a fortress. (See the description of the helépolis (ἑλέπολις) of Demetrius. Plutarch, *Life of Demetrius*, cap. 21.)

While the same species of artillery continued to be used in warfare, it is evident that no material change could take place in the nature of the edifices constructed to cover it; but from the epoch of the invention of gunpowder, the wooden sheds or towers were superseded by masses of earth, whose thickness was necessarily made greater than the depth to which a cannon-shot can penetrate into them. In modern times the designation of a battery varies with the purposes to be accomplished, the nature of the ordnance employed, and the manner in which the firing may be made.

A *breaching battery* is one which may be placed at between 50 and 1000 yards from any wall or rampart, in order to demolish it; and the effect is produced by firing directly, or, as it is called, *point blanc* at the object: such a battery generally has its front parallel to the face of the wall to be breached.

An *enfilading battery* is one whose epaulement is perpendicular to the produced line of the enemy's rampart; so that the shot from the guns may graze the interior side of that rampart or its parapet, in the direction of its length. When shot discharged from pieces of ordnance make successive rebounds along the ground, the firing is said to be *à ricochet* and the battery a ricochetting battery; and this mode of firing is employed when it is intended to dismount artillery by enfilading a rampart. The effect is produced by giving to the axis of the gun an elevation of between six and nine degrees above a line passing from its *chamber* through the crest of the enemy's parapet in front; and, according to the latest experiments, the distance at which a battery should be placed from the nearest extremity of the rampart to be enfiladed by ricochet firing is between 400 and 600 yards: at a greater distance than the latter much of the ammunition would be expended without effect.

A *gun battery* is one in which guns only are employed, for either of the purposes above mentioned, or to defend any ground, by a fire of round, or solid shot.

A *howitzer battery*, is one in which howitzers are employed. This species of ordnance throws shells, or hollow shot, generally at a small elevation of the axis to the horizon; and it serves to produce, by the bursting of the shells, a breach in a rampart of earth; or, when fired *à ricochet*, to destroy the pallisades or other obstacles which might impede the troops in assaulting an enemy's work. Howitzers are also used in conjunction with guns, to form breaches in ramparts of brick or stone.

A *mortar battery* is one in which shells are thrown from mortars at a great elevation of the axis of the piece; so that, by the momentum acquired in falling, they may crush the roofs, and by their explosion complete the destruction of magazines or other buildings. This is called a vertical fire. By employing large charges of powder, a very extensive range has been produced by mortars; for, at the siege of Cadiz, during the late war, the French are said to have sent shells to the distance of more than three miles from the battery.

When the battery is mounted on a natural or artificial eminence, in order to allow the guns to fire from above downward, or to make what is called a plunging fire against or into the works of the enemy, it constitutes a *cavalier battery*; and when the guns are elevated on a platform, or on tall carriages, so as to be enabled to fire over the superior surface of the parapet or epaulement, the battery is said to be *en barbette.* This kind of battery is usually executed at the most advanced points of a fortress, for the purpose of allowing considerable variation in the direction of the artillery towards the right or left; by which means the reconnoitring parties of the besiegers may be annoyed while at a distance and in motion.

In the formation of any of the field batteries above mentioned, while they are beyond the range of the enemy's musketry, they may be executed without cover for the working parties, like any simple breast-work, after the outline has been traced on the ground by the engineers; but, when the men employed in the work would be much exposed to annoyance from the enemy's fire, it becomes necessary that they should be protected by a mask of *gabions*. [See GABION.] These being planted on their bases along the exterior side of the intended trench in front of the battery, form a cover, even while empty, which a musket-ball cannot pierce. Within this line of gabions the excavation is commenced, and part of the earth obtained from the trench is thrown into and beyond the gabions, till the covering mass is thick enough, if necessary, to be proof against a cannon ball: the men thus work in comparative security to raise the epaulement with earth, which they do generally to the height of about seven feet from the ground, and to the thickness of eighteen or twenty feet, not including the breadths of the slopes given to the exterior and interior sides. The exterior slope is generally left with that inclination which earth, when thrown up, naturally assumes, that is at about 45° to the horizon; but the interior slope being necessarily more steep, in order to allow the guns to be brought close up to it, is retained by a *revêtement* or covering, either of *fascines* [see FASCINES] or bags of earth.

The *embrazures*, or openings in the epaulement, through which the guns are to fire, are, at the neck or interior extremity, about two feet wide, and at the exterior about half the thickness of the epaulement: each of their sides or cheeks has a small declination from a vertical plane, so that the breadth of the opening at top is rather greater than at the bottom, or on what is called the *sole* of the embrazure, in order that the flame from the muzzle of the gun may be less liable to damage those sides: for the same reason the latter are lined with fascines, or, which is preferred, with gabions, at the neck of the embrazure. The interval between two embrazures is called a *merlon*; and the part between the *sole* and the ground within the battery is called the *genouillère*.

The guns rest on platforms, generally of timber, either of a rectangular or dovetailed figure, about fourteen feet long and seven feet wide; each of these is constructed by embedding five *sleepers* in the ground, in the direction of its length, and covering them with planks, which are closely fitted to each other, and fastened down by screws.

Besides the epaulement in front of the battery, a wing is constructed of the same materials on each side, in order to protect the interior from any enfilading fire of the enemy. A magazine is always formed either within or near the rear of the battery, to contain the ammunition for its service; this is generally a rectangular pit sunk to about three feet below, with sides and a roof of timber rising about as much above, the natural ground: the roof is covered with earth of a thickness which may be capable of resisting the momentum of a shell, and the descent to the floor of the magazine is by an inclined plane towards the rear. *Traverses*, or elevations of earth, secured at the sides generally by gabions, are formed at intervals in the interior of the battery, to afford protection for the men against such shot or shells of the enemy as may fall there.

Howitzer and mortar batteries are executed nearly in the same manner as the others, but the former of these seldom, and the latter never, have embrazures; the level of their interior is also generally sunk three feet below that of the natural ground, consequently no trench is required on their exterior to furnish earth, which can be obtained in sufficient quantity from within.

BATTICALO'A, an island situated near the entrance of an inlet of the sea, on the east coast of Ceylon, 7° 44′ N. lat., 81° 52′ E. long. It contains a small fort and garrison, and is the head station of the assistant government agent of the district of Batticaloa. The island cannot be approached by ships of any size, as the entrance to the inlet, which extends north and south nearly thirty miles, is closed by a bar, over which the depth of water is only six feet. The country in the immediate neighbourhood of Batticaloa is flat and fertile; some scattered hills appear in the distance, among which two called Friar's Hood and Funnel Hill, serve as excellent landmarks to those who are sailing round the island of Ceylon. It was here that the Dutch admiral Spilbergen landed, in 1602, when a communication was first opened between the King of Candy and Holland. At that time this district was under the immediate rule of a petty prince, who seems to have owed a divided allegiance to the Portuguese and the Candian emperor.

Batticaloa is also the name of a district of Ceylon, now under the charge of an assistant government agent, comprising an area of 13,060 square miles, the population of which, according to the census of 1832, amounted to 29,424.

BATTICE, a commune and market-town in the province of Liége, situated three leagues N.N.W. of Verviers, and bounded on the north by the communes of Mortier, St. André, and Charneux; on the east by that of Thimister; on the south by those of Dison, Petit Rechain, Grand Rechain, and Xhendelesse; and on the west by Soumagne, Melin, and Bolland. The town has a weekly grain-market which is much frequented, and two fairs are held there on the 15th May and 15th November every year. The country is well watered by numerous small streams. The soil is generally a sandy clay, and in some parts is stony; it produces rye, barley, spelt-wheat, oats, beans, and trefoil. A considerable quantity of butter and cheese are made and sent away, partly to other districts and partly to foreign countries. Some coal-mines, which are opened in this district, and cloth-weaving, furnish employment for a considerable part of the inhabitants. A description of sand is found in one part of the commune, very useful in making cement for plasterer's work. There are three very old castles, those of Crèvecœur, Bosmel, and Xhéneumont; the two latter are now occupied as farm-houses: population 4280. (Meisser's *Dictionnaire Géographique de la Province de Liége*.)

BATTLE, or **BATTEL**, a parish and market-town in the hundred of the same name in the rape of Hastings, county of Sussex. It is fifty-two miles S.E. from London, in a pleasant country, where the land rises in wooded swells The name of the place was antiently Epiton, and acquired the present denomination in consequence of the great battle between the English and Normans, in which the former were defeated, and their king (Harold) killed, on the 14th October, 1066. The Conqueror commenced, in the following year, an abbey upon the site where the battle had raged most fiercely, the high altar of its church being upon the precise spot where, according to some authorities, Harold was killed, or where, as others say, his standard was taken. But as the whole neighbourhood does not afford any other spot equally eligible for such a structure, Mr. Gilpin is of opinion that accident did not determine the precise spot, though it might the general situation of the erection. When the abbey church was finished, the Conqueror made an offering of his sword and coronation robe at the high altar, in which was also deposited the famous roll or table of all the Normans of consequence who attended William to England. Copies of this catalogue have been preserved; but modern antiquarians in general concur in the opinion of Dugdale, that the list was often falsified and altered by the monks to gratify persons who wished to be considered of Norman extraction. The abbey was dedicated by the founder to St. Martin, and filled, in the first instance, with Benedictine monks from that of Marmontier in Normandy. All the land for a league around the house was given to it, besides various churches and manors in different counties, which were enlarged by royal and private donations in subsequent reigns. Its prerogatives and immunities were placed on the same footing with those of Christ Church, Canterbury; the monks and their tenants were exempt from episcopal and other ecclesiastical jurisdiction; they had the exclusive right of inquest in all murders committed within their lands, the property of all treasure discovered on their estates, the right of free warren, and the church was made a sanctuary in cases of homicide, besides other privileges. The abbot, who was mitred, and a peer in parliament, had also the royal power of pardoning any condemned thief whom he should pass or meet on going to execution. In the reign of Edward III. the abbot obtained the king's leave to fortify the abbey. The Conqueror's intention seems to have been that the foundation should maintain 140 monks, but provision does not appear to have been actually made for more than sixty. At the dissolution of the monastery, in the 26th of Henry VIII., its income was valued at 880*l.* 14*s.* 7½*d.*, according to Dugdale, or 987*l.* 0*s.* 10¼*d.*, according to Speed.

A pension of 66*l.* 13*s.* 4*d.* was settled upon the abbot, with smaller sums on sixteen other officers and monks. The site and demesnes of the abbey were given to a person named Gilmer, who pulled down a considerable portion of the buildings in order to dispose of the materials. He afterwards sold the estate to Sir Anthony Browne, who began to convert part of the abbey into a mansion, which was finished by his son, the first Lord Montague. This afterwards fell to decay; and when the property was sold to Sir Thomas Webster, the ancestor of Sir Godfrey Webster, the existing proprietor, the present dwelling was erected on one side of the quadrangle of which the old abbey appears to have consisted.

Battle Abbey stands on a gentle rise, with a fine sweep before it of meadows and woods, confined by wooded hills, which form a valley winding towards Hastings, and there meeting the sea. The ruins show the antient magnificence of the structure; their circuit is computed at about a mile, and Gilpin considers that the style proves that the greater part must have been rebuilt in the time of the later Henries, when our architecture began to assume a lighter and more embellished form. The remains occupy three sides of a large quadrangle, the fourth having probably been taken down to admit a view of the country when what is now the middle side was converted into a dwelling. The two wings are in ruins. The side of the quadrangle that faces the town contains the grand entrance, which is a large square building, embattled at the top with a handsome octagon tower at each corner. The front is adorned with a series of arches and neat pilasters; and this entrance is altogether a very rich and elegant specimen of Gothic architecture. This pile is locally called 'the Castle,' and until 1794, when the roof fell in and rendered it unfit for the purpose, it was used as a town-hall by the people of Battle. The side of the quadrangle opposite this entrance consists only of two long, low, parallel walls, which formerly supported a row of chambers, and terminated in two elegant turrets. The remaining side, which forms the existing mansion, has undergone the greatest dilapidations. Here stood the abbey church, though the ground-plan cannot now be traced; the only vestiges of it are nine elegant arches, which seem to have belonged to the inside of a cloister; they are now filled up, and appear on the outside of the house. Contiguous to the great church are the ruins of a hall, which appears to have been the refectory in ordinary use by the monks. There is another building of the same kind a little detached from the abbey, and which is of great beauty, although its dimensions, 166 feet by 35, are not in good proportion. It has twelve windows on one side and six on the other, and is strongly buttressed on the outside. This appears of older date than the remaining portions of the abbey: it is now used as a barn; its original purpose was probably to accommodate the numerous tenants to whom the monks gave entertainments at stated times. The floor of the hall is raised, and there is an ascent to it by a flight of steps. Underneath are crypts of freestone divided by elegant pillars and springing arches, which form a curious vaulted building, now converted into a stable.

The town of Battle owes its origin to the abbey. Under the encouragement of the monks, houses to the number of 150 were gradually erected in the vicinity; and to the town thus formed, a market, to be held on Sundays, was granted by Henry I. At the commencement of the seventeenth century Anthony Viscount Montague obtained an act of parliament for changing the market-day to Thursday, on which it is still held. The present town consists of one street, running along a valley from north-west to south-east. The church is dedicated to St. Mary, and is a very handsome edifice, consisting of a nave, chancel, two aisles, and a substantial tower. The windows of the north aisle are decorated with numerous figures, portraits, and devices in painted glass. The incumbent is styled 'Dean of Battle,' though the living is, in fact, a vicarage in the archdeaconry of Lewes and diocese of Chichester, charged in the king's book at 24*l.* 13*s.* 4*d.* The lord of the manor is patron. The number of houses in the parish was 515 in 1831, when the population amounted to 2999 persons, of whom 1538 were females. The only manufacture for which the place is remarkable is the excellent gunpowder, well known to sportsmen by the name of Battle powder. It is considered to be surpassed only by that of Dartford: there are several extensive mills in the neighbourhood for the manufacture of it. Besides the weekly market, there is one on the second Tuesday of every month for cattle, at which, as well as at the fairs, on Whit-Monday and 22nd November, considerable business is transacted. The town possesses a charity-school for forty boys. The Burrell MSS. in the British Museum state that the hundred of Battle 'is a franchise, the inhabitants whereof are exempt from attending assizes and sessions, or serving on juries, and the lord appoints a coroner thereof.' The petty sessions are holden at Battle.

BATTLE-AXE, a military weapon of offence used in different countries from the remotest times. Sir Samuel Meyrick says, as it was suggested by, so it immediately followed, the invention of the hatchet. The two Greek names for the battle-axe ἀξίνη (*axine*), and πέλεκυς (*pélekus*), occur in Homer in the same verse, *Il.* O. l. 711. What was the precise difference between the two weapons we are not told by antient writers, but it seems probable that the *axine* was similar to our hatchet, while the *pelekus*, which is usually translated in Latin by *bipennis*, had evidently two heads or edges; for Homer mentions another instrument of the same kind in the 23rd book of the *Iliad*, called Ἡμιπέλεκον (*hemipelekon*), or the half-axe. Suidas interprets Ἡμιπέλεκα (*hemipeleka*), by αἱ μονόστομοι ἀξίναι, one-edged axes. (See Kuster's note on Ἡμιπέλεκα.) The *pelekus*, or *bipennis*, was also called *securis Amazonica*, the Amazonian axe, from its having been supposed to have been used by those female warriors. The best representation of the antient form of this *bipennis* is probably to be found in Petit's *Dissertatio de Amazonibus*, 8vo. Amst. 1687, where it appears on the reverse of a coin of Thyatira, as well as upon the reverses of two coins of Marcus Aurelius. Numerous other coins of great antiquity bearing the *bipennis* are referred to in Rasche's *Lexicon Rei Nummariæ*, tom. i. col. 502, *et seq.*; *Supplem.* tom. i. p. 596.

Among the nations and tribes who joined the great expedition of Xerxes, we find battle-axes among the Sacæ (Herodot. vii. c. lxiv.), and the Egyptians (*ibid.* c. lxxxix.). Brennus, at the siege of the Roman capitol by the Gauls, was armed with a battle-axe. The Vindelici fought against Drusus with the battle-axe. (Horat. *Carm.* iv. 4.) Tacitus, speaking of a later period (*Hist.* ii. 42), describes Otho's forces as cutting through helmets and breastplates with their swords and axes (*gladiis et securibus*). In the Roman armies, however, we do not find the battle axe in ordinary use. It seems to have been considered as the weapon more peculiarly used by uncivilized nations. Ammianus Marcellinus (fol. Par. 1681, lib. xix. c. vi.), under the year 359, describes a body of Gauls as furnished with battle-axes and swords.

The introduction of the battle-axe into this country has been frequently attributed to the Danes; but proofs of an earlier use of it in our islands are deducible. Mr. Hayman Rooke, in a memoir printed in the *Archæologia* of the Society of Antiquaries, has engraved a fragment of a battle-axe found among some Druidical remains at Aspatria in Cumberland, in June, 1789 (*Archæol.* vol. x. p. 113); and in the same volume, pl. xl., are two representations of the old Galwegian bill or battle-axe, each two feet six inches long, found in a moss near Terreagles. Remains of others are stated to have been found among the barrows on the downs of Wiltshire, and in the north of Scotland. The Danes and Norwegians, however, probably made more use of this instrument than any other nations of their time.

At the battle of Stamford Bridge, between Harold of England and Harold Harfager of Norway, when the Norwegians gave way and the English pursued them, a total stop is stated to have been put to the pursuit for some hours by the desperate boldness of a single Norwegian, who defended the pass of the bridge with his battle-axe. He killed more than forty of the English, and was himself at last slain only by stratagem. (Hen. Huntingt. l. vii. 211.)

That the battle-axe was used in England in the Saxon times we have the authority of different MSS. of the ninth century, and the English are represented as using it, in the Bayeux tapestry. The pole-axe, with an edge on one side and a sharp point on the other, is believed to have come in with the Normans.

When King Stephen was taken prisoner by the Earl of Gloucester, we are told by Gervas of Canterbury that he had broken his battle-axe in pieces before he took to his sword, and was even then brought down by a stone. (Script. x. Twysd. col. 1354.)

During the middle period of English history we read but little of this weapon, though it appears to have been constantly used. The Welsh infantry at the battle of Agincourt, in 1415, found it particularly serviceable in despatching those whom the archers had wounded with their arrows. In Strutt's *Manners and Customs of the English*, vol. ii. pl. xliv., Henry V. is represented as setting Richard, Earl of Warwick, to keep Port Quartervyle, at the siege of Rouen, by the delivery of a battle-axe.

Toward the close of the sixteenth century, the battle-axe, as a weapon of war, seems to have fallen into gradual disuse: although the occasional placing of a pistol in its handle, in some specimens which remain, seems to bespeak a wish on the part of the warriors of that period that it should be retained with an improved use.

Grose, in his *Military Antiquities*, vol. ii. pl. xxviii. fig. 4, and pl. xxxiv. fig. 3, has engraved a Lochaber axe, and an antient battle-axe. Sir Samuel Meyrick, in his engraved illustrations of antient armour now at Goodrich Court in Herefordshire, pl. lxxxiii., has engraved numerous specimens of battle-axes and pole-axes from the time of Henry VI. Fig. 1 represents a German pole-axe of the time of Henry VI., furnished with a ring to which a thong might be fastened, in order to twist round the arm of the person wielding it. Fig. 2, a battle-axe of the time of Henry VIII., to which was once attached a match-lock pistol. The whole is of iron, and came from Ireland. Fig. 3, a Venetian pole-axe of the same period, the blade beautifully engraved, and having on it the lion of St. Mark. Fig. 4, another specimen. Fig. 5, a battle-axe of the close of the reign of Henry VIII. Fig. 6, a Jedburg axe, or Jeddart staff of the same period, found in a river in Scotland. Such weapons were implied by the single word 'staves,' which included all kinds of arms whose handles were long poles. Fig. 7, a Lochaber axe as old as the last described, if not of greater age. Fig. 8, a battle-axe of the commencement of the reign of Queen Elizabeth. Fig. 9, another of the middle of that period. Figs. 10, 11, two of the close of her reign. Fig. 12, one of the commencement of the reign of James I. Fig. 13, another of this period, furnished with a wheel-lock pistol. Fig. 14, a Polish pole-axe, having on the blade a crown, and the letter S. twisted round the number III., for Sigismund III.; its staff ornamented with a brass bead, and its form exactly like those of the Anglo-Saxons in the Bayeux tapestry. Fig. 15, a Dutch battle-axe, having on it the date 1685, the handle being ornamented with ivory.

In Sir Samuel Meyrick's engraved *Illustrations*, vol. ii. pl. 93, fig. 7, he has given the blade of a battle-axe of its full size of the time of Queen Elizabeth, made in Germany.

The battle-axe was used at a very early period in naval fights, chiefly to cut the ropes and rigging of vessels. (See Scheffer, *Mil. Nav.* ii. 7.)

BATTLE, WAGER OF. [See APPEAL.]

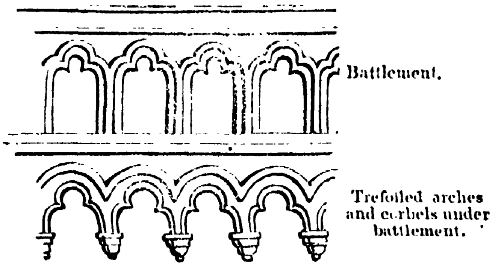
BATTLEMENT, a parapet wall, commonly employed in castellated and in ecclesiastical edifices of that kind which are distinguished by the general name of Gothic. [See GOTHIC ARCHITECTURE.] The battlement is of very remote antiquity, as remains of them still exist in Greece and Italy. (See Mazois' *Pompeii* and Stuart's *Athens*.) The modern battlement, however, is better known as belonging to buildings from the eleventh to the end of the sixteenth century; but it was not in general use in ecclesiastical edifices until the middle of the twelfth century.

The battlement is generally indented, with a coping sloping both ways from about the centre; the lower part between the coping and the cornice of the building is often pierced and decorated. Although by the word battlement is generally understood the whole indented parapet wall, the term may perhaps with more propriety be applied to express rather the higher part of the wall, in contradistinction to the indent, interval, or embrasure. It is possible that the term battlement may have derived its name from the facility afforded to soldiers of doing battle under the protection afforded by the higher part of the indented wall. Battlements offer in their proportions, and in the details of their mouldings and ornaments, a great variety of examples. Mr. Rickman has endeavoured to distinguish the different periods in which the pointed-arch style of Gothic architecture changed the form of its detail; and in this endeavour he has taken great pains to describe the characteristic features of the Norman, early English, decorated English, and perpendicular English styles of battlements.

As to Norman battlements, he says it is very difficult to ascertain what was their precise form. He considers them to have been only plain parapets; but remarks that there are instances in some castellated Norman buildings of a parapet with here and there a narrow interval cut in it, which appears original.

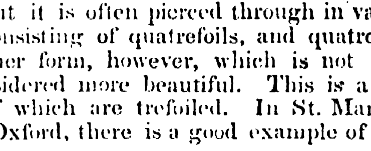
It is more probable, then, that the Norman battlement was a plain parapet, but without intervals; and, if decorated, the decoration probably consisted of the semicircular arch, the peculiar feature of the Norman style. In support of this opinion we may mention the upper part or rim of a Norman font, decorated with semicircular-headed pannels, in South Hayling Church, Hampshire. The Norman church of l'Abbaye aux Dames, at Caen in Normandy, has a parapet decorated with pointed-arched-headed pannels, which at the introduction of the pointed-arch style most probably supplanted the old semicircular-arched pannel, similar to that at Hayling Church.

Early English Battlements.—During nearly the whole period in which this style was in use, the parapet was seldom indented; and in many buildings it was plain, in others decorated. At Salisbury it is executed with a series of arches and pannels, and in Lincoln Cathedral with quatrefoils in sunk pannels. A battlement of equal intervals occurs in small ornamented works erected about the close of this period, when the early English style gave way to another more decorated, denominated by Mr. Rickman the decorated English style.

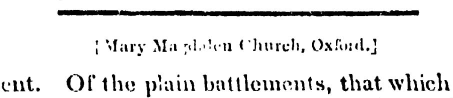


[Salisbury Cathedral.]

Decorated English Battlement.—During this period the parapet wall without indentations continued frequently to be used; but it is often pierced through in various forms, generally consisting of quatrefoils, and quatrefoils in circles. Another form, however, which is not so common, may be considered more beautiful. This is a waved line, the spaces of which are trefoiled. In St. Mary Magdalen Church, at Oxford, there is a good example of this kind of battlement. Of the plain battlements, that which was most in use in this period has the embrasures or intervals narrow, and is surmounted with a capping moulding placed in a horizontal position as at Waltham Cross; but there are some battlements of the same date with the capping running both vertically and horizontally, of which there is a fine specimen in the tower of Merton Chapel, Oxford. In some small works of this style a flower is occasionally used as a finish above the capping, moulding, or cornice, but it is by no means common. The nave of York Cathedral presents a fine example of the pierced battlement so prevalent during this period: it consists of arches or arched pannels



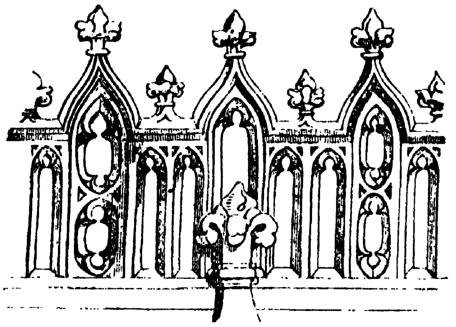
[Mary Magdalen Church, Oxford.]



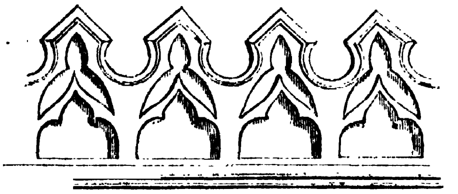
[Waltham Cross, as restored from the antient fragments, by W. B. Clarke.]

trefoiled or cinquefoiled, and the interval is a quatrefoil in a circle; the whole is covered with a moulding running both horizontally and vertically.

Perpendicular English Battlements.—In the battlements belonging to this period, parapets without indentures still continued to be used occasionally; the serpentine line with the trefoil was also still in use, but the line dividing the trefoil was more frequently made straight, and the divisions were consequently formed into triangular pannels. But in the early and best works the trefoils are not divided by straight lines. One of the finest examples of pannelled parapets is at the Beauchamp Chapel, at Warwick, consisting of quatrefoils in squares, with shields and flowers. There are many varieties of pierced battlements belonging to this period. Those erected in the early part of it have commonly quatrefoils, either in the lower compartments or above the pannels of the lower compartments, forming part of the higher pannels. Two heights of pannels are also frequently employed in battlements of this period. At Loughborough there is an example of a fine battlement, consisting of rich pierced quatrefoils in two heights. Such battlements have generally a moulded cornice running round the battlement and the embrasure. A few edifices of a later period have pierced battlements ornamented with pointed compartments, as in the tower of Lincoln Cathedral, the Tomb-house at Windsor, the Lady Chapel at Peterborough, and the great battlement at King's College Chapel, Cambridge. Sometimes on the exterior of a building, and often within, the Tudor or three-leaved flower, forming a point at the top, is used on the battlement, as at the screens in the choir of Exeter Cathedral; and there are a few instances of the upper part of a battlement analogous in form to it in small works erected long before this date,—as at Northampton Cross. But Waltham Cross, erected at the same time, is without this finish. Some battlements of this period, especially in very rich designs, have, in lieu of the Tudor flower, a finial on the top of pierced quatrefoils, as at Woolpit and Blithborough Churches in Suffolk.

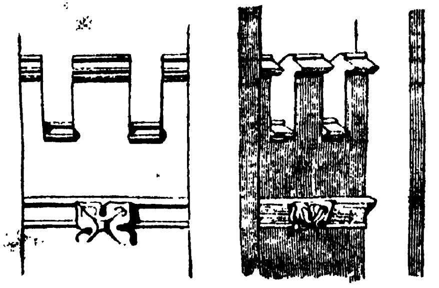


[From the tower of Lincoln Cathedral, from a sketch by G. Moore, Arch.]

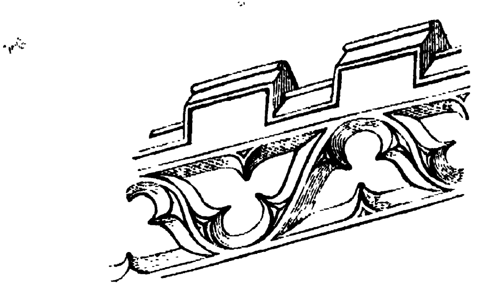


[Northampton Cross, from an original sketch by G. Moore, Arch.]

Of plain battlements in the perpendicular style there are many varieties. Some are formed with nearly equal intervals, and with a plain coping placed both horizontally and vertically. Castellated battlements have the embrasures between the battlements nearly equal to the width of the battlements themselves: sometimes they have wide battlements and narrow embrasures, with the coping moulding placed horizontally and the sides cut plain. Another battlement consists of a moulding running round the battlement and the embrasure, while a capping is set upon the horizontal part of the embrasure and battlement, as at York Minster. The most common battlement towards the close of this period has a broad cornice consisting of several mouldings running both vertically and horizontally, the embrasures being very often much narrowed and the battlement enlarged.



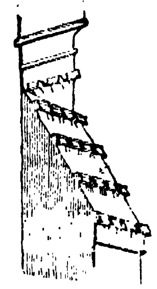
[Turret of King's College Chapel, Cambridge.]



[York Minster.]

As the battlements of the perpendicular style were liable to frequent alterations, they cannot alone be depended on to determine the age of a building. (Rickman's *Attempt to Discriminate the Styles of English Architecture.*) Between the periods which are distinguished by the appellations of early, decorated, and perpendicular English, there are some minute shades of difference in the detail and proportion of battlements. This will be apparent on an examination of the antient edifices of Great Britain.

The battlement, which was originally designed for the protection of the besieged, became afterwards merely an ornament to an edifice. A most remarkable example of the excessive use of it as a decoration is shown in the annexed cut, representing the top of a buttress at Loddon Church, Norfolk.



[Buttress, with battlements, at Loddon Church, Norfolk.]

(For representations of battlements, see Britton's *Cathedrals*; and *Views of Collegiate and Parochial Churches in Great Britain*, by J. P. Neale.)

BATURIN, a town founded by Stephen Bathory when king of Poland, at present situated in the Russian province of Tschernigoff, or Czerniechoff, and in the circle of Konotoss. It occupies a picturesque position on a hill, and is skirted on one side by the Seyma, in the midst of a beautiful expanse of country which is remarkable for its fertility. The town is surrounded by a wall of earth, and contains a handsome convent, eight churches, and about 5000 inhabitants. The environs are well cultivated. The soil and climate are favourable to the partial growth of the filbert, vine, and mulberry; and the trade of the district, which is promoted by fairs held in the place, depends chiefly on agricultural produce. Baturin was for some time a favourite residence of the Atamans of the Cossacks, among whom none has acquired greater notoriety than the traitor Mazeppa, who sold himself to the Swedes in 1708. The Russians, to whom the town has belonged since the year 1604, afterwards burnt it in revenge for the treachery of Mazeppa. It has since been rebuilt, and was with its dependencies, including at that time nearly 9300 male inhabitants, granted by the Empress Elizabeth to Prince Razumoffsky, whose descendants are its present proprietors. The palace of the Atamans and its once handsome grounds are now going to decay. Baturin lies, according to Hassel, in 51° 45′ N. lat., and 50° 40′ E. long.

BAUD, a town in the department of Morbihan on the road from Pontivy to Hennebon and Lorient, 15 miles from Pontivy, and 269 miles W. by S. of Paris; 47° 53′ N. lat., 3° 1′ W. long. It is near the river Evel, which flows into the Blavet a few miles below the town. The population of the commune amounted in 1832 to 5120, but what proportion belongs to the town itself we are not aware.

In the environs of this town is found the staurolite, a mineral composed chiefly of silex and alumine, and whose crystals frequently penetrate each other at right angles or obliquely, so as to form a cross. It is found also in the adjacent department of Finisterre, and in one or two places in the south of France.

BAUDOUR, a town and commune in the province of Hainault, situated two leagues west of Mons. It is bounded on the north by the commune of Villerot, on the south-west by Hautrage, on the south by Boussu and St. Ghislain, on the south-east by Quaregnon and Jemappes, on the east by Ghlin, and on the north-west by Erbisœul. The surface of this commune is much varied. Near the town, on the west, is a hill covered with wood; to the south are large meadows, and on the north considerable sand-hills. The central part contains a coal-mine, but it is not worked. Potter's clay is found in considerable quantities, and gives employment to many of the population in making earthenware. In the wood of Baudour, already mentioned, is a considerable deposit of pulverulent phosphate of iron. The soil generally is of very moderate fertility. Wheat can be grown only in a few spots. The rotation of crops on such lands is wheat, barley, rye, trefoil, oats, and then fallow. Some hops are likewise grown, and different kinds of common fruits. There are two salt-refineries in the commune. Population of the commune, 2577. (Meisser's *Dictionnaire Géographique de Hainaut*, 1833.)

BAUGE′, a town in France in the department of Maine et Loire, on a cross-road between La Flèche and Saumur, 10 miles S. of La Flèche and 158 miles S. W. of Paris; 47° 33′ N. lat., 0° 7′ W. long. Baugé is on the right bank of the little river Couanon or Couesnon. Strictly speaking, it consists of two towns, about half a mile or a mile from each other. One of these is named Baugé le Vieil (Old Baugé), or Baugé le Château, while the other, which is the principal, has for its distinctive name Baugé la Ville. There are some manufactures of cloth, serge, drugget, sail-cloth, cotton yarn, &c. The chief trade of the place is in its manufactures, and in timber and cattle. There is a fine bridge of freestone over the Couesnon.

The English, under the Duke of Clarence, brother of Henry V., were defeated before Baugé le Vieil in the year 1421. The French were commanded in this encounter by the Maréchal de la Fayette. There is an hospital in this place; and also a castle, built by Foulques, or Fulk Nera, in the eleventh century.

Baugé is the capital of an arrondissement containing 668 square miles, or 427,520 acres, with a population in 1832 of 81,690. The population of Baugé, without any distinction of the two towns, is given in the same return at 3553 for the commune, or 3433 for the town itself. We suppose this refers only to Baugé la Ville; for in the *Dictionnaire Universel de la France*, 1804, the population of this place is given at 2904, and that of Baugé le Vieil at 1874: together, 4778.

In the arrondissement a considerable quantity of paper is made.

BAUHIN, JOHN, a distinguished botanist, was born at Basle according to Sprengel, or at Lyons according to others, in 1541. His father, who was a physician of great reputation, having destined him also for the medical profession, placed him, towards the completion of his studies, with Fuchsius, a botanist of considerable eminence in his day, and afterwards with the celebrated Conrad Gesner, whom he accompanied in his various excursions through Switzerland. He afterwards visited several other parts of Europe for the purpose of becoming acquainted with their vegetable productions, and with a view to collecting materials for his *Historia Plantarum*, afterwards published. In 1566 he fixed himself at Basle, where he was elected professor of rhetoric. A few years subsequently he was appointed principal physician of the Duke of Wirtemberg, in which situation he died at Montbelliard in 1613.

During his life he published little of importance, but he occupied himself with great industry in reducing the scattered knowledge of the botanists of his day into a single and connected history of the whole vegetable kingdom, which he arranged upon the plan sketched out by Lovel. This work was not printed till nearly forty years after his death, in 3 vols. folio, published at Yverdun in 1650-1, under the care of Dr. Chatré, his brother-in-law. This work, although by no means free from errors, was a most important performance for the time when it appeared, and may be considered the first step towards reducing systematical botany into order. It is now consulted only by those who are curious in the history of botanical discovery, but it will always remain the key to the botanical works which preceded it. In the words of Sprengel, the author deserves great praise for his diligence in collecting and describing plants, disentangling their synonyms, and ascertaining with precision their native places.

BAUHIN, GASPARD, the brother of John, was born at Basle in 1560. After receiving the usual college education, he visited several parts of Europe, with a view to examine their vegetable productions, and to render himself conversant with the state of medical science. Upon his return to Basle, he appears to have gained great reputation as a learned man and a skilful naturalist, and he had honours showered upon him with a profusion which marks strongly the force of public opinion in his favour. We find him described as holding the offices of professor of Greek, of anatomy and botany, and of the practice of medicine, dean of the faculty of medicine, chief physician to the town, and rector of the university. He died in 1624.

His works consist of several medical treatises, especially of a set of anatomical plates, partly original and partly copied from Vesalius and Eustachius; but his reputation chiefly depends upon his botanical publications. He appears to have been better furnished with materials than his brother John, and to have had more command of good artists for embellishing his works, which consist partly of descriptions and figures of new plants,—in his *Phytopinax*, published at Basle in 4to., 1596, and in the *Prodromus Theatri Botanici*, which appeared at Frankfort in 1620; and partly of collections of the synonyms of the botanical writers who had preceded him. The latter appeared in his *Pinax Theatri Botanici* in 1623, of which a second edition was published in 1671, and which is a complete key to the knowledge of the day. He also commenced a very important work, in which all the plants at that time known were to be reduced to the natural orders; but of this, called *Theatrum Botanicum*, one volume only was published, containing the grasses, sedges, and liliaceous plants. He also published a catalogue of the plants growing wild about Basle, a work which both Haller and Sprengel describe as being remarkably complete. Although the writings of the two Bauhins are now little consulted, except by those who occupy themselves with the not very important subject of the history of European species, they must be considered as men who, by their zeal, learning, and good sense, aided by unwearied industry, have largely contributed to the advance of botany, and have been surpassed by no one, unless by Linnæus, in their own department of the science. They do not appear, however, to have been men of much originality of mind, or to have in any way extended the sphere of botanical science: they can only be considered useful pioneers, but as such they are entitled to the gratitude of posterity; for, as De Candolle has well remarked, if they did not succeed in discovering any sufficiently methodical manner of classifying their knowledge, they at least rendered the want of some good classification more apparent than it had ever been before.

BAUHI′NIA, a genus of plants belonging to the natural order *Leguminosæ*. Linnæus applied the name very happily to commemorate the merits of the two Bauhins, for the genus is remarkable for its leaves being generally divided into two twin lobes.

The species are usually twining plants, found in the woods of hot countries, and often stretching from tree to tree like living cables, forming with other plants an almost insurmountable obstacle to the traveller who would penetrate the recesses of a tropical forest. Some of them, however, are small trees, as for example *B. porruta*, which is called in Jamaica mountain ebony, because its wood is sheathed with black. Their flowers are often very beautiful; for which reason they have long been cultivated in the hot-houses of Europe, but they are too impatient of the wretched treatment they receive in the toys which we call stoves to flourish and produce their noble blossoms. So long as plants are cramped in earthen pots, and are treated like the feet of Chinese ladies, we must not hope to see in Europe those

noble flowers which are described by the travellers who have visited the forests of America and India.

BAUMANSHÖHLE is a remarkable cavern in northern Germany, situated in the south-eastern range of the Harz, not far from the village of Rübeland, less than two miles from Elbingerode, a town of the kingdom of Hanover, and nearly six from Blankenburg, a town of the dukedom of Brunswick. This cavern, which is considered one of the most remarkable natural phenomena of the Harz, is in a calcareous rock, and consists of six distinct large chambers, besides a smaller one. These six caverns taken together measure in length nearly 800 feet, and their entrance is 136 feet above the bed of the Bode, a small river which runs through a narrow valley at the foot of the calcareous rocks. The first cavern rises to upwards of 33 feet, and is the largest and most striking. The water penetrating through the rocks which form the roofs of the caverns, brings down with it calcareous matter, which hardens and forms stalactites. These stalactites are of great beauty in the third cavern, and among them is the sounding column, which emits a loud sound when beaten. This cavern was discovered in 1672, by a miner, called Baumann, who entered it in hope of finding metallic ores.

BAUME, or **BEAUME**, the name of two towns in France, and of several smaller places. The towns were distinguished as Baume les Dames, and Baume les Messieurs, or Baume les Moines, from celebrated religious establishments which existed there: that in the former place was for females, and that in the latter for men.

Beaume-les-Dames is situated on the right or N.W. bank of the river Doubs, and in the department to which that river gives name. It is 255 miles E.S.E. of Paris, through Besançon, from which it is distant 18 miles E.N.E. 47° 22′ N. lat., 6° 21′ E. long.

The religious establishment to which this town owes its designation was of the order of St. Benedict, and of great antiquity. According to some it was formed by two brothers, St. Romain, abbot of Condat, and St. Lupicin, abbot of Leucone, (both in Franche Comté, with part of which the department of Doubs coincides,) about the middle of the fifth century: and these appointed their own sister as abbess. Piganiol de la Force (*Nouvelle Description de la France*, Paris, 1722) says its origin is uncertain, and that all that is known is that it was considerable in the time of Charlemagne, and of his son Louis le Débonnaire. The nuns were all of noble birth, and strict examination into this point was instituted when any desired to enter. The abbey however was far from rich. There appears to have been also in this town a convent of Capuchins

This little place has been much injured by the passage of troops in time of war; and, though it is the capital of an arrondissement, had not in 1832 a greater population than 2209 for the town, or 2467 for the whole commune. It is however an agreeable place, surrounded by meadows and by vineyards, the produce of which is well esteemed. The pillars of the high altar of the church attached to the Benedictine abbey mentioned above now adorn the Pantheon, or church of St. Geneviève, at Paris.

Baume-les-Dames contains one or two factories of cotton goods, considerable iron works, with a manufactory of wire and pins, large pottery and glass works, and a paper-mill. There are a library, a *collège* or high school, and an agricultural society. In the environs of the town are quarries of marble, gypsum, and slate; and mines of iron and coal. Baume-les-Dames is also called Baume-les-Nones, and Baume-sur-le-Doubs. The arrondissement of Baume comprehends 633 square miles, or 405,120 acres, and it had in 1832 a population of 64,884.

Baume-les-Moines is a small place, about four or five miles north-east of Lons-le-Saunier, capital of the department of Jura. The Benedictine convent from which it derived its name was originally a mere cell, when it was raised to the rank of an abbey by Count Bernon, abbot of Giny, early in the tenth century. Others carry the foundation of the abbey higher, and ascribe to Bernon a great reformation in the establishment. Pope Eugenius III. reduced the establishment to a simple priory, dependent on the abbey of Clugni, in 1147, but the title of abbey was restored some time after. Proof of nobility was necessary, in order to be received into this establishment as a monk.

The population of Baume-les-Moines, as given in the *Dictionnaire Universel de la France*, Paris, 1804, our latest authority, was 855.

BAUMGARTEN, ALEXANDER GOTTLIEB, was born in 1714 at Berlin, where his father was preacher to the court of Prussia. He studied at Halle, and became a warm admirer of Wolf's philosophy, though it was at that time considered heretical, and Wolf himself had in consequence been obliged to leave Halle. Baumgarten applied himself to the study of logic and of belles lettres, on which he afterwards gave lectures at the Orphan institution of Halle. Having examined what had been taught till then under the name of belles lettres, he endeavoured to reduce that branch of study to fixed principles. He invented the word *æsthetic*, which he applied to the theory of taste, or the science of the beautiful. Previous writers who had written on this subject had mostly limited their investigations to the beautiful in works of art; Baumgarten extended his researches to the qualities that constitute the beautiful in general, whether in natural or artificial objects, and to our faculty of perceiving the same. He divided the science of æsthetic into theoretical and practical: he developed his ideas first in his treatise, *Disputatio de nonnullis ad Poema pertinentibus*, Halle, 1735, and afterwards in his *Æsthetica*, Frankfurt on the Oder, 1750. Æsthetic has since become a distinct science, and is taught as such in the German universities. The other works of Baumgarten are *Metaphysica; Æthica Philosophica; Initia Philosophiæ Practicæ.* 'He examined chiefly the general rights of man, without reference to civil and political law, or to the law of nations, and, like Wolf, he confounded the object of natural law with that of morality.' Such is Buhle's judgment in his *History of Modern Philosophy*, iv. ch. 8.

In his metaphysics, Baumgarten maintained Wolf's principle of the 'sufficient reason,' and also that of the 'harmonia præstabilita' of Leibnitz, though somewhat modified in his definition of it. In 1740 Baumgarten was appointed professor of philosophy at Frankfurt on the Oder. His constant application undermined his health, and after lingering in a weak state for several years he died in 1762. He was a profound thinker, remarkably methodical in the arrangement of his thoughts, and precise in his exposition of them. His elder brother, James Sigismund, studied also at Halle and became professor of theology in that university. He wrote *Instructions on Moral Theology*, 8vo. 1738; *Abridgment of Ecclesiastical History*, 3 vols. 8vo. 1745; *Primæ Lineæ Breviarii Antiquitatum Christianarum*, 1747, and other works on ecclesiastical studies. He introduced important ameliorations into the study of theology at Halle. He died in 1757.

Another Baumgarten, Martin of Breitenbach, patrician of Nuremberg, no relation to the preceding, travelled in the east in the beginning of the sixteenth century and left an account of his journey, which was published after his death under the title of *Peregrinatio in Ægyptum, Arabiam, Palæstinam, et Syriam, facta annis* 1507 *et* 1508, *in lucem edita a Cristophoro Donaver*, 4to. Nuremberg, 1594.

BAUTZEN, or **BUDISSIN** (in the Wend language **BUDISHYN**), a well-built town near the eastern borders of the kingdom of Saxony, situated on the Spree: it is the capital of the circle of Upper Lusatia. Bautzen is known to have existed before the times of the celebrated Wittikind, and to have been defended by a strong castle, now in ruins. It is the seat of a provincial government, a consistory, and other public establishments; and the residence of a titular Roman Catholic bishop. Among other edifices of note, it contains a royal palace called the Orlenburg, now used as public offices (which was burned down in 1410, and rebuilt by

Mathias, King of Hungary); a Roman Catholic chapter-house; a spacious town-hall and public library; a house of assembly for the states; a flourishing and richly-endowed gymnasium; a seminary for educating teachers, with a primary school attached to it; a large cathedral church, founded in 1213, and used both by the Catholics and Lutherans in common, for which purpose it is divided by a screen of trellis-work; a Protestant church for the Wend congregation; three other churches; an orphan asylum; five hospitals; a mechanics' school, &c. There are manufactures of woollens, cotton, linen, stockings, yarn, gunpowder, paper, copper and iron-ware, beer and spirits, &c., in and about Bautzen; and it carries on considerable internal trade. It was the birth-place of Meissner the poet, who died in 1805. In the neighbourhood of Bautzen is Klein Welke, a Moravian colony with seminaries for boys and girls; and also the battle-fields of Hochkirch, and Kittlitz or Wurschen, the one fought in 1746, and the other, which was attended by the conflagration of thirty villages, on the 20th and 21st of May, 1813, between Napoleon and the allied Russians and Prussians. The town contains about 1400 houses and 7200 inhabitants, but with its suburbs nearly 13,000. It is in 51° 10′ N. lat., 14° 30′ E. long.: about 30 miles E.N.E. of Dresden.

BAVARIA (THE KINGDOM OF) derives its origin from one of the most ancient duchies in modern Europe; the name appears to come from the Boii or Boioarii, its early inhabitants, and the appellation is retained in the modern German name of Baiern. It is composed of the greater part of the former circles of Bavaria and Franconia, of certain districts of Swabia, the principalities of Ansbach and Baireuth, the bishoprics of Bamberg, Würzburg, Augsburg, Eichstädt, and Freisingen, and some parts of those of Mainz, Fulda, and Speyer (Spires). Its extent is at present more than one-half greater than in the year 1777, when the elector Charles Theodore inherited it, and added to it his patrimony in the Palatinate, comprising 4240 square miles. The electorate itself did not previously exceed 16,674 square miles, but this accession, and the subsequent acquisition of the Deux Ponts territory in 1799, increased it to 21,550 square miles.* Above seven-eighths of the territories which now compose it lie in the south of Germany, east of the Rhine, and form a compact state, commonly designated the *Territory of the Danube and Main*, which extends from 47° 19′ to 50° 41′ N. lat., and from 8° 51′ to 13° 44′ E. long.; its circuit, taken in straight lines, is estimated at nearly 1130 miles, but followed out in all its curvatures, at upwards of 1530. This portion of the Bavarian dominions, in which seven out of the eight provinces are comprised, is bounded on the south by the Tyrol and Vorarlberg, and at its south eastern extremity by the Austrian circle of the Salzach, in the province of the Upper Ens; in the east, part of the same province and of Bohemia border on it; its north-eastern frontier is skirted by the kingdom of Saxony, and its northern and north-western, by the principalities of Reuss and the states of ducal Saxony; and in the west, it skirts the dominions of Electoral Hesse, Hesse-Darmstadt, and Baden, until its borders reach the Tauber, at Mergentheim, whence the whole boundary to its south-western point on Lake Constanz is formed by the kingdom of Würtemberg. The other portion of the Bavarian dominions, the *Territory of the Rhine*, which is situated on the west bank of that river, and is completely disjoined from the preceding, by the interposition of the Baden and Hesse-Darmstadt possessions, extends from 48° 57′ to 49° 50′ N. lat. and from 7° 6′ to 8° 31′ E. long. The French departments of the Lower Rhine and Moselle bound it on the south, and the Rhine separates it from the grand duchy of Baden on the east; the Rhenish dominions of Hesse-Darmstadt are its north-eastern neighbour; the Prussian province of the Lower Rhine borders it on the north and south-west; and in the north-west and west it adjoins the domain of Meissenheim, belonging to Hesse-Homburg, and the principality of Lichtenberg.

Area and Subdivisions.—In consequence of the want of official details, considerable difficulty has hitherto attended every attempt to estimate the superficial extent of the Bavarian territory; some have reduced it to 28,000 square miles, while others have exaggerated it to 37,000; and one writer (Jacobi) to nearly 38,000. The documents, however, which have been lately brought before the Bavarian legislature enable us to submit the following as a correct statement of the total area of the kingdom of Bavaria. We have availed ourselves of this opportunity to add some other details for the purpose of rendering the statement still more comprehensive.

	Provinces or Circles.	Area.Sq. Miles.	Towns.	Market Towns.	Villages and Hamlets.	Population.		
						1817.	1828.	1833.
Territory of the Danube and Main.	The Isar, containing 31 districts (Land-gerichte) capital München (Munich)	5908	16	41	6550	489,452	581,923	595,363
	Lower Danube, 23 districts, capital Passau	2964	12	42	4511	488,442	539,039	552,028
	Regen, 27 districts, capital Regensburg (Ratisbon)	3495	27	60	2688	362,021	407,541	432,068
	Upper Danube, 46 districts, capital Augsburg	3914	23	72	2730	487,840	505,220	516,435
	Retzat, 42 districts, capital Nürnberg or Nuremberg	3112	41	65	2764	361,675	419,949	432,172
	Upper Main, 44 districts, capital Baireuth	3198	34	70	2370	460,328	523,789	547,003
	Lower Main, 51 districts, capital Würzburg	3489	43	31	1136	485,312	542,475	568,337
		26080						
	Province of the Rhine, 12 circles (Land-commissariat) each having from 2 to 4 cantons, capital Speyer (Spires)	2355	12	29	713	429,687	517,081	543,984
	Total	28,435	208	410	23,462	3,564,757	4,037,017	4,187,390

This area of 28,435 square miles is thus distributed;

Arable land	8,171,520 acres
Meadow do.	2,325,120
Vineyards, gardens, dwellings, out-buildings, &c.	309,120
Woods and forests	5,376,000
Waters, rivers, and lakes	420,080
Grazing and other land	1,596,560
	18,198,400

Bavaria is the thirteenth in the list of European states with regard to extent and amount of population, and ranks next to France, but immediately above Austria, with regard to density of population: as appears by Von Zedlitz's comparative tables.

Mountains.—The highlands of Bavaria are offsets from two great masses, the Alps and Sudete-Hercynian chain. To the former belongs that portion of the Noric Alps which stretches along the south-east of the circle of the Isar, and throws out its arms into that province; the Arlberg mountains, which enter the circle of the Upper Danube from the Tyrol and subside in this province; the Allgau-Alps, which commence near Kempten in the south of the same province, and extending north-eastward, terminate near Mindelheim. The highlands on the north side of the Danube, beginning at the northern part of the kingdom, contain the Spessart mountains, a finely wooded chain, separated from the Odenwald by the Main. They cover an area of 147 square miles, and traverse the circle of the Lower Main from north to south; their highest summits, such as the Engelsberg and Geiersberg, do not exceed 2000 feet in elevation. The Steigerwald, a forest range of inferior altitude, extends south of the Main, along the borders of the circles of the Lower and Upper Main and the Retzat, and affords a picturesque alternation of woods and fruitful valleys. The Rhongebirge, a bleak and desolate chain of mountains, with flattened summits covered half the year with snow, lie in the circle of the Lower Main, to the north of the river Main. They are attached on the east to the Fichtelgebirge, and on the west border on the Spessart; they attain their highest elevation in the Kreuzberg, which is 4162 feet above the level of the sea. The Fichtelgebirge, which is connected with the Bohemian forest chain, lies in the north-eastern circle of the Upper Main: the chief component parts of this mass are granite, gneiss, quartz, and clayslate; the highest summits are the Ochsenkopf, or Ox's Head (5280 feet) and some points of the Schneekopf, or Snow-peak, (3502 feet). Of the Thüringerwald, or forest of Thuringen, an inconsiderable portion lies within the circle of the Upper Main, where it goes by the name of the forest of Franconia (Frankenwald). On the west side of the Rhine, a branch of the Jura, the 'Vosgesus Mons,' which loses the name of the 'Vosges' on entering Rhenish Bavaria, where it is Germanized into the Wasgau, stretches in a north-easterly line deep into the centre of that province, and terminates in the canton of Kirchheim, in which is situated its loftiest summit, the Königsstuhl, one of the group of the Donnersberg (Mountain of Thunder), 2142 feet high. The composition of this chain is chiefly old red sandstone, though in some parts, particularly on the Donnersberg, which is crowned with a plateau above 100 acres in area, it contains hornblende and porphyry.

In these masses of Bavarian highlands the most elevated points, not before indicated, are, the Zugspitz of the Noric Alps, in the circle of the Isar, 9659 feet, and the Wetterschroffen, 9387; the Hochvogel of the Allgau range, in the circle of the Upper Danube, 8476: and the Teufelg'süss, in the same circle, 9283 feet. The only Bavarian heights which rise into the region of perpetual snow belong to the Noric Alps. The Bavarian mountains are generally raw and inhospitable, but well wooded. The Sudetsh branch of the great Hercynian range comprehends the Bohemian forest mountains (Böhmer-Wald Gebirge) which run along the eastern confines of Bavaria to the extreme eastern point where Hohenstein, about twenty-three miles north of the Danube, is situated, and, separating the kingdom from the Austrian dominions east of them, throw out several arms into the circles of the Lower Danube and Regen. Their highest summits on the Bavarian side are the Arber, 4824 feet, the Rachel, 4720, and the Dreisesselberg, 4054

Bavaria is, on the whole, a mountainous country; not only is it walled in by lofty mountains on the north and south, but its interior is intersected in various directions by elevated ranges. It contains, however, many wide and fertile valleys, and numerous extensive plains, the face of which is not unfrequently disfigured by swamps and morasses, here called 'Moose' and 'Filze,' from their surface being covered with a thick jungle of lichens (*lichen-muscus*) and reeds. Of these moors the largest are the Donaumoos, eighty miles in area, between Schrobenhausen and Ingolstadt: the Erdingermoos, in the circle of the Isar, upwards of 100 miles in area: the Isarmoos, between Laroek and the banks of the Danube, thirty-five miles in length and about three in breadth; the Eschenlohermoos, which stretches from the banks of the Laisach to Mornau; and the Rosenheimermoos on the Inn. These moors, part of which have latterly been drained, have hitherto been entirely unprofitable. The greatest extent of plain stretches full fifty miles in a south-eastern direction along the Danube from Ratisbon to Osterhofen; next to this in extent are the Königswiese (Royal Meadow), or Bockinger Heath, spreading from Bocking to Schärding; the Riefs, in the heart of which lies Nördlingen: the flats of the Regnitz which encircle Nuremberg; and that portion of the valley of the Rhine, on its west bank, which spreads into a dead plain round Landau, in Rhenish Bavaria. The most romantic parts of Bavaria are the regions on the south-eastern borders, where Alpine heights, mountain-torrents, lakes, and glaciers, combine to give them the characteristics of the Swiss or Tyrolese landscape.

Rivers, Lakes, &c.—The Rhine forms the eastern boundary of the Rhenish subdivision of Bavaria, from a point north-east of Lauterburg to a point a little south of Worms; the principal streams which fall into it on the Bavarian side are the Lauter, below Lauterburg; the Klingbach, south of Sondernheim; the Queich, close to Germersheim; the Speier, near the town of Speier or Spires; the Rehbach, &c. The breadth of the Rhine above Lauterburg is 1400 feet; its fall in this part of its course is estimated at four and a half feet in every three miles and a quarter, and it flows at the rate of about 395 feet per minute.

The Danube enters the south west of Bavaria from the Würtemberg dominions about two miles south of Ulm, and in its north-easterly and navigable course through the heart of the kingdom as far as Regensburg (Ratisbon) flows past Günzburg, Hochstädt, Donauwörth, Neuburg, and Ingolstadt, between which last town and Ratisbon it has a fall of 110 feet. In its course (which is about E.S.E.) from Ratisbon to Passau it has on its right bank Straubing and Vilshofen, and between Ratisbon and Nieder-Altaich, a spot five miles below Deckendorf, not far from Passau, in the circle of the Lower Danube, a fall of 150 feet. The course of this tortuous and impetuous river from Ulm to Passau is stated by St. Behlen to be fifty-seven and a half German miles, or about 270 English: the principal streams which are tributary to it along this line are, on its right bank, the Iller (after the latter has received the Bleibach), the Leiba, Mündel, Zusam, and Lech, the Isar below Deggendorf (after it has been joined by the Loisach, Amper, and Würm), and the Inn, near Passau (after it has been increased by the influx of the Alz, Salzach, &c.). On its left bank the chief rivers which fall into the Danube are the Wörnitz near Donauwörth, the Altmühl near Kehlheim, which rises not far from Hornau in the Retzat circle, the Rohrbach near Bubenheim, the Sulz near Beilingries, the Naab, which flows down from the Böhmerwald, is increased by the waters of the Heidnab from the region of the Fichtelgebirge, and joins the Danube above Ratisbon: and lastly the Regen, which also comes from the Böhmerwald, and uniting with the black, white, and lesser Regen, traverses the circle to which it gives its name, and discharges itself into the Danube near Stadh-am-Hof, opposite Ratisbon. During its course through the Bavarian territory the Danube receives no less than thirty-eight rivers.

The Main originates in two streams, the red and white Main, the white springing from the vicinity of Neubau, and the red from the Ochsenkopf, part of the Fichtelgebirge in the circle of the Upper Danube; these unite at Steinhausen below Kulmbach, and flow in a general western course to a point a few miles west of Bamberg. Bamberg is on the Regnitz, a large stream which joins the Main on the left bank, a little below Bamberg. The Main continues a general western course to Schweinfurth, Kitzingen, Würzburg, and Aschaffenburg, whence it passes into the territory of Hesse. It is navigable above Bamberg, and in its course through the northern circles of the Upper and Lower Main receives the Rodach near Staffelstein, the Franconian-Saale at Gmünden, the Regnitz (as already mentioned), below Bamberg, and many other smaller streams. There are three other rivers of note which rise in the Bavarian territory · the Eger and Saale, both come from the Fichtelgebirge; the former runs eastward in the circle of the Upper Main into Bohemia; and the latter northward from the Zetterwald in the same circle into Saxony; and the Fulda, which flows immediately into Electoral Hesse, and after its junction with the Werra forms the Weser.

Bavaria does not yet possess canals of any magnitude. There is a canal in the neighbourhood of the Ammersee, in the western part of the circle of the Isar, 13,000 feet in length, which enables timber-rafts to avoid the hazardous navigation of that lake as well as to save a distance of more than five miles. A cut was made in 1818 betweeen Wörth and Knitlingen (both on the Rhine), 10,624 feet long and sixty-two feet broad, with sluice-gates upon the Rhine at each extremity. Another canal was finished in 1807, between Rosenheim and Kufstein, which is 7400 feet long and thirty-six broad, and by which nearly two square miles of highly fertile land have been brought under cultivation. There is also a navigable canal from Frankenthal to the Rhine. In the year 793 the Emperor Charlemagne resolved upon uniting the German Ocean with the Black Sea by a canal which would have run from the Altmühl to the Regnitz, and thus have established a navigable line between the Danube and the Rhine through the Main; and there is every prospect, from the active exertions of the Bavarian government to forward this great object, that this undertaking will now be accomplished.*

---

* The official prospectus upon which, as well as upon a law passed in July last (1834), a company is forming for the purpose, states, that 'the Junction Canal between the Danube and Rhine, by means of the Main, including the portion of the river Altmühl which is to be made navigable, will be 592,543 Bavarian feet, or twenty-three and a half German miles in length (about 563,900 English feet, or 107 miles). It is to pass in the direction of the two great commercial towns Nuremberg and Fürth. Its proposed dimensions are a breadth of fifty-four feet at top and thirty-four feet at bottom, and a depth of five feet. The width of the chambers for the sluices is to be sixteen feet,

On the Boden See (Lake Constanz) are situated the harbour and fortress of Lindau, the most south-western point in Bavaria, but only a small portion of the surface of this lake belongs to Bavaria. There are numerous lakes within the Bavarian territory. The largest is the Chiem-see (lake Chiem), which lies between the Inn and the Alz, about thirteen miles south of Wasserburg and twenty miles east of Rosenheim, in the circle of the Isar; its surface is about 22,400 acres; it is about thirty-five miles in circuit, and its greatest depth is above 500 feet. Three islands, or rather hills, rise above its surface, on two of which are the remains of suppressed ecclesiastical communities: its fisheries, which belong to the crown, are extremely productive. In the western part of the same circle is the Würm, or Stahrenberger-See, a beautiful lake, about sixteen miles south-west of Munich, fourteen miles in length and about four in breadth. The Ammer-See, west of the Würm-See, is a beautiful piece of water, about twelve miles long and twenty-seven in circuit; its area contains about 11,000 acres, and its greatest depth is 269 feet. There are seven villages on its western banks: it abounds in fish, and derives its name from the Ammer, Amper, or Amber, which falls into it at its southern extremity and quits it in the north-east near Eching. This lake is united by the river with the Staffen or Staffel-See, a lake on the west side of the town of Murnau, about five or six miles in circuit. The Waller or Walchen-See (Lacus Wallensis), is another large lake to the south-east of Murnau, containing about 13,500 acres. This lake appears to be an old crater, an opinion which has gained more general credit from the violent agitation of its waters during the great earthquake of Lisbon in November, 1755. Its greatest depth is 612 feet, and it lies 561 feet higher than the adjoining Kochel or Kechel-See, which is also situated in the south-western part of the circle of the Isar, on the road from Munich to Innsbruck. The surface of the Kochel-See is estimated at about 1200 acres and its depth at 210 feet; both these lakes are full of fish. The most south-eastern of all the lakes in Bavaria is the King's (König) or Bartholomæus-See, in the same circle: its banks are precipitous, and it is surrounded by mountains. The Königsbach throws itself into the lake from a lofty precipice. South-east of Munich, between the Isar and Inn, about thirteen miles east of Holzkirchen, is the beautiful lake called the Tegern-See, with a royal residence, once a Benedictine monastery, on high ground at its south-east extremity: it is encircled on all sides by green valleys, woods, and mountains, and has an elevation of 2187 feet above the level of the Mediterranean: its length is about a mile and a half, and its breadth about two miles: its greatest depth is 337 feet. On its east side is the Quirine spring, a spring of naphtha, discovered in 1430, which flows from a layer of peat: the liquid is of a greenish-brown tint, inflammable, and affords, in some years, a supply of about fifteen or sixteen gallons.

Climate.—The climate of Bavaria is, on the whole, temperate and healthy. It is cold and bleak in the mountainous districts, but milder in the plains and valleys through which the Main, Altmühl, and Regnitz flow, particularly in the parts adjacent to the first of those streams, where the Thuringian and other mountains shelter them from north winds. In these parts the chestnut and almond thrive; and the vine is cultivated for wine; but the latter does not succeed so well in the low country about the Danube, which suffers from extreme cold in winter and oppressive heat in summer. In the elevated regions of southern Bavaria, fruit cannot be raised. The Rhenish possessions have a climate as mild and salubrious as the country traversed by the Main, except in some districts of the west, which are intersected by the Vosges and their branches: here the winter still prevails, while flowers and fruit-trees are blossoming in the rich and sunny plains. 'In the plains,' says Crome, 'the thermometer seldom rises above 86° Fahrenheit, or falls below 50°.' We give this fact as we find it stated in Crome's work.

Vegetable Productions.—Few countries possess a more productive soil than Bavaria; yet, until very recently, few people have turned their natural advantages to so little account: ignorance and idleness have been the obstacles by which the improvement of husbandry has been checked. It is not many years since nearly one-third of the available surface of the circles of the Isar, Lower Danube, and Regen was lying waste and uncultivated; but a new spirit has sprung up under the present enlightened government, agricultural enterprise has been roused, and antiquated habits and prejudices are rapidly giving way to improved methods of cultivation. Large tracts of the Moose or moors have already been brought under cultivation; and the quantity of land under the plough has increased to nearly nine-twentieths of the whole surface of the Bavarian dominions. Of this quantity, six-sevenths belong to the provinces of Bavaria Proper, the area of which is more than nine-tenths of that of the whole kingdom; the remaining seventh belongs to Rhenish-Bavaria, whose surface is considerably below one-tenth of the whole.

Agricultural industry is principally directed to the cultivation of wheat, rye, barley, and oats. the produce of the crops, however, varies considerably both in quality and quantity, so much so indeed with respect to the latter, as to range from three-fold to twelve fold: on the average it may be estimated at about 5¾ bushels per English acre. The annual quantity of grain, therefore, which Bavaria raises is between 5,200,000 and 5,900,000 quarters, which agrees closely with the calculation made by Malchus, and is corroborated by the well-known fact, that the country produces a much larger supply than its own consumption requires. The circle of the Lower Danube, which comprises the larger portion of Southern Bavaria, is comparatively the most productive in grain; the circle of the Retzat, and particularly the Ansbach and Baireuth districts, are superior to the remaining provinces, which, with the exception of the Rhenish possessions, whence corn is exported, scarcely raise more grain in common years than what is adequate to their own demand. In some districts rice, spelt, maize, and buckwheat are also cultivated; but there are parts in the neighbourhood of the Spessart where the climate and soil are unfavourable to the growth of almost every kind of corn-seed.

Next to grain, the vine and hop-plant are important objects of cultivation. The former is grown in few districts, except the circles of the Rhine and Lower Main. The Lower Main produces the Franconian wines, mostly white, known by the names of the Main, Were, Saale, and Tauber wines, which indicate the districts where they are made: the western declivity of the Steigerwald, and the Plain of Geroldshofen, have their vineyards also. The celebrated Steinwein is a produce of the Steinberg, in the Mark of Würzburg; and the no less celebrated Leistenwein is from the same quarter, namely, the southern slope of the Marienberg, near the town of Würzburg. Those parts of the circle of the Rhine which produce the choicest wine, are the vineyards near Forst, Deidesheim, and Wachenheim, on the declivities of the Hardt mountains. In favourable seasons, the quantity of wine produced in the Lower Main is estimated at 63,000 fuder (about 11,340,000 imperial gallons), and in the Rhenish province, at 92,000 (about 16,560,090 gallons): the whole amounts to about 27,900,000 gallons. Allowance being made for failures in unfavourable seasons, the average yearly produce may be estimated at 104,000 to 117,000 fuder (18,700,000 to 21,000,000 gallons), and their value at between 750,000*l.* and 850,000*l.* The cultivation of *hops* has made much progress in Bavaria: and the produce of the plantations around Spalt and Heersbrück (in the Retzat), and Höchstädt, and other parts of the Upper Danube circles, is accounted scarcely inferior to the finest Bohemian: the quantity raised every year is about 80,000 cwt., of which from 16,000 to 18,000 are exported, and the whole, at the average market-price, may be estimated at an annual value of about 7,500,000 or 8,000,000 florins (720,000*l.* to 766,000*l.*). Considerable quantities of tobacco are grown in the circles of the Rhine and Retzat, the former of which produces between 7000 and 8000 cwt., and the latter from 20,000 to 30,000; altogether more than adequate to the home demand. The cultivation of *flax* and *hemp* has greatly increased, particularly in the justiceship of Wasserburg, in the south-east of Bavaria: but the country is still dependent on foreign supplies of both articles. *Oil*, extracted from linseed, rape, and other seeds, is a manufacture so much on the increase, more especially in the two circles of the Main and in the Rhenish territory, that the exportation

---

and their length 120; they are to be divided into two parts by an intermediate gate, so that the chambers may be filled for a length of 90 or of 120 feet; the last of these lengths being designed for the use of boats, loaded with timber for building, which are extremely long.' The estimated cost of this undertaking is about 817.500*l.* (8,529,997 florins), and the Bavarian government, without waiting for the complete formation of the company, have directed the works upon the Altmühl to be commenced.

frequently exceeds the importation: much oil likewise is obtained from poppies in the Lower Main; but the finer descriptions of oils consumed are of foreign growth. The raising of *silk* has occupied the attention of the government for some years past, and it has to a certain extent succeeded. The cultivation of this article has been greatly promoted by the Silk Committee of the Society of Agriculture, who imported some hundreds of mulberry trees from Italy, Hungary, and the Rhenish districts, in 1824, and distributed them in various quarters. A hundred thousand of these trees have also been raised from the seed brought from Italy, and sown in the royal plantations about the English Garden at Munich. *Fruit* is most extensively raised in the southern districts of the kingdom; though the finest sorts are probably those which are cultivated in the environs of the Main and the Rhenish territory, whence considerable quantities are exported. Liquorice (of which the Bamberg sort is considered the finest raised in Germany), aniseed, coriander, cumminseed, and saffron are cultivated in many parts. Madder forms an article of large export from the circle of the Rhine; and generally the cultivation of such roots and plants as afford a dye appears to have been successful. The potato is far more generally cultivated in the northern and Rhenish districts than in the southern: hay and other fodder for cattle are produced in abundance. Iceland moss is also collected in Bavaria.

Division of Property.—'The soil,' says St. Behlen, 'is divided in very equal proportions. In the six old circles (those of the Retzat, Regen, Upper Main, and Isar, and of the Upper and Lower Danube) there are 2,254,603 estates held by 606,989 proprietors. The same may be remarked of the circle of the Rhine; but of the Lower Main we have no authentic returns. The rare occurrence of large properties is shown by the inconsiderable number of individuals, who, as possessing freeholds rated to the land-tax at the value of 8000 florins (about 765*l.*), are eligible to seats in the legislature; for it appeared at the first election, that exclusively of noblemen and persons holding property in towns, the number of such individuals did not exceed 7181. The laws of the land are favourable to the subdivision of estates. In the circles of the Isar, Regen, and Lower Danube we find many comparatively large properties, between 200 to 400 tagwerken (170 and 340 acres) in extent; in these quarters such subdivisions are seldomest known, on account of the thinness of the population. The state possesses, in landed property and ground-rents, to the value of 209,548,415 florins (about 20,087,000*l.*), which constitutes between a fifth and a sixth part of the entire value of landed property in Bavaria.'

Forests, Timber, &c.—The proportion of soil occupied by woods and forests, as compared with the surface occupied by arable land, is nearly 66 of the former to 100 of the latter. Most of the mountains in Bavaria are finely wooded: many of the more extensive plains also contain forests. Those of the Spessart and Rhön mountains, in the circle of the Lower Main, may be considered as the most valuable; the oak obtained from the Spessart is highly esteemed, and is exported to a large amount; but the beech of the Rhön is very little inferior to it in strength. It may be observed, in general, that the woods in the lowlands consist of oaks and beeches, but, in the elevated regions, of junipers, with firs, pines, and others of the same species. Extensive tracts of wretched woodland occur in some parts, as, for instance, in the circle of the Isar, where there are upwards of 103,000 acres of such land, intersected by ranges of high barren rocks. The yearly produce of the Bavarian forests, independently of fire-wood and brush-wood, is estimated at 2,370,000 klafters, and the quantity of timber thus produced is so much beyond the domestic consumption, that, in 1821, the value of the exports was 221,350*l.* (2,309,676 florins) greater than that of the imports. The quantity of woodland belonging to the state forms one-third of the whole Bavarian woods and forests; and their gross annual value for 1821, as reported to the legislature in 1828, was about 344,530*l.* (3,595,065 florins). In consequence, however, of the heavy expenses attending their management, the rights possessed by individuals to certain proportions of the fellings and other burthensome contingencies, the net produce accruing to the state does not appear to have been more than about 160,180*l.*, or 1,671,466 florins. In this amount, we should add, no credit is taken for the quantity of timber, &c. in stock, nor for the produce of the 167,000 acres which are appropriated to the consumption of the salt-works, and to other public purposes. The remaining two-thirds of the Bavarian woodlands belong to parishes, endowments, and private individuals. The largest forests are those near Kempten, which cover a surface of 235,143 acres, and in the region of the Spessart, which are 91,740 acres in extent but in Rhenish Bavaria both timber and fuel are comparatively scarce. Potashes, tar, turpentine, and juniper berries are among the other products of the Bavarian forests.

Animals.—Bavaria is full of rivers and streams, the banks of which are bordered with excellent pastures; and they have been rendered still more productive in the two circles of the Main and that of the Retzat by artificial irrigation. The mountains also abound in pastures, which have been improved in many parts by careful cultivation. No branch of grazing, however, is so extensively pursued as the rearing of horned cattle; and in this respect the circles of the Upper Danube and Isar take the lead; yet the whole stock is inadequate to the wants of the inhabitants, and by no means commensurate with the capabilities of the country. In 1821 the stock amounted to 1,895,687 heads; and supposing the annual increase to have been at the rate of one in every three hundred for the thirteen years since elapsed, the present stock may be estimated at nearly 1,980,000. It may be observed also that the imports of oxen, hides, and cheese exceed the exports by about 16,000 oxen, 2000 cwt. of hides, and 2500 tons of cheese. Sufficient exertions have not yet been made to improve the breeds, though much good has been done by the establishment of agricultural and veterinary schools, and the distribution of prizes at the rural festivals. Of sheep, the numbers in 1821 were 1,238,103, and it is calculated that they have increased to about 1,400,000 since that time. The neglect of this branch of agriculture during the last forty years, which, we believe, is without a parallel in any other German state, may be inferred from the fact, that in the year 1794, when the Bavarian dominions were but 20,030 square miles, their flocks contained 1,046,881 sheep: whereas now, when the territory spreads over an area of 28,435 square miles, they are not more than we have stated. The majority of the Bavarian flocks are of the native breed; but great pains are at present bestowed upon their improvement, and the result has already been advantageously felt on the royal sheep grounds at Schleissheim near Munich, and Waldbrunn, as well as in other parts of the country. Much also remains to be done, we are told, towards improving the domestic breed of horses: their number, which was 324,991 in the year 1821, is now said to have risen to 340,000, exclusive of such as are employed for military service and in public establishments. The horses imported into the country, however, still continue to exceed those exported, by several hundreds annually. Swine are reared in all quarters, but more particularly in the neighbourhood of the Spessart and Rhön mountains, where acorns are abundant: though no accurate account of their numbers is extant, Malchus is of opinion that they range between 1,400,000 and 1,500,000. Of goats the stock is not large; and few mules or asses are bred. Fowl, both wild and domestic, are plentiful: the rearing of bees has been neglected until of late years. The lakes and rivers of Bavaria abound with fish: in the circle of the Isar especially, where the largest inland waters exist, and along the banks of the Main and Rhine, thousands derive a comfortable livelihood from the fisheries. The most noted species are the salmon of the Rhine, the trout of the Franconian streams, and the crayfish of the Altmühl. Pearls are found in the Ilz and other minor streams. The wolves and bears, which used to infest the forests and highlands of Bavaria, are rapidly diminishing.

Metals and Minerals.—Every inducement has been held out by the Bavarian government, both to natives and strangers, with a view to encourage the working of the mines. The principal products are iron, coals, and salt; gold and silver are found in small quantities, only in the waters of the Inn, Rhine, Danube, and Isar; quicksilver, to the amount of 280 or 290 cwt., in the circle of the Rhine; and copper, which was formerly raised in several quarters, is now confined to the works at Kahl and Kaulsdorf, in the circle of the Upper Main, which produce about 770 cwt. per annum. There are two mines of cobalt also on the latter spot, from which small quantities of tin, lead, and antimony have occasionally been obtained. The Upper Main, Rhenish Bavaria, Regen, Lower Danube, and Isar territories are the chief mining districts in Bavaria. There are, in the whole kingdom, 44 iron high-blast furnaces, of which 8 belong to the crown; 30 low-heat furnaces, 17 smelting-works, 332 forges and hammers for beating out the metal, &c., 1 steel-works, and 19 wire-mills, the annual produce of which is about 11,150 tons of raw and cast-iron, 6990 tons of wrought-iron, 4300 cwt. of steel, 7200 of plate-iron, and 4000 cwt. of wire; but as the whole quantity of metal raised is not sufficient for the consumption of the country, the deficiency is made good by importations. Of this native iron, the Isar mines at Neukirchen average yearly about 5500 tons, and the Upper Main about 4000. Bavaria possesses likewise 136 pits of iron-stone, which is raised in all of its eight circles, to the average extent of 41,500 tons a year. The coal-mines are in the districts of Stadsteinach and Wundsiedel in the Upper Main, and of Kaiserslautern in Rhenish Bavaria; the number of shafts at work in these parts is fifty-one, of which eight are the property of the crown, and the remainder of private individuals. The whole quantity raised is about 35,000 tons a year, which might be greatly increased by working the rich beds in which other districts of Bavaria are known to abound. Black-lead (or graphite) is worked in several places, particularly at Obernzell, whence much is sent to America for the purpose of making crucibles: the whole number of mines in activity is thirty-three, and the quantity produced, about 200 tons per annum. The sulphur raised in various parts is not sufficient for the home consumption. Porcelain-earth is another Bavarian product; the best is obtained in the justiceship of Wunsiedel in the Upper Main, and of a quality said to be the finest in Germany, if not in Europe. Salt has been a monopoly of the crown for several ages; and in the last century the pans and works of Schellenberg alone, from which the government supplied the country, produced 241,000 tons. The public salt-works are at present seven in number, and are established at Berchtesgaden, Rosenheim, Reichenhall, and Trauenstein, in the circle of the Isar (average produce about 28,600 tons a year), Orb and Kissingen in the Lower Main (average about 3000 tons a year), and Türkheim in the Upper Danube (average about 420 tons a year). The whole supply amounts to between 32,000 and 33,000 tons per annum: the expense is estimated at about two shillings and sixpence per ton, and the portion retained for domestic consumption at 30,000 tons. On an average of four years, the clear annual profit accruing to the state appears to have been 2,217,375 florins (about 213,000*l.*). There are, according to Stein, three hundred different sorts of marble in the circle of the Upper Main alone. Alabaster and rock crystal, the agate, jasper, and garnet, cornelians, and asbestos, should be added to the list of Bavarian minerals.

Bavaria is abundantly supplied with mineral waters, but few of them are of any note. Among the saponaceous springs we may instance the well of the Virgin (*Marienbrunnen*) at Moehlingen: there are alkaline waters at the monastery of Heilsbrunn in the Retzat, as well as at Bakler in the Würzburg territory; muriatic springs at Benedictbeuern and Kissingen, and at the Wildbad at Rothenburg; sulphuretted-alkaline waters at Abach; and chalybeate springs in various quarters, particularly the Fokberger Baths and Alexander Baths in the circle of the Main.

Inhabitants.—It appears from the tabular statement given above that Rhenish Bavaria surpasses every other part of the kingdom in density of population, the number of inhabitants to the square mile being 230; in the Lower Danube it is 186; in the Upper Main, 171; in the Lower Main, nearly 163; in the Retzat, 138; in the Upper Danube, nearly 132; in the Regen, 123; and in the Isar, although the capital with a population of 80,000 souls and upwards lies within it, not quite 100. The comparative numbers of the two sexes are as follow:—

In the year 1819, 1,788,495 males; 1,908,900 females.
„ 1825, 1,929,625 „ 2,052,912 „
„ 1828, 1,980,278 „ 2,056,739 „

From the average of these three years the proportion of males to females is 125 of the former to 132 of the latter, or 1000 to 1056; which is a little less than the proportion given by Malchus, who states the excess of females over males as being 'not quite 5½ per cent.' According to Rudhart's statement in 1826, the number of dwelling-houses was then 619,482, and the number of families inhabiting them 787,318; each family averaging between four and five individuals. The proportion of the population in towns having 500 families or upwards is also estimated by him at one-seventh of the entire number of inhabitants; and so low a proportion cannot be matter of surprise in a state which is so pre-eminently agricultural. The average proportion of births and deaths for the three years 1819, 1825, and 1828, is 143,576 of the former to 108,345 of the latter; whence we have an average increase, on these three years, of 35,231 souls.

The number of parishes is 8155, and that of public and private buildings of all descriptions was, in 1833, 1,271,567, the value of which was estimated at 778,908,699 florins (about 74,645,417*l.*). The number of such buildings insured against fire was 1,136,977, and their estimated value was 551,026,798 florins, or 52,806,730*l.*

According to Von Zedlitz, the inhabitants of Bavaria consist of 4,113,500 Germans, 60,000 Jews, and 6500 French, or persons of French extraction, who are mostly scattered about Landau and in the circle of the Rhine; the German part of the population is divided into native Bavarians, Franconians, Swabians, and Rhinelanders.

Religion.—We know of no classification of the inhabitants according to their religious tenets of a more recent date than that given by Von St. Behlen for the year 1828, at which period they were composed of

2,880,383 Roman Catholics,
1,094,633 Protestants,
57,574 Jews, and
4,427 of other persuasions.

The 'Edict of Religion' of the 16th May, 1818, does not recognize any predominant national church, but establishes full liberty of conscience, and gives both to Roman Catholic and Protestant an equality of civil rights; the privilege of private worship is secured to individuals of every persuasion, and that of public worship may be granted by the king upon the application of a sufficient number of families. All matters connected with the temporal concerns of religious communities are conducted by the section for ecclesiastical affairs in the home department; but the exercise of judicial power in the Catholic Church, with reference to members of their own body, is entrusted to the archbishops, bishops, abbots, and deacons. The king is the temporal head of that church, and no laws, ordinances, or other public acts relating to it can be promulgated without the royal sanction.

By the concordat concluded with the Pope, on the 5th June, 1817, two archbishoprics, Munich and Bamberg, and six bishoprics, Würzburg, Eichstädt, and Spires, under the former, and Augsburg, Ratisbon, and Passau, under the latter, were instituted. The Roman Catholic Church in Bavaria possesses 191 deaneries, and 2512 cures of souls. The Lutheran Church, which is most prevalent in the circles of the Retzat, Upper Danube, the two Mains, and Rhine, contains 37 inspections, consisting of 1036 parishes or ministries, under the conduct of the three consistories of Baireuth, Ansbach, and Spires, which are subordinate to the 'Independent Superior Consistory' of Munich, the latter being itself subject, to a certain extent, to the control of the home department. We observe that the king of Bavaria does not allow his prelates to use the præfix 'Dei gratiâ' in their titles, considering it a peculiar attribute of royalty; but he permits them to substitute, as an appendix to their official designation, the words 'Divinâ gratiâ.' The revenues of the Roman Catholic Church arise from estates and endowments, over which its hierarchs exercise unlimited control: out of these revenues the archbishop of Munich receives an annual stipend of about 1920*l.* (20,000 florins), and the archbishop of Bamberg, about 1440*l.* (15,000 florins); the bishops of Augsburg, Ratisbon, and Würzburg, 960*l.* (10,000 florins) each, and those of Passau, Eichstädt, and Spires, about 765*l.* (8000 florins) each. Several monasteries and convents have been allowed to spring up again of late years, for the professed purpose of instructing young persons in religious and worldly knowledge, of assisting in the ministerial office, and taking charge of the sick. The present number of religious establishments is thirty-four, of which fourteen are very recent revivals of suppressed communities. In the year 1832 there was not one such establishment in the circle of the Retzat; but there were twelve in the Upper and Lower Danube, seven in the Isar, four in the Regen, ten in the Upper and Lower Main, and two in the Rhenish territory. The higher orders of the clergy, including deans of chapters, are nominated by the sovereign; and, on the representation of the bishops, the circulation of such books as they may deem adverse to 'the true faith, good manners, or church discipline is prohibited. The president of the Lutheran Consistory has a seat and vote in the Senate or Council of the Kingdom (*Reichs-rath*); and the Protestant clergy are maintained by the state at an expense of about 28,000*l.* (290,000 florins) a year. An annual grant of about 95,000*l.* (1,000,000 florins), is likewise made for the support of the inferior Roman Catholic ministers. Besides the pure Lutherans, there are about 7000 reformed Lutherans in Bavaria; but the members of the two persuasions in Rhenish Bavaria came to an understanding in 1818, when the vote of every individual was taken, and it appeared by the result, that 40,167 were in favour of the union, and only 539 against it. Since that period they have formed one single religious community, under the designation of the 'Protestant Evangelical Christian Church.' There are a few Mennonites and Herrnhuthers in the Bavarian States, and since the elevation of the present king's second son to the new throne of Greece, a number of Greeks have taken up their abode in Munich, where they have a separate school for their children, and are allowed the use of one of the churches. The Jewish portion of the population are mostly settled in the Retzat and Lower Main: they enjoy full liberty of conscience, but, under the edict of the 10th June, 1813, are not admitted to participate in civil rights and immunities, unless they become naturalized and adopt distinct family names.

Education.—This important department is under the immediate superintendence of the 'Superior Board of Education and Ecclesiastical Affairs' (*Ober-Schul-und-Kirchen-rath*), attached to the ministry of home affairs, and under the subordinate direction of the several provincial governments, one member of which has particular charge of all matters connected with scholastic institutions. Subordinate again to the latter are the inspectors of district and local schools: those for the local schools being in general the ministers and elders of parishes. No child is excused attendance at the schools, except such as have received permission to pursue their studies under private tutors. There are three universities, two Catholic, at Munich and Würzburg, and one Protestant at Erlangen; the two former are attended by about 2200, and the latter by about 400 students. These three universities have eighty-six professors, and between twenty and thirty tutors (*docenten*), private lecturers, and others, besides excellent scientific collections and auxiliary institutions. Next in rank are the seven lycæa, thirty-four schools of studies, and twenty-one gymnasia, of which Munich and Augsburg have two each: the gymnasia are conducted by seventy-nine professors and 147 other teachers. The lycæa are attended by about 700, and the gymnasia by about 3100 pupils. There are also twenty one pro-gymnasia, and sixteen 'preparatory Latin schools' in Munich, Augsburg, Ratisbon, Würzburg, Landau, Kaiserslautern, &c.; in the last (the Latin schools) there are about 2300 pupils. The number of elementary, mechanics', and Sunday schools exceeds 5000; but we have no return of them of a later date than the year 1821, at which time there were 5008 school-houses, with 7114 masters and assistants, and 489,196 pupils attending them. Bavaria has eight seminaries for the education of teachers, and its legislature annually votes about 3000*l.* (32,000 florins) for the encouragement of elementary schools, besides about 2350*l.* for the inspectors' expenses, and allowances to retired masters. The whole public grant for forwarding 'education and intellectual culture' is 767,811 florins (about 73,600*l.*) The seminaries for educating candidates for ecclesiastical preferment are seven in number. There are veterinary schools at Munich and Würzburg; a royal academy of the arts and sciences of nearly 400 members, and another of the fine arts with eight professors, and an agricultural society, which distributes annual prizes, all in Munich; an academy of physics and medicine at Würzburg, and another of naturalists, as well as a medico-physical economical society at Erlangen: a horticultural society (the Pegnesian order of flowers) in Nuremberg, where there are also societies for the promotion of national industry and the propagation of Christianity; a botanical society at Ratisbon; a school of the fine arts at Augsburg, in connexion with the academy in Munich: and numerous other associations of a useful character. The largest public library in Bavaria is the 'Central Library' in Munich, which contains upwards of 500,000 volumes, including 16,000 manuscripts, 400,000 pamphlets and dissertations, and 250,000 distinct works: the University Library, in the same city, has upwards of 160,000 volumes; that of Würzburg, above 30,000; and that of Erlangen, between 40,000 and 50,000. No printing-press can be established without the previous sanction of the king. Piracy of books, as well as the sale of pirated works, is held to be a misdemeanor; and every bookseller, dealer in antiquities, owner of a circulating library, printer, and head of a lithographic establishment, is placed under the control of the local police in every town, and liable to be brought under judicial cognizance for any offence against the laws, morals, or the public safety.

Constitution.—Most of the states, of which the kingdom of Bavaria is composed, namely, the former duchy of Bavaria, the upper Palatinate, the duchy of Neuburg, and the principalities of Ansbach, Baireuth, Bamberg, and Würzburg, possessed representative constitutions before their consolidation under one head. But the aristocracy in these territories had succeeded in rendering these representative constitutions a dead letter: and in fact, they had long been in a state of abeyance previously to being abrogated by the terms of the constitution promulgated by the late king, Maximilian Joseph, on the 1st of May, 1808. The convulsions which subsequently affected the whole of Europe rendered the constitution of Maximilian Joseph incompatible with the new order of things; and the same king, therefore, on the 26th of May, 1818, granted the Bavarians a new constitution, which defines and establishes their rights and privileges. Its fundamental principles are - liberty of conscience and freedom of opinion, with the reservation of legal provisions against the abuse of either: the right of every native-born subject to be employed in the public service, without exception on account of birth or rank in society; general liability to personal service in the national defence; equality of all before the law: the impartial and uninterrupted administration of justice; general liability to taxes, and an equitable distribution of them; and a legislature, elected by all classes of resident citizens, and enjoying the right of discussing and approving laws, voting the public taxes, and requiring the redress of all infringements upon the rights recognised by the constitution. The kingdom of Bavaria, by this charter, is declared a 'sovereign monarchical state,' and the legislative power is vested in two chambers, conjointly with the king, as head of the state. The succession is limited to the male line, according to the right of primogeniture, with a proviso, that on the extinction of direct heirs male, the next male descendants of the female line shall succeed. No offices of high rank in the civil or military service, nor any office under the crown or in the church, nor any ecclesiastical benefice, can be conferred upon any individual who is not a native-born citizen or legally naturalized. Feudal bondage is abolished, as indeed it was previously by the edict of the 3rd of August, 1808. No Bavarian, to use the words of the charter, can be deprived of his natural and recognised judges. All endowments for public worship (*Kultus*) and education, and for charitable purposes are placed under the immediate protection of the state.

The legislature consists of two chambers, namely the Senators (*Reichsräthe*) and the Deputies. The former is composed of the princes of royal blood, who have attained their majority,—the great officers of the crown,—the heads of houses in the cases of such principalities and earldoms as were parts of the Holy Roman Empire,—a bishop named by the king,—the president of the Protestant General Consistory,—and lastly, of those individuals, whom the king may create members of the chamber for life or hereditarily. The Chamber of Deputies consists, 1, of such landed proprietors as exercise judicial powers in right of their properties (*gutsherrliche Gerichtsbarkeit*), provided they have no seat or vote in the upper chamber;—2, of deputies from the universities:—3, of ecclesiastics representing the Roman Catholic and Protestant churches;—4, of deputies from cities and market-towns;—and 5, of such landed proprietors as do not come within the classes already described. The number of members is in the proportion of one to every 7000 families: of these members one-eighth of the whole number must be taken from class 1: one member from each of the three universities; one-eighth from class 3; one-fourth from class 4; and two-fourths of the whole number from class 5. The chamber is re-elected every six years, except when the king dissolves it, and then the members going out are re-eligible. The chambers cannot proceed to deliberate unless two-thirds of the deputies are present; and both chambers commence and close their sessions at the same time. All motions respecting the public burthens are, in the first place, brought under the consideration of the Chamber of Deputies; in respect of any other subjects the king determines before which chamber they shall be first brought. No direct or new indirect taxes can be levied, nor any augmentation or alteration of existing taxes be made by the king, without the previous sanction of the legislature; and the same sanction is required before any new law or any alteration, authentic exposition (*authentische Erlaüterung*), or repeal of an existing law, affecting the freedom of persons or properties, can take effect. The free right of complaint against violations of the constitution is secured to every citizen, or district. The king is bound to call the legislature together once at least in every three years. Its ordinary session lasts two months; but it may be extended or adjourned, or it may be dissolved, as he may deem expedient: in the last case, a new election of deputies must take place within three months. The ministers, though they are not members of the chambers, have the right of being present at all deliberations. The king, upon his accession to the throne, swears to 'govern according to the constitution and laws of the kingdom:' and every prince of royal blood, upon attaining his majority, solemnly makes oath that he will rigidly observe the terms of this constitution.

The Public Administration.—At the head of public affairs is a council of state, established by a royal decree of the 18th of November, 1825: it is composed of the king, the crown-prince, if of age, of such princes of royal blood in a direct line as are also of age, resident in the capital, and appointed of the council by the sovereign, of the ministers of state, the field marshal, and six councillors nominated by the sovereign. The executive authority is vested in the heads of the following five departments,—the royal household and foreign affairs,—justice,—home affairs,—finance,—and the army—whose heads form the cabinet, and are assisted at their meetings by a secretary-general. Each of the eight circles or provinces has a provincial government consisting of two boards: the one called the Chamber of the Interior, takes charge of civil concerns, the police, the schools, &c.; the other termed the Chamber of Finance, manages the affairs of the domains of the state, and every matter connected with the financial department. The commissary-general (*General-commissair*) is president of both boards, and in some circles he is assisted by a vice-president; each board consists of a director, and several members, called councillors and assessors. The medical-police department is attached to the Chamber of the Interior; and a councillor of medicine (*Kreis-medicinal-rath*) superintends it. Each circle has also its official architect and surveyor.

The Legislature.—The members composing the Chamber of Senators are at present fifty-one: thirty attend in right of hereditary rank or dignities, or from the nature of their family possessions; and twenty-one have been nominated by the king either for life (ten) or as hereditary senators (eleven), the latter of whom are always landholders of noble blood, and must pay at least 144*l*. (1500 florins) clear in land or domanial taxes. St. Behlen observes, that 'there are few noble families by whom this condition is fulfilled.' The number named for life cannot exceed one-third of the whole body of hereditary senators. This chamber, which has a President and Vice-President, cannot open any sitting unless one-half or upwards of the members are present. The qualifications required for a member of the Chamber of Deputies are—that the candidate has completed his thirtieth year; that he is a free and independent citizen; that he is a member of either the Roman Catholic, Lutheran, or Reformed-Lutheran church; that no charge of crime or misdemeanor has been proved against him; and that he pays the house or land-tax on property of the value of 765*l*. (8000 florins), at the least. This chamber is at present composed of 123 members: namely, fourteen landholders, exercising judicial powers on their estates; three deputies from universities; eleven from the Roman Catholic ecclesiastical bodies, and five from the Protestant: thirty from cities and towns: and 60 from the body of landholders not exercising judicial powers. Its deliberations are conducted under a President and Vice-President. At the commencement of each session, an accurate account of the state and appropriation of the public income is submitted by the executive: the national debt cannot be increased without the consent of the legislature, and each chamber appoints a commissioner to assist the Board for its liquidation. Conditions are not allowed by the constitution to be coupled with the voting of any fresh taxes; nor can any subject, as to which the chambers are at variance, be discussed a second time at the same sitting. District Assemblies were likewise established in the year 1825: these consist of the burgomaster, a deputy from each town, or place, where a market is held; of the headsman of each parish (Gemeinde-Vorsteher); a deputy, being the person who pays most taxes, or a small land proprietor, from each parish; and a certain proportion of landholders, tithing-men, and farmers; besides a representative for the financial department of the district. A royal commissioner acts as president of these assemblies; the functions of which are to assess the public burthens and district rates equitably in each parish, and to decide all local questions relating to any matter having reference to these burthens and rates: such as their application in support of establishments for the poor, the sick, &c., in making roads, &c.

Finance.—The continued state of warfare, in which the consequences of the French Revolution involved the Bavarian dominions, and the sacrifices which were made first, in support of Napoleon, and subsequently in shaking off his yoke, involved the state in great financial embarrassments. At the time of the peace of 1815, the state paper had fallen from forty to fifty per cent. below its nominal value; many financial accounts were twenty years in arrear; and the public income was not only of a precarious nature, and the receipts subject to all sorts of irregularities, but seriously prejudiced by neglect or obstacles to their collection. This unfortunate state of things was aggravated by the failure of the crops in 1816 and 1817. The change of ministry, which occurred in the last of those years, has proved eminently beneficial to the kingdom in a financial point of view, for it was the signal for the adoption of a series of judicious measures which introduced order and economy and have already produced their natural results. It appears that in 1819 the excess of the expenditure over the income was 2,007,800 florins (about 192,115*l*.): that the national debt amounted to 105,740,173 florins (10,133,430*l*.), and that the surplus fund towards the redemption of this debt was 1,550,000 florins, (148,542*l*.). In the same year the financial laws enacted by the legislature, fixed the income for the year at 31,126,811 florins (2,982,986*l*.), and the expenditure at 31,017,596 (2,972,519*l*.). The improved administration of the Bavarian finances, however, during the succeeding thirteen years, enabled the government to report to the Chamber of Deputies, in March last (1834), that the surplus revenue for the financial year, 1829—1830, which had been 5,032,353 florins (482,267*l*.) at the beginning of that year, had increased at the close of it to 6,697,731 (641,865*l*.), which surplus had been appropriated subsequently to the current service of the state. They also reported, that in the year 1831-1832, the revenues had produced 29,217,009 florins (2,799,963*l*.), and that the expenditure had been 27,095,883 florins (2,596,688*l*.), leaving a surplus, inclusive of 3534 florins from former years, of 2,121,660 florins (203,613*l*.). With respect to the *national debt* we find, that, between the years 1819 and 1829, it had, from various circumstances affecting the earlier part of this interval, increased from 10,133,430*l*. to 11,392,019*l*. or 118,873,250 florins; and the additions, which raised it to 12,595,276*l*. (131,428,972 florins) in the year 1833, have been chiefly occasioned by the extraordinary expenses attendant upon the convulsed state of Germany since the change of dynasty in France, in August, 1830. *The net public income* of Bavaria for the third financial period, 1832–1837*, has been fixed by the legislature at 2,738,656*l*. (28,577,285 florins); the charges of management, both in collecting the taxes and carrying on the crown monopolies (regie-aufwand), being estimated at 971,656*l*. (10,139,025 florins), and having been previously deducted. The expenses of management amount, therefore, to nearly 26½ per cent. on the gross revenue of 3,710,312*l*. If we assume the population to be 4,200,000, the average amount of revenue contributed by each individual will be found to be 13*s*. 0½*d*. per annum. The *expenditure* for the same period, with a reserved fund of 52,405*l*. (546,840 florins), is fixed at a sum exactly corresponding with the income, of which 2,329,518*l*. (24,308,014 florins) are to be appropriated to the general expenditure of the state, and 409,138*l*. (4,269,271 florins) to the budgets of the several circles (kreis-fonds). The subsequent items of *receipt* are, among others, applied to the purposes of the general expenditure: namely, from the immediate property of the state (national domains and forests, public farms, crown manufactures of glass, molasses, and porcelain, as well as the pearl-fisheries in the Upper Main, Regen, and Upper Danube), 719,007*l.* (7,502,687 florins); from national royalties and establishments (mines and salt-works, the post-office, lotteries, mint, and the profit on the publication of the 'Law and Government Journal') 373,870*l.* (3,901,252 florins); from indirect taxes, such as stamps, tolls, &c., 892,004*l.* (9,307,874 florins): and from direct taxes, 699,439*l.* (7,298,498 florins). Among the items of expenditure are, for the royal household and foreign affairs, 48,560*l.* (506,705 florins); education and civilization (*bildung*) 73,581*l.* (767,811 florins); public worship (viz. Roman Catholic, 100,269*l.*, and Protestant, 27,775*l.*), in all 128,044*l.* (1,336,116 florins); public safety, 39,675*l.* (414,000 florins); the construction of highways, bridges, &c., 118,087*l.* (1,232,216 florins); interest and redemption of the national debt, 785,255*l.* (8,193,964 florins): civil list, 287,500*l.* (3,000,000 florins); and army expenses, 546,250*l.* (5,700,000 florins), independently of the gendarmerie.

---

* For the second financial period, 1825—1831, the income had been fixed by the states at 2,971,840*l*., or 29,132,260 florins, and the expenditure at 2,791,400*l*., or 29,126,600 florins.

Military Resources. - The Conscription Law of the 29th of March, 1812, rendered every male in Bavaria, up to a certain age, with the exception of ecclesiastics and the sons of noblemen, liable to the ballot; but a new law of the 1st of May, 1829, allows every Bavarian to enlist between the ages of eighteen and thirty; and such as have already served six years may contract a fresh engagement in the service until they reach their fortieth year. Every Bavarian is liable to the Conscription Law after he has completed his twenty-first year: and from the first of January succeeding the ballot by which he has been drawn, his liability to serve in the army, if called upon, continues during the two following years: the exemptions are confined to the only son of a parent, who has already lost two sons in the service, and the surviving sons of every parent who has lost three sons in a similar manner. The period of service is six years; no Bavarian can settle or marry, or receive any definitive appointment before he has done all that the law requires with regard to his liability to bear arms. Certain exemptions are granted in the case of ecclesiastics and students, as well as in the case of sons, without whose aid the subsistence of families would become precarious.

Bavaria, as a member of the German Confederation, furnishes the largest contingent of any exclusively German state. It forms the seventh corps of the confederate forces, and consists of 35,600 men: namely, 5068 cavalry, 26,215 infantry, 1380 sharpshooters, and 2919 artillery, pioneers, &c.; to which eighteen howitzers, and fifty-four field-pieces and cannon are to be added. The real strength of the army, however, supposing the present scale of its organization to remain, is now, and would, in the event of a war, be as follows:

			Peace.	War.
Infantry...	16 regts. of the line 4 battal. of sharpshooters	each 2 battal.—each battal. 6 comp.	40,608	41,688
Cavalry...	2 regts. of Cuirassiers 6 do. Light Cavalry	each 6 squadrons	9216	9360
Artillery...	2 regts.—each 2 battal. of 6 comps.—each comp. being competent to serve a battery of 8 cannon		3120	3156
	2 comp. of sappers, 1 of miners, 1 of pontoonmen, and 1 of artificers		650	720
			53,594	55,224

The effective strength of the army, however, as laid down in the details which form the groundwork of the military budget for the third financial period (1832—1837), is of a somewhat different character, for they give as

Constantly present, Officers and others on service,—including, 1 Field-Marshal, 2 Generals, 15 Lieut.-Generals, and 26 Major-Generals, the civil and medical employés, &c.	2119
Subaltern officers, engineers, &c.	4109
Infantry	6912
Cavalry	5032
Artillery, sappers and miners, &c.	1470
	19,642
Present for 1 month only. In all	21,224
Constantly on Furlough. In all	17,196
	58,062

The difference of 2838 men between these numbers and those which have been given as the full war complement, arises from the omission in the last statement of the civil and medical employés, and others, not immediately bearing arms. The infantry and cavalry form four divisions (head-quarters, Munich, Augsburg, Nuremberg, and Würzburg, respectively), each of which consists of two brigades, or four regiments of infantry of the line, one battalion of sharpshooters, a brigade of two regiments of cavalry, and two batteries of heavy cannon, and one of field-pieces. The artillery, pontoonmen, and artificers, as well as the corps of engineers, sappers, and miners, constitute distinct divisions.

The Landwehr, or militia, is, under the ordinance of the year 1826, composed of all Bavarians, who have not been already drafted into the ranks of the active army or battalions of reserve, are not under nineteen or above sixty years of age, and are not noblemen or ecclesiastics. The number is determined by the king according to the emergency; but this force has not hitherto been completely organized, though there are staffs and head-quarters appointed in every circle. On the scale projected it would amount to 250,000 men and upwards, independently of any levies in the Rhenish territory. There is a corps of gens-d'armes, also consisting of nine companies, one for Munich and one for each of the eight circles, and mustering in all about 1700 men. Bavaria has a right to pass by a military road through the territory of Baden, which gives Bavaria direct access to its dominions on the Rhine.

The expense of the military establishment for the six years, 1825-6—1830-1, was 41,719,962 florins, which averages 6,953,327 florins, or 666,366*l.* per annum. In 1824 the moveable property belonging to the Bavarian army was estimated at 979,415*l.* (10,219,987 florins), and the immoveable at 350,905*l.* (3,661,627 florins). The property and funds for the relief of widows and orphans, invalids, &c., also amounted at that time to 385,233*l.* (4,019,821 florins).

The fortified places in Bavaria are—Landau, the strongest of its fortresses, in the circle of the Rhine: it is also one of the fortresses immediately attached to the German Confederation; Passau, on the Danube, in the circle of the Lower Danube; Würzburg, in conjunction with the citadel of Marienberg; Ingolstadt, at the confluence of the Schütter and Danube, in the Regen, at this moment in course of construction; and Vorchheim, in the circle of the Lower Main, a place of inconsiderable strength. Bavaria also possesses several mountain strongholds, such as Rosenberg, near Kronach, in the Upper Main: Rothenberg and Wülzburg, in the Retzat; and Willibaldsburg, near Eichstädt, in the Regen.

Nobility.—The nobility of Bavaria form 2107 families, of whom there are not 1000 possessed of landed property: and the relative proportion of their property as compared with that of the remaining subjects of the crown is as one to nine. The registered nobles in 1823 consisted of 1 grand duke, 13 princes, 154 counts, 422 barons, and 1038 of inferior rank, using the præfix of 'Von.' In all cases where a nobleman enters a menial service, or opens and conducts a shop or warehouse, his title of nobility becomes suspended. In civil and criminal matters he is exempt from the jurisdiction of local courts of judicature, and none but a noble is entitled to establish a seignorial tribunal of justice: but he does not enjoy any advantages, with respect to taxation, legislative pre-eminence, or government appointments, which are not common to his fellow subjects. The royal title is simply '———, by the Grace of God, King of Bavaria.' The order of St. Hubert (1444), with 142 members, holds the first rank: that of St. George, instituted during the Crusades, follows next in precedence; the other orders are, that of Maximilian Joseph (1806), a military, and of the Bavarian crown, a civil order; of St. Michael (1693), and the order founded by the present king in 1827 for the faithful discharge of civil or military duties after a service of fifty years.

Manufactures.—In Bavaria, as in many other German states, the profits arising from vast establishments, and the concentration of productive powers, are comparatively unknown; manufacturing industry is mostly diffused over a multitude of adventures on a small scale. Bavaria is also essentially an agricultural country, and hence the deficient supply in many branches of its manufactures. That of linens, for instance, which is the chief, is not confined to a few large establishments, but is scattered over the whole state, and in many districts the agricultural population partly maintain themselves by weaving linen. The majority of the articles made are of the coarser descriptions; and a large proportion of them are the produce of the Upper Main (where upwards of 7000 weavers and 1000 apprentices are employed upon them), and of the Upper and Lower

Danube. The finer sorts, particularly damask, are inferior both in texture and finish to the Saxon or Silesian; still the quantity exported exceeds the quantity imported by about 12,000*l.* a year. Linen-yarn is also spun in some districts, but not to any great extent, and chiefly for exportation. The manufacture of woollens and worsted hose is carried on principally in the circles of the Regen, Danubes and Mains, the finest being produced in Ansbach, Baireuth, Lindau, Munich, and the Upper Palatinate; but this branch of industry is in the hands of individuals, and not carried on in large factories. The supply is very inadequate to the consumption of the country, and sometimes the excess of imports over exports has amounted to 40,000*l.* per annum. There is a similar deficiency in the domestic supply of manufactured cottons; the use of improved machinery, however, is gradually increasing in many quarters, and additions are constantly making to the number of spinning-mills. The districts about Augsburg, Kaufbeueren, and Hof are the most important seats of this branch of Bavarian industry, and numbers are also employed in hand-spinning. The yearly importation of cotton goods is still said to be 100,000*l.*, and that of cotton yarns to be 51,000*l.* more in value than the exportation. The leather manufactories are of considerable importance, but mostly carried on by numbers of small manufacturers, particularly in the minor towns in the circles of the Retzat, Isar, Upper and Lower Danubes, and of the Rhine. Bavarian calf-skins are in great repute and largely exported, but sole leathers are not produced in sufficient quantity for the home demand. Between the years 1819 and 1824, the yearly value of the leather exported (20,396 cwt.) rose to 58,640*l.*, and that of the same article imported (17,133 cwt.) to 49,260*l.* The supply of paper, of which Aschaffenburg, Nuremberg, Fürth, Augsburg, and Schwabach furnish many fancy sorts, is beyond the domestic consumption; though the usual descriptions are indifferent, there are still about 2800 cwts. exported to the value of about 7000*l.* The number of paper mills is 150, of which 29 are in the circle of the Upper Danube, 25 in the Lower Main, 27 in the Rhine, and 23 in the Regen. Schweinfurt and Mainberg possess large manufactories of paper-hangings, which are of excellent quality and in much demand in other German states. Straw-platting has increased considerably of late years; even in 1824 the exportation amounted to 3312 cwt. and 16,740*l.* in value; and there are some districts, such as that of Weiler in the Isar, which gain between 3800*l.* and 4800*l.* a year by this branch of industry. The 45 glass-houses in Bavaria, of which there are 13 in each of the circles of the Regen and Lower Danube, and 8 in the Upper Main, produce window-glass, bottles, and other ordinary glass-ware to such an amount, that the exports exceed the imports above 19,000 cwt. and 55,000*l.* in value. In the finer sorts the quality is much inferior to the English, and even the French or Bohemian. The number of works for grinding and polishing looking-glasses is upwards of 100; they export on an average 11,700 cwt. of the article in a finished, and 5100 cwt. in an unfinished state. Nuremberg, Fürth, Bamberg, and Augsburg are the principal seats of this manufacture. The whole value of the glass exported is upwards of 100,000*l.* per annum. No optical instruments made on the Continent are more highly valued than those made by Utzschneider and Frauenhofer's establishment at Munich. The manufacture of articles in wood, and the felling, hewing, and general manipulation of timber occupy thousands of hands. There are nearly 2000 sawing-mills in Bavaria for the preparation of boards, deals, and laths; and almost as many families are wholly supported in Ammergau and Berchtesgaden by the manufacture of articles in carved wood, some of which are very beautiful. There are nine porcelain manufactories at work; that at Nymphenburg, not far from Munich, produces china which may bear comparison with the finest in Europe. The number of earthenware manufactories is 14, but the articles which they make are inferior to the English in strength and finish. The Bavarian crucibles are in much request; and the potteries employ nearly 2000 master-workmen, besides labourers, &c. Of slate-works there are above 350. The working of the metals chiefly consists in extensive manufactories of iron-ware, especially nails and needles, the export of which is considerable. Schwabach alone produces annually 140,000,000 sewing, and above 300,000 knitting needles. There is a manufactory of arms at Amberg which supplies the army. The gold and silver-smiths of Munich, Würzburg, Nuremberg, and Augsburg, are in great repute. Fire-arms, fowling-pieces, &c., employ 167 workmen at Burglingenfeld and Neustadt. Nuremberg is celebrated for its brass-wares. Munich and Augsburg possess cannon and other foundries. Fürth contains many beaters of gold and silver, &c., and exports leaf-gold and silver for gilding and plating to most European markets. The brewing of beer, in many respects the most important branch of manufacture in Bavaria, employs upwards of 5000 establishments, or taxed brewers, by whom more than 9,300,000 aulms (95,790,000 gallons) of beer are made, and more than 980,000 Bavarian bushels (759,500 quarters) of malt are consumed. A very favourable impulse has been given to national industry by the institution of the Polytechnic Society at Munich in 1816: its members consist of operatives, men of science, and official persons in all parts of the country; and its principal object is to afford instruction, in their respective branches, to mechanics and other work-people. An annual exhibition of domestic products and manufactures, and an award of prizes, form part of its plan. Similar societies exist in Augsburg, Nuremberg, and other towns. The Bavarian government has likewise established mechanics' schools (Gewerbs-Schulen) in most of the larger places; and there are various other institutions in Munich, Bamberg, Augsburg, Ratisbon, Fürth, Passau, Nuremberg, as well as elsewhere, for the promotion of trade and manufactures. The royal decree of the 25th September, 1825, which granted full liberty to individual skill and industry, has done much to remove the tyranny of corporate monopolies; but, owing to peculiar circumstances, this decree has not hitherto come into full operation.

Trade.—Though Bavaria is an inland country, its trade is greatly favoured by its geographical position, which has rendered it in some degree a central point between the Mediterranean, the Baltic, and the German Ocean, and a medium of intercourse between the west and east of Europe. This advantage is increased by its natural productiveness, and by the navigable lines of the Danube, Rhine, Main, and other streams, over which above 1600 larger and smaller bridges have been thrown; as well as by the constant attention which the government has paid of late years to the maintenance and multiplication of public roads, the length of which is estimated at upwards of 5500 miles. The treaties of reciprocity, which have thrown the markets of many neighbouring states open to the industry and enterprise of the Bavarians, have also given an additional stimulus to their commercial activity. Though an agricultural state, the export of its wrought produce and manufactures exceeds in value that of its raw produce by more than one-half; a strong proof, observes Von St. Behlen, that the mechanical industry of the country is more advanced than its agricultural. The system of duties has been placed on a liberal footing: great facilities are given to importation, and scarcely any obstacles are thrown in the way of exportations. Salt is the only article the introduction of which is wholly prohibited; and most articles imported from countries with which commercial treaties have been formed are treated on the same terms as native products, with reference to internal duties or excise imposts. In the list of duties, which for the period 1832—1837, are taken at a yearly average of 178,799*l.*, we may instance foreign wines and liqueurs, which pay 10 florins per 100 tons; silks 60 florins per cwt.; china 40 florins; vegetable oils 10 florins; coffee 15 florins; sugar 12 florins, &c. The transit trade has latterly declined, though it is still estimated to leave several hundred thousand pounds of profit in the country: the lines which it takes are, from Saxony into Switzerland; from the northern states of Germany, through Ratisbon, and thence by the Danube into Austria; from Strasburg into Saxony; from the countries on the Rhine into Italy; and from Frankfort into Austria; and the places through which it passes are Bamberg, Würzburg, Ratisbon, Augsburg, Hof, Nuremberg, Marksteft, and some minor towns. The principal articles of export are grain, about 380,000 quarters, in value about 750,000*l.*; salt; timber, of which about 48,000*l.* from the Upper Main alone; potashes, whereof 170 tons to France; fruit; liquorice-root, of which the Upper Main exports 17,000 lbs. to Austria; seed; hops; cattle, the whole export of which amounts to 10,000 heads of oxen, and 200,000 sheep and swine; fish; flax, 500 tons; yarn and coarse linens, of which the circle of the Regen supplies to the extent of 50,000*l.* in value; glass; leather; Nuremberg, Fürth, and Berchtesgaden light fabrics, beer, &c. The imports are principally wines; cotton, 450,000 lbs.; coffee, 1700 tons; sugar, 80,000 cwt.; rice, 8000 cwt.; tobacco; 10,000 cwt.; drugs, 5000 cwt.; sea-fish, 5200 cwt.; copper, 410 tons; oil, 12,000 cwt.; hides and skins, 560,000 lbs.; hemp and flax, 750 tons; silk and silk goods, 230,000*l.*; woollens, 93,000*l.*; lead, 175 tons; furs, honey, and cheese. On the whole, the value of the exports is estimated at about 3,350,000*l.*, and that of the imports at 3,250,000*l.* With respect to the former, the relative proportion of raw native produce exported is said to be about 700,000*l.*, and of manufactures, inclusive of salt, 1,150,000*l.*

History.—Our accounts of the antient Celtic Boii are few and of little importance. If tradition, however, is to be credited, they migrated from Gaul and took possession of the country between the Upper Danube and the Alps, after subduing the native inhabitants, about 600 years before the Christian æra. Shortly before this last epoch the land of the Boii fell under the Roman yoke, and a considerable portion of the present territory of Bavaria became a constituent part of the Roman empire, under the name of Vindelicia, during the following 150 years. In the second century, when the North poured down its barbarians upon the South, there was no country in Germany which felt the pressure more severely than the land of the Boii; and its inhabitants were long kept in a state of wretchedness and slavery by a constant succession of barbarous invaders, till at last, between the middle of the fifth and sixth centuries, the Heruli, Marcomanni, Thuringii, and other tribes, established themselves permanently in Noricum, which constitutes part of the Bavaria of the present day, adopted the name of Boioarii, and forced the owners of the soil to abandon their native language and customs for those of the German race. The country received the appellation of Boioaria, which has since been corrupted into Baiern and Bavaria. On the dissolution of the Roman empire, Bavaria became a vassal of the Ostrogothic empire, and, at a later date, of that of the Franks, whose yoke however was so easy that the people were permitted to elect their own dukes out of the patrician line of the Agilolfingers. These princes, whose sway lasted for more than 250 years, were so little dependent upon their foreign masters, that they exercised every prerogative of sovereignty except the right of making laws and alienating lands, which were acts that required the sanction of a body of legislators, consisting of priests, counts, judges, and elders of the people. Thassilo, the last duke of the Agilolfingian line, was, in the year 783, compelled to submit to Charlemagne after an obstinate resistance, and was condemned to death at the assembly of May in that year, but was subsequently pardoned and shut up in a monastery. From this time, which was at the close of the eighth century, the kings of the Franks and Germans governed the country by their lieutenants, who were dukes or counts taken from various families. In 1070 it passed, by imperial grant, into the possession of the Guelphs; and in 1180, upon the expulsion of Henry the Lion, Duke of Bavaria and Saxony, it was transferred by the Emperor Frederic to Otho, Count of Wittelsbach, a native prince, from whom the present king is descended. One of the most important acquisitions subsequently made was that of the earldom of the Rhenish Palatinate, with which the Emperor Frederic III. invested this family in 1216. Their dominions were afterwards divided between contending relatives at various times, until the dukedom of Bavaria was fully severed from the Upper and Rhenish Palatinates in 1329. Several other partitions ensued. In 1507 the right of primogeniture in the royal family was introduced, and finally received as the law of the land in 1573. The treaty of Westphalia not only recognised the title of the Bavarian princes to the Upper Palatinate, of which they had re-possessed themselves in 1621, but confirmed them in the electoral dignity, to which they had been raised by the emperor of Germany in 1623. Upon the extinction of the direct Wittelbach line in the person of Maximilian Joseph III. in 1777, the Elector Palatine, Charles Theodore, succeeded to the sovereignty, and ceded the districts of the Inn, containing an area of 840 square miles, to Austria; but by adding his patrimonial possessions (the Palatinate, and the duchies of Juliers and Berg) to the Bavarian territory, he increased its superficial extent to upwards of 21,000 square miles, and its population to 2,384,000. To these acquisitions the treaty of Luneville in 1801 added the lands on the left bank of the Rhine; but the re-settlement of Germany, two years afterwards, deprived Bavaria of the palatinate on the right bank, to the extent of about 4620 square miles, while it transferred to it in exchange 6720 square miles, including the dissolved bishoprics of Augsburg, Bamberg, Würzburg, and Freisingen, parts of the domains of Eichstädt and Passau, &c. The treaty of Pressburg, which raised the electorate to the rank of a kingdom in 1805, transferred certain possessions of Austria to the Bavarian crown, among which were several districts in Swabia, the Tyrol, Vorarlberg, Brixen, and Trent, as well as the cities of Augsburg, Lindau, &c. The additions thus made were about 12,180 square miles, from which, however, a deduction of about 2040 is to be made for the abandonment of the Würzburg territory.

All these changes and accessions increased the area of Bavaria, in 1806, to nearly 31,500 square miles. In the same year, Bavaria relinquished the duchy of Berg in exchange for the margraviate of Ansbach, became a member of the Rhenish Confederation, and received the city of Nuremberg, and the sovereignty over the mediatised territories of several former princes of the empire, as a compensation for the cession of some inconsiderable districts to Würtemberg. By the treaty of Vienna in 1809, the Bavarian dominions attained the greatest extent of territory which they ever possessed. One of the consequences of this treaty was, that, upon giving up the south of the Tyrol to the Italian crown, and certain domains to Würtemberg and Würzburg, Bavaria acquired nearly the whole of Salzburg, Berchtesgaden, the Austrian circle of the Inn, and part of that of the Hausruck, Baireuth, and Ratisbon, by which exchange her possessions were increased to about 35,700 square miles. In conformity with the treaty of Nied in 1812, the settlement with Austria on the 19th June, 1814, and the negotiations concluded with the same power on the 14th of April, 1816, Bavaria restored to Austria the Tyrol, Vorarlberg, the districts of the Inn and Hausruck, and those portions of Salzburg which lie to the east of the Salzach and Saale. Bavaria received in return Würzburg, and certain parts of Fulda, of the grand duchy of Hesse, of Baden, and of the territories of the old palatinate, Spires, &c. (formerly constituting portions of the French departments of Donnersberg, Saar, and the Lower Rhine.)

The following nobles have seignorial domains within the Bavarian dominions, extending over an area of about 1500 square miles:—The Princes of Eichstädt, Schwarzenberg, Fugger-Babenhausen, Leiningen-Amorbach, Löwenstein-Rosenberg, Löwenstein-Freudenberg, Ottingen-Ottingen, Ottingen-Wallerstein, Hohenlohe, Schillingsfürst, Thurn-and-Taxis, and Esterhazy, besides thirteen counts.

The first King of Bavaria was Maximilian Joseph, who assumed the royal dignity on the 1st of January, 1806, and was succeeded by his son Lewis Charles Augustus I., the present king, on the 13th of October, 1825.

(Rudhardt's *State of the Kingdom of Bavaria, from official sources*; Liechtenstern's *History and Statistics of Bavaria*; Von St. Behlen's *History, Statistics, &c., of the Kingdom of Bavaria*; Von Schlieben's *Bavaria*; Cammerer; Hassel; Stein; Hörschelmann; Malchus; Westenrieder; Eisenmann, &c.)

BAVAY, a small town in the department of Nord, in France, between Valenciennes and Maubeuge, 134 miles N.E. of Paris, through St. Quentin and Landrecies, 50° 18′ N. lat., 3° 47′ E. long.

This place, though now decayed, was once of considerable importance; and, under the name Bagacum, was the chief town of the Nervii, one of the nations of Gaul, who made an obstinate resistance to the Romans under Julius Cæsar. Its importance is testified by the fact, that the Romans brought water to it across the valley of the Sambre by means of an aqueduct, from springs in the village of Florésies, distant 10 or 11 miles. Bavay is at the junction of several Roman ways which traversed the surrounding country; these roads led respectively from Bagacum to Turnacum (Tournay), to Camaracum (Cambray), to Durocortum or Remi (Reims), and to Atuatuca or Tungri (Tongres): another road, known under the title of the *Chaussée de Brunehaut* (because repaired by Brunehaut, queen of Austrasia), afforded a communication from Bagacum to the road from Samarobriva (Amiens), to Augusta Veromanduorum (St. Quentin); and a sixth led from Bagacum, in the direction of Mons and Antwerp. In the *Encyclop. Méthodique*, a seventh road is mentioned, leading to Augusta Trevirorum, or Trèves, but D'Anville does not notice this, nor is it marked in his map; though the existence of a seventh road seems to be implied by the seven faces of the stone mentioned below. Bagacum lost its rank of capital early in the fifth century, and was succeeded by Turnacum and Camaracum. Some have supposed that it was destroyed about this time by the barbarians. The name was variously written, Bagacum in the Itinerary of Antoninus, Baganum by Ptolemy, and Basiacum, Bavacum, and Bacacum in later authorities. In the middle ages it was a mere castle. (D'Anville; *Le Grand Dictionnaire de Martinière.*)

Bavay retains scarcely any monuments of its former greatness. A stone of seven faces, in the middle of the *place* (or square) of the town, marks the convergence of the roads above mentioned. It was substituted in the third century for a more antient one of great height. Many excavations in the neighbourhood, called *troue Sarrasins*, two subterraneous passages for conveying provisions to the neighbouring fortresses, and a great number of wells from 8 to 12 feet diameter, serve to show the former extent of the place. These remains extend half a mile or more each way. The *Dictionnaire Universel de la France* speaks vaguely of inscriptions, tombs of Roman generals, and the ruins of an amphitheatre; but other authorities do not mention the last two.

The town in 1832 contained 1635 inhabitants.

BAWTRY, a market town and township which is generally considered to be in the West Riding of Yorkshire; part of the town is, however, in Nottinghamshire. Bawtry is partly in the parish of Blyth, and partly in that of Scrooby. That portion which is in Yorkshire belongs to the lower division of the wapentake of Strafforth and Tickhill; the portion which is in Nottinghamshire belongs to the wapentake of Bassetlaw. It is 153 miles N. by W. of London, 8 miles S.E. of Doncaster, and 44 miles S. by E. of York.

Bawtry is situated on a slight eminence which gradually slopes towards the river Idle, eastward of the town. This river was considered an important one previous to the improvements in inland navigation. Falling into the Trent, the Idle formerly conveyed in boats the lead of Derbyshire, the hardwares of Sheffield, and the agricultural produce of the vale of the Don, to Gainsborough, Hull, &c. A better conveyance for these goods is now found by the navigation of the Don and the Ouse. The road from London to York passes through the main street of Bawtry, in which there are some very respectable houses. The whole town is cleanly and cheerful in its appearance. The population is 1149. The chief employments of the people are those connected with agriculture: and the retail shops are chiefly supported by the neighbouring rural district. The market day is Thursday. The church, which is small, is subordinate to that of Blyth. There is a national school at Bawtry, which is supported by subscription, and which furnishes instruction to about 100 children: and there are two dissenting meeting-houses. The mansion of the Dowager Viscountess Galway is situated at the southern extremity of the town. It is adorned with pleasure grounds, which are interspersed with flower-gardens, groves and plantations. An elegant aviary on the lawn contains a choice selection of birds. (*Communication from a correspondent in Yorkshire.*)

Dr. Hunter says (*History of the Deanery of Doncaster*) that 'The position of Bawtry, on the great north road, occasions it to have the appearance of activity and business. Formerly, when the sovereign, or any member of his family, travelled with more state than at present, they were usually met at Bawtry by the sheriff of the county with a train of attendants.'

BAXTER, WILLIAM, an eminent grammarian and critic, nephew of the celebrated Richard Baxter, was born, in 1650, at Lanlugan in Shropshire. His education is stated to have been so entirely neglected in his early years, that at the age of eighteen, when he went to the school at Harrow-on-the-Hill in Middlesex, he knew not one letter in a book, nor understood one word of any language but Welsh: but he soon retrieved his lost time, and became a man of great learning. He applied chiefly to the study of antiquities and philology.

His first publication was upon Latin grammar: *De Analogiâ, sive Arte Latinæ Linguæ Commentariolus: in usum Provectioris Adolescentiæ*, 12mo. Lond. 1679. In 1695 he edited Anacreon: *Anacreontis Teii Carmina, Gr. Lat. Subjiciuntur etiam duo vetustissima Poëtriæ Sapphus elegantissima Odaria, una cum correctione Isaaci Vossii: et Theocriti Anacreonticum in mortuum Adonin*, 12mo. Lond. 1695; reprinted with improvements in 1710. In 1701, his edition of Horace made its appearance, *typis J. L.*; of which a second edition was finished by him but a few days before his death, and was published by his son John, under the title of *Q. Horatii Flacci Eclogæ, una cum scholiis perpetuis*, 8vo. Lond. 1725. This for a long time was considered the best edition of Horace which had been published in England. It bore so high a character upon the Continent as to be reprinted by Gesner at Leipzig, with additional notes, in 1752; and again at the same place in 1772 and 1778. It was again republished with additions by Zeunius in 1788; and lastly printed at Glasgow for a London bookseller in 8vo. 1797. In 1719 Baxter's *Glossarium Antiquitatum Britannicarum* appeared, dedicated to Dr. Richard Mead, accompanied with a portrait of the author, engraved by Vertue from a picture by Highmore, painted when Baxter was in his sixty-ninth year. This work is stated to have been published under the care of the Rev. Moses Williams, who also afterwards published Baxter's glossary of Roman antiquities, containing the letter A only, under the title of *Reliquiæ Baxterianæ, sive Willielmi Baxteri Opera posthuma. Præmittitur eruditi Auctoris Vitæ à seipso conscriptæ Fragmentum*, 8vo. Lond. 1726. A few copies of this work came out with the title of *Glossarium Antiquitatum Romanarum*, in 1731.

These form the whole of Baxter's printed works. He is said to have had a share in the English translation of Plutarch by several hands, published at the beginning of the last century; and proposals for printing an edition of Juvenal with his notes were circulated in 1732, but without success. Bishop Squire used some of his notes in his edition of Plutarch's treatise *de Iside et Osiride*, published at Cambridge in 1744.

Of smaller scattered pieces by Baxter, there are three letters on subjects of antiquity printed in the *Philosophical Transactions*, Nos. 306, 311, and 401; and four of his Latin letters to Dr. Geekie of Cambridge, who had been his pupil, in the first volume of the *Archæologia* of the Society of Antiquaries.

Besides Latin and Greek, Baxter is allowed to have been skilled in the British and Irish tongues, as well as in the Northern and Hebrew languages. He was in correspondence, also, with the most learned men of his time. The greater part of his life was passed in the education of youth. Nichols, in his *Literary Anecdotes*, states Baxter to have kept a boarding-school at Tottenham High Cross in Middlesex; but Dr. Robinson, in the *History of Tottenham* (8vo. Lond. 1818, p. 133), says he was the master of the free grammar-school there. He certainly was resident at Tottenham before 1697, and remained there till he was chosen master of the Mercers' School in London, which situation he held above twenty years, but resigned it before his death. He died May 31st, 1723, and was buried at Islington.

(See Nichols's *Literary Anecdotes*, vol. i. pp. 163-165, 329, 348, 349, 351, 363, vol. ii. pp. 24, 350; Chalmers's *Biogr. Dict.* vol. iv. p. 200-202; Robinson's *Hist. Tottenham*, p. 133-135.)

BAXTER, RICHARD. This eminent Nonconformist divine was born at Rowdon, a small village in Shropshire, on the 12th of November, 1615; but he resided till 1625 at Eaton Constantine, about five miles from Shrewsbury. The contiguity of his birth-place to the seat of Lord Newport was probably the means of introducing him to the notice of that nobleman. His father's little property was so much encumbered, as to prevent him from giving his son any education beyond what could be obtained from the village schoolmasters, who were neither competent teachers nor moral men. To Mr. John Owen, who kept the free grammar-school at Wroxeter, Baxter acknowledges some obligations. Though he was captain of the school, his acquirements were very inconsiderable when he left it. His ambition was to enter one of the universities to qualify himself for the ministry; but his master, Mr. Owen, probably perceiving that he required more regular instruction than he could expect to receive from a college tutor, recommended him to Mr. Richard Wickstead, chaplain to the council at Ludlow, who had an allowance from government for a divinity student. Though the defects in his previous education were but ill supplied by this arrangement (Wickstead being a negligent tutor), he had access to a good library, where he acquired a taste for those studies which he pursued with such indefatigable diligence in after life. Here he continued for eighteen months, when he returned to his father's house, and, at Lord Newport's request, supplied for a few months the place of his old master at Wroxeter grammar-school. Finding all his hopes of going to the university disappointed, he resumed his professional studies under the direction of Mr. Francis Garbett, a clergyman of some celebrity, who conducted him through a course of theology, and gave him much valuable assistance in his general reading. While he was thus engaged, he was suddenly diverted from his pursuits by a proposition from his friend, Mr. Wickstead, to try his fortune at court. The project, singular as it was, seems not to have been unpalatable either to the future puritan-divine or to his father: theology was thrown aside, and Baxter went up to Whitehall, specially introduced to Sir Henry Herbert, master of the revels, as an aspirant to royal favour. His reception was courteous and even kind. For one month he mingled in the festivities of the palace,—a period which was sufficient to convince him of the unsuitableness of such a mode of life to his tastes, his habits, and his conscience;—he then returned home, and resumed his studies with a determination never to be again diverted from them. Before he went to London, his religious impressions were deepened by the perusal of Bunny's *Resolution*, Sibbs's *Bruised Reed*, and other works of this kind. Some books which he read after his return increased that habitual seriousness which he derived from his natural disposition, as well as from the example of his father; and a protracted illness completed the preparation of his mind for the reception of those impressions of religious duty under which he acted through the remainder of his life.

While he was in this declining state of health, his anxiety to commence his ministerial labours overcame every other consideration. He applied for ordination to the bishop of Worcester, and obtained it, together with a schoolmaster's license, as he had accepted the mastership of the free grammar-school at Dudley, just then founded by his friend Mr. Foley of Stourbridge. He was then twenty-three years of age, and at this time entertained no scruples on the subject of conformity, having never examined with any nicety the grounds of subscription. His attention, however, was speedily drawn to the debatable points of the controversy; but, at first, the bitter tone of the Nonconformists gave him an unfavourable impression of their character, though he admired their fervent piety, and their energetic efforts to stem the moral corruption of the times. There was much in his own views and temperament which corresponded with theirs; but it required time and circumstances to develop the tendencies of his mind.

At the end of nine months Baxter removed from Dudley to Bridgenorth, where he acted as assistant to the clergyman. A release from his school engagements must, to such a mind as Baxter's, intent upon pastoral duties, have appeared a sufficient inducement for the change, but, in the then state of his feelings, it was of still greater moment to him to be relieved from the prospect of having to renew his subscription. Bridgenorth is the centre of a little district comprising six parishes, exempt from all episcopal jurisdiction, except a triennial visitation from the archbishop. Here he expected to perform the humble duties of a curate without obstruction, happy in the society of a colleague whose views harmonized with his own, and still happier in having a wide field for his exertions. But his hopes were soon frustrated by the 'et cetera oath,' as it was called, which enjoined all who had taken orders to swear that they would never consent to any alteration in the ceremonial or government of the church by archbishops, bishops, deans, archdeacons, &c. It does not appear that Mr. Baxter, any more than his brother clergyman at Bridgenorth, thought it necessary to observe the terms of this oath, for a complaint was laid against them for non-compliance with the ritual in various particulars.

Baxter left Bridgenorth after a residence of one year and nine months, on an invitation from a committee of the parishioners (1640) to become the officiating clergyman at the parish church in Kidderminster, the vicar having agreed, in order to settle disputes, to allow 60*l*. per annum to a curate of their own choosing. The living was afterwards sequestered, the townsmen collected the tithes, paid Baxter and Baxter's curate, and gave the vicar 40*l*. per annum. The circumstances under which Baxter settled at Kidderminster were favourable to his views; but it was not without considerable opposition from one portion of the community, whose vices he publicly reproved, that he carried some of his reforms into effect. Not satisfied with correcting the more flagrant offences of the inhabitants, he visited them at their houses, became acquainted with their families, gave them religious instruction in private, and became their friend as well as their pastor. By these means he soon wrought a complete change in the habits of the people. Though so strict a disciplinarian, his conciliatory manners won the hearts of all but a few who were irreclaimable. His preaching was acceptable to all ranks. Wherever he went, large audiences attended him; and his energy was so unremitting, notwithstanding his feeble health and constant indisposition, that he preached three or four times a week.

During the civil wars of that period Baxter held a position by which he was connected with both the opposite parties in the state, and yet was the partisan of neither. His attachment to monarchy was well known, though his adherence to the royalist party was not so certain; while the deep stream of religious feeling which ran through the conversation of the parliamentarians drew his sympathies to that side. The undisguised respect paid by him to the character of some of the puritans, made him and many others, who were sincerely attached to the crown, the objects of jealousy and persecution. A clamour was raised against them, and the rabble, whose excesses had been checked by him, were eager enough to become the trumpeters of the charge. During one of these ebullitions of party excitement, Baxter spent a few days in the parliamentary army, and was preaching within sound of the cannon when the memorable battle was fought at Edge Hill. His friends, not considering it safe for him to return to Kidderminster, he retired to Coventry, where he lived two years, preaching regularly to the parliamentary garrison and to the inhabitants. After the battle of Naseby, in 1645, he passed a night on a visit to some friends in Cromwell's army, a circumstance which led to the chaplaincy of Colonel Whalley's regiment being offered to him, which, after consulting his friends at Coventry, he accepted. In this capacity he was present at the taking of Bridgewater, the sieges of Exeter, Bristol, and Worcester, by Colonels Whalley and Rainsboro'. He lost no opportunity of moderating the temper of the champions of the commonwealth, and of restraining them within the bounds of reason; but as it was known that the check proceeded from one who was unfriendly to the ulterior objects of the party, his interference was coolly received. Among the soldiery he laboured with unceasing ardour to diffuse a better spirit, and to correct those sectarian errors, as he considered them,—anabaptism, antinomianism, and separatism inclusive—which in his view were so productive of disputes and animosity.

After his recovery from an illness, which compelled him to leave the army, we find him again at Kidderminster, exerting himself with renewed vigour to moderate conflicting opinions. The conduct of Cromwell at this crisis exceedingly perplexed that class of men of whom Baxter might be regarded as the type. For the sake of peace they yielded to an authority which they condemned as a usurpation, but nothing could purchase their approbation of the measures by which it had been attained and was supported In open conference, Baxter did not scruple to denounce Cromwell and his adherents as guilty of treason and rebellion; though he afterwards doubted if he was right in opposing him so strongly. (See Baxter's *Penitent Confessions* quoted in Orme.) The reputation of Baxter rendered his countenance to the new order of things highly desirable, and accordingly no pains were spared to procure it. At the suggestion of some of his noble friends, he once preached before the Protector, who afterwards invited him to an interview, and endeavoured to reconcile him to the political changes that had taken place; but the preacher was unconvinced by his arguments, and boldly told him that 'the honest people of the land took their antient monarchy to be a blessing, and not an evil.' The necessity of any alteration in the government did not come within the scope of his comprehension. He looked with a single eye to the diffusion of a deeper spirit of religion by means of a purified establishment, beyond which he was incapable of carrying his views or lending his sanction.

In the disputes which prevailed about this time on the subject of episcopal ordination, Baxter took the side of the Presbyterians in denying its necessity. With them, too, he agreed in matters of discipline and church government. He dissented from them in their condemnation of episcopacy as unlawful. On their great principle, viz. the sufficiency of the Scriptures to determine all points of faith and conduct, he wavered for some time, but ultimately adopted it in its full extent. Occupying, as he did, this middle ground between the Episcopalians and the Presbyterians, it was not very obvious with which of the two parties he was to be classed. Had all impositions and restraints been removed, there is every reason to suppose that he would have preferred a moderate episcopacy to any other form of church government; but the measures of the prelatical party were so grievous to the conscience, that he had no choice between sacrificing his opinions or quitting their communion.

The views maintained by Baxter, blended as they were with the principles of monarchy, made them extremely popular towards the close of Cromwell's career, when men were beginning to find that they had only exchanged one species of tyranny for another, and, as some thought, for a worse. In the sermon which Baxter preached before the parliament on the day preceding that on which they voted the return of the king, he spoke his sentiments on this subject with manly resolution, and in allusion to the political state of the country, he maintained that loyalty to their king was a thing essential to all true Protestants of every persuasion.

It was expected that on the restoration of the king moderation would have prevailed in the councils of the nation, and a conciliatory policy have been adopted with regard to religious opinions. Some indication of such a spirit appeared in the appointment of Presbyterian divines among the king's chaplains, and Baxter along with the rest. Many who had access to the king strenuously recommended conciliation, and for a time their advice prevailed against the intrigues of court influence. Among other measures a conference was appointed at the Savoy, consisting of a certain number of Episcopalian and Presbyterian divines, to devise a form of ecclesiastical government which might reconcile the differences and satisfy the scruples of the contending parties. Baxter and the Presbyterians were extremely desirous of bringing this commission to a successful issue; and Baxter himself drew up a reformed liturgy, which, with some alterations, he presented at this conference. The Presbyterians would have accepted Bishop Usher's scheme as a model, with any alterations which might be mutually agreed upon; but the bishops were secretly opposed to the arrangement, and finally frustrated it by carrying a declaration to this effect, that although all were agreed upon the ends contemplated in this commission, they disagreed about the means. Having thus defeated the object of the conference, the next step was to sequestrate the livings of those divines who had been inducted during the Protectorate. Oaths and subscriptions, which had been suspended while there was any prospect of a union of parties, were again called for by the bishops and their adherents. In accordance with this demand a law was passed in 1662, called the Act of Uniformity, so strict in its requisitions upon the debatable points of ceremonial worship, that it had the effect of banishing at once two thousand divines from the pale of the English church. Of this number was Baxter. Previous to the passing of this measure he had refused the bishopric of Hereford and other preferments offered him by Clarendon, the Chancellor, asking one favour only in lieu of them—to be allowed to return to his beloved flock at Kidderminster. The vicar, who was ejected in 1640, had been restored; and was bound by the old agreement to pay Baxter 60*l.* a year as a lecturer. But Baxter was willing to perform the pastoral duties without remuneration: all he wanted was to watch over those whom he had brought into the fold of Christ; but this request was refused.

On the 25th of May, 1662, three months before the day on which the Bartholomew Act, as the Act of Uniformity was called, from its coming into operation on St. Bartholomew's day, Baxter had preached in London his last sermon, under a regular engagement in the church; and, finding his public duties at an end, he retired in July 1663 to Acton, in Middlesex, where he employed most of his leisure in writing for the press. Some of his largest works were the fruits of this seclusion. His two most popular treatises, *The Saints' Everlasting Rest*, and *A Call to the Unconverted*, were published before he left Kidderminster, and raised his fame as a writer to a higher pitch than what he had enjoyed even as a preacher. Several attempts were made by the ejected ministers and their friends in parliament to get the rigorous restrictions against them removed, but without success. The persecutions continued with unabated violence. Even those who, like Baxter, disliked separation, and attended the worship of the church, suffered penalties for having morning and evening prayers at their own houses. In the midst of those awful calamities, the plague and the fire, which raged with such frightful devastation in two successive years, the services of the Puritan divines to the inhabitants of the metropolis were so conspicuous, that the current of opinion turned in their favour, and led to new efforts in their behalf, which ended for the time in the Indulgence granted in 1672. This drew Baxter from his retirement at Totteridge, to which place he had removed on the suppression of his ministry at Acton. He settled again in London, and preached as a lecturer in different parts of the city, but more constantly at Pinner's Hall and Fetter Lane. His preaching, though highly acceptable to his more immediate friends, was never so popular as it had been at Kidderminster. While he advocated tolerance from an intolerant communion he shone like a light in a dark place; but now that he was the apologist of conformity, while he was a sufferer for non-conformity, his conduct involved a kind of consistency too refined for public admiration. An ineffectual attempt which he made at this time to combine the Protestant interests against Papal ascendancy exposed him to various misrepresentations, to remove which he published a vindication of himself in a tract entitled *An Appeal to the Light*, but without eradicating the unfavourable impressions.

His time was now divided between writing and preaching. For a while he had a regular audience in a room over St. James's market-house, and at other places in London. But his public duties were frequently suspended by those rigorous enactments to which the Nonconformists were subjected during the last two reigns of the Stuarts.

In 1682 the officers of the law burst into his house, at a time when he laboured under severe indisposition, with a warrant to seize his person for coming within five miles of a corporation, and would have hurried him before a justice of the peace in this condition, had they not been met by his physician, whose interference probably saved his life as well as obtained his pardon. Two years later, while his health was still in a precarious state from a chronic disease, he was again harassed by distraints and penal proceedings. Still later it was his misfortune to be one of the unhappy victims of Jefferies. He was apprehended on a lord chief justice's warrant, on a charge of sedition and being hostile to episcopacy. The charge was founded on some passages in his *Paraphrase of the New Testament*. On the trial, Jefferies, not content with using language the most opprobrious to the prisoner and his counsel, acted the part of prosecutor as well as judge, and scrupled not to gain his ends by silencing the accused, by insulting his counsel, by refusing to hear his witnesses, and by triumphing over his sentence. He said upon the bench, 'he was sorry that the Act of Indemnity disabled him from hanging him.' His punishment was a fine of 500 marks, to lie in prison till it was paid, and to be bound to his good behaviour for seven years. For the non-payment of this heavy penalty he was committed to the King's Bench prison, where he lay until the 26th of November in the following year (1686), having been confined for nearly eighteen months. His pardon was obtained by the mediation of Lord Powis, and the fine was remitted. The solitude of his prison was enlivened on this, as on former occasions, by the affectionate attentions of his wife. Baxter himself lived to see that favourable change in reference to religious toleration which commenced at the Revolution of 1688. He died on the 8th of December, 1691, and was buried in Christ Church.

The literary career of Baxter is not the least extraordinary part of his history. He published a body of practical and polemical divinity with a rapidity almost unequalled; the excellence of some of his practical writings secured them an unexampled popularity, and thus laid the foundation of a new theological system which still retains his name. The catalogue of his works is not easily described. It contains nearly 168 distinct publications: (see list in Orme's *Life*, prefixed to the edition of his works, London, 1830.) Many of these are only known to his admirers, but others are more read than any other productions of a religious character. His fame chiefly rests on his two most popular works, and on his *Methodus Theologiæ* and *Catholic Theology*, in which his peculiar views are embodied. Several of his learned contemporaries have recorded their testimony to the character of his writings. Sir Matthew Hale was a constant reader of them, and honoured Baxter with his friendship. Bishop Wilkins praised him in the phrase that

Johnson afterwards applied to Goldsmith: 'he has cultivated every subject which he has handled;' and Dr. Isaac Barrow said, that 'his practical writings were never mended, and his controversial ones seldom confuted.' Baxter left behind him a *Narrative of the most Memorable Passages of his Life and Times*, which was published in a folio volume after his death (1696) by his intimate friend Mr. Matthew Sylvester, under the title *Reliquiæ Baxterianæ*. It is here that we find that review of his religious opinions written in the latter part of his life, which Coleridge speaks of as one of the most remarkable pieces of writing that have come down to us. (See Coleridge's *Biographia Literaria.*) Calamy's *Life of Baxter* is a kind of abridgment of this work, which abounds in notices of the men, the transactions, the habits, and the opinions of the stirring period in which he lived.

There are a few poems by Baxter, not long ago published in a small volume. His *World of Spirits* has been lately reprinted.

BAXTERIANS, a name which is applied to those who adopt the theological system of Richard Baxter. The name is now almost extinct; but Baxterianism is still the resting place of many who do not approve of the extremes of Calvinism. The Baxterians hardly ever attained the rank of a separate denomination, even when they were most numerous; and they are now completely scattered among different communions. Their writings are most popular among the orthodox dissenters.

Baxterianism occupies a sort of middle place between Arminianism and Calvinism. It is not correct to say that it reconciles the two schemes. It only connects them by showing that portions from each may be made to harmonize with each other. Hence it would be more properly described as a system of theology framed out of the systems of Calvin and Arminius, and becoming itself the point of union between them. Its chief merit is supposed to consist in the amalgamation of the Arminian doctrine of free grace with the Calvinistic doctrine of election. The Baxterians profess to believe that a certain number, determined upon in the divine counsels, are elected to salvation without respect to their good works. To this extent they receive the doctrine of effectual calling. But to make their view of the operation and comprehensiveness of divine favour complete, they contend that all to whom the gospel is preached are placed in a condition for securing their own salvation. Hence they think with Calvin that Christ died in a special manner for the elect; and, in a more general sense, for all others who come within the light of the gospel. The Calvinistic tenet of reprobation forms no part of their system.

The grounds on which Baxter contended that the death of Christ put all men in a state of salvation are briefly these:—1st, Because Christ assumed the human nature and bore the sins of the human race; 2dly, Because pardon and life were offered to all mankind on condition of acceptance,—'Whosoever believeth shall be saved;' and, 3dly, Because it is not to the elect alone, but to all men, that the benefits of the gospel are proclaimed.

The arguments by which the learned divines of this school prove the elect to have a superior interest in the death of Christ over the non-elect, are deeply tinctured with that metaphysical subtlety of which Bishop Burnet complains as the great blemish of Baxter's writings. The hypothesis, in a few words, may be thus stated: that Christ has made *a conditional gift of the benefits accruing from his death to all mankind; but to the elect the gift is absolute and irreversible*; from which he draws the inference that, notwithstanding the *positive* possession of these advantages was decreed to the few, yet conditionally the benefit was *extended to all.*

The Baxterians are greatly opposed to Antinomianism. Faith without works they hold to be an unscriptural and dangerous tenet. Several of the minor doctrines of Calvinism are adopted in a modified sense, among which may be mentioned justification and the perseverance of the saints. They advocate the certainty of perseverance, but incline to the opinion that it may be lost by too weak a degree of saving grace.

In all the Baxterian deviations from the system of Calvin there is a decided leaning to more comprehensive views. Baxter was himself opposed to the narrowing of the terms of salvation, and designed to remove every appearance of exclusiveness in the operation of divine favour from the system which he took such pains to adjust and promulgate. The most eminent divines who have embraced these opinions since the death of their author are Watts and Doddridge—men who have both illustrated in their works and lives the candid and amiable spirit of the school to which they belonged.

(Calamy's *Abridgment of Mr. Baxter's History of his Life and Times*, 2nd edit. 1713. A second volume contains an account of other ministers deprived or silenced by the Act of 1662. In 1727 two volumes of *Continuation* were published. Baxter's *Catholic Theology*; Buck's *Theological Dictionary.*)

BAY (*bahia*, Portuguese, Spanish; *baia*, Italian; *baie*, French; *meerbusen*, German), is a portion of the sea, of such a form that it is wider at the part nearest the open sea, and narrower the farther it advances into the main land. According to this definition the term is rightly applied to the Bay of Biscay, the Bay of Bengal, Chesapeak Bay, and Botany Bay; but sometimes it is used where the term *gulf* would seem to be more appropriate. This latter term properly implies an arm of the sea, which, without any or with only little diminution in breadth, enters very deeply into the main land, as the Gulf of Bothnia or the Gulf of Finland. Smaller portions of the sea of this description are called, in Scotland, *firths*, and in Norway, where they are very numerous, *fiords*, in Iceland *fiördurs*. According to this definition we should not say Baffin's Bay, but Baffin's Gulf. To introduce greater precision into geography, it would still be necessary to distinguish both bays and gulfs from *close seas*, by which we understand extensive parts of the sea, enclosed on every side with land, and united with the ocean only by straits or narrow arms, like the Mediterranean or the Baltic Sea and the Red Sea. But here, too, the common practice is not exact. We say Hudson's Bay where we should use the term Hudson's Sea, and the same observation holds good for the Gulf of Mexico, which as well deserves the name of sea as the Caribbean Sea. Sometimes also close seas have received the name of gulfs, as the Persian Gulf.

BAY SALT. [See Salt.]

BAY TREE. [See Laurus.]

BAYADEER (said to be a corruption of *Bailadeira*, a Portuguese word, which signifies a dancing woman), a name given to the regularly bred dancing girls in India, who are also the regular prostitutes. Certain women make it their business to select the handsomest girls they can find among the children of the lowest class of people; and, after having secured their beauty from the ravages of the small-pox by inoculation, carefully instruct them in dancing, singing, and the acting of small comedies, with the little arts and manners which form the accomplished bayadeer. The system of training commences at the age of seven or eight years, and continues two or three years. From the end of this training to the age of seventeen is the professional life of a bayadeer. Towards its termination, their personal attractions being considered on the wane, they find it expedient to transfer them to the more contracted sphere of the temples. Some are devoted, under a vow of the parents, to the service of the temples from their birth. They are brought up in the usual accomplishments, and the wages of their exertions and their infamy enter the treasury of the temple with which they are connected.

These girls are generally introduced to any party that requires their attendance, escorted by a band of musicians. *A native band consists of instruments resembling guitars, and others like clarionets, with cymbals and kettle-drums*, which altogether produce a very wild, but not an unpleasing, and a somewhat melancholy harmony. The women dance and sing; and when one is desired to dance, she calls for the ornaments of her feet, which consist of silver chains, which she fastens on her ankles. Then, rising from the ground, she arranges her dress, which generally consists of about a hundred yards of light muslin, which terminates in innumerable folds at about the swell of the leg: and of a shawl which covers part of the head, comes over the shoulders, and falls in folds over the petticoat. The hair is seldom ornamented, but is parted in the middle, and kept close down by the aid of the cocoa-nut, which improves its jet and gloss, but communicates an unpleasant odour. Behind the ears a bunch of pearls is worn like a cluster of grapes, and a ring is suspended from one of the nostrils, through which it is inserted. The ornaments, however, are sometimes more and sometimes less numerous and costly than this.

The dancing consists in a certain methodical kicking of the right foot, which causes the chains on the ankles to jingle retreating; sometimes with the hands up, and twisting them about; at others, enveloping her head completely in the shawl. The movements of the bayadeer are sometimes so slow in this performance, that an inexperienced spectator might suppose her about to fall asleep, when, in correspondence with a change in the music, she becomes full of life, and exhibits a rapid and exhausting succession of violent action. She takes up her robe and folds it into various shapes, then she lets it go, so that while she spins round like a top, it forms a circle, bearing some resemblance to the tail of a peacock. It is perfectly amazing for what a length of time practice enables them to maintain this circular motion. This part of the performance is sometimes dispensed with. In different parts of the country these dances vary in the proprieties of dress and attitude. In some parts they are highly indecent, but this is not always, or perhaps generally, the case. The songs of the bayadeers, however, commonly express, in very warm language, the sentiments of amorous passion, as addressed by the female to her lover. Such songs afford a striking contrast to those of the Persians, who, according to Sir William Ouseley, 'never suffer their females to make, either in prose or verse, any advances or declarations of love.'

BAYAMO, in Cuba. [See SALVADOR, S.]

BAYAN KHARA MOUNTAINS is the Mongol name of a very extensive range in Eastern Asia, in a corner of the globe which has never been visited by Europeans, and which, therefore, is only known to us by the accounts of the Chinese geographers. According to them a vast mountain-knot is situated nearly in the centre of the high table-land of Eastern Asia to the west of the lake Khoo-khoo-nor, between 35° and 38° N. lat., and about 96° and 100° E. long. This mountain-knot, called Kulkun, is considered as the eastern portion of the Kuen-luen Mountains, which traverse the high table-land from west to east about the thirty-fourth parallel. From this mountain-knot high ranges seem to proceed towards all the points of the compass, three of which extend to the east in the direction of the principal chain. The most northern, called Khi-lian Shan, separates the basin of the lake of Khoo-khoo-nor from the great desert of the Gobi. The middle chain, and as it seems the highest of the three, called Siue Shan (Snow Mountains), fills up with its numerous high and steep summits the whole region between the lake of Khoo-khoo-nor and the great river Hoango. The most southern of the three, the Bayan Khara Mountains, first runs towards the south, and the waters descending from its eastern declivities give rise to the river Hoango. Soon afterwards the range declines towards east-south-east and separates in this direction the upper courses of the two great rivers Hoango and Yan-tse-kiang, until branching off in numerous ramifications, it obliges the Yan-tse-kiang to take a southern and the Hoango a northern course. Thus these rivers, which to the west of the 100th meridian run hardly more than fifty miles from one another, attain under the 103rd a distance of more than ten degrees of latitude, which they keep to about the 112th meridian, where they again approach one another within about four degrees, or about 270 miles. All the numerous mountain chains which occupy the eastern parts of Tibet, and that portion of China which extends between the Hoango and Yan-tse-kiang are connected with the Bayan Khara Mountains, and ought to be considered as ramifications of this mass. The most remarkable is that which, including the basin of the Hoango on the south, divides Sifan from the Chinese province Kan-su: there it is called by the Chinese Min-shan. Its eastern prolongation, which divides the province Sut-shuan from those of Kan-su and Shen-si, bears the name of Peling (Northern range), and, forming the watershed between the two great rivers, it advances into the great plain of Northern China, where the last offsets terminate at a distance of about 100 miles from the Whang Hay or Yellow Sea.

We know nothing respecting the mineral riches of the Bayan Khara Mountains from the Chinese geographers; but we are informed that those ranges which lie to the west of the 103rd meridian in many places rise above the line of eternal snow, and that even glaciers are frequent among them. They are, however, rarely visited, on account of their

BAYARD, PIERRE DE TERRAIL, known by the honourable appellation of the 'Good Knight, without fear and without reproach' (*le bon Chevalier, sans peur et sans reproche*), was born, in the year 1475, at the Château de Bayard in Dauphiné. His family were for generations the feudal lords of the territory whence they took their name, and were distinguished for their military prowess during the wars of the English in France. Almost all his immediate ancestors died on the field of battle: his great-great-grandfather fell at Poictiers; his great-grandfather at Cressy; his grandfather at Montchery; and his father also received many wounds in the wars of Louis XI. With a view to being educated for the profession of arms, he was placed, when thirteen years old, in the household of the Duke of Savoy as page, in which capacity he continued for five years, perfecting himself in the various accomplishments then considered essential to the character of a true knight. Bayard, when only eighteen years of age, carried away the prize in a tournament against one of the most experienced knights in France. When he had completed his eighteenth year he entered into actual service.

In the latter end of the year 1494, Bayard accompanied Charles VIII. in his expedition against Naples, and greatly distinguished himself at the battle of Fornovo, fought on the 6th of July in the next year. He had two horses killed under him in this engagement, and he performed numerous feats of that romantic valour which have perpetuated his name as one of the last and best representatives of the days of chivalry. Bayard served also in the Italian wars of Louis XII., which began in 1499. On one occasion he kept a bridge over the Garigliano single-handed against 200 Spaniards, long enough to enable the main-body of the French to make good their retreat.

Bayard was also present at the famous 'battle of the Spurs,' fought at Guingette near Terouenne in Picardy, on the 16th of August, 1513. Either from panic or mistaken orders, the French gendarmerie, when retreating from the English force, commanded in person by the then youthful Henry VIII., fled before the English cavalry in disgraceful confusion. The contest, in fact, was one of mere speed between the pursuers and the pursued, and hence the humorous epithet, applied by the vanquished themselves, of the 'battle of the Spurs.' But for the presence of mind and daring valour of Bayard, the whole French army would have shared in the disgrace of the gendarmerie. He retired with fourteen men-at-arms, often turning on his pursuers, till he reached a place where only two could pass in front. 'We halt here,' said he, 'the enemy will be an hour gaining this post. Go and tell them so at the camp.' He was obeyed, and succeeded in gaining time for the French army to re-assemble itself, but was himself taken prisoner. Henry's reception of the knight was much more courteous than that of the Emperor Maximilian, who was present, being, with his troops, in the pay of the English king. The emperor taunted him with the remark that he thought Bayard was one who never fled. 'Sire, if I had fled I should not have been here,' was the prompt answer.

Bayard attended Francis I., then in the pride of youth, and ambitious of the honours of chivalry, in the war undertaken to recover Milan and the other Italian conquests of his predecessor. The bloody battle of Marignano, Sept. 13, 1515, which lasted two days, was fought with a fierceness that made Trivulzio, the French commander, who had been in eighteen pitched battles, exclaim that 'all other fights compared with this were but children's sport: this is the war of giants.' Bayard displayed his usual romantic daring and prowess. When the battle was won, Francis, who had fought by his side, and who had witnessed his extraordinary valour, begged and received the honour of knighthood at his hands upon the field.

The next great service which Bayard rendered his country was the obstinate and successful defence of Mezières, on the Netherlands frontier of France, in 1522, against the Count of Nassau, with a force of 35,000 men, aided by a strong artillery. The garrison consisted of only 1000 men, but such was the fame of Bayard, that many of the young nobility of France considered it the highest honour to be engaged under him in the defence of this frontier town.

In 1524 Bayard had a command in the force which Francis I. sent to Italy to act against the army of the Emperor Charles, directed by the celebrated Duke of Bourbon, The command-in-chief was intrusted to Bonnivet, whose only qualification was personal courage. After various movements and partial successes, Bonnivet was compelled to abandon his strong entrenchments at Biagrasso, and move nearer to the Alps, in expectation of reinforcements from Switzerland. He was pursued by the imperial forces, who attacked his rear with great fury just as he had reached the banks of the Sesia. Bonnivet, while displaying much valour in rallying his troops, was wounded in the arm by a ball from an arquebuss. He sent to Bayard immediately, telling him that the fate of the army was in his hands. Bayard, who had in vain throughout the campaign remonstrated with Bonnivet on the course he was pursuing, replied, 'It is now too late, but I commend my soul to my God; my life belongs to my country.' He then put himself at the head of the men-at-arms, and kept the main-body of the enemy occupied long enough to enable the rest of the French forces to make good their retreat. While thus engaged he received a mortal wound from a ball, and fell from his horse. He was pressed to withdraw from the field, but his answer was that he had never turned his back upon an enemy. He ordered himself to be placed with his back against a tree, and his face to the enemy. In this situation he was found by Bourbon, who expressed his regret at seeing him in this condition. 'Pity not me,' said the dying man, 'I die as a man of honour ought, in the discharge of my duty; they, indeed, are objects of pity who fight against their king, their country, and their oath.' The Marquis of Pescara, commander of the Spanish troops, passing soon after, manifested (we quote from Robertson's *Charles V.*, book iii.) his admiration of Bayard's virtues, as well as his sorrow for his fate, with the generosity of a gallant enemy; and, finding that he could not be removed with safety from that spot, ordered a tent to be pitched there, and appointed proper persons to attend him. He died, notwithstanding their care, as his ancestors for several generations had done, on the field of battle. Pescara ordered his body to be embalmed and sent to his relations; and such was the respect paid to his memory that the Duke of Savoy commanded it to be received with royal honours in all the cities of his dominions. In Dauphiné, Bayard's native country, the people of all ranks came out in a solemn procession to meet it.

(See *Mémoires du Chevalier de Bayard, &c.*, with notes by Theodore Godefroy, and the contemporary histories; also Brantome's works, and the *Mémoires de Bellay*.)

BAYAZID I., surnamed **ILDIRIM**, or 'the Lightning,' in allusion to the rapidity of his military achievements, was the son of the sultan of the Osmans, Murad I. He was born A. Heg. 748 (A. D. 1347), and came to the throne in A. Heg. 792 (A. D. 1389), after his father had been killed in an engagement with the Servians near Cossowa. The Osman dominions at this epoch extended from the Danube to the Euphrates; and Bayazid at the head of his army was almost incessantly moving from one extremity of his empire to the other, to reduce his Mohammedan neighbours to obedience, or to add to his possessions by conquests from the Christian powers of Europe. Brussa and Adrianople were respectively the Asiatic and European capitals of his dominions, and the erection of a magnificent mosque in each of them is one of the earliest acts of his reign that we find recorded. This seemingly pious act forms a strong contrast with his behaviour to Yacub his only brother, whom he put to death almost immediately on ascending the throne, from no other motive than an apprehension that the example of other Eastern princes might encourage him to rebel, and dispute Bayazid's right to the throne.

The conquests of the Osmans had, in the beginning of the eighth century of the Mohammedan æra (the fourteenth after Christ), put an end to the Seljukide dominion in western Asia, and on its ruins several small dynasties had sprung up, the principal of which were that of Sinope and Castemuni on the northern coast of Asia Minor, and those of Aidin, Zarukhan, and Kermiyan. These dynasties Bayazid determined to destroy, and to embody their territories in his empire. Within the first year after his ascending the throne he had conquered Zarukhan, Aidin, and part of the northern coast of Anatolia: nor did his previous marriage (in A. D. 1381) with a daughter of the prince of Kermiyan prevent him from leading an expedition against his father-in-law, whom he took prisoner and deprived of his territory. Bayazid had to encounter greater difficulties in subduing the principality of Caramania. Timurtash, his general, had conquered part of the country, when Alâ-eddîn the reigning sovereign, defeated him in a battle and took him prisoner. When this happened, Bayazid was on the banks of the Danube engaged in a war with Stephan, the prince of Moldavia, who had been instigated by Kœturum Bayazid (i. e. 'Bayazid the Lame'), a Musulman chief on the borders of the Black Sea, to invade Wallachia and Bessarabia. On receiving the news of Timurtash's defeat, Bayazid hastened from Europe into Asia, and within a very short time subdued the whole of Caramania, besides which he now added to his empire the towns of Konia, Akshehr, Akseraï, Larenda, Siwas (Sebaste), Tokat, and Kaisariyah. Soon after he took away the dominions of Kœturum Bayazid on the Black Sea; and when Kœturum died, Bayazid allowed his son, Isfendiar, to retain possession only of Sinope.

The year 1391 is remarkable also for the capture of Philadelphia, or Alashehr (i. e. 'The Variegated City'), the last Greek town in Asia Minor that continued faithful to the Byzantine empire. Its Greek commander made a vigorous resistance to the besieging forces of Bayazid, and rejected his invitation to surrender the fortress: while the Emperor Joannes and his son Manuel, then the confederates of the sultan, were actually assisting in the siege.

In 1393 Bayazid undertook another expedition into Europe, in which he took possession of the towns of Saloniki and Yenishehr (Larissa), and for the first time besieged Constantinople. He compelled the emperor to give up his plan of adding to the strength of the capital by new fortifications, and to assign a separate suburb to the Turks with a mosque and a *kadhi*, or judge, of their own. Bayazid at the same time built the fort of Guzelje, or Anatoli-hissar, on the eastern side of the Bosporus, which secured to him the command of that channel.

In 1396 Bayazid gained an important victory near Nicopolis on the Danube over an army of a hundred thousand Christians, including many of the bravest knights of France and Germany, who had assembled under the standard of Sigismond, the king of Hungary, to check the farther progress of the Mohammedan power in Europe. The greater part of the Christian forces were slain or driven into the Danube. Sigismond escaped to Constantinople. Sixty-thousand Turks are stated to have fallen in the same battle; and when Bayazid became aware of the extent of his loss, he gave orders to put to death all the prisoners with the exception of twenty-four nobles, who were subsequently ransomed. This great victory was soon followed by further conquests in Greece. The Morea was taken, and in 1397 (according to the oriental authorities quoted by M. von Hammer, *Gesch. des Osman-Reichs*, i. 252) Athens fell into the power of the Osmans.

The dominions of Bayazid and those of the Tartar conqueror Timur now touched each other in the neighbourhood of Erzerum and on the banks of the Euphrates. With doubtful limits between the two empires, which had never been defined by treaty, a cause for war between two jealous sovereigns could not long be wanting. Timur had taken possession of Siwas (the antient Sebaste), on the Halys, then one of the strongest and most flourishing cities of Western Asia, and had treated its inhabitants with great cruelty. Bayazid was then engaged in his European dominions, which prevented him from resenting this violation of his territory. About the same time two Musulman princes, Ahmed Jelair and Kara Yussuf, whom Timur had deprived of their possessions, fled for protection first to Seifeddin Barkuk, the Sultan of Egypt, and subsequently to Bayazid, who received them with kindness, and married his son, Mustafa Chelebi, to a sister of Ahmed Jelair. Timur sent two embassies for the purpose of demanding the surrender of the princes; but Bayazid refused to comply, and, instigated by the advice of the princes, took possession of Erzinjan, a town situated on the Euphrates within the dominions of Timur. Timur, who now determined to commence an open war against Bayazid, begun the campaign by taking Haleb, Antakia, and other Syrian towns that were subject to the Osmans. He was at Siwas when he received information of the approach of Bayazid from the west. The two sovereigns at the head of their armies met in the plains of Angora, the capital of the antient Galatia. A decisive battle took place (according to M. von Hammer's calculations on the 19th of Zulhaj, A. Heg. 804, i. e. the 20th of July, A.D. 1401), in which the Osmans were totally defeated, and Bayazid became a prisoner in the hands of Timur. The conqueror, according to his Persian biographer, Sherif-eddin, received Bayazid with great kindness, assigned him suitable accommodations, and continued to treat him with distinction till he died, A. Heg. 806 (A.D. 1403). D'Herbelot (*Bibliothèque Orient.*, art. *Timour*, p. 876, edit. 1776) and M. Von Hammer express themselves satisfied with this account, and reject the common report which would charge Timur with great cruelty towards his prisoner. But Sir William Jones (*Works*, vol. v. p. 547) draws our attention to a passage in another contemporary historian, Ebn Arabshah's life of Timur, which had been overlooked by D'Herbelot, and in which the Arabian author expressly affirms 'that Timur did inclose his captive, Ilderim Bayazid, in a cage of iron, in order to retaliate the insult offered to the Persians by a sovereign of Lower Asia, who had treated Shapor, king of Persia, in the same manner; that he intended to carry him in this confinement into Tartary, but that the miserable prince died in Syria, at a place called Akshehr.' (See Ahmedis Arabsiadæ, *Vita Timuri*, ed. Manger, tom. ii. pp. 225, 276, &c.)

We will not venture to decide a question on which there is such conflicting evidence; but we must notice a curious passage of Busbequius, who visited Constantinople as ambassador from the German emperor about the middle of the sixteenth century, as it seems to have escaped the notice of M. von Hammer. The passage is to the following effect: that Bayazid, after his defeat, became a prisoner in the hands of Timur, who treated him with great cruelty; that his wife, who was also made a prisoner, was grossly insulted before his face; and that from this time till the age of Suleiman I., who reigned from A.D. 1520 to 1566, the Osman sultans have never married, for fear that the reverses of fortune might expose them to similar insults. (*Aug. Gislenii Busbequii Legationis Turcicæ Epistola Prima*, pp. 26, 27, ed. Lond. 1660, 16mo.)

Bayazid was succeeded upon the throne of the Osman empire by his son Mohammed I. (Joseph von Hammer, *Geschichte des Osmanischen Reichs*, vol. i. p. 216, &c.; Sherif-eddin's *Life of Timur*, translated by P. De La Croix.)

BAYAZID II., the eldest son of the Osman sultan, Mohammed II., was born A.D. 1447, and in 1481 succeeded his father on the throne of the Osman empire, which he occupied till 1512. Bayazid was governor of Amasia when his father died (3rd of May, 1481). Upon receiving the news of his demise he hastened to Constantinople, but had to establish his claims to the throne by a contest with his brother Jem—called Zizim or Zizymus, by Caoursin and other contemporary European writers. Jem was defeated in a battle at Yenishehr near Brussa, 20th of June, 1481, and fled to Egypt, where he was kindly received by the Sultan Kaitbai. In the following year Jem was induced, by the representations of his friends in Syria, to venture upon another campaign against his brother; but he was again unsuccessful, and took refuge at Rhodes. Here D'Aubusson, the grandmaster of the Knights of St. John, received him with marked attention, but afterwards sent him to France, where he was kept in close confinement till 1488. Towards the end of that year the king of France, Charles VIII., surrendered him into the hands of Pope Alexander VI., by whom he was poisoned (Feb. 24, 1495).

A considerable part of Bayazid's reign was spent in war. When Mohammed II. died, the Osman empire was engaged in a conflict with Venice. Bayazid found it necessary in 1482 to conclude a peace which secured considerable advantages to the republic. In the same year, Keduk Ahmed Pasha, a military commander to whom the empire owed many important victories, was murdered by Bayazid's command.

In 1485 Bayazid declared war against Kaitbai, the Mamluk sultan of Egypt. Karagös-Pasha, the commander of the Osman army, suffered two signal defeats, and in 1491 a peace was negotiated upon terms by no means advantageous or creditable to the Osman arms. In the same year the fortresses of Depedelen and Bayendera in Albania were taken by the Osmans. Bayazid was himself engaged in this expedition, and near Depedelen had a narrow escape from an assassin who had approached him in the disguise of a monk. This incident, M. von Hammer observes, gave rise to the rule ever since most strictly observed at the Osman court, that no one bearing any weapon is admitted into the presence of the sultan.

The year 1490 is remarkable in Turkish history for the first treaty concluded between the Osman government and that of Poland; and in 1495 we find recorded the first diplomatic relations between the sultan and the czar of Moscow.

In 1499 another war broke out between the Osman empire and Venice. A Venetian fleet was defeated in a battle near the island of Sapienza, July 28, 1499; and Lepanto (Naupactos), Modon, Coron, and Navarino, were besieged and taken by the Osmans, while Iskandar Pasha, with a land army, invaded and laid waste the country along the river Tagliamento in the north of Italy. A combined Venetian and Spanish fleet took possession of Ægina and Cephalonia, and captured twenty Turkish galleys. By the treaty of peace, which was concluded in December, 1502, the Venetians were obliged to leave the island of Santa Maura in the hands of the Turks, but they kept possession of Cephalonia, and obtained the privilege of appointing a consul at Constantinople, and of trading in the Black Sea.

Bayazid was induced to yield a peace upon such conditions by the rapid rise of the Persian power on the eastern frontier of his dominions, under Shah Ismail, the founder of the Safawi (commonly called the Sofi) dynasty. Shah Ismail had encroached upon the Osman territory near Tokat, and when forced to retreat by the governor of the province, had taken possession of Merash. About the same time, Korkud, Bayazid's eldest son, disgusted at the contemptuous treatment which he experienced from Ali Pasha, the grand vizir, quitted the empire and went to Egypt. Ahmed, though younger than Korkud, had been appointed by Bayazid his successor on the throne. Selim, a younger brother of Ahmed, dissatisfied with the preference thus given to the latter, revolted against his father (1511), at the same time that an alarming rebellion, headed by Kuli Shah, also named Sheitan Kuli, broke out in Asia Minor. Kuli Shah was soon obliged to retire, and his adherents became dispersed; but the conflict between the princes, Korkud, Selim, and Ahmed, continued, till at last Selim prevailed. Bayazid was obliged to resign the government in his favour, and Selim, supported by the Janissaries, and the great mass of the people of Constantinople, ascended the throne April 25, 1512. Bayazid quitted the capital, in order to spend the remainder of his life in peaceful retirement at Demitoka, his birth-place; but he died on his journey thither at Aya, near Hassa, May 26, 1512.

(Joseph von Hammer's *Geschichte des Osmanischen Reichs*, vol. ii. p. 250, &c.)

BAYAZID, a town of Turkish Armenia, situated at the base of Mount Ararat, in 39° 24′ N. lat., 44° 20′ E. long.; 50 miles S.S.W. from Erivan, and about 180 miles E. of Erzerum. It is governed by a pasha of two tails, whose authority extends over a surrounding district of considerable extent, but its limits are not distinctly defined. Kinneir assigns to the place a population of 30,000, of whom the great majority are Turks; but Stocqueler says that the population is estimated at 3000, the greatest proportion of whom are Armenians; and French writers estimate the population at 10,000. Whatever be the number, the majority are, undoubtedly, Armenians; and our own information inclines us to consider the French estimate of the population to be nearest the mark.

The town is built on a declivity, the summit of which is said by the inhabitants to be strongly fortified; but they do not like to allow the fortifications to be inspected. The city itself is also surrounded by walls and a rampart. Bayazid has a very uninteresting appearance. The houses are small, and, for the most part, inconveniently built. Were it not for the pasha's palace, which is covered with white plaster and rises high above the rest of the town, it would be difficult to distinguish it from the craggy elevation on the side of which it is built, for the houses are composed of the same material as the rocks, and the soil affords not an inch of verdure. There are three mosques, two Christian churches, and a monastery of considerable celebrity in Armenia. Little business is carried on at Bayazid. The inhabitants have no encouragement to attempt manufactures, because Russian articles of a much better quality than they can make, and at a much cheaper rate, are obtained from Erivan. (See Kinneir's *Geographical Memoir of the Persian Empire*; Morier's *Journey through Persia, Armenia, and Asia Minor*; Stocqueler's *Pilgrimage through Khuzistan and Persia*.)

BAYER, JOHN, was born at the town of Rhain (*Rhaina Biorum*; it is called *Rhain* by Kästner, and appears to be Rain, which is not far from the confluence of the Lech and the Danube), in Bavaria, in 1572. He followed the profession of an advocate at Augsburg, where he died in 1625, having lived a bachelor fifty-three years. He was an astronomer, and a diligent inquirer into antiquity. The preceding particulars are (or were) stated in his epitaph, in the church of St. Dominic at Augsburg. (See Schiller, *Cœlum stellatum Christianum*, Aug. Vind. 1627; or Kästner, *Gesch. der Math.* vol. iv. p. 94.) Of his life we can find no account, except in the *Biographie Universelle*, which states that he was a minister of the gospel, whose zeal got him into trouble, but who was withal so good an astronomer, that he was ennobled by the Emperor Leopold in 1669. With whom he has been confounded in this strange mistake we cannot tell, but he himself, in the preface to his charts, justifies himself for employing his time in mathematics, he being a lawyer. There was a John Bayer who published various works between 1662 and 1667, one of which, *Ostium vel Atrium Naturæ, &c.*, might have contained astronomy. Perhaps this one may have been confounded with John Bayer of Augsburg.

Bayer has immortalized his name, as Delambre remarks, at a very cheap rate. He published charts of the stars in 1603, in which, for the first time, he distinguished one from another by affixing letters. When Flamsteed and others adopted this practice, which has since become universal, the letters of Bayer were followed, which has made his maps valuable: otherwise they are not so good as those of Hevelius.

The first edition of Bayer's maps was published at Augsburg in September, 1603, with the following title: Johannis Baieri Rhainani, J. C. *Uranometria, omnium asterismorum continens schemata novâ methodo delineata, æreis laminis expressa.* The title given by Lalande (*Bibliogr. Astr.*) is incorrect. He had obtained the constellations visible in the northern hemisphere from the catalogue of Tycho Brahé, and those about the south pole from Americus Vesputius and others. (Kepler, *Tab. Rudolph.* cited by Kästner.) It is not known whether he observed himself, but Riccioli, in the words 'suis vigiliis astronomicis aucta et emendata,' implies that he did; and Bartschius (*Planisph. in Pref. ad Lect.*) affirms that Bayer was not in possession of the more recent observations of Tycho Brahé, and that his places were erroneous in consequence. There are fifty-one maps by Bayer, namely, two of the hemispheres, one of nine constellations about the south pole, and forty-eight of single constellations. The Greek letters are employed to denote the stars, and where the Greek alphabet ends, the Roman small letters are used.

The following is the list of Bayer's constellations, after each of which is placed the letter with which the reckoning ends; so that by looking at the numbering of the two alphabets annexed, the number of stars reckoned by him may be seen. In applying the letters he seems to have arranged the stars in order of brilliancy: thus α is the largest star in a constellation, that is, the largest in the opinion of Bayer, observing with the naked eye, in and about 1600. Bayer's names and spellings are retained. The constellations are all in Ptolemy.

50. Synopsis Cœli Superioris Borea
51. Synopsis Cœli Inferioris Austro

In Delambre's list (*Hist. de l'Ast. Mod.*), in Canis Major, for x — o read α — ο. The title of the last map is presumed by us, as the only copy of the first edition we know of does not contain it, and the succeeding editions have no letter-press. The constellations in Italics are those of which a front view is presented, of which we shall presently speak.

In this first edition, the letter-press is on the back of the plates. It contains, in addition to what has been noticed, the various names of the constellations and single stars, together with the planets with which they were supposed to have astrological affinities.

In order to restore, as he supposed, the sphere of Ptolemy, Bayer has inverted many of the constellations, and made them turn their backs; and this he has done upon an ecliptic and equator so disposed as to place the spectator *inside*. The state of the question is this: it is pretty clear either that Ptolemy imagined himself on the outside of the globe, looking on the backs of the constellations, or in the inside, looking on the fronts; for neither of the two remaining suppositions will place those stars on the right or left arms, &c., which Ptolemy places there. The alternative might be easily settled by remarking whether the stars in the body are placed in the front or back; but, unfortunately, Ptolemy generally refers them to some part of the dress or arms which has both back and front, such as the belt of Orion; but in the few instances which are tests, Ptolemy always names the back, the only exception we know of being a star in Virgo, which is said to be in the front face (*πρόσωπον*), which may be reconciled with the rest by supposing the back of a figure with the face turned sideways. Therefore, to represent Ptolemy completely, an outside of a sphere, or part of a sphere, must be drawn; and on an inside sphere there is only the choice of changing left into right, and *vice versâ*, by drawing backs, or backs into fronts, and *vice versâ*, by drawing fronts. Bayer has chosen the first, with the exceptions noted in italics in the preceding list, for which he has been blamed by Schickard, Bartsch, Hevelius, Flamsteed, and others: but, singularly enough, he has not carried his own system through; for Andromeda, of which he has represented the face, is precisely one of those signs in which a crucial word is found in Ptolemy, who places one star between the shoulders (*ἐν τῷ μεταφρένῳ*). Flamsteed cuts the knot by assuring us that *νῶτον* and *μετάφρενον*, which vulgar scholars imagine to mean 'the back,' and 'the part of the back between the shoulders,' sometimes mean 'the front' and 'the chest,' in proof of which he brings his own conviction, that Homer and others must in some places have adopted these senses. Montucla, with great probability, conjectures that Bayer intended to draw a convex sphere, but overlooked, or was ignorant of, the proper method of inverting the figures on the copper.

Circumstances which we shall have to mention in FLAMSTEED make it worth while to give the preceding details. The rest of the history of Bayer's work is as follows:—In 1627, Julius Schiller published at Augsburg his *Cœlum Stellatum Christianum*, &c. *sociali operâ J. Bayeri*, &c. *Uranometriam novam priore accuratiorem locupletioremque suppeditantis.* This was an attempt to change the names of the constellations into others derived from the Scriptures; as, for instance, calling the twelve signs of the zodiac after the apostles, &c. The northern constellations were taken from the New Testament and the southern from the Old. Schiller's account is as follows: that Bayer, having laid down the positions of the stars, left all the rest to Schiller, but died before the whole (and Ursa Minor in particular) was completed, and without having time to finish some astronomical *Prolegomena*; that the new Uranometry of Bayer differed from the old in the number and positions of the stars, which he had altered, as well from many nights' observations of his own (whether of positions or of magnitudes is not stated), as from various books which he had found; and that, for this reason, he (Bayer) was anxious that the old Uranometry should never be republished. These maps also represented the convex side of the sphere, that men might see the fronts of these Christian constellations, it being judged indecorous that the apostles should turn their backs. Thus we see that Bayer committed a mistake again, as far as Ptolemy's sphere is concerned. He should have drawn the inside or concave of the sphere, in turning the fronts towards the spectator. This work of Schiller's is also mentioned by Gassendi as follows: 'Cœlum Christianum a J. Bayero affectum, et a Julio Schillero confectum.' (Gass. *Vit. Peir. in ann.* 1628.) It is remarkable that, in this edition, Bayer has abandoned his letters and taken numbers, either of his own or from Ptolemy. The plates are remarkably well executed for the period, and the grouping of the constellations is strikingly beautiful, but the stars are almost lost in the shading.

Schiller states, that a surreptitious edition of Bayer was offered for sale at Frankfort Fair in autumn, 1624; which, by means of the words *novâ methodo delineata*, was made to pass for the expected edition of 1627, that is Schiller's own; but it was struck from the same plates as that of 1603, and therefore probably could not be distinguished from the subsequent editions.

The second edition of the *Uranometria* (plates only, and without letter-press) was printed at Ulm in 1648, and the third (plates only) at Ulm in 1666. In the meanwhile, the letter-press of the first edition, with additions, had been printed under the following clumsy title: *Explicatio Characterum æneis Uranometrias Imaginum Tabulis insculptorum addita.* First edition, Strasburg, 1624; second, Ulm, 1640; third, Augsburg, 1654; fourth, Ulm, 1697.

BAYER, GOTTLIEB (THEOPHILUS) SIEGFRIED, grandson of John Bayer the astronomer, was born at Kœnigsberg in 1694. He applied zealously to the study of the Oriental languages under the tuition of Abraham Wolf, and of some learned Rabbis: he also took a peculiar interest in the study of the Chinese language. After travelling in various parts of Germany for his improvement, he returned to Kœnigsberg in 1717, when he was appointed librarian to the University. In 1726 he was called to Petersburg to fill the chair of Greek and Roman Antiquities, and was there much noticed by the minister, Count Ostermann, and by the Bishop of Novogorod. His health became much impaired by intense study, and he died in February, 1738. He wrote numerous works, some of which are printed separately; others are inserted in the *Memoirs of the Academy of Petersburg* and in the *Acta Eruditorum*; and some were left at his death in MS. Of those that have been published separately the principal are: 1. *Museum Sinicum*, 2 vols. 8vo. Petersburg, 1730. The greater part of the first volume is occupied by an interesting preface, in which the author recapitulates the labours of those who preceded him in the field of Chinese literature; this is followed by a general Chinese grammar; and by a grammar of the popular Chinese dialect of the province of Chin Cheu, which, he says, differs but little from the language of the learned or mandarins. This is followed by a letter from some missionaries at Tranquebar, concerning the Tamul language. The second volume contains a Chinese Lexicon, extracts from several Chinese works, a commentary on the Siao ul lun, or Origines Sinicæ, a treatise on Chinese chronology; and another on the weights and measures of the Chinese. The plates of the Chinese characters in this work are said (*Biographie Universelle*) to be badly executed. 2. *De Horis Sinicis et Cyclo Horario Commentationes*, 4to. Petersburg, 1735. 3. *Historia Osrhoëna et Edessena ex numis illustrata*, 4to. 1734, *Biog. Univ.* This work, which he dedicated to Joseph Simonius Assemani, is much esteemed. 4. *Historia Regni Græcorum Bactriani*, 1738. [See BACTRIA.] 5. *De Nummis Romanis in agro Prussico repertis.* 6. *De Eclipsi Sinica liber singularis*, in which he examines and confutes the Chinese account of a total eclipse, which a Jesuit asserted to have occurred at the time of our Saviour's death. (See Weidler, p. 171.) Of his scattered dissertations, some are on the Mongol, Tangutian, and Brahmanic languages: one is *de Elementis Calmucicis*; another on some books in an unknown language, found near the banks of the Caspian Sea; one is a translation from Confucius; and another, *De Inscriptionibus Iudæorum Græcis et Latinis*, &c. He wrote also *Historia Congregationis Cardinalium de Propaganda fide*, 4to., 1721, giving an account of that celebrated institution, in which, however, he displayed somewhat of a prejudiced spirit and sectarian intolerance. He himself afterwards, writing to Lacroze, said that he was not altogether satisfied with his work, and that he intended to make more accurate researches on the subject. His *Opuscula*, which treat of several topics of erudition, were published by Klotz, 8vo., Halle, 1770, with a biography of Bayer. There is also a life of Bayer in the *Bibliotheque Germanique*, vol. l., from which Chaufepié has taken his account of that writer in the *Nouveau Dictionnaire Historique*.

BAYEUX, a town in the department of Calvados, in France, 17 miles W. by N. of Caen, the capital of the department, and 151 miles in the same direction from Paris, 49° 17′ N. lat., 0° 44′ W. long. It is on the little river Aure, and only about 5 or 6 miles from the coast.

In the earliest times this place was a chief seat of the Druids. After the Roman conquest, if not before, it appears to have borne the name of Arægenus, and subsequently that of Baiocasses (from the people whose capital it was), and by contraction, Baiocæ, and Baiocas. From these latter forms, Bayeux, its modern name, has sprung. Roman relics, vases, statues, and medals, have been dug up in considerable numbers. Under the kings of France, of the Merovingian and Carlovingian races, the town was of considerable importance, and it had a mint. Bayeux was destroyed by the Normans, and rebuilt and peopled by them. The dukes of Normandy regarded it as the second place in their duchy, and had a palace here. It was however pillaged and burned by Henry I. of England, in the beginning of his reign. It suffered severely in the invasions of France by Edward III. and Henry V., as well as in the religious wars of the sixteenth century. The bishopric was erected in the fourth century, as it is believed; and the bishops claimed, on account of the antiquity of the see, superiority over the other bishops of the ecclesiastical province of Neustria, or Normandy: but the popes, to whom, in 1581, the question was referred, did not allow their superiority; without however, so far as appears, disputing the fact (the early origin of the see) on which the claim was grounded.

The town is old, and ill built, with the exception of one good street. The houses are chiefly of wood and plaster, but some are of stone. The antient cathedral is the oldest place of worship in Normandy. It is in the form of a cross, with pointed arches and two spire-crowned towers of unequal height at the western end, and a central tower, which is inferior to the two western towers in height. These towers are of inferior architecture. 'The end spires,' says Dr. Dibdin, 'are rather lofty than elegant; in truth they are, in respect to form and ornament, about as sorry performances as can be seen.' There are five porches at the western end, the central one rather large, the two on each side comparatively small. They were formerly covered with sculptured figures, but the Calvinists in the sixteenth century, and the Revolutionists in the eighteenth, have much mutilated and defaced them. The interior of the cathedral is plain, solid, and rather bare of ornament. Dr. Ducarel, who visited it in 1752, says that it was not adorned with any statues or other ornaments, and that the pictures and painted glass were very indifferent. The walls and chapels of the choir were once covered with large fresco paintings, now nearly obliterated. In each side of the nave are richly-ornamented arches, springing from massive single pillars. The choir is rather fine, and the flying buttresses of the exterior of the nave are admirable. The lead was stripped from part of the roof during the revolution for the purpose of making bullets, and the building in consequence exhibits indications of decay. There is a crypt or subterraneous chapel, the walls of which are covered with paintings, some probably of the fifteenth century, and some still older. The extreme length of the interior is about 315 English feet by 81 feet high, and about 105 feet wide. The transepts are about 120 feet long, by 35 feet wide. The cathedral, after being twice or thrice rebuilt by the Normans, was erected in its present form (except one of the western towers, and some other parts evidently of later origin) by Philip de Harcourt, who held the see in the middle of the twelfth century: but it seems doubtful whether some part does not belong to the earlier edifice erected by bishop Odo, brother of William the Conqueror. The chapter-library consists of 5000 volumes, the remains of a much larger collection, which, having been kept shut up in the chapter-house for ten years during the revolution, was in a great degree spoiled by the wet, which penetrated to them after the roof of the chapter-house had been stripped of its lead. There are now four churches; before the revolution, there were in Bayeux and its suburbs fourteen, or, according to others, eighteen parish churches, two priories, three convents for men, and four for women: the bishopric was very rich.

The chief articles of trade at Bayeux are cloth, linen, serge, hosiery, and other woven fabrics, grain, hemp, cider, and especially butter and lace; the best butter is made during winter and spring, put up into small pots, and carried in large panniers to the adjacent parts of the country, and even to Paris. It is shipped also in large quantities to the French colonies. About three thousand females are constantly employed in the manufacture of lace. Hats, stout muslins, and especially porcelain, are also manufactured here. The population, in 1832, was 9954 for the town, or 10,303 for the whole commune.

Bayeux possesses a *collège* or high school, of considerable reputation; there is a *tribunal de commerce*: a building formerly occupied by the Lazarists as a seminary for the clergy, is now used as a barrack. Bayeux is the capital of an arrondissement containing 390 square miles, or 249,600 acres; the population, in 1832, was 80,414. There are several paper-mills in the arrondissement.

Bayeux was, according to some, the native place of Alain Chartier, one of the old French poets, who lived early in the fifteenth century.

The country of Bessin, of which Bayeux was the capital, was a subdivision of Normandy. It is productive in apples, from which the inhabitants make a great quantity of cider, partly for home consumption, partly to be sent to Rouen and Paris. Towards the sea there is some rich pasture land; but the district generally is not fertile. Slate is quarried in several places; poultry and game, especially quails and red-legged partridges, are plentiful; and butter forms a considerable article of trade, as already noticed. Fish is also abundant, and the shad, the sole, and the oysters of the river Vire, are in good repute. The forest of Cerisy, the largest in the territory, shelters the wild boar, and numerous foxes. The churches of the district are remarkable for their handsome steeples.

BAYEUX TAPESTRY, a web or roll of linen cloth or canvass, preserved at Bayeux in Normandy, upon which a continuous representation of the events connected with the invasion and conquest of England by the Normans is worked in woollen thread of different colours, in the form of a sampler. It is twenty inches wide, and two hundred and fourteen feet long; and is divided into seventy-two compartments, each bearing a superscription in Latin which indicates its subject, or the person or persons represented. It is edged on its upper, as well as its lower part, by a border representing chiefly quadrupeds, birds, sphinxes, minotaurs, and other similar subjects.

Attention was first directed to this singular monument by M. Lancelot, in a memoir presented to the Academy of Inscriptions and Belles Lettres, in 1724, in consequence of his discovering an illuminated drawing from a portion of it, among the manuscripts in the library of M. Foucault, who had been Intendant of Normandy. At the time of finding it he did not know what it actually represented; whether the original was a sculpture round the choir of a church, upon a tomb, or on a frieze; whether it was a painting in fresco, or on glass; or, lastly, whether it might not be a tapestry. He saw that it was historical, and that it related to William Duke of Normandy and the conquest of England; and he wrote to Caën respecting it, but got no information.

Père Montfaucon, upon reading Lancelot's memoir, saw the value of this curious representation, and left no stone unturned till he had discovered the original. He wrote to Caën and Bayeux, and sent a copy of the drawing for inspection, when, at last, the canons of Bayeux recognized it as a portion of the tapestry in their possession, which tradition said had been worked by, or under the superintendence of, Matilda, the Conqueror's queen, which she had herself given to the cathedral, of which Odo, the Conqueror's half-brother, was bishop, and which they, the canons of Bayeux, were accustomed to exhibit to the inhabitants of the city, in the nave of their church, at a particular season of the year. M. Lancelot, in a second memoir, says it was at that time traditionally called *la Toilette de Duc Guillaume*. Montfaucon sent an able artist, of the name of Antoine Benoit, to copy it; and at the opening of the second volume of his *Monumens de la Monarchie Françoise*, published in 1730, engraved the whole in a reduced form, accompanied with a commentary upon the Latin inscriptions, which, throughout, explain the intention of the figures represented in the different compartments.

M. Lancelot, upon the publication of the tapestry by Montfaucon, sent a second memoir to the Academy of Inscriptions and Belles Lettres (as has been just mentioned), which was read in 1730, and published in the same year, in the eighth volume of their transactions, in which he states that the earliest mention of this tapestry among the archives of the cathedral is in an inventory of jewels and ornaments belonging to the church, taken in 1476, where it is called 'une tente très longue et étroite de telle à broderie de ymages et escrpteaulx faisans representation du conquest d'Angleterre, laquelle est tendue environ la nef de l'Eglise le jour et par les octaves des reliques.'

Dr. Ducarel is the next who gives us an account of this tapestry, in the appendix to his *Anglo-Norman Antiquities* (folio, London, 1767), where he has printed an elaborate description of it, which had been drawn up some years before, during a residence in Normandy, by Smart Lethieullier, Esq., an able English antiquary. Ducarel tells us that when he was in Normandy it was annually hung up on St. John's day, and went exactly round the nave of the church, where it continued eight days. At all other times it was carefully kept locked up in a strong wainscot press in a chapel on the south side of the cathedral.

From this time till the autumn of 1803, it received but little further notice, when Bonaparte, then First Consul of France, contemplating the immediate invasion of England, ordered it to be brought from Bayeux to the National Museum at Paris, where it was deposited during some months for public inspection. The First Consul himself went to see it, and affected to be struck with that particular part which represents Harold on his throne at the moment when he was alarmed at the appearance of a meteor which presaged his defeat: affording an opportunity for the inference that the meteor which had then been lately seen in the south of France was the presage of a similar event. (*Gentleman's Magazine*, 1830, vol. lxiii., pt. ii. p. 1136.) The exhibition was popular: so much so, that a small dramatic piece was got up at the Theatre du Vaudeville, entitled *La Tapisserie de la Reine Mathilde*, in which Matilda, who had retired to her uncle Roger during the contest, was represented passing her time with her women in embroidering the exploits of her husband, never leaving their work, except to put up prayers for his success. (Millin, *Magazin Encyclopédique*, 1803, tom. iv. p. 541.) After having been exhibited in Paris, and in one or two large towns, the tapestry was returned to Bayeux, and lodged with the municipality. Mr. Dawson Turner, in his *Tour in Normandy*, written in 1818, says, the bishop and chapter of Bayeux had then recently applied to the government for the tapestry to be restored to their cathedral, but without effect. (*Tour in Normandy*, 8vo. Lond. 1820, vol. ii. p. 242.)

It was most fortunate that this curious monument escaped destruction during the Revolution. Its surrender at that time was demanded for the purpose of covering the guns: a priest, however, succeeded in concealing and preserving it from destruction.

The new degree of publicity given to the tapestry by its exposure in the French capital, again made it a subject of discussion; and the Abbé de la Rue, professor of history in the Academy of Caën, endeavoured, in a memoir, afterwards translated by Francis Douce, Esq. and printed in the seventeenth volume of the *Archæologia* of the Society of Antiquaries, to show that a mistake had been committed by tradition in the selection of the Matilda, and that its origin ought not to have been ascribed to Matilda the Conqueror's queen, but to Matilda the empress, the daughter of King Henry I.

The next memoir on this curious subject is comprised in a short letter from Mr. Hudson Gurney, printed in the eighteenth volume of the *Archæologia*, who saw the tapestry at Bayeux in 1814, where it then went by the appellation of the *Toile de St. Jean*, which is explained by what Ducarel has said, that it was formerly exhibited upon St. John's day. Lancelot, Montfaucon, Ducarel, and De la Rue, appear all to have considered the tapestry as a monument of the Conquest of England, intended to have been continued to Duke William's coronation, but from some cause or other left unfinished. Mr. Gurney considered it to be an apologetical history of the claims of William to the crown of England, and of the breach of faith and fall of Harold; and that, as it stands, it contains a perfect and finished action.

In the mean time, the Society of Antiquaries in 1816 despatched an excellent and accurate artist, Mr. Charles Stothard, to Bayeux, who in that and the succeeding year brought home a perfect fac-simile of the tapestry; the drawings of which have been since engraved, coloured like the original, and published in the sixth volume of the *Vetusta Monumenta*, plate i. to xvii.

The appearance of the first portion of Mr. Stothard's drawings gave rise to some Observations from Mr. Amyot, in refutation of an historical fact which the tapestry had been supposed to establish: namely, that of Harold's mission to Normandy by the Confessor to offer the succession to William. (*Archæol.* vol. xix. p. 88.) These were followed by C. Stothard's own observations while at Bayeux, pointing out such circumstances as presented themselves to his notice during the minute investigation to which the tapestry was necessarily subjected (*Ibid.* vol. xix. p. 184), and again followed by *A Defence of the early antiquity of the Tapestry*, by Mr. Amyot (*Ibid.* p. 192), in which the objections raised by the Abbé de la Rue against the tradition which made the tapestry co-eval with the events it celebrates, are completely invalidated. The last account of this tapestry is in Mrs. Stothard's *Letters from Normandy*, 4to. Lond. 1820, let. xi. pp. 121-134; except a brief notice of it in Dibdin's *Bibliographical Tour*, 8vo. Lond. 1821, vol. i. pp. 375-391.

The work begins with the figure of a king seated upon his throne, who is addressing one of two persons standing by his side: the inscription is simply 'EDWARD REX.' It appears to be Harold taking leave. We next see Harold proceeding to Boseham attended by several followers; he carries a hawk upon his fist, at that time the distinguishing mark of nobility; his dogs are running before him: 'IBI HAROLD DVX ANGLORVM ET SVI MILITES EQVITANT AD BOSHAM.' A church is then represented, in front of which are two men who appear about to enter: above is the word 'ECCLESIA.' This church is Boseham in Sussex. The party next appear feasting at a table in a house, previous to their embarkation. Some persons are descending the steps from the apartment where they have been dining; others are embarking in four vessels. Harold enters first, still bearing the hawk and carrying a dog under his arm. These last-mentioned figures are wading through the water, naked from the waist downwards: 'HIC HAROLD MARE NAVIGAVIT ET VELIS VENTO PLENIS VENIT IN TERRAM WIDONIS COMITIS.' The last of the four vessels next appears anchoring in France, Harold standing at the prow: his name 'HAROLD' above. Three figures are then represented upon land; one of them is Harold in the act of being seized by order of Guy Earl of Ponthieu, who is on horseback, followed by his people: 'HIC APPREHENDIT WIDO HAROLDVM ET DVXIT EVM AD BELREM ET IBI EVM TENVIT.' Harold and Guy are next seen mounted upon their horses, and attended both by Saxon and Norman soldiers. The Saxons are distinguished by wearing mustachios; the Normans have none. Harold and Guy appear in conversation, 'VBI HAROLD ET WIDO PARABOLANT:' when messengers arrive from William Duke of Normandy to the Earl of Ponthieu 'VBI NVNTII WILIELMI DVCIS VENERVNT AD WIDONEM.' Between the Earl of Ponthieu who is seated, and his guards who receive the messengers, a tree divides the subject, as other trees, in like manner, divide all the principal events throughout the work. A dwarf, with the name of 'TVROLD' above, holds the horses of Duke William's messengers. William's messengers are again represented on horseback, bearing shields; 'NVNTII WILIELMI.' Next is a Saxon messenger mustached, kneeling to William on his ducal seat: 'HIC VENIT NVNCIVS AD WILGELMVM DVCEM.' Guy is seen immediately after, conducting Harold to the duke: 'HIC WIDO ADDVXIT HAROLDVM AD WILGELMVM NORMANNORVM DVCEM.' William meets them, and returns with Harold to his palace: 'HIC DUX WILGELM CVM HAROLDO VENIT AD PALATIUM SVVM.' We have then a female figure within the door of a church, and a priest, and beneath them the words 'VNVS CLERICVS ET ÆLFGYVA.' Mr. Douce says evidently Adeliza, William's daughter, who was affianced to Harold. The next event is William's warfare with Conan Earl of Bretagne, in which it is apparent Harold assisted and rendered essential service to the Norman party: 'HIC WILLEM DVX ET EXERCITVS EIVS VENERVNT AD MONTEM MICHAELIS.' Soldiers, mounted on horseback, arrive at Mount St. Michael and pass the river Cosno: 'ET HIC TRANSIERVNT FLVMEN COSNONIS ET VENERVNT AD DOL.' Harold is depicted among them, assisting some persons who had fallen into the quicksands while passing the river: 'HIC HAROLD DVX TRAHEBAT EOS DE ARENA.' We have then the words 'ET CONAN FVGA VERTIT.' Conan is seen escaping from Dol and descending the walls by a rope. Troops are flying and approach Rennes: 'REDNES.' The Norman soldiers are next employed in attacking Dinant: 'HIC MILITES WILLELMI DVCIS PVGNANT CONTRA DINANTES.' Conan delivers up to them the keys of the town, which they succeed in taking: 'ET CVNAN CLAVES PORREXIT. After this event William rewards the services of Harold by giving him a suit of armour: 'HIC WILLELM DEDIT HAROLDO ARMA.' William and his party then arrive at Bayeux: 'HIC WILLELM VENIT BAGIAS.' It is said that William, in order to secure to himself the succession of the Saxon throne, without having Harold for a competitor, caused him to take a solemn vow that he would never attempt the possession of the English crown: this vow he obliged Harold (then within his power) to make upon a covered altar, beneath which William had placed the most sacred and precious relics. No sooner had Harold sworn the oath, than the Norman duke uncovered the altar, and showing him by what sacred things he had vowed, enforced upon his mind the blasphemy he would be guilty of, if he ever attempted the violation of his oath. Harold is represented taking the oath, while standing between two covered altars· 'VBI HAROLD SACRAMENTVM FECIT WILLELMO DVCI.' Harold next embarks for England: 'HIC HAROLD DVX REVERSVS EST AD ANGLICAM TERRAM ET VENIT AD EDWARDVM REGEM;' and is immediately after represented as relating the events of his journey to the Saxon king.

The next subject is the death and funeral of Edward the Confessor. The funeral procession comes first: 'HIC PORTATVR CORPVS EADWARDI REGIS AD ECCLESIAM PETRI APOSTOLI.' The king is then represented in his bed, giving his last directions to the officers of his court: his wife Editha weeping by his side: 'HIC EADWARDVS REX ALLOQVIT FIDELES.' Beneath he is represented dead and laid out: 'ET HIC DEFVNCTVS EST.' The next subject is the crown offered to Harold by the people: 'HIC DEDERVNT HAROLDO CORONAM REGIS.' Harold then appears upon his throne, Stigand, Archbishop of Canterbury, at his side: 'HIC RESIDET HAROLD REX ANGLORVM. STIGANT ARCHIEPISCOPVS.' The subject that follows is the appearance of a comet, at which the people are gazing: 'ISTI MIRANT STELLAM.' Harold is seen below it, listening to a person who has approached him: his name above, 'HAROLD.' Boats are represented in the border beneath. The next subject which the tapestry represents is a ship, bringing to William the news of Harold's having assumed the English crown: 'HIC NAVIS ANGLICA VENIT IN TERRAM WILLELMI DVCIS.' William and his half-brother, Odo bishop of Bayeux (distinguishable by the tonsure), appear consulting together and giving orders that ships should be built for the purposed invasion of England: 'HIC WILLELM DVX IVSSIT NAVES EDIFICARE.' Accordingly several persons are next represented as employed in cutting down trees; carpenters are constructing vessels, and others draw them into the sea: 'HIC TRAHVNT NAVES AD MARE.' The embarkation of the Normans forms the succeeding subject; they carry with them on board the ships wine, arms, and provisions: 'ISTI PORTANT ARMAS AD NAVES ET TRAHVNT CARRVM CVM VINO ET ARMIS.' William going to his own vessel is next represented: 'HIC WILLELM DVX IN MAGNO NAVIGIO.' Numerous ships are then seen passing the sea, loaded with troops and horses, and William arrives in Pevensey bay (his own vessel known by the figure of a boy holding a pennon at the stern; it bears a lantern at the mast): 'MARE TRANSIVIT ET VENIT AD PEVENESÆ.' The troops and horses next appear disembarking: they proceed to Hastings, where they seize provisions: 'HIC EXEVNT CABALLI DE NAVIBVS ET HIC MILITES FESTINAVERVNT HASTINGA VT CIBVM RAPERENTVR.' A figure on horseback, bearing a pennon at the end of his lance, is here distinguished by the words 'HIC EST WADARD.' The Normans are now busied in cooking meats and regaling themselves: 'HIC COQVITVR CARO ET HIC MINISTRAVERVNT MINISTRI. HIC FECERVNT PRANDIVM.' The soldiers dine upon their shields. Odo seated at a table, with William on his right hand, bestows his benediction on the viands: 'ET HIC EPISCOPVS CIBVM ET POTVM BENEDICIT.' William, with Odo and Robert Earl of Mortaigne, are seated under a canopy: 'ODO EPISCOPVS. WILLELM. ROTBERTVS.' A figure carrying a pennon then appears giving orders that the army should encamp at Hastings: 'ISTE IVSSIT VT FODERETVR CASTELLVM AT HESTENGA.' The camp forming: 'CEASTRA.' William appears directing the building of a castle. The news is then brought to William that Harold is advancing to oppose the Normans; William on a raised seat: 'HIC NVNTIATVM EST WILLELMO DE HAROLD.' Two Normans setting fire to a house; a woman and child escaping from it: 'HIC DOMVS INCENDITVR.' The soldiers of William leave Hastings to meet Harold in the field; and the duke now, for the first time since his arrival, appears in armour: the march of the horsemen: 'HIC MILITES EXIERVNT DE HESTENGA ET VENERVNT AD PRELIVM CONTRA HAROLDVM REGEM.' Odo is represented bearing a mace, but preceded by William on horseback with a club, who interrogates Vitalis, an individual of his army, also on horseback, whether he has seen Harold's forces: WILLELM DVX INTERROGAT VITAL. SI VIDISSET EXERCITVM HAROLDI. Harold also receives information relative to William's force: 'ISTE NVNTIAT HAROLDVM DE EXERCITV WILLELMI DVCIS.' William then addresses his soldiers, who are proceeding onward to the battle: HIC WILLELM DVX ALLOQVITVR SVIS MILITIBVS VT PREPARARENT SE VIRILITER ET SAPIENTER AD PRELIVM CONTRA ANGLORVM EXERCITVM.' The Normans approach, mostly on horseback, but intermixed with archers on foot. The battle now ensues, in which the Saxons are chiefly on foot, their shields distinguished from those of the Normans by being usually round with a boss in the centre. Lewine and Gyrth, the brothers of Harold, are slain: 'HIC CECIDERVNT LEWINE ET GYRTH FRATRES HAROLDI REGIS.' The obstinacy of the contest is next represented: 'HIC CECIDERVNT SIMVL ANGLI ET FRANCI IN PRELIO.' Odo is now represented charging full speed and striking at a horseman with a club or mace: 'HIC ODO EPISCOPVS BACVLVM TENENS CONFORTAT PVEROS.' This probably means that Odo had to encourage the troops, upon a report that William was slain. The battle continues: 'HIC EST WILLELM DVX.' The duke appears showing himself and giving orders: 'HIC FRANCI PVGNANT ET CECIDERVNT QVI ERANT CVM HAROLDO.' The death of Harold, the standard carried before whom appears to be a dragon. We have then the discomfiture and flight of the Saxons. Here the tapestry ends with figures of persons retreating in great haste; not complete in its ornamental work, but, in all probability, complete in its history.

This extraordinary piece of needle-work, for such it is, though called tapestry, is now preserved in the hotel of the prefecture at Bayeux, coiled round a machine, like that which lets down the buckets of a well, and is exhibited by being drawn out at leisure over a table. The plates of it, published by the Society of Antiquaries, in the fourth volume of the *Vetusta Monumenta*, will enable any one to form a very accurate notion of its actual appearance. Plates i. to xvi. represent the whole, one-fourth size of the original. The xviith plate gives a portion of the true size. Dibdin, in his *Bibliographical Tour*, vol. i. p. 377, has engraved a view of it upon its machine.

It was long since decided by the French antiquaries, that this work is of the age of the Conquest. The Abbé de la Rue, alone, still maintains that it was executed in the time of our Henry the First. Those persons, however, among the English antiquaries, whose particular learning and knowledge render them competent judges of the authenticity of this tapestry, unite in the conviction that its own internal evidence corroborates the antient tradition which the French antiquaries adopted. It represents the minutest manners and customs of the earliest Norman times in England; and was evidently designed while the particulars of the contest were known and fresh in recollection. It embraces several events of which no other record now exists: amongst which may be noticed the taking of Dinant, and the war between the Duke of Normandy and Conan Earl of Bretagne. Nor does any other notice exist of the service rendered by Harold to duke William, during his war in Britany. It is not a little remarkable too, that in the compartment which represents the funeral procession of Edward the Confessor, a figure is portrayed placing a weathercock upon the spire of Westminster abbey, indicating that the building was scarcely finished at the time of his decease. Ducarel, as we have already mentioned, says, that this tapestry, when exhibited at Bayeux, went exactly round the nave of the church.

Odo, it is to be remarked, makes the most conspicuous appearance, next to Duke William, of any Norman personage represented in the tapestry; and three figures, *Wadard*, *Turold*, and *Vital*, apparently unimportant personages, were really among the chief of those whom Odo brought into the field. Wadard and Vitalis, with the son of a person named Turold, are recorded, twenty years after the conquest, among the under-tenants of Odo, as persons rewarded with lands, in the Domesday Survey. Wadard held property under the bishop in no fewer than six counties; Vitalis held lands under Odo in Kent; and the son of Turold in Essex. (Ellis's *Introduction and Indices to Domesday*, vol. ii. p. 403.) These circumstances cannot but appear convincing, not only that the tapestry is of the age assigned to it by tradition, and was worked expressly for the bishop's cathedral; but that, in all probability, it was a present from Matilda the conqueror's queen, as a grateful memorial of the effective service which Odo had rendered in the conquest.

BAYLE, PETER, an eminent critic and controversial writer of the seventeenth century, was born at Carlat, November 18, 1647, in the Comté de Foix, in France. Of his early life we shall only state, that he displayed great aptitude for learning, and an uncommon passion for reading, and that his education was commenced under the care of his father, the Protestant minister of Carlat, continued at the Protestant University of Puylaurens, where he studied from February, 1666, to February, 1669, and concluded at the Catholic University of Toulouse. He had not been there more than a month when he made public profession of the Roman Catholic religion, to which, it is said, he was converted by the free perusal of controversial divinity at Puylaurens. It would seem that his creed was lightly taken up, for, during his short residence at Toulouse, he was reconverted to Protestantism by the conversation of his Protestant connexions. *Perhaps this facility of belief in early life may* have had some effect in producing the scepticism of his latter years.

In August, 1670, he made a secret abjuration of Catholicism, and immediately went to Geneva, where he formed an acquaintance with many eminent men, and especially contracted a close friendship with James Basnage and Minutoli. At Geneva and in the Pays de Vaud he lived four years, supporting himself by private tuition. In 1674 he removed first to Rouen, and soon after to Paris. The treasures of the public libraries, and the easy access to literary society, rendered that city agreeable to him above all other places. He corresponded freely on literary subjects with his friend Basnage, then studying theology in the Protestant University of Sedan, who showed the letters to the theological professor, M. Jurieu. By these, and by the recommendations of Basnage, Jurieu was induced to propose their author as a proper person to fill the then vacant chair of philosophy, to which, after a public disputation, Bayle was elected, November 2, 1675. For five years he seems to have been almost entirely occupied by the duties of his office. In the spring of 1681, however, he found time to write his celebrated letter on comets, in consequence of the appearance of the remarkable comet of 1680, which had excited great alarm among the superstitious and vulgar. But the license for its publication being refused, it was not published till the following year, after the author's removal to Rotterdam.

In July, 1681, the University of Sedan, contrary to the faith of treaties, was arbitrarily disfranchised by a decree of Louis XIV. Thus deprived of employment, Bayle fortunately obtained, through the agency of one of his pupils, a pension from the magistracy of Rotterdam, who were further induced to form a new establishment for education, in which Bayle was appointed professor of history and philosophy, and Jurieu of theology. Bayle delivered his first lecture in December, 1681. In the following spring the letter on comets was anonymously printed; but its author was soon discovered, and obtained a considerable increase of reputation. The reader will readily gather from the title (*Lettre . . . . ou il est prouvé par plusiéurs raisons tirées de la Philosophie et Théologie, que les Comètes ne sont point le présage d'aucun malheur. Avec plusieurs réflexions morales et politiques, et plusieurs observations historiques, et la réfutation de quelques erreurs populaires*) that it was composed quite as much for the sake of the digressions and incidental discussion of various points, as for that refutation of a popular superstition, which is its ostensible purpose. In the same spring (1682) he wrote an answer to Maimbourg's *Histoire du Calvinisme*, a libellous misrepresentation of the conduct of the French Protestant Church. (*Critique Générale de l'Hist. du Calv. de M. Maimb.*) This was composed in a fortnight, during the Easter vacation. It met with great success, and having been condemned to be publicly burnt in Paris, was bought and read in that city with great avidity.

We pass over some minor works to mention that in 1684 Bayle commenced his *Nouvelles de la République des Lettres*. The notion of a literary journal was not new; the *Journal des Savans* had been set on foot in Paris in 1665, and received with applause in Germany and Italy, as well as France. The *Nouvelles* were published monthly, beginning with March, 1684, and consisted of a series of reviews of such works as the editor thought worthy of special notice, and a list of new publications, with short remarks on them. In May the states of Friesland offered to make Bayle professor of philosophy in the University of Franeker, but he declined the appointment, which was more lucrative than the one that he held. On completing the first year of the *Nouvelles*, Bayle affixed his name to the work, contrary to his usual practice, which was carefully to conceal the parentage of all that he wrote. We may here state, that, whether from timidity, habitual love of secrecy, or the wish to leave himself at liberty to take either side of a question, Bayle generally employed the most elaborate devices of false dates and fictitious prefaces, to divert public suspicion from himself. These practices he carried to an extent, inconsistent, as we think, with a candid and manly spirit.

At this time men's minds were deeply steeped in the bitterness of political and religious dissension. The revocation of the Edict of Nantes, and persecution of the French Protestants, had raised a violent indignation on the part of those who were banished for conscience-sake, and a strong sympathy in all Protestant countries for the sufferings of their brethren. Bayle expressed his feelings on this subject with moderation in the *Nouvelles*; but he made a bitter attack on the dominant church in an anonymous publication (*Ce que c'est que la France toute Catholique sous le Règne de Louis le Grand*), which he followed in the same year, 1686, by a 'Philosophical Commentary' on the words of St. Luke xiv. 23, 'Constrain them to come in.' In these two works he laboured to expose the atrocious conduct of the French government towards the Protestants, and the odious nature of persecution in general. The pains which Bayle bestowed upon this work, in addition to the fatiguing task of writing his *Nouvelles*, brought on an illness in the spring of 1687, which incapacitated him for literary exertion during more than a year. He was obliged to give up his periodical, which at his own request was continued, but under a different name (*Histoire des Ouvrages des Sçavans*), by Henry Basnage, brother to his friend. The *Nouvelles*, however, continued to be published by another hand.

In 1690 there appeared a book, once celebrated, now forgotten, entitled *Avis Important aux Refugiez, &c.*, containing a violent attack on the doctrines and conduct of the French Protestants. This work Jurieu, whose former friendship had long given way to jealousy of the reputation, or dislike of the opinions, real or suspected, of his colleague, chose to attribute, without any proof, to Bayle, upon whom he published a violent attack. (*Examen d'un libelle intitulé Avis Important, &c.*) Bayle retorted in *La Cabale Chimérique*, Rotterdam, 1691, followed by *La Chimère de la Cabale de Rotterdam démontrée, &c.* It is not necessary to trace the progress of the quarrel, which was marked by great asperity. The question whether Bayle was the author of the *Avis, &c.*, or not, a question deeply affecting his literary integrity, can hardly be regarded as determined. Bayle always denied it. His friend and biographer, Des Maizeaux, seems nevertheless to disbelieve his assertions, and has, hypothetically, made a very lame defence on the supposition that he was the author. The piece is inserted in the collection of his miscellaneous works: there is, however, no direct evidence whatever to prove that he wrote it but the assertions of the printer, and of a person who corrected the press, and said that the manuscript was in Bayle's writing.

Whether Jurieu was right or wrong in his accusation, his precipitate and violent conduct drew on him great discredit, especially at Geneva. But he possessed much influence in Holland, which he employed in inducing the Consistory of Rotterdam to review his adversary's letter on comets, which they condemned as containing dangerous and antichristian doctrines. This was employed by the magistracy of Rotterdam as an excuse for depriving him of his pension and license to teach; but the real cause, according to Des Maizeaux, was the express command of William III., who exercised an overpowering influence in that body, and who was led to believe that Bayle was deeply engaged in advocating the views and wishes of the court of France. The injury thus done to our author was slight, for his habits were simple and unexpensive, and he rejoiced in being finally delivered from the labour of teaching, and left at liberty to attend to his chief work, the *Dictionnaire Historique et Critique*. His first scheme in respect of this undertaking was to compose a dictionary, expressly to correct the errors of other dictionaries; and he proceeded so far as to publish a specimen of the intended work (*Projet et Fragmens d'un Dictionnaire Critique*). But this specimen not suiting the public taste, he altered his plan, and produced his dictionary in the form in which it now is. The composition of it, together with his paper warfare with Jurieu, engrossed his time until August, 1695, when the first volume appeared; the second volume, which completed the first edition, was printed in 1696, but bears the date of 1697. It obtained great popularity, so that a second edition was soon called for; but it gave great offence to the religious, and incurred a public censure from the Consistory of Rotterdam. Five principal errors were alleged against it:—1. The indecency visible in many passages; 2. The tendency of the whole article on David; 3 and 4. The support covertly given to the Manichean doctrine of evil, and the sceptical tenets of the philosopher Pyrrhon; 5. Too studious commendation of Epicureans and atheists, by which a tacit support was supposed to be given to their tenets. The author submitted to the authority of the church, and promised to amend the faults in a second edition. According to promise, the article David was replaced by another; but the purchasers exclaimed loudly against this interference with the work, and the publisher finally reprinted the obnoxious article in a separate form. It is to be found at the end of the second volume of the editions of 1720 and 1730, &c. Little notice was taken of the other objections. Instead of altering, Bayle defended himself and his work in a series of *Eclaircissements*, subjoined to the second edition of 1702, and published in subsequent editions of the book.

It is a singular property of this singular work, that, unlike all other dictionaries, it has never been superseded, though near a century and a half has elapsed since it was written. The author did not intend it to be, like Moréri's antecedent dictionary, a book of general historical reference; we might rather suppose that, being disappointed in his first scheme of publishing a work supplementary to, and corrective of, other works, he had resolved to make available, in the shape in which they could most readily be produced the multifarious stores of his vast reading and extensive memory. Consequently the dictionary contains much curious and minute, and much trifling and almost useless information. The chance is against our finding exactly what we want in it; but if the subject is treated at all, we are pretty sure to find something which we should hardly find elsewhere. As a book for casual reading it is highly amusing, both in respect of the matter and the style, in which his wit and power of sarcasm are largely displayed: the form, however, is highly objectionable, the text being usually meagre, and serving as a vehicle to introduce numberless digressions, criticisms, and quotations in the shape of notes. This is the more to be regretted, because the influence of Bayle's example has caused two valuable English works, the *General Dictionary*, in 10 vols. folio, and Kippis's *Biographia Britannica*, to be composed on the same plan

After the publication of the second edition, which was considerably enlarged, Bayle amused himself by preparing the first volume of *Réponses aux Questions d'un Provincial* intended, as he says, 'to occupy a middle place between books for study and books for recreation.' It is characterized by a late writer (*Biog. Univ.*) as 'a work which the author could not define, and which is undefinable, because all possible matters are treated in it without order, and in separate chapters.' In 1704 he published a defence of his Letter on Comets, which engaged him in a controversy, which lasted for the rest of his life, with Le Clerc, the well-known author of the *Bibliothèque Choisie*, and a theological writer named Jacquelot. To this discussion the second and third volumes of the *Réponses aux Questions, &c.*, 1705, were devoted. Controversy seems to have been Bayle's pleasure; and it is probable that the attacks made on his works made no impression on his tranquillity; but his enemies had nearly done him a serious injury by endeavouring to procure his banishment from Holland in 1706, by reviving the accusation that he was a secret agent of France. It appears probable that the English ministry, possessed with this belief, would have demanded his banishment, had it not been for the Earl of Shaftesbury, who had known Bayle in Holland, and who interfered in his behalf. At that time he was suffering from an affection of the chest, for which, believing it to be hereditary and mortal, he refused to call in medical assistance. His last works were a fourth volume of the *Réponses*, and *Entretiens de Maxime et Themiste*, in answer to Le Clerc, and a second book under the same title, in answer to Jacquelot. The last was not quite finished: he was working on it the evening before his death, which took place December 28, 1706, in the 60th year of his age.

Bayle's life and habits, in the relations of man to man, were simple, temperate, and moral. Without a cynical or affected contempt, he displayed a truly philosophical indifference to wealth; and he lived independently, in virtue of the moderation of his wants, yet not improvidently, for he left a legacy of 10,000 florins to his niece. The worst moral charge brought against him is that of literary duplicity; and of this he had no right to complain: for a man who is known to conceal his authorship under the thickest disguises of false names, false dates, and false prefaces, need not wonder if much which cannot be proved is believed to be his. The same spirit of concealment attended him in religion; for whether he was Atheist, Epicurean, or Christian, it is at least pretty clear from his writings that he could not have been at heart a member of the strict church to which he outwardly conformed.

Warburton says of Bayle, 'A writer whose strength and clearness of reasoning can be equalled only by the gaiety, easiness, and delicacy of his wit; who, pervading human nature with a glance, struck into the province of *paradox* as an exercise for the restless vigour of his mind; who, with a soul superior to the sharpest attacks of fortune, and a heart practised to the best philosophy, had not yet enough of real greatness to overcome that last foible of superior geniuses,—the temptation of honour, which the academic exercise of wit is supposed to bring to its possessors.' (*Divine Legation*, book i. sect. 4, vol. i. p. 33, 8vo. edition, 1733.)

The later folio editions of Bayle's *Dictionary* are comprised in four volumes. The supplement by the Abbé Chaufepié occupies four more. Bayle's miscellaneous works, of which we have not given any thing like a complete list, fill four volumes also. (*Life of Bayle*, by Des Maizeaux, prefixed to his edition of the *Dictionary*.)

BAYLÉN, the Roman BÉTULA or BÆTULON, a town of Andalusia, in the province of Jaen, 38° 2′ N. lat., 3° 45′ W. long. It is situated on a gentle elevation, commanding an extensive plain, which is bounded on the north, east, and west, by lofty hills, and on the south, south-east, and south-west, by the rivers Guadalon and Campana. The soil is very fertile, and produces corn, fruit, oil and wine, the two last in abundance. The town is mentioned in public records of the eighth century. It contains one parish church, an ancient castle, a palace belonging to the Count of Baylen, an hospital, and some good houses. The inhabitants, who amount to 5996, are employed in agriculture, the manufacturing of glass, bricks, and common cloth. There are also twelve oil-presses or mills, and some soap manufactories.

On the 19th of July, 1808, an engagement took place here, between the Spanish and French armies, the former commanded by General Castaños, the latter by General Dupont, who had occupied Baylen. At three o'clock in the morning the battle began, and was sustained with equal courage on both sides until noon, when the French general sued for terms. A convention was agreed upon, by which the French were to lay down their arms in the field, and to be conveyed into France by the Spanish government. On the 23rd 18,000 French soldiers defiled before the Spanish army, laid down their arms, eagles, and other military accoutrements, and were conducted to Cadiz. But unfortunately the circumstances of the war prevented the exact fulfilment of the latter part of the convention. The officers were conveyed to France, but the men were placed in hulks, where they remained some years, until, driven to despair, the few who had survived the miseries of their confinement cut the cables of their prison ships, and, abandoning themselves to the mercy of the winds, were saved by their countrymen then besieging Cadiz. This victory, the first obtained in the peninsula over the French, cost the Spaniards 978 men in killed and wounded. The loss on the side of the French was 2600 men in killed and wounded, among which latter was General Dupont himself. (*Bulletin of General Castaños.*)

BAYNE, ALEXANDER, of Rires, first professor of the municipal law of Scotland. The only biographical notice of this learned person we have yet met with is that by Bower (*Hist. of the University of Edinburgh*, vol. ii. p. 197), and in the 'very little information concerning him' which it contains, there are doubts to be removed and errors to be corrected.

He was son of John Bayne of Logie in the county of Fife, who was descended from the old Fifeshire family Bayne of Tulloch, to whom he was served heir in general on the 8th of October, 1700. (*Inquis. Retorn. Abbrev.*) On the 10th of July, 1714, he passed advocate at the Scottish bar (*Fac. Rec.*), but does not appear ever to have had much practice. In January, 1722, the faculty appointed him senior curator of their library (*Fac. Rec.*), and on the 28th of November, same year, he was constituted by the town-council of Edinburgh professor of Scots law in the university of that city. The late settlement of this the earliest chair of Scots law is not a little remarkable, and can be accounted for only by a reference to the actual law and practice of the Scots courts, to which, therefore, we shall here for a moment advert.

The common law of Scotland was substantially the same with that of England till the erection of the Court of Session in the beginning of the sixteenth century, when, in consequence of the peculiar constitution of that court, the old common law was superseded by the principles of the civil and canon laws, which thereupon became, in fact, as in legal acceptation, the common law. The members of the Court of Session were, from its first institution, associated together under the name of the college of justice; but it does not appear that they ever adopted a collegiate mode of life, or that any domestic school of law was ever erected among them. The consequence was, that till the beginning of the last century, when, as we shall immediately see, the sources of the Scottish law ceased to be sought in the Roman code, preparation was generally made for the Scottish bar at some one of the foreign colleges, of which those of France and Italy were the most frequented, till the lustre of the Cujacian School in the Low Countries, aiding the connexion which arose between Scotland and them at the Reformation, drew the student thither. On the erection of the University of Edinburgh, however, attempts were made by the bench and bar to remedy the inconvenience of foreign study, but as the object of those attempts was to establish a chair of civil law, they were long baffled by the want of means of preparatory instruction in the language of that law. The only method of attaining a practical knowledge of the profession in those times was attendance on some lawyer of reputation; and, accordingly, we not only find such individuals as Sir Thomas Hope and others who rose to celebrity at the bar passing their early years in the capacity of clerk, or, as it was then, in French phrase, called 'servitor' to an advocate, but these servitors were privileged by the court to act behind the bar, a station and privilege which their descendants, the 'advocates first clerks,' enjoy to this day. In the end of the seventeenth century private lectures on the law began to be given in Edinburgh by members of the faculty, and at length, in 1707, a chair of public law was founded; and, in 1709, the chair of civil law. By this time, however, the natural working of an independent judicature, and, still more, the operation of the union with England, by which the Scots courts were subjected to an appellate jurisdiction common to both parts of the island, carved out a system of law in many respects different from that of Rome, and requiring a separate chair for its elucidation. But with the predilections which habit and associations had given to the Scottish lawyer, the civil law was clung to as the guide of the courts, and several circumstances impress us with the idea, that the chair of Scots law to which Bayne was inducted was regarded with contempt by the learned faculty whereof he was a member. The *Faculty Records* contain no allu sion to his appointment. The only record of it which we have is in the *Council Register*, where, under date 28th November 1722, there is this entry:—

'Mr. Alexander Bayne having represented how much it would be for the interest of the nation and of this city, to have a professor of the law of Scotland placed in the university of this city, not only for teaching the Scots law but also for qualifying of writers to his Majesty's signet; and being fully apprised of the fitness and qualifications of Mr. Alexander Bayne of Rires, advocate, to discharge such a province—therefore the council elect him to be professor of the law of Scotland in the university of this city, for teaching the Scots law and qualifying writers to his Majesty's signet.' (Bower's *Hist. ut supra.*) We have not been able distinctly to ascertain the estimation in which Bayne was held by his learned compeers, any more than the true source of the neglect with which his little works on the law have been hitherto regarded: but only a year elapsed when his despised chair began to work a change on the course of examination for the bar, and on the system of legal study. In January, 1724, Mr. Dundas of Arniston, D.F., proposed to the faculty, that all Intrants should, previous to their admission, undergo a trial, not only in the civil law, as heretofore, but also in the municipal law of Scotland (*Fac. Rec.*); and though this was long resisted, it was at length determined by Act of Sederunt, 28th February, 1750. We apprehend it is to Bayne, also, we ought to concede the impulse given at this time to investigate the sources of the Scottish antient common law.

In the beginning of 1726, the usual period of remaining senior curator of the advocates' library having expired, Bayne retired from the office, and the same year he published the first edition of Sir Thomas Hope's *Minor Practicks*—a work which, though delivered by the author to his son orally, it is said, at his morning's toilet, is remarkable for its legal learning, the breadth and boldness of its views, the acuteness of its observations, and the subtlety of its distinctions, but which had lain near a century in MS. To this work Bayne now added a *Discourse on the Rise and Progress of the Law of Scotland, and the Method of studying it.* In 1731 he published a small volume of *Notes*, for the use of the students of the municipal law in the University of Edinburgh. These *Notes* were framed out of the lectures delivered from the chair, and impress us with a very favourable opinion of the author's acquaintance not only with the Roman jurisprudence, but also with the antient common law. About the same time he published another small volume, which he entitled *Institutions of the Criminal Law of Scotland*, for the use of his students. The author of such works, distinguished for their modesty not less than for their learning, could not but exercise a salutary influence on the youth by whom he was surrounded; and his career, though short, was sufficient to prove his talent and diligence, and to make his chair an object of no inconsiderable ambition.

In June, 1737, Bayne's death was intimated to the faculty by the magistrates of Edinburgh (*Fac. Rec.*); and in the following month a leet of two advocates (Mr. Erskine and Mr. Balfour) was delivered by the faculty to the magistrates or their election of a successor.

Bayne married Mary, a younger daughter of Anne, only surviving child of Sir William Bruce of Kinross, by her second husband, Sir John Carstairs of Kilconquhar, and by her he had three sons and two daughters.

BAYONET. [See ARMS.]

BAYO'NNE, a considerable town in the south of France, in the departments of Basses Pyrénées (Lower Pyrenees) and Landes, 43° 30′ N. lat., 1° 30′ W. long. It is 531 miles S.S.W. of Paris, through Orleans, Châteauroux, Limoges, Bordeaux, and Mont-de-Marsan. There is an old road from Bordeaux to Bayonne more direct than that through Mont de Marsan, by which a considerable distance may be saved. This road leads through the pine forests of the Landes; but the deep sandy soil renders travelling very incommodious, which is probably the cause why this route has been laid aside for one more circuitous but more convenient.

Bayonne is a town of considerable trade, for which it is favourably situated, being at the junction of two navigable rivers, the Adour and the Nive, whose united streams fall into the Bay of Biscay two or three miles below Bayonne. By these two rivers Bayonne is divided into three parts. That part situated on the left, or south-west bank of the Nive, is called Great Bayonne, that between the two rivers is called Little Bayonne, and that on the north or right bank of the Adour is called the suburb of St. Esprit (*i.e.* of the Holy Ghost.) The latter is in the department of Landes, the two former in that of Basses Pyrénées. The entrance of the port is narrow, and a very dangerous bar crosses it, on which, in westerly winds, there is a violent surf. The harbour is however safe, the bar affording it shelter seaward, and it is well frequented. The name Bayonne is a compound of two Basque words, 'Baia' and 'Ona,' signifying good bay or good port, and indicates the estimation in which the harbour was formerly held.

Bayonne is fortified, and is in the first class of strong places. Each part of it is surrounded on the land side by an ancient wall, outside of which are the modern works. Great Bayonne has a castle flanked by four round towers, called the Old Castle; Little Bayonne has the New Castle, flanked by four bastions; and adjoining to the suburb St. Esprit is a citadel, the work of Vauban, which has been strengthened by works recently added.

Bayonne is a handsome place. The houses are well built of stone, the streets are wide, and the *places* (open spaces) adorned with good buildings. The different parts of the town communicate by several bridges, two over the Nive, and one handsome wooden bridge over the Adour. The numerous vessels, large and small, by which the rivers are covered, give animation to the scene. The public promenade is also very beautiful. Of the public buildings the Cathedral of Notre Dame may be mentioned, although there is nothing in its architecture which calls for particular notice. The Mint is also one of the principal edifices in Bayonne. The town has a school of navigation and also a theatre.

The manufactures of Bayonne are not important; that of glass bottles is the chief. The town is famous for hams, for the liqueur which bears the name of the village of Andaye, and for chocolate. In the preparation of the liqueur Bayonne is considered to rival Andaye itself. Shipbuilding is carried on with advantage, as the neighbourhood supplies the materials. The trade of the town is very considerable; drugs, wines (those of the neighbourhood are accounted excellent), brandies, and fir timber, are among its exports; also masts, which are floated down from the forests of the Pyrenees by the Nive and Adour, or their branches, and sent to Brest and other ports. Of the imports Spanish wool is the principal; the quantity brought in yearly is said to be about 20,000 bales. Bullion is also brought in from Spain. The coasting trade employs the greater part of the vessels which enter or leave the port of Bayonne; a few ships are engaged in the cod fishery, but there is no trade with the French colonies. The population of the town, in 1832, was as follows:

Bayonne town	13,008	whole commune	14,773
St. Esprit .	4,108	,,	5,895
Together . .	17,116	,,	20,668

When Expilly published his *Dictionnaire des Gaules* (in 1762), above half the population of St. Esprit were Jews, viz. 3500 out of 5800.

Before the Revolution Bayonne had only one parish church, the cathedral; for though there was in the suburb of St. Esprit a collegiate church, it was not parochial, as the suburb was in the parish of St. Etienne, the church of which is at some distance to the northward. There were in Great and Little Bayonne eight religious houses (of which three were for females), and in St. Esprit a Commandery of the Order of Malta, and a convent of Ursuline nuns. An abbey of Cistertian nuns was situated without the walls of that suburb.

Bayonne is the capital of an arrondissement, comprehending 491 square miles, or 314,240 acres, and containing, in 1832, a population of 78,411. It is also the see of a bishop, whose diocese includes the department of Basses Pyrénées, and who is a suffragan of the Archbishop of Auch.

D'Anville considers Bayonne to be the Lapurdum mentioned in the *Notitia Imperii*; but the correctness of his opinion is disputed or doubted by some. The origin of the see cannot be traced higher than the tenth century. The bishops of Bayonne bore the title Episcopi Lapurdenses, but this title, it is contended, only implies that they were bishops of the territory of Labour. Their diocese included some parts of Spain, but they were severed from it by the Pope at the instigation of Philip II., King of Spain, in the sixteenth century, and placed under the control of the Bishop of Pampeluna as the pope's vicar.

In the invasion of France by the allies under the Duke of Wellington, in 1814, the citadel of Bayonne was invested by a force under Lieutenant-General Sir John Hope. On the morning of the 14th April, several days after hostilities in the north of France—the then great scene of warfare—had been terminated by the abdication of Napoleon, a sortie took place from the entrenched camp formed by the French in front of the citadel. The attack, though repulsed, caused a severe loss (800 officers and men killed, wounded, or taken) to the besiegers. Sir John Hope was taken prisoner, and Major-General Hay, the general commanding the line of outposts, was killed.

Bayonne was the scene of an interview, in 1564, between Catherine de' Medici and the Duke of Alba, one of the chief officers of Philip II. of Spain, at which it has been supposed the massacre of the Huguenots or Protestants was devised, though not executed till seven years after, on the day of St. Bartholomew. When the massacre took place, however, D'Orthez, commandant of Bayonne, refused to execute the orders of the court. He replied to the king's order in these words: 'I have found, Sire, in Bayonne, only good citizens and brave soldiers, but not one executioner.' Bayonne was the scene of the arrest of Charles IV. and Ferdinand VII. of Spain in 1808.

BAYSWATER, one of the suburbs of London, denominated a hamlet, and situated three miles and a half west of St. Paul's. Like most of the other suburbs of the metropolis which retain their old denominations of villages and hamlets, Bayswater has of late years been much enlarged by the addition of new streets and houses. At the eastern extremity of Bayswater is the Queen's Lying-in-Hospital, a retired building surrounded by an extensive garden. The charity was originally established at Uxbridge in 1752, but was removed hither in 1791; it is supported by annual subscriptions, and affords assistance to poor pregnant women at their own houses, if within a limited distance, or receives them into the hospital. The tea-gardens in Bayswater occupy the site of the house and botanical garden of Sir Joseph Hill, whose various writings and high-sounding nostrums were popular in their day. In the neighbourhood is one of the conduits formerly used for supplying the city with water. It belongs to the City of London, and still serves to convey water by brick drains to some western parts of the metropolis. There is also a reservoir of some magnitude belonging to the Grand Junction Water Company at Bayswater. The population is not stated separately from that of the parish of Paddington, to which it belongs. (Lysons's *Environs of London*; Brewer's *Middlesex*, &c.)

BA'ZA, the Roman Basti, a city of Andalusia, in the kingdom of Granada, 37° 30′ N. lat., 2° 50′ W. long. It is situated near the river Guadalquiton in a valley in the Sierra de Baza, which, according to some geographers, is a branch of the Sierra Nevada. The *hoya* or valley of Baza is very productive in grain, fruit, hemp, and flax. The city, which is of very old construction, was taken from the Moors by Fernando the Catholic, in 1489, after a seven months' siege. Baza is a bishop's see, has a cathedral, three parishes, six convents, an ecclesiastical seminary, an hospital, and six inns. The population amounts to 11,486 inhabitants. At the distance of two miles from the city several interesting antiquities of the Augustan age, belonging to the city of Basti, have been dug up by the farmers. These monuments, on which a curious antiquarian would set a high value, are only dug from the earth to be buried in the house of some obscure farmer.

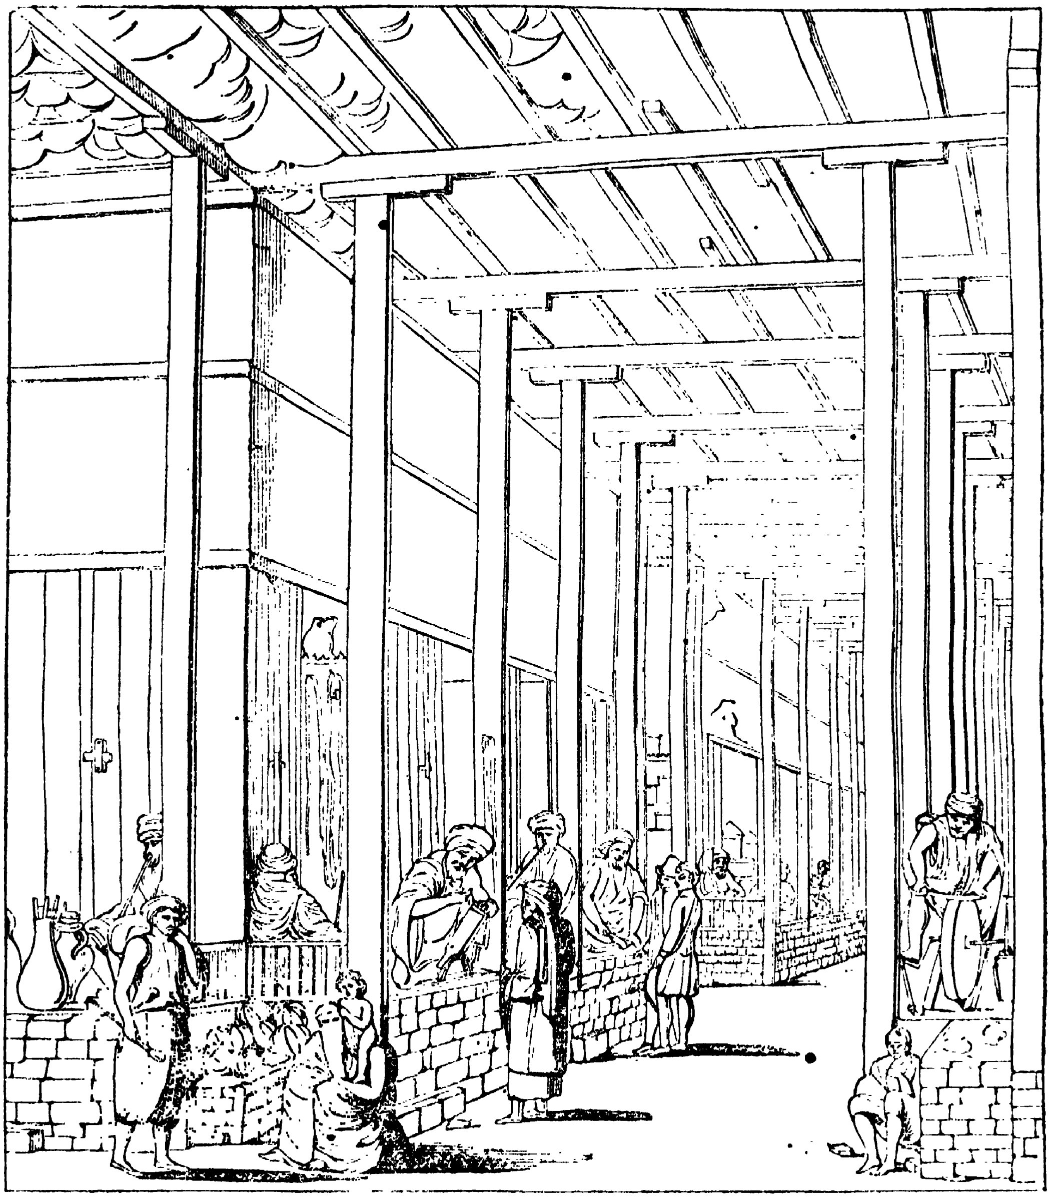
Baza is the capital of the district which bears its name, and comprises fifty-four towns and villages and three cities, besides the capital, viz., Purchena, Vera, and Mujacar. The Sierra de Baza abounds in trees, which supply the inhabitants with timber and fire-wood: it produces also lead in great abundance, as well as marble, the most celebrated of which is that of Macael. Six miles from Baza is a hot spring, called Los Baños de Benzalema (Benzalema's baths), the temperature of which is 30° Réaumur. The inhabitants of the district are exclusively employed in agriculture.

BAZAAR. The word *bazaar* is Persian, and its primary meaning is *a market, a forum*. In Turkey, Egypt, Persia, and India this term distinguishes those parts of towns which are exclusively appropriated to trade. In this exclusive appropriation they resemble our markets; but in other respects they approximate more nearly to our retail shops. We have interpreted the word in its large sense; for although the term bazaar is in this country commonly understood to mean an assemblage of shops or stalls under cover, yet in fact it equally applies to open places in which bulky commodities are offered for sale. Such places sometimes occur in eastern towns, and are used chiefly in the early morning, at least in summer, for the sale of vegetables and cattle. If a place in the open ground outside a town be commonly applied to this use, it will be called a bazaar, and will be distinguished, as in all other cases, by joining to the word 'bazaar' the name of the commodity sold. In large towns, however, such markets are generally near or in the midst of the regular covered bazaars; except the market for cattle, which is always outside or at the extremity of the town. In some places bazaars are rather extensive squares, the sides of which are lined with shops under arcades. In a few cases the covered ways branch off with some regularity from these squares as from a centre: and in one of the best specimens of the open market, at Kermanshah in Persia, the palace of the prince-governor occupies one of its sides. When, however, as in this and some other instances, the principal open area in the city is thus appropriated, its distinctive appellation of the *Maidan*, or square, is retained.

The regular bazaars consist of a connected series of streets and lanes, and, when of a superior description, they are vaulted with high brick roofs. The domes or cupolas which surmount the vaulting admit a subdued daylight; and as all direct rays of the sun are excluded, a comparatively low temperature is obtained. The description of a good bazaar in Persia is a description of a good bazaar in Turkey or India. Nevertheless, the Persian bazaars are rather more light and lively than those of Turkey. They are painted in many places, and sometimes decorated, particularly under the domes, with portraits of the heroes of the country, with representations of battles or hunts, with figures of real or fabulous animals, and with other subjects. The approaches to the bazaars are commonly lined with low shops, in which commodities of little value are exposed for sale. These approaches are sometimes open to the sky; but they are more generally covered in a rude manner with branches of trees, and leaves laid upon beams. In many of the provincial towns of Turkey and Persia, the bazaar, as a whole, would answer to this last description; and in others it is nothing more than a mud platform continued along the way side, about two feet above the footpath, on which little covered shops are raised, that are mere boxes, scarcely affording room for the vendor to sit down on a bit of carpet or felt in the midst of his scanty stock.

In the best specimens of the vaulted bazaar the passages are lined on each side with a uniform series of shops, the floor of which is a platform raised from two to three feet above the level of the ground, and faced with brick. As the vault springs from the front of the line of shops, they seem like a series of recesses, and the partition-walls between them appear like piers supporting the arch. These recesses are entirely open in front, in all their height and breadth; they are scarcely more than very small closets, seldom exceeding six feet in breadth, rarely so deep as wide, but generally from eight to ten feet in height, and occasionally more. But in the more respectable parts of large bazaars there is generally a little door in the back wall which conducts to another small and dark closet, which serves the purpose of a store-room. The front cell is the shop, on the floor of which the master sits with his goods all around him, the articles most in demand being placed so within his reach that he has seldom occasion to rise, which, if he is a Turk, he rarely does without manifest reluctance. Such a dealer offers a very singular contrast to our ideas of a shopkeeper, being the very personification of luxurious repose as he sits smoking his pipe; or, if in winter, when these berths are chilly and uncomfortable, bending over a brazier of burning charcoal. The neighbouring shopkeepers have much communication with one another, and generally exhibit as much alacrity in promoting the interest of a neighbour as can be compatible with attention to their own. Indeed, a stranger might be disposed to imagine that all the tradesmen in the same line of business are in a general partnership, so little anxiety does any one exhibit to obtain a preference, and so willingly does he inform a customer where he may obtain an article more exactly suited to his wants than he can himself supply. This is more apparent in Turkey than in Persia. Persian, Armenian, and Jewish shopkeepers are in general more civil and obliging than

Turks, and exhibit more anxiety to obtain custom. The writer has often been constrained by the former to turn aside and smoke of their pipes, and eat of their onions and bread, without being directly urged to make any purchase; but it is more pleasant to deal with a Turk, though he would not do this, because he deserves more confidence, yet not implicit confidence, in matters of purchase and sale. A French writer (M. Aubert de Vitry) says, 'It is not necessary to offer a Turk less than two-thirds of the price he demands; to a shopkeeper of any other nation one-half may be safely offered; and in the case of the Jews there is no limit to the abatement.' This is perfectly true; and no stranger in the East could have a better rule for his guidance in such matters.



[Turkish Bazaar, from the French work on Egypt.]

Business commences and terminates with daylight in oriental bazaars. No trade or handicraft employment is in general carried on in the East by candle-light. None of the shopkeepers or artizans reside in the bazaars. When it gets dark, every one shuts up his shop and goes home. The fastenings of the shops are very slight; but the bazaars are in general well watched, and frequently secured with strong gates. In very warm countries it is usual for the majority of the shopkeepers to close their shops at mid-day, and go home to have their lunch and enjoy a siesta. The bazaars have then a very deserted appearance. Larcenies in the bazaars are scarcely known in Turkey; hence the shopkeepers do not hesitate to leave their shops quite open, without any one in charge, during their occasional absences; but when a rather long absence is intended, and the goods are of great value, a net, like a cabbage-net, is sometimes hung up in front, or laid over the goods.

The peculiar principle of oriental bazaars is that all the shops of a city are there collected, instead of being dispersed in different streets as in Europe, and that in this collected form the different trades and occupations are severally associated in different parts of the bazaar, instead of being indiscriminately mingled as in our streets. Thus one passage of the bazaar will be exclusively occupied by drapers, another by tailors, another by cap-makers, another by saddlers, and so on. In the bazaars of Persia, and, although less usually, in those of Turkey, the shops of provisions for immediate use form an exception to the rule. The shops of cooks and bakers are dispersed in different parts of the bazaar; the preparations in the former seldom extend beyond soups, and a sort of sausage without skin, called *kuboob*, a highly-seasoned and savoury article, which is much relished both in Turkey and Persia. Not only are trades carried on, but handicraft employments are exercised in the bazaars of the East: and thus while one part is very quiet, another resounds with the hammers of carpenters, smiths, and shoe-makers. The stocks of the individual dealers are seldom of much value. It would be difficult to find a shop which contains a greater stock than that of a small retail tradesman in London; but an imposing effect is produced by the exhibition of the several stocks in a connected form, so that the whole of a particular street in a bazaar will appear as one great shop for the article in which it deals. This is the cause of the reported splendour and riches of an oriental bazaar. Of this kind of effect the bazaar for ladies' slippers in Constantinople is a very remarkable instance: such an extensive display on each side, through a long covered street, of small slippers, resplendent with gold and silver embroidery, and silk, and coloured stones, conveys an impression of wealth, luxury, and populousness which ten times the number of shops in a dispersed form would not give. Wholesale dealers have no open shops in the bazaars, but they have warehouses in it or in its vicinity, to which the retailers resort as they have occasion. These warehouses are frequently in a large house or khan, occupied in common by several wholesale dealers. The khans also, to which the itinerant merchants resort until they have disposed of their goods, are generally in or near the bazaars; and they frequently make use of the same building with the stationary merchants. The principle of association for facility of reference is the true principle of a bazaar; the vaulted covering is merely a circumstance of climate. Therefore Paternoster-row with its books, Monmouth-street with its shoes, and Holywell-street with its old clothes, are more properly bazaars than the miscellaneous shops assembled under cover, which are in London designated by the name.

Besides the regular business conducted in the bazaars by the professional shopkeepers, there is an under-current of irregular trade, highly characteristic of oriental manners. If a person not in business, or a stranger, has an article of which he wishes to dispose, he employs a crier, who takes it through the bazaar, proclaiming, at the top of his voice, its praises and its price. Many poor people also endeavour in the same manner, without the services of the crier, to dispose of such articles of their property, or produce of their industry, as they desire to sell. These are mostly persons who imagine they shall be able to obtain a better price from the purchasers or idlers in the bazaar than they have found the shopkeepers willing to give. There is also a class of sellers who exhibit a little stock of wares upon stools, in baskets, or on cloths spread on the ground. They generally deal in but one commodity, which they profess to sell on lower terms than the shopkeepers will take. It would seem that in respectable towns a preference is given to this mode of selling some one particular commodity. Much tobacco, and most of the little snuff that is used, are sold in this way at Bagdad; much opium is thus disposed of every morning at Tabreez in Persia; and at Constantinople many women post themselves in the bazaars, displaying embroidered handkerchiefs and other needlework, often wrought by the hands of ladies of quality, who are enabled by the produce to make a private purse for themselves, and purchase some little indulgences which they might not otherwise obtain. If the truth be told, at Constantinople no small portion of this supply to the bazaars of that metropolis is contributed by the ladies of the imperial seraglio.

In hot weather, oriental bazaars are traversed by men laden with a skin or pitcher, from which they deal out to the thirsty a draught of excellently filtered water. Sometimes payment, seldom exceeding the fourth of a farthing, is expected; but frequently the men are employed to distribute water gratuitously, by pious individuals, who consider it an act of charity acceptable to Allah.

The contrast between the deserted appearance of the streets in an oriental town and the thronged state of the bazaars surprises a stranger. The women, except those of the lowest class, go little abroad; and of the men, the idle resort to the bazaar for amusement or conversation; and those who are not idle generally have some business there in the course of the day, which collects the visible population much into that part of the town, until the approach of evening effects a more equal distribution. The bazaar is not only the seat of immediate traffic, but of all commercial business; there all public, mercantile, and private news circulates, and there only free discussion can be carried on, unrestrained by the presence of the emissaries of power who haunt the coffee-houses. Hence in the bazaar the timid becomes bold, and the bold insolent. Public measures are keenly investigated, and the popular voice is often loudly expressed even to the ears of princes or ministers if they appear in the bazaars, as they sometimes do. Through the medium of slaves, eunuchs, and other agents, a constant intercourse is maintained between the innermost recesses of the seraglio and the bazaar. This is particularly the case at Constantinople, and in the capitals of the Turkish pashalics, and it is doubtful whether any thing is transacted in the palaces at night, which is not known in the bazaars the next morning. This intercourse has often exercised an influence upon public affairs which none but the most minute inquirers into oriental history would suspect.

The various characteristic displays of oriental manners which the bazaars furnish, the nature of the goods exposed for sale, and the splendid appearance they sometimes make, the manner in which the artizans conduct their various labours, the endless variety of picturesque costumes which meet the eye, and the babel-like confusion of tongues, all combine to form a scene of unequalled singularity and interest. No traveller who does not, in some oriental costume, sedulously frequent the bazaars and make many little purchases for himself, ought to feel assured that he understands the people, or has materials for fairly estimating their condition. The remarks here made are the result of the writer's intimate personal acquaintance with the bazaars of the East.

BAZAS, a town in France, in the department of Gironde, 41 miles S.E. of Bordeaux, and 419 miles S.S.W. of Paris. It is on a rivulet which flows into the Garonne, a few miles to the N. of the town, 44° 27′ N. lat., 0° 13 W. long.

Under the name of Cossio it existed in the Roman times, and is mentioned by Ptolemy; but in the latter period of the Roman empire, the name of the people whose metropolis it was, the *Vasates* (called also Vasarii), prevailed over the older designation: we read in Ammianus Marcellinus, of Vasatæ, as a place of some consequence in Novempopulana: and in other authorities of Civitas Vasatas and Civitas Vasatica.

Bazas early attained the rank of a bishopric, which however it has now lost. A bishop of Bazas sat in the council of Agde in 506, and at the council of Orleans in 511. The bishop of Bazas was, during part of the tenth and eleventh centuries, the only bishop in Gascony, the towns having been destroyed by the Normans, and the cathedral being without clergy. During this interval he took the title of bishop of Gascony, *Vasconensis Episcopus;* but when the churches were again supplied with clergy, he shrunk into bishop of Bazas.

The town is situated on a rock, and has little in it that is remarkable except the cathedral, a fine edifice of the fourteenth century. In front of the cathedral is a *place* (or an open space), surrounded by a piazza. The walls of the town are in ruins. Among the manufactures are druggets, leather, glass, pottery, white wax, and wax-candles. The trade carried on is in the above mentioned goods, wood of all kinds, including timber for ship-building, and saltpetre. The population in 1832 was 2165 for the town, and 4255 for the whole commune.

The arrondissement of Bazas comprehends 697 square miles, or 446,080 acres. It had, in 1832, a population of 53,802.

The district of Bazadois was a subdivision of Guienne. (*Dictionnaire Universel de la France;* Piganiol de la Force, *Nouvelle Description de la France, &c.*)

BAZOIS, the name of a small district in France, forming, under the old division of that country, the eastern part of Nivernois, now included in the department of Nièvre. It comprehended several valleys, and was bounded on the N.E. by the mountains of Morvan. It is watered by several small streams, the Airon, Aron, or Avron, a tributary of the Loire, being the principal. It produces little corn, but there is abundance of good pasturage and wood. Coal is dug. The chief town of the district is Moulins in Gilbert. The dimensions are usually given as nine or ten leagues, or about twenty-seven to twenty-eight miles long, and as many broad.

BAZTA'N, or **BASTA'N**, a valley in the Pyrenees to the north of Pamplona, extending twenty-three miles from north to south, and two from east to west: but authorities differ considerably as to the width of the valley; Miñano states it to be fifteen miles wide, and the dictionary of the Academy only two. The truth probably lies between them. It is bounded on the north and east by France, and on the south and west by the valleys of Ulzama and Basaburua Menor. It is surrounded on the north and east by the heights of Otamburdi, Otsondo, Auza, Ariete, Izpegui, and Urrichiquia, and on the south by those of Ernazabal, Arcesia, Velate, and Oclumendi. Several streams descend from these mountains, and form in the valley a river, which is called by the inhabitants Baztan-zubi. This river, after it leaves the valley, receives the name of Bidassoa. The valley produces Indian corn, wheat, pulse, and flax. The meadows and forests are held in common. Every man is bound by law to plant a certain number of trees every year.

Baztan is the sixth partido or district of the merindad or province of Pamplona. It is governed by its particular fueros or privileges, which were collected in a body of rural laws called Ordenanzas del valle (laws or statutes of the valley), approved by the supreme council of Navarra in 1696. The inhabitants, in a junta-general held every three years, appoint three individuals, out of whom the viceroy of Navarra chooses one to hold the office of Alcalde. This officer is the civil and military chief of the valley, and also the judge in minor offences. He is also the president of the concejo, or common council of the capital. Every man in the valley is a soldier, and is bound to provide himself with arms and ammunition. It is the alcalde's duty to instruct the men in the management of arms, and every three years he holds a general review, on which occasion every man is obliged to appear with a musket in good condition, half a pound of gunpowder, and twelve bullets. In a privilege granted by Alonso I. of Aragon, to the town of Sangüesa, in 1132, he is entitled king of Aragon and Baztan. The Baztanese, afterwards, on the separation of Aragon from Navarra, became subjects of the kings of Navarra. At the battle of Las Navas de Tolosa they fought so gallantly that their king, Sancho VI., granted them a privilege in 1212, by which every native of Baztan was declared an hidalgo or gentleman. Any Spaniard from another province, who can prove a noble origin, is admitted to the rights of citizenship in the valley. The letters of citizenship are granted by the junta-general of the valley. The population of the valley amounts to 7065 inhabitants, distributed into fourteen towns and villages. The capital, Elizondo, is situated on the banks of the Baztanzubi, which divides it into two parts. According to Miñano it contains 1111 inhabitants. The principal buildings are the town-house, where the junta-general is held, and the Casa de Misericordia, or charity house, in which the poor and destitute of the village receive support and employment. This benevolent institution has ceased to exist for want of funds. The house was inhabited by some poor families of the town, and has been of late changed into a fortified place by the Carlists: but it is at present occupied by the troops of the queen (1835). The front of the town-house is ornamented with the names of the illustrious persons who at different epochs have made themselves conspicuous for their valour, or for other eminent services. These names are written on wooden scutcheons carved into the shape of a crowned eagle with two heads. The Baztanese speak the Basque language.

(See *Academia de la Historia, Diccionario Geográfico Histórico de España*; Miñano.)

BDELLIUM, commonly called a gum, but in reality a gum-resin, the origin of which is a subject of doubt. It would appear that there are two, if not more kinds, of bdellium, the source of one of which seems to be ascertained; the others are matters of controversy. The bdellium of the antients, said by Pliny (book xii. chap. 9) to be brought from Bactria and other parts of Asia, still comes from Asia. Adanson states that he saw in Africa the substance exude from a thorny species of *amyris*, called by the natives *niouttoutt*. From its resemblance to myrrh, the analogy is in favour of its being obtained from an amyris or balsamodendron. Indeed, according to the recent statement of Mr. Royle, bdellium would appear to be the produce of a species of amyris, or rather balsamodendron, a native of India, called by Dr. Roxburgh *Amyris Commiphora* (*Fl. Ind.* ii. p. 244), *Amyris Agallocha* (*Calcutta Catalogue*, p. 28), the native name of which is *googul*. (Royle, *Illustrations of the Flora of the Himalayah*, part vi. p. 176.) The opinion of its being obtained from a palm, either the *Lontarus domestica* (Gaertn.), or the *Borassus flabelliformis*, is very improbable. This substance occurs in masses of variable size and shape, sometimes as large as a walnut, in oblong or angular pieces of a yellow, red, or brownish colour. The clearest pieces are transparent; the odour is weak and peculiar; the taste bitter, balsamic, and resembling myrrh or Venice turpentine. It is tolerably brittle at the ordinary temperature of the atmosphere, but with a slight increase of heat the finer kinds may be kneaded between the fingers. Its specific gravity is 1·371. In potass it is completely soluble. Analysed by Pelletier, 100 parts yielded

Resin	59
Gum	9·2
Bassorin	30·6
Volatile oil and loss . . .	1·2
	100

John found also caoutchouc, sulphates, muriates, and phosphates of potass, and lime with salts of magnesia, but probably he examined a different sort from that of Pelletier.

Resembling myrrh in appearance, it also resembles it in its effects upon the human system, and is often fraudulently substituted for it; it is, however, weaker, while it is more disagreeable and acrid. [See BALSAMODENDRON.] It was formerly used in many compounds and plasters, such as *diachylon*. It is now disused in Britain; but is to be found intermixed with gum Arabic.

The Sicilian bdellium is produced by the *Daucus Hispanicus* (Decand.), the *D. gummifer* of Lamarck, or perhaps the *D. gingidium* (Linn.), according to Boccone (*Museo di Piante rare della Sicilia, &c.* tom. xx.), which grows on the islands and shores of the Mediterranean.

The Egyptian bdellium is conjectured to be produced by the *Borassus flabelliformis* (Linn.), the *Chamærops humilis*, or the *Hyphæne cuciphera* (Pers.)

The bdellium mentioned in the second chapter of Genesis is obviously a mineral, and has no reference to the substances above-mentioned. It is supposed to mean *pearls*.

BEACHY HEAD, in Sussex, is a high bluff chalk cliff, forming a remarkable headland in the British Channel, which may always be known by seven conspicuous white cliffs to the westward of it. There is a telegraph and station-house on the top; and a little farther to the westward, on that portion of the Head called Belltout Cliff, a temporary lighthouse was erected in 1828, which has been found so serviceable, that it has been replaced by a more durable one of stone. The lights, like the old one, revolve alternately bright and dark at intervals of two minutes: their elevation above the sea is 285 feet.

Caverns near Beachy Head.—There are six caverns, with entrances three feet wide, and flights of steps twenty feet in height, terminating in an apartment eight feet square, now cut in the cliffs, between Beachy Head and Cuckmere. A place called Derby Cave has also been repaired, by which means mariners, who may be unfortunately wrecked on that part of the coast, can find a place of refuge from the sea. There is no danger a quarter of a mile immediately off the Cape, but six miles to the eastward of it there are some dangerous rocks, on which the Royal Sovereign, a first-rate, once struck. (*British Channel Pilot*, p. 51.)

BEACON, a sign or token ordinarily raised upon some foreland or high ground as a sea mark. It is also used for the fire-signal which was formerly set up to alarm the interior of the country upon the approach of a foreign enemy. The word, as used in England, is derived from the Anglo-Saxon beacen or beacn, a sign or signal, whence bycnian, to show or point out. *Beac* or *bec* is the real root, which we still have in *beck*, *beckon*.

Fires by night, as signals, to convey the notice of impending danger to distant places with the greatest expedition, have been used in almost all countries. They are mentioned in the prophecies of Jeremiah, who (chap. vi. v. 1) says, 'Set up a sign of fire in Beth-haccerem, for evil appeareth out of the north, and great destruction.' In the treatise *De Mundo*, attributed to Aristotle, we are told (edit. 12mo. Glasg. 1745, p. 35), that fire-signals were so disposed on watch-towers through the King of Persia's dominions that, within the space of a day, he could receive intelligence of any disturbances plotted or undertaken in the most distant part of his dominions: but this is evidently an exaggerated statement. Æschylus, in his play of the *Agamemnon*, represents the intelligence of the capture of Troy as conveyed to the Peloponnesus by fire-beacons. During the Peloponnesian war we find fire-beacons (*φρυκτοί*) employed. (Thucyd. iii. 22.) Pliny distinguishes this sort of signal from the Phari, or light-houses placed upon the coasts for the direction of ships, by the name of 'Ignes prænuntiativi,' notice-giving fires (Plin. *Hist. Nat.*, edit. Harduin, lib. ii. sect. 73), these being occasional only, the phari constant.

Lord Coke, in his Fourth Institute, chap. xxv., speaking of our own beacons, says, 'Before the reign of Edward III. they were but stacks of wood set up on high places, which were fired when the coming of enemies was descried; but in his reign pitch-boxes, as now they be, were, instead of those stacks, set up; and this properly is a beacon.' These beacons had watches regularly kept at them, and horsemen called hobbelars were stationed by most of them to give notice in day-time of an enemy's approach, when the fire would not be seen. (Camd. *Brit.* in Hampshire, edit. 1789 vol. i. p. 173.)

Stowe, in his *Annals*, under the year 1326, mentions, among the precautions which Edward II. took when preparing against the return of the queen and Mortimer to England, that 'he ordained bikenings or beacons to be set up, that the same being fired might be seen far off, and thereby the people to be raised.'

The Cottonian MS. in the British Museum, Augustus I. vol. i. art. 31, preserves a plan of the harbours of Poole, Purbeck, &c., followed, art. 33, by a chart of the coast of Dorsetshire from Lyme to Weymouth, both exhibiting the beacons which were erected on the Dorsetshire coast against the Spanish invasion in 1588. Art. 58 preserves a similar chart of the coast of Suffolk from Orwell Haven to Gorlston, near Yarmouth, with the several forts and beacons erected on that coast.

The power of erecting beacons was originally in the king, and was usually delegated to the Lord High Admiral. In the eighth of Elizabeth an act passed touching sea marks and mariners (chap 13), by which the corporation of the Trinity House of Deptford Strond were empowered to erect beacons and sea marks on the shores, forelands, &c., of the country according to their discretion, and to continue and renew the same at the cost of the corporation.

Professor Ward, in his 'Observations on the Antiquity and Use of Beacons in England' (*Archæologia*, vol. i. p. 4), says, the money due or payable for the maintenance of beacons was called *Beconagium*,' and was levied by the sheriff of the county upon each hundred, as appears by an ordinance in manuscript for the county of Norfolk, issued to Robert de Monte and Thomas de Bardolfe, who sat in parliament as barons, 14th Edward II.

The manner of watching the beacons, particularly upon the coast, in the time of Queen Elizabeth, may be gathered from the instructions of two contemporary manuscripts printed in the *Archæologia*, vol. viii. pp. 100, 183. The surprise of those by the sea-side was usually a matter of policy with an invading enemy, to prevent the alarm of an arrival from being spread.

An iron beacon or fire-pot may still be seen standing upon the tower of Hadley Church in Middlesex. Gough, in his edition of Camden, fol. 1789, vol. iii. p. 281, says, at Ingleborough, in Yorkshire, on the west edge, are remains of a beacon, ascended to by a flight of steps, and ruins of a watch-house. Collinson, in his *History of Somersetshire*, 4to. 1791, vol. ii. p. 5, describes the fire-hearths of four large beacons as remaining in his time upon a hill called Dunkery Beacon in that county. He also mentions the remains of a watch-house for a beacon at Dundry (vol. ii. p. 105). Beacon-hills occur in some part or other of most counties of England which have elevated ground. The Herefordshire beacon is well known. Gough, in his additions to Camden, ut supr. vol. i. p. 394, mentions a beacon hill at Harescombe in Gloucestershire, inclosed by a transverse vallation fifty feet deep. Salmon, in his *History of Hertfordshire*, p. 349, says, at Therfield, on a hill west of the church, stood one of the four beacons of this county.

BEACONSFIELD, a small market-town of Buckinghamshire, in the hundred and deanery of Burnham, twenty-four miles W. by N. of London, and thirty-one S.S.E. of Buckingham. It is situated upon high ground, whence it has been supposed that its name is derived from a beacon that formerly occupied the spot. The town consists of four streets, the principal of which, forming part of the road from Uxbridge to High Wycombe, is nearly three quarters of a mile in length. The substratum on which the town stands is chiefly gravel, and the houses are built with flints or brick. The church, dedicated to All Saints, is built of flint and squared stones, and consists of a nave, chancel, and side aisles, with a tower at the west end. The remains of Edmund Burke, who resided and died at Gregories in this parish, are deposited in the church; and the churchyard contains a white marble table monument in honour of Waller, to whom the manor belonged, as it still does to his descendant. Hull Court, the poet's family mansion, is still in existence. The church, as well as the manor, was formerly attached to Burnham Priory. The living is a rectory in the archdeaconry of Bucks and diocese of Lincoln, valued in the king's book at 26*l.* 2*s.* 8½*d.*; the advowson belongs to Magdalen College, Oxford, which purchased it about the year 1705. Beaconsfield derives great advantage from its situation on the high road between London and Oxford; and considerable business in the sale of cattle is done at its market and fairs. The proximity of High Wycombe and Uxbridge is, however, said to have rendered the market of less relative importance now than in former times. The market-day is Wednesday, and the fairs are held on February 13th and Holy Thursday, the latter being for cattle. The number of houses in the parish was 341, according to the returns of 1831, when the population consisted of 1763 persons, of whom 891 were females.

(Lysons's *Magna Britannia; Beauties of England and Wales.*)

BEAD MOULDING. [See MOULDING.]

BEAD TREE. [See MELIA and ELÆOCARPUS.]

BEADLE, the messenger or apparitor of a court, who cites persons to appear to what is alleged against them. It is probably in this sense that we are to understand the *bedelli*, or under-bailiffs of manors mentioned in several parts of the *Domesday Survey*. Spelman, Somner, and Watts, all agree in the derivation of beadle from the Saxon byꝺel, a cryer, and that from biꝺ, to publish, as in bidding the banns of matrimony. The bedelli of manors probably acted as criers in the lord's court. The beadle of a forest, as Lord Coke informs us in his Fourth Institute, was an officer who not only warned the forest courts and executed process, but made all proclamations.

Bishop Kennett, in the Glossary to his *Parochial Antiquities of Oxfordshire*, says that rural deans had formerly their beadles to cite the clergy and church officers to visitations and execute the orders of the court Christian. Parochial and church beadles were probably in their origin persons of this description, though now employed in more menial services.

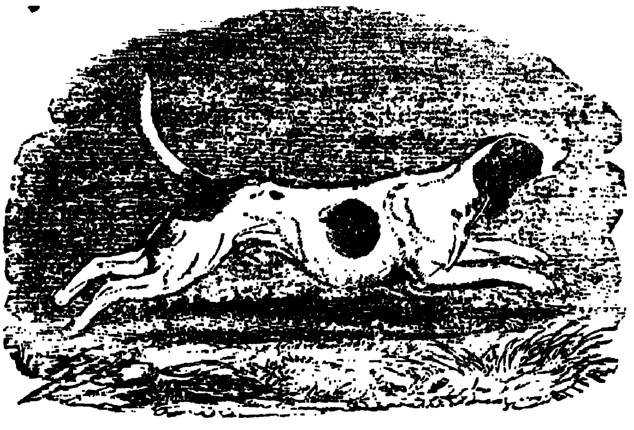
Bedel, or beadle, is also the name of an officer in the English universities, who in processions, &c., precedes the chancellor or vice-chancellor, bearing a mace. In Oxford there are three esquire and three yeomen bedels, each attached to the respective faculties of divinity, medicine and arts, and law. In Cambridge there are three esquire bedels and one yeoman bedel. The esquire bedels in the latter university, beside attending the vice-chancellor on public solemnities, attend also the professors and respondents, collect fines and penalties, and summon to the chancellor's court all members of the senate. (See Ducange's *Gloss.* in voce Bedellus: Kennett, *Paroch. Antiq.* vol. ii. Gloss.: *Gen. Introd. to Domesday Book*, 8vo. edit. vol. i. p. 247; *Camb. and Oxf. Univ. Calendars.*)

BEADS (Rosary Beads) are made of horn, ebony, ivory, glass, box-wood, and other materials, and are strung in chaplets used by the Roman Catholics for the purpose of counting their prayers. The Rosary is a series of prayers said to have been first instituted by St. Dominic about the year 1200, in honour of the Virgin Mary, and as an invocation to her for spiritual assistance. It consists of a repetition of the Ave Maria and the Paternoster or Lord's Prayer, both in Latin. It is divided into decads of ten Ave Marias, each decad being preceded by the Lord's Prayer, and terminating with the Gloria Patri. The full or great rosary consists of fifteen decads, but the common rosary, which is recited generally in the evening by pious Catholics, consists of only five decads. At the end of the five decads they recite the Creed, or Symbol of the Apostles, and afterwards (in Italy at least) the Litany of the Virgin, which is different from the Litany of the Liturgy. The rosary is a daily family evening prayer; the head of the family says the first part of each Ave Maria, and the other members repeat in chorus the remaining part. [See AVE MARIA.] 'The original rosary of St. Dominic is a recitation of fifteen decads of Ave Marias, preceded each by a Pater, each decad being devoted to the meditation of one of the mysteries of the life of our Saviour. The first five mysteries are those of the incarnation, nativity, &c., and are styled joyful mysteries. The next five are those of the passion and death, and are styled sorrowful. The remaining five are those of the resurrection, ascension, assumption of the Virgin, &c., and are termed glorious.' (Touron, *Vie de St. Dominic; Quindecim Mysteria Rosarii Beatæ Mariæ Virginis*, a R. Schiaminosso delin. atque incisa, Rome, 1609.) The common chaplet is called *Corona*, 'a crown,' in honour of the Virgin.

The beads are distinguished by their size and shape, those marking the Lord's Prayer being larger than those for the Ave Marias. Rosaries of very small glass beads are worn by pious Catholics round their necks. The object of St. Dominic was probably, while doing honour to the Virgin, to fix at the same time the attention of the pious on the contemplation of the principal events of the Saviour's life, by allowing a certain time, marked by the recitation of ten Ave Marias, to the meditation upon each event or mystery. The name of rosary is figurative: it means a chaplet of spiritual roses, divided into three sets, white, red, and damask roses, corresponding to the joyful, sorrowful, and glorious mysteries. Such are the allegory and its explanation. (*The Rosarie of our Ladie otherwise called our Ladie's Psalter*, Antwerp, 1600.)

The Turks and other eastern nations have also chaplets of beads made of amber or other materials, which they turn through their fingers while sitting in a listless mood, but not, as it seems, for any purpose of prayer. The Turkish chaplet is called 'Comboloïo.'

BEAGLE, a small well-proportioned hound, slow but sure, having an excellent nose and most enduring diligence, formerly much in fashion for hunting the hare, but now comparatively neglected, its place being occupied, where hare-hunting is patronized, by the harrier. [See HARRIER.]



[The Beagle.]

These were the little hounds so much prized by 'the good *old* English gentleman;' for, at a trifling expense, and greatly to the delight of the neighbouring rustics who followed on foot, he could keep his ten or eleven couple, not more than so many inches high individually, and, mounted on his easy pad, would generally make certain of killing his hare, though it frequently cost him two or three hours to perform the feat. During this protracted chase he had ample leisure for enjoying the sight of his admirably matched pack, running so well together that 'they might have been covered with a sheet,' and for gratifying his ears with their tunable cry.

The hare distanced them immeasurably at first, and, in the course of the run, she might be observed to sit and listen 'sad on some little eminence,' but

> ——— 'In louder peals, the loaded winds
> Brought on the gathering storm'—

and, after exhausting all her speed, shifts, and doublings, she almost always fell a victim to their persevering and destructive instinct.

A well-bred beagle of the proper size, which should not exceed that above-mentioned, is a very pretty and symmetrical variety. This symmetry (the term is used in relation to the purposes for which the dog is employed) was the result of much care among amateurs, who spared no efforts to bring it to what they considered the standard of perfection.

Some prided themselves on the diminutive but still effective size of their packs. Daniel and others have not forgotten to commemorate Colonel Hardy's 'cry of beagles.' They amounted to ten or eleven couple, and were always carried to and from the field in a pair of panniers upon a horse's back. Small as they were, they rarely failed, though they could never get near enough to press the hare in the early part of the run, to stick to her and worry her to death at last.

Such diminutive hounds are sometimes called 'lap-dog beagles' and 'rabbit beagles.'

The fairy pack above alluded to had a little barn for their kennel, where also their panniers were kept. The door was one night broken open, and every hound, panniers and all, stolen; nor could the disconsolate owner ever discover either the thieves or their booty.

BEAMINSTER, or BEMINSTER FORUM, a market-town in Dorsetshire, in the Bridport division of the hundred of Beaminster, 123 miles W.S.W. of London, and 14½ W.N.W. of Dorchester. It is situated on the river Birt, which issues from several springs running from the hills with which the town is surrounded. Beaminster is of considerable antiquity. In Domesday Book, Beminstre is classed among the lands belonging to the bishopric of Sarum. Begeminster was given by Bishop Ormund, in 1091, to augment two of the prebends of his cathedral. The parish consists of three manors, Beaminster Prima, Beaminster Secunda, and Beaminster Parsonatus, all of which are held by lease by the present lords under the church of Salisbury. Leland thus describes Beaminster in his time:—'It is a praty market town, and usith much housbandry, and lyith in one street from N. to S., and in another from W. to E. There is a faire chapelle of ease in this town. Netherby [Netherbury] is the paroch chirch to it, and Beminstre is a prebend to the chirch of Saresbyri.' The town was almost entirely destroyed by fire in 1644, while Prince Maurice was in quarters there. It was re-built by the assistance of parliament, but in 1684 was again consumed; and, finally, in 1781, upwards of fifty houses, besides barns, stables, and other buildings, were reduced to ruins. To these fires, however, the town is indebted for its present very respectable appearance, most of the houses being good modern buildings. The streets have lately been paved by a subscription of the inhabitants, and the shops and some of the houses are now lighted with gas. The church and free-school are the principal buildings of the town. The church is dedicated to the nativity of the Blessed Virgin, and although only a chapel of ease to the vicarage of Netherbury, is a large handsome structure, standing on an eminence on the south side of the town. It is supported in the inside by Gothic arches and pillars of Ham-hill stone. The tower is nearly 100 feet high, and is decorated with sculptures, illustrative of the woollen trade, for which the town was famous at the time they were executed: there are also figures of one or two of the kings, and a number of roses, of which tradition states that the figures are those of kings who reigned at the times that repairs were done to the church, and that the roses commemorate the union between the houses of York and Lancaster. The town has a commodious workhouse, which is maintained partly by the rents of a small estate, and partly by the poor-rates. There is also an almshouse, built about 1627 by Sir John Strode, and afterwards endowed by him and his daughter, Lady Joan Tuberville, for the maintenance of six poor women. The free-school was founded in or about the year 1684 by Mrs. Frances Tucker, for the education of twenty of the poorest boys in Beaminster, three or four of whom are to be apprenticed to the sea service. The estate with which this school is endowed was let in the year 1707, at 65*l.* a year, which is now increased to 160*l.*; the surplus has been employed in increasing the number of boys at the school from 20 to 100, and in providing fuel, which is sold to the poor at a reduced rate during the winter. The Rev. Samuel Hood, the father of Lords Hood and Bridport, was master of this school in 1715. The number of houses in Beaminster was 567 in 1831, when the population amounted to 2968 persons, of whom 1573 were females. During the year 1834, the town was visited with an extraordinary mortality, owing principally to the small-pox and measles, which raised the proportion of deaths to one in twenty-six on the whole number of inhabitants. The inhabitants are chiefly engaged in the manufacture of sail-cloth, of iron, tin, and copper wares. The market is held on Thursday, and there are fairs on April 14, September 10, and October 9. The quarter-sessions were held here in the reign of Elizabeth and the seven first years of Charles I., but they were afterwards removed to Bridport. (Hutchins's *History and Antiquities of the Counties of Dorset*; *Beauties of England and Wales*; *Communication of a Correspondent, &c.*)

BEAMS. [See MATERIALS, STRENGTH OF.]

BEAN. [See FABA, PHASEOLUS, and DOLICHOS.]

BEAN, a leguminous plant, extensively cultivated in the garden and in the field, classed by Linnæus in the *Diadelphia Decandria*, and by Jussieu among the *Leguminosæ*. There are two distinct kinds of beans cultivated; the one is called the *Faba vulgaris* or *Vicia Faba*, which is our common garden and field bean; the other is the *Phaseolus vulgaris*, the French bean, haricot, or kidney-bean. We here consider them only in an agricultural point of view.

The common bean, of which there are several varieties, bears a pod containing several oblong rounded seeds, which are used in the soft young state for the table, and in the hard dry state for domestic animals chiefly, either whole or ground into meal. In some places bean-meal is mixed with other meal in making coarse bread; or the beans are boiled into a mess with fat meat, in which state they are very palatable and nutritious. The bean came originally from the east, and was cultivated in Egypt and Barbary in the earliest ages of which we have any records. It spread thence into Spain and Portugal, from whence some of the best varieties have been introduced into this country. The most common varieties of garden beans are the Windsor, the Toker, the long-pod, and the Magazan, all productive and well tasted. In the field the tick bean, the common horse bean, and the small Dutch, or Heligoland bean, are preferred, being hardy as well as productive. The long-pod is occasionally sown in the field, the Magazan and broad Windsor bean seldom.

There is no plant in which the transformation of the cotyledons into seed leaves is more readily traced than in the bean. The Windsor bean, in particular, from the size of its lobes and distinctness of its vessels, is admirably adapted for observation, the parts being readily distinguished by the naked eye. If a bean is planted in moist earth or soaked in water, in a moderate temperature, the cotyledons will swell and soon burst the skin which envelopes them, separating into two lobes, which open like the shells of an oyster. In the part which forms the joint an oblong body will appear, which is the embryo stem of the plant. This increases rapidly in the earth, and pushes a root downwards, and a stem upwards, which latter carries the lobes with it till they rise above the ground, when they expand, and are transformed into seed leaves. It is curious to observe the force of vegetation in the young bean when it is, as it were, imprisoned in a strong soil hardened at the surface, as may be seen when a path crosses a field of beans newly planted; the cotyledons, under these circumstances, are drawn into the crevices made by the young stem, where they often remain held fast till the first shower releases them. The change in the cotyledons deserves particular attention. As soon as the seed swells by imbibing moisture, the oxygen, which is always present in the atmosphere and in water, acts upon the farinaceous substance in the seed, and takes a portion of carbon from it producing carbonic acid, which is absorbed by the surrounding plants, or flies off in the state of gas: by this loss the remaining substance becomes a mild fluid emulsion, analogous to the milk of animals, which, being taken up by the minute vessels of the radicle, nourishes and increases them. It is this alone which produces the first growth; the earth is the mere cradle to protect the young plant and to keep it moist, by preventing the too rapid evaporation which the heat and light of the sun would otherwise produce: when the ground is entirely deprived of moisture, vegetation necessarily ceases. The cotyledons are the reservoirs of nature to supply proper food for the plant in its infant state, as the mother's milk does in animals of the class of mammalia, and the yolk of the egg in birds and oviparous animals. In proportion as the farina in the lobes is gradually exhausted new vessels appear through the substance of the lobes, conveying the newly formed juice from every part of them into the root and stem, and, at last, the cotyledons are transformed into seed leaves. The fibres of the roots are by this time completely formed, and their extremities, called *spongioles*,[*] from their appearance when minutely examined, have acquired the power of absorbing nourishment from the soil. The plant may now be said to be weaned. The stem is then considerably advanced in growth, having put forth new leaves of a different form from the seed leaves: these last, having now performed their part, wither and soon fall off; if they are removed before this period, the plant, having lost its nurse, languishes and dies.

The bean at this stage of its growth requires particular attention. If the soil is rich and well prepared, it will grow rapidly and luxuriantly, and be soon out of reach of insects or weeds, and capable of resisting the varying influences of the atmosphere; but if the soil is poor and parched, and the supply of nutritive juices is scanty, the plant will soon show weakness and disease, and the only way to prevent a total failure of the crop, is to supply by art the deficiency of nature. In very poor soils manure may be applied in a liquid state, or as a top-dressing: in those which are not exhausted, tillage alone will enable the roots to spread, and give them a wider range to seek their food in. The weeds being destroyed, the whole powers of the soil are reserved for the crop; and the air charged with fertilizing vapours being allowed to penetrate the surface, and being retained in the interstices of the soil, greatly assists in invigorating the vegetation. These are the principles on which is founded the whole culture of leguminous plants, whether in the garden or the field. Where labour is not spared and the produce is valuable, as where vegetables are raised as a kind of luxury for the tables of the rich, the greatest attention is paid to the cultivation of beans, so as to have them early and in regular succession during the whole summer. They are even occasionally raised by artificial heat. In general they are sown or planted, at various times, from the beginning of winter to the middle of summer, but they must be protected from frost in the first case, and from too great heat and drought in the latter. They are set in rows with wide intervals, which are kept dug and clean, and in which lesser vegetables are advancing in growth, to be sheltered by the beans, and to succeed them when removed. In order to strengthen the pods already formed, as soon as those which are near the bottom of the stem are filled, the tops of the plants are cut off, and the beans are gathered when the seed has acquired sufficient consistency to be taken from the shells, before they have acquired any farinaceous qualities. One crop is made to succeed another by regulating the times of sowing; and thus beans are gathered for the table from May to November, or till the frosty nights check the growth of the plant. The cultivation of the field bean is only as perfect an imitation of the garden culture as circumstances will permit. As only one crop is required, and that in a perfectly ripe state, when the seeds are fully formed and hard, they are sown at one particular season, so as to avoid the danger from frosts and ungenial weather in spring, and at the same time to have the crop ripe in good time to be harvested before the cold and wet season sets in. The usual mode is to drill them by a machine, at the distance of from twenty to thirty inches, according to the richness of the soil, or to dibble them by hand, either singly or by putting four or five beans in each hole, increasing the distance of the holes from six to twelve inches. Beans are tolerably hardy, and will bear moderate dry frosts; but they suffer much from alternate frosts and thaws, which in this climate are so common in February. The end of February, or the beginning of March, is therefore generally preferred for bean-sowing. When the season is remarkably mild, as was the case in 1834, early sowing is a great advantage. The writer of this article planted a field of beans on the 1st January 1834, in a soil duly prepared; they were reaped in August, and produced a very good crop: his neighbours, who planted their beans in March, had not half the quantity on equally good land, owing to the dryness of the summer. But this was an experiment which succeeded: had severe weather come on in February, the whole crop might have been lost. As a general rule, beans may be sown from the middle of February to the middle of March. The sorts usually cultivated in the fields are the tick bean, the horse bean, and the small Dutch or Heligoland bean. In some situations the Magazan and the long-pod have produced good crops in the field: the first three are however best suited for general cultivation. There are several varieties of these, which differ but little in their appearance; experience is the best guide in choosing the seed which suits particular soils and situations. The small round regular-shaped beans are generally preferred, as obtaining the best prices in the markets, especially in large towns, where there is a great consumption of beans by hard-working horses.

The soil best adapted for beans is a rich strong loam, such as produces good wheat. In such a soil the produce is sometimes fifty or sixty bushels per acre, but an average crop, on moderate land, is about half that quantity. On very rich land beans have produced extraordinary crops, by being sown broad-cast and very thick, the stems being drawn up to a great height in favourable seasons. A small field of very rich land, in the county of Sussex, was sown in the year 1832 with four bushels of the small tick bean, which came up so thick, that the proprietor thought of thinning out the plants by hoeing; but he was advised to see what the produce would be, and when they were threshed out, there were ten quarters and one bushel of beans. He had the ground accurately measured, and it was found to be one acre and twenty-nine perches, which makes the crop above sixty-eight bushels per acre. They completely smothered all weeds, and the subsequent crop of wheat produced five quarters to the acre; but this particular example of sowing beans broad-cast we do not hold up for general imitation. By cultivating the beans in rows, and by careful hoeing and manuring, alternate crops of wheat and beans may be raised for many years, without intermission, or any necessity for change or fallow: this has been long the practice in the richest part of Kent. In this case the beans must be drilled or set in rows, with intervals of from twenty-four to thirty inches between the rows; and the intervals must be repeatedly stirred and hoed with proper instruments, so as to prevent the growth of weeds and keep the soil in a perfectly clean and mellow state; the weeds which rise in the rows are removed by hand. Immediately after bean harvest the land is scarified, or skimmed over with a plough having a very broad share, whence the operation is sometimes called *broad-sharing*. All roots of weeds and the remains of bean-halm are collected and burned, or put in a heap with quicklime, to be converted into manure. The ground is then ploughed once or several times, according to circumstances, and wheat is sown about the month of October, either broadcast or by means of a drilling machine, in rows ten or twelve inches asunder, which gives greater facility for hoeing and weeding the crop when necessary. The wheat which follows beans is generally good and heavy, and seldom runs to straw. After wheat-harvest the stubble is ploughed up and turned in with a very deep furrow; the land is harrowed flat, and a good coating of manure is put on in a moderately rotten state, and this is covered with a shallow ploughing: the land is well water-furrowed and left so till spring, when the beans are drilled in the mellow surface produced by the winter's frost. This is the most approved practice; but many experienced farmers vary it according to the varieties of soil, or according to difference of opinion. Some put on manure for the beans in spring, and some drill the beans in every second or third furrow after the plough; but all good farmers agree in manuring the land for the beans and carefully hoeing them. It is evident that a different method is required in different soils, varied according to their texture and situation. Alternate crops of wheat and beans can only succeed, for any length of time, on soils peculiarly favoured. In general, a change of crops and occasional fallows, will be indispensable to keep the land perfectly clean and in good heart.

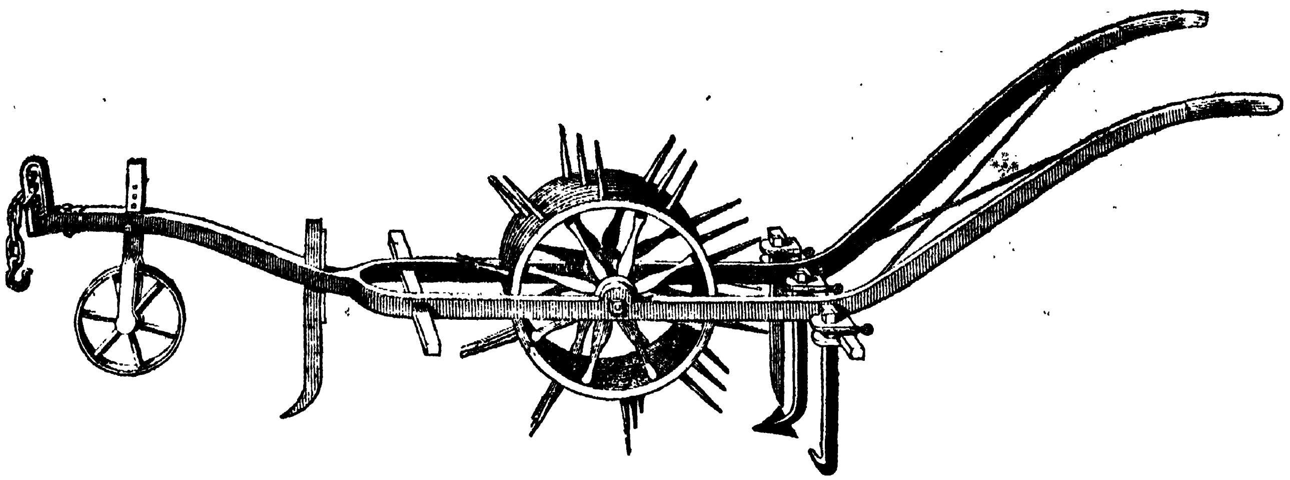
---

[*] *Spongioles*. At the extremities of the smallest ramifications of the roots may be seen, by means of high magnifiers, small bodies, which seem to be enlargements of the minute fibres of the root: they are called *spongioles*, from their resemblance to a *sponge*. Their use is to draw in the juices, by which the plant is sustained and increased. They possess a vital power, by which they more readily absorb some fluids than others, and are by some thought to have a power of selection, as the lacteals have in the intestines of animals. [See ROOT.]

In cold wet soils beans require great care to ensure good crops. Although they will grow well and seem to flourish in the stiffest and most unsubdued clays, they will seldom produce much at harvest, unless the land has been well prepared and the cultivation managed with skill. There is no better criterion of the experience and industry of the farmer of cold, wet clays than the appearance of his beans at harvest; and he may be judged by this crop, as the farmer of light, sandy soils may be judged by his turnips. The cultivation of these two opposite kinds of inferior soils will, in general, be profitable or otherwise in proportion to the produce of the beans in the one and the turnips in the other; the first being a substitute for clean fallow, and the latter the foundation of all the succeeding crops. The bean, by its strong and penetrating root, opens the stiff soil to the influence of the atmosphere, by which the surface is dried and at the same time mellowed. Although the nutritious matter in a good crop of beans is great, and almost equal to that obtained from a crop of wheat, it exhausts the soil much less: its succulent stems and leaves absorb much nourishment from the atmosphere, and the latter falling off and decaying, restore carbon and mucilage to the soil, and make up for the inferior quantity of manure produced by the bean-halm in comparison with wheat straw. There is perhaps no crop, bearing seed, which gives so great a return with so small an expenditure of the nutritive juices of the soil; and certainly none that repays manure better, or leaves the land in a better condition for wheat or oats. It is a very common practice to plough a stiff soil in spring only once, after it has borne clover, grasses, or wheat, and to drill beans in the furrows immediately after the plough, by hand or by an instrument; in this case it is best to deposit the beans as near the angle of the furrow as possible, and in every second furrow only, that they may rise regularly at a proper distance. In spite of the tough slues which the plough turns over in a mass, the force of vegetation in the bean makes it pierce through them, and, under favourable circumstances, a tolerable crop is sometimes obtained; while the more industrious neighbour, who has tilled his land in autumn and again in spring, by repeated ploughings, and made it fine and mellow, may be disappointed in his crop by untoward variations of weather. The slovenly farmer then laughs at the more perfect system of the other, pretending that it is wrong to work strong soils so much and make them *too fine*, as the term is. Thus the progress of a whole district in rational and improved culture is arrested or checked by the apparent evil of frequent ploughing. But the conclusion is founded in error. There can be no rule better confirmed by experience than that adhesive soils should be stirred and divided as much as possible; but this must be done with due regard to circumstances and seasons, and the differences in soils: chalking, marling, or manuring, are necessary, in order to prevent the divided soil from *setting* into a hard compact mass. Light coloured clays which consist of siliceous sand and argillaceous earth only, without any intermixture of other substances, set the harder in drying the more they are stirred; after being ploughed they soon have the appearance of stripes of unburned brick; and if a heavy shower has fallen after the land has been harrowed, they become hard like a barn floor. It is of no use to pulverise such land, until its texture is altered by chalk, marl, dung, or ashes; and the safest way is not to stir it too much, as no good crop can be expected, at all events, till it be ameliorated. To prepare a middling stiff soil for beans, it should be ploughed into high and narrow lands in autumn, with numerous and deep water-furrows, so that no water may lie on any part of it, and, if possible, it should be manured with long dung before it is ploughed. In spring, if there has been some frost, the surface will be loose and mellow; in this the beans should be drilled or dibbled by hand, and a time should be chosen for hoeing them, when the ground is neither wet nor dry, so that the hoe, whether hand-hoe or horse-hoe, may penetrate two or three inches below the surface to open the soil and destroy the weeds. The hoeing of the beans is a most essential part of the culture, and according as it is well or ill executed the land will produce more or fewer crops after it without its being necessary to have recourse to a fallow. Objections have been made to the use of the horse-hoe and scarifier between the rows in stiff soils, because, when the ground is dry and caked, the hoe raises large clods and lays the roots bare, sometimes even destroying the plants. But there are means of preventing this: if the ground is repeatedly hoed when not quite dry, it will not bind into a hard crust or rise in clods; and should a sudden dry wind, after much rain, bake the surface in spite of every attention to it, a spiky roller, of such dimensions as to work between the rows, will effectually loosen the soil, so that hoes and grubbers may follow without inconvenience. We give a drawing of such an instrument, which has been found very effective.

The cylinder may be used with or without the spikes, or may be removed entirely; the instrument then becomes a scarifier or grubber, according to the shape of the coulters which are fixed to it. The front wheel is of use to move the whole instrument upon, by lifting the stilts or handles in the manner of a wheelbarrow, at the end of the rows, when the horse turns out of one row into another. The cross bar on the frame before the roller is to fix hoes or coulters on, when the roller is taken away.

When the beans have pushed their stems, and the proper leaves appear above the seed leaves, the intervals should be carefully hoed, and, where it is practicable, three or four bushels of gypsum per acre may be sown, if the soil does not already contain this substance, and it will greatly stimulate the growth. The mode of its operation is not exactly known, but experience has proved its utility. [See MANURE and GYPSUM.] A very small quantity of gypsum seems to stimulate the growth of all leguminous plants and clovers, but if this quantity be already present in the soil no additional quantity seems to have any effect. It has been recommended to cut off the tops of the plants when the lower pods are set, as is frequently done in garden culture, to accelerate the filling of them, and to prevent useless blossoms from drawing the



[Roller with Spikes.]

nourishment to the top. The reason for doing this in gardens is, that when a plant has borne pods a certain time it is most advantageous to remove it, and the top blossoms, of course, never come to perfection. In the field this is not the case, there being no succession of plants; and, unless the top blossoms are very late, or the black dolphin (aphis) begins to appear, which is shown by the honey-dew on the top shoots, no advantage is gained by topping the plants, and the labour is thrown away. When the leaves of the beans begin to lose their green colour, and the pods to turn black, the crop should be reaped with the sickle, and made into small sheaves, tied with straw bands or tar twine, and set up in the field to dry. In some places pease are sown mixed with the beans, or the headlands are sown with pease, the halm of which is used to tie the beans with; but pease cling round the bean stalks and impede the setting of the pods; they also interfere with the hoeing and weeding, so that the practice is not to be recommended. Pease require a lighter soil and are best sown separately, except when they are sown broad-cast mixed with beans, in order to be mown in a green state as fodder for cattle or for pigs. Sowing beans for this last-mentioned purpose is not much practised in England, but is found very useful on the Continent, especially in Flanders; in this case they are mown like tares soon after the pods are formed. In order to have a succession of this green food, they should be sown at different times, with a week or fortnight's interval. By this means a great deal of grass is saved, which may be reserved for hay; the cattle fed in the stables or yards thrive well on this food, and produce a quantity of rich manure, chiefly in a liquid state, which fills the tanks and reservoirs which we have repeatedly mentioned as indispensable appendages to every good farm-yard. By having winter tares when the turnips are consumed, pease and beans after the first crop of clover, and summer tares to succeed them, cattle may be fed in the stables all the year round with great advantage, the land may be tilled at the best season of the year, and prepared for wheat, as well as by a clean fallow, while the green crop will fully repay all the expenses. Three bushels of beans and two of pease mixed together are required per acre when sown broadcast, or drilled in each furrow after the plough. It is often advantageous to cut in a green state those beans which were sown for a general crop, when food for pigs is scarce. They will go nearly as far in this way in feeding store pigs as the beans would have done when ripe, and the ground is left in a much better state for the following crop.

Although beans grow best in a rather heavy soil, they are often profitable on much lighter land, especially after clover ley or grass, which is broken up after being depastured two or three years. This is an excellent preparatory crop for wheat, and better than oats, which leave such land full of weeds. In this case the land should be carefully ploughed up. For this purpose a skim-coulter, which has a small wing attached to it, to slice off the grassy surface of the land and turn it under the furrow, is a most useful appendage to the plough. This makes very clean work, and a heavy roller drawn across the stitches or lands leaves the whole surface compact and solid, keeping the moisture from evaporating and facilitating the slow decomposition of the roots of the grass. Thus a very good and clean crop of beans may be obtained. If the soil should be exhausted or very poor, a good coat of manure spread over the grass and ploughed in will be a great advantage to the beans, and to the wheat which is to follow. On moderately light loams the most profitable rotation of crops is that of turnips, barley, clover, beans, wheat; or, if it is in a rich state, turnips, barley, clover, oats, beans, wheat, beans. When land is in good heart beans are often added to any rotation after wheat or before it, and the fallow is thus removed a year farther on. This is likewise done when it is intended to change the course of crops; because beans are considered the least exhausting of the crops which are allowed to ripen their seeds, and this practice is far less hurtful than the too common one of taking another crop of oats after the wheat, by which more harm is done than the value of the crop can compensate for.

The diseases to which beans are subject are, the mildew, which is a minute fungus that grows on the stems of leaves, and is caused by cold fogs and frequent sudden variations of weather, and the black dolphin, an insect of the aphis tribe, which appears first in the form of a honey-dew on the tops of the plants. For the mildew no remedy or preventive has yet been found. Whenever it has attacked the plants generally, before the pods are filled, the best method is to cut down the crop in its green state; and if it cannot be consumed in the farm-yard, to plough it into the ground, where it will decay rapidly, and be an excellent manuring for the succeeding crop of wheat. If allowed to stand, the crop will not only be unproductive, but the weeds will infest the ground, and spoil the wheat crop by their seeds and roots, which will remain in the soil. Whenever the tops of the beans begin to be moist and clammy to the feel, it is the forerunner of the aphis. They should then be immediately cut off, and this, if done in time, may save the crop from the ravages of the insects; but the most effectual way to prevent any disease from attacking the plants in their growth is to have the ground in good heart, and well tilled; to drill the beans at a sufficient distance between the rows to allow of the use of the horse-hoe, and thus to accelerate the growth of the plants, and enable them to outgrow the effect of incipient disease, which seldom attacks any but weak plants.

The principal use of beans is to feed horses, for which purpose they are admirably adapted, and far more nourishing than oats. They should be bruised or split in a mill, and given to horses mixed with hay and straw cut into chaff; this will ensure proper mastication and prevent that thickening of the wind, as it is called, caused by indigestion, which makes beans alone not so well adapted for the food of hunters and race-horses. Great quantities of beans are consumed in fatting hogs, to whom they are given whole at first, and afterwards ground into meal. Bacon hogs may be fatted entirely on beans and bean-meal; but as this food makes the flesh very firm, it is not so well adapted for delicate porkers. In the last period of their fatting, therefore barley-meal is usually substituted for bean-meal. Bean-meal given to oxen soon makes them fat, and the meat is far better than when oil-cake is used for that purpose: mixed with water and given as a drink to cows it greatly increases their milk. A small quantity of beans is generally mixed with new wheat when ground to flour: the millers pretend that soft wheat will not grind well without beans, and they generally contrive that there shall be no deficiency in the necessary proportion. Thus a quantity of beans is converted into what is considered as wheaten flour-

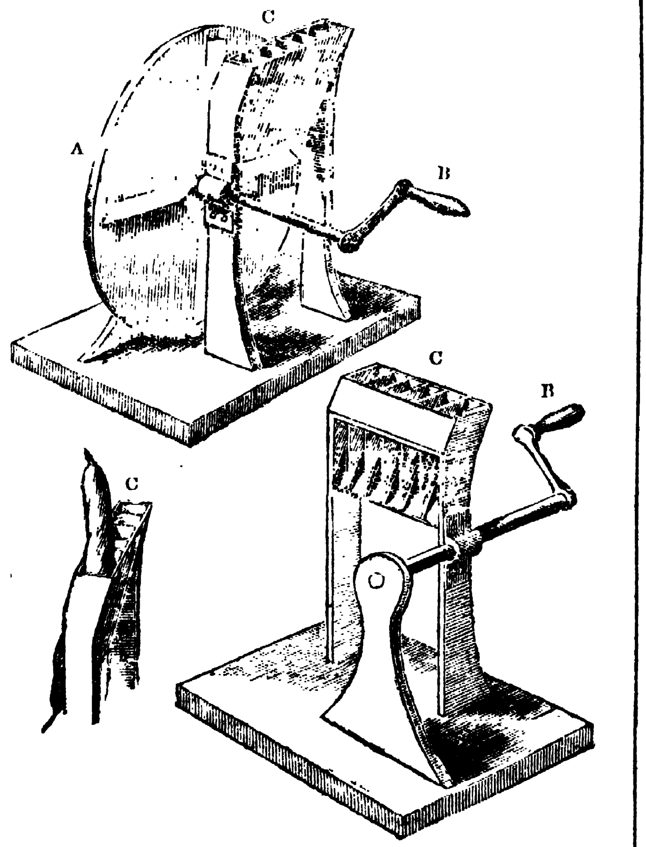
This practice is well known to all bakers and dealers in flour; and as there are means of discovering the quantity of bean-meal in the flour, the ignorant and unsuspecting only are deceived, and the price of the flour to the skilful purchaser varies according to the quality.

The proportion of nutritive matter in beans, compared with other grain, is, according to Einhof, as follows:—

	By weight.		Or in a bushel.
Wheat . . .	74 per cent.		about 47 lb.
Rye . . .	70	„	„ 39
Barley . .	65	„	„ 33
Oats . . .	58	„	„ 23
Beans . .	68	„	„ 45
Peas . . .	75	„	„ 49
French beans	84	„	„ 54

The French bean, kidney bean, or haricot bean (*Phaseolus vulgaris*), is chiefly cultivated for its tender and succulent pod, being one of the most esteemed vegetables for the table. The varieties are innumerable, differing slightly in their qualities: they may be divided into two distinct kinds, the dwarf and climbing; the former are the earlier, the latter the more productive. French beans are much less hardy than the common beans; a very slight degree of frost will destroy them entirely. The early sorts are therefore sown in sheltered situations, and occasionally protected by glass frames or mats. The climbing beans require the support of sticks or wires, round which they twine as they grow, with this peculiarity, that the coils turn round the support from the right to the left, contrary to the growth of some indigenous twisting plants, which turn from the left to the right, following the apparent diurnal motion of the sun.

The French bean, as an esculent vegetable, is wholesome and nutritious in a fresh state, and may be readily preserved for winter store or sea voyages by salting in casks. For this purpose the large, flat-podded, Dutch white runner is preferred. In Holland and Germany, where large quantities are salted in almost every family, a machine is used for cutting them expeditiously, which greatly resembles a turnip slicer, and may, with a slight alteration, be used also for slicing cabbages when making the national German preparation of sour krout (*sauer-kraut*). It consists of a wheel or disk, A, in which two or four knives are set at a small angle with the plane of it, so as to shave off a thin slice obliquely from the beans, which are held in a box, C, with several partitions in which they are kept upright, so as to slide down in proportion as they are cut: thus six or eight beans are sliced at once, and very rapidly, merely by turning the handle B, and supplying the box with beans in succession. The sliced beans fall on the table below, and are immediately put in a cask with alternate layers of salt. When the cask is full and well pressed down, a round board is put over the beans and a heavy weight upon it. As the beans are compressed, and begin slightly to ferment, the liquor is poured off, some fresh salt is strewed over the surface, and a linen cloth is pressed close upon it to keep out the air; the round board and weight are put over the cloth, and so the beans remain till wanted for use. When any are taken out they are washed in soft water to take out the salt, and gently stewed with a little gravy, or with milk and a piece of butter. They form a very wholesome vegetable dish at a time when fresh vegetables are scarce. The dried seeds are also boiled after being soaked in water for some time, and are usually mixed with the preserved green beans in the same dish. This use of the French bean is not common in England, but when we take into consideration that they are extremely wholesome and nutritive, much more so than pease, and that they are an admirable corrective of the oily qualities of animal fat by their farinaceous qualities, we shall regret that both the culture and the use of them in the dry state are not extended for the benefit of the labouring part of the community. The cultivation of the French bean for the seed is confined in this country to the gardens and nurseries, and to a few spots in the Isle of Thanet in Kent, where they are raised for the London seedsmen. This is the only place, as far as our observation goes, where they are sown in the field. The produce in seed is said not to exceed twenty bushels per acre, but it must be observed that it is chiefly the dwarf sorts which are sown. There is no doubt that the produce of the runners would greatly exceed this quantity, and although it might be expensive to support them with sticks, the example of the hop grounds proves that, where the return is large, no expense or trouble is spared.



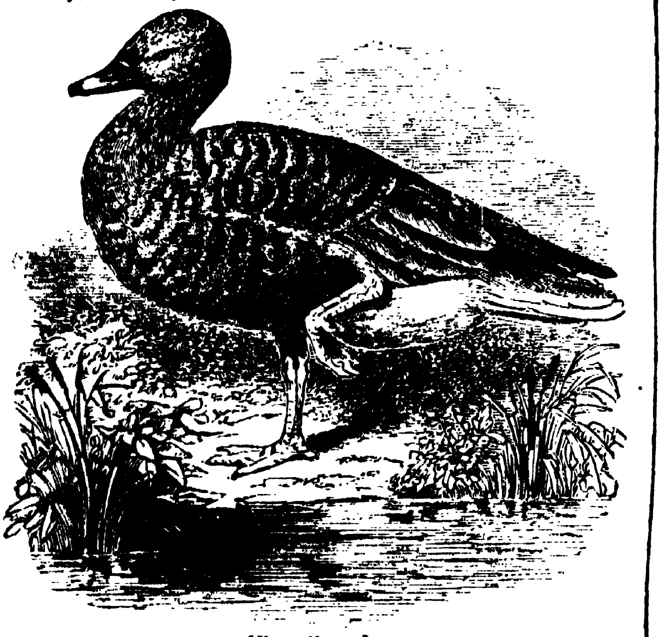
[Bean Cutter.]

The best soil for French beans is a rich mellow loam, rather light than otherwise; but, provided the ground be well stirred, they will grow in any soil. They may be planted in rows, the dwarf sorts at two and a half or three feet distance; the runners at four feet. As soon as the stems begin to rise above the seed leaves, the intervals should be well hoed with the horse-hoe, and the rows by hand. The scarifier or grubber may be used to loosen the soil, and when they are somewhat advanced in growth the runners may have sticks to climb upon. A row of turnips may be sown between every two rows of beans; or cabbages may be planted for cattle. The crop may be harvested as soon as the lower pods are quite dry and the seeds hard, and threshed like other beans. The seeds when raw have a bitter taste, and are rather tough under the teeth, which makes animals refuse to eat them in that state, but when boiled they become soft and pleasant. Oxen and pigs eat them readily. They contain, according to Einhof, 84 per cent. of nutritive matter, of which 50 is pure farina, the rest gluten and mucilage: they are, consequently, superior to every other grain or pulse cultivated, in point of nourishment; and when it is taken into the account that they remain in the ground only from May to September, and that a crop of cabbages or turnips is growing in the intervals at the same time, it will appear that the cultivation of this pulse on a large scale might add greatly to the resources of agriculture.

BEAN GOOSE (Zoology),* *Anser ferus* of Ray and Fleming, *Anas segetum* of Gmelin, one of the wild geese, which we must be careful not to confound with the *Grey Lagg*, or true wild-goose, the *Anser palustris noster* of Lister and Ray, and the species from which, as is generally admitted, our domestic geese are derived. From *that* species the *bean goose* is to be distinguished by its comparatively small and short bill, which is more compressed towards the end, and also differs in colour: for, in the bean goose the base of the under mandible, and also of the upper one, as far as the nostrils, together with the nails of both, are black, the rest of the organ being of a reddish flesh-colour, inclining to orange; whereas the bill of the grey lagg is of an orange-red, with the nail generally of a greyish white. The wings, moreover, in the bean goose reach, when closed, beyond the end of the tail.

Selby gives the following interesting account of its habits, from personal observation:—

'In Britain it is well known as a regular winter visitant, arriving in large bodies from its northern summer haunts, during September or the beginning of October, and seldom taking its final departure before the end of April or beginning of May. The various flocks, during their residence in this country, have each their particular haunts or feeding districts, to which, on each ensuing season, they invariably return, as I have found to be the case in Northumberland and the southern parts of Scotland, where wild geese have been known to frequent certain localities for a continued series of years. The habits of this and the preceding species * are very similar, and they show the same vigilance, and use the same means of guarding against surprise: their capture is therefore proportionably difficult, and it is only by stratagem that, when at rest on the ground or feeding, they can be approached within gun-shot. In stormy weather, when they are compelled to fly lower than they usually do, they may be sometimes intercepted from a hedge or bank, situated in the route they are observed to take early in the morning, in passing to their feeding ground. At night they retire to the water, or else (as I have often remarked in Northumberland) to some ridge or bar of sand on the sea-coast, sufficiently distant from the main land to afford a secure retreat; and where the approach of an enemy must become visible, or at least audible to their acute organs, before it could endanger their safety. The haunts or feeding-grounds of these birds are more frequently in the higher districts than in the lower and marshy tracts of the country, and they give the preference to open land, or where the inclosures are very large. They feed much upon the tender wheat, sometimes injuring these fields to a great extent; and they frequent also the stubbles, particularly such as are laid down with clover and other grasses. In the early part of spring they often alight upon the newly-sown bean and pea fields, picking up greedily such of the pulse as is left on the surface; and I am inclined to think that their trivial name has been acquired from their apparent predilection for this kind of food, rather than from the shape and aspect of the nail of the upper mandible, to which it has been generally attributed. They usually fly at a considerable elevation, either in a diagonal line, or in two such lines, opposed to each other, and forming a leading acute angle, like the other species; and when on wing they maintain a loud cackling, in which the voices of the two sexes may be easily distinguished. The rate at which they move, when favoured by a gentle breeze, is seldom less than from forty to fifty miles an hour, a velocity which enables them to have their roosting-place far removed from the district they frequent by day. The principal breeding stations, or summer retreats, of the bean goose are in countries within the arctic circle: it is said, however, that great numbers breed annually in Harris, and some of the other outermost Western Islands. The nest is made in the marshy grounds, and formed of grasses and other dry vegetable materials; the eggs are white, and from eight to twelve in number. The trachea of this species increases in diameter towards the middle, and the bronchiæ are short and tumid. The denticulated laminæ of the sides of the bill are similar in formation to those of the *Anser palustris*, and form thin sharp cutting edges, and the manner in which they lock within each other renders the bill an instrument beautifully adapted for vegetable food.'



[Bean Goose.]

In bulk, the bean goose is generally rather less than the grey lagg, and it is, accordingly, sometimes called provincially the *small grey goose*, but it not unfrequently equals the other in size and weight.

The head and upper part of the neck incline to brown, with a greyish tinge, and the feathers of the latter hue are so disposed as almost to produce a furrowed appearance. The lower parts of the body are ash-grey, with transverse darker shades; and the back and scapulars are brown, with a grey tinge, the feathers being edged with white. Wing-coverts grey; secondaries brown, edged and tipped with white; primaries grey-black; rump grey; upper tail-coverts white; tail brown, with the feathers deeply bordered and tipped with white; legs and toes reddish, inclining to orange, the intensity of the colour varying according to the bird's age. [See GOOSE.]

BEAR, GREAT, and LITTLE. [See URSA MAJOR, and MINOR.]

BEAR (Zoology), the English name for a family of Plantigrades (mammiferous quadrupeds of the carnivorous order, which are supported in walking on the entire sole of the foot), forming a natural group with six incisor teeth and two canine teeth in each jaw, twelve molars in the upper and fourteen in the lower jaw; pentadactyle or five-toed feet, armed with strong claws; and a short tail. The bears exhibit but a comparatively small carnivorous development: for, notwithstanding their strength, their dentition, particularly in the form of the crowns of their molar teeth, indicates a propensity bordering on the frugivorous exclusively; and indeed it appears that, although they are omnivorous *, they, for the most part, rarely devour flesh, unless pressed by necessity. Their claws, too, though formidable weapons, are not retractile, and are more calculated for digging and climbing than for tearing prey. It is their general characteristic to lay themselves up in caves or hollows for the winter, which they pass in a dormant state, and without taking food. The female produces her young at this season.

EUROPEAN BEARS.

The *Brown Bear*, Ἄρκτος of Aristotle, the *Ours* of the French, *Orso* of the Italians, *Bär* of the Germans, *Björn* of the Swedes, *Ursus Arctos* (Linn.) This appears to have been the only species certainly known to Linnæus [see POLAR BEAR]; and though zoologists are not without their suspicions as to some of the species since recorded, the number of those which can no longer be considered doubtful will prove how much this department of natural history has been enriched since his time. The brown bear is widely diffused. The mountainous districts of Europe, from very high latitudes (Arctic Circle) in the north, to the Alps and Pyrenees in the south; Siberia, Kamtchatka, and even Japan to the eastward, and a portion of the northern regions of America, form the range of its geographical distribution. Africa and the Moluccas have been added; but it is far from improbable that these localities have been assigned to it by travellers who have taken some other species for it.

To the Kamtchatkans this bear seems to have given the necessaries, and even the comforts of life. The skin, we are told, formed their beds and their coverlets, bonnets for their heads, gloves for their hands, and collars for their dogs; while an overall made of it, and drawn over the soles of their shoes, prevented them from slipping on the ice. The flesh and fat were their dainties. Of the intestines they made masks, or covers for their faces, to protect them from the glare of the sun in the spring, and used them as a substitute for glass, by extending them over their windows. Even the shoulder-blades are said to have been put in requisition for cutting grass.

---

* The Grey Lagg, or true Wild Goose.

* Aristotle well knew this, and thus described the habits of the bear:—'Ἡ δὲ ἄρκτος παμφάγον ἐστι· καὶ γὰρ καρπὸν ἐσθίει, καὶ ἀναβαίνει ἐπὶ τὰ δένδρα διὰ τὴν ὑγρότητα τοῦ σώματος· καὶ τοὺς καρποὺς τοὺς χέδροπας. Ἐσθίει δὲ καὶ μέλι, τὰ σμήνη καταγνύουσα· καὶ καρκίνους, καὶ μύρμηκας· καὶ σαρκοφαγεῖ. κ. τ. λ. lib. viii. c. 5. 'But the bear is an omnivorous animal, and by the suppleness of its body climbs trees and eats the fruits and also legumes. It also devours honey, having first broken up the hives; crabs, too, and ants it eats, and also preys upon flesh.' Aristotle then describes how the animal attacks the stag, the boar, and even the bull.

The ranger in the *Tour on the Prairies* notices the honey-seeking propensity in language which, though not quite classical, is truly nomadic. 'The bears is the knowingest varmint for finding out a bee tree in the world. They'll gnaw for a day together at the trunk, till they make a hole big enough to get in their paws, and then they'll haul out honey, bees and all' (τὰ σμήνη καταγνύουσαι). See the admirable description of a bee hunt, p. 68.

The Laplanders held it in great veneration, and, according to Leems, called it the Dog of God, for it appears, that, among the Norwegians, there had long been a proverb, that it had the strength of ten men, and the sense of twelve. They never, says the same author, presume to call it by its proper name of *Guouzhja*, lest it should revenge the insult on their flocks, but make mention of it as *Moedda-aigja*, or the old man with a fur-cloak (senem cum mastrucâ).

The brown bear is a solitary animal. Its retreat, during the period of hybernation, is the natural hollow of a tree, or some cavern; and if these are not to be found, the animal constructs a habitation for itself, sometimes by digging, sometimes by forming a rude kind of hut or den with branches of trees, lined with moss. Here it retires when fat with the summer's food, and remains dormant, without taking any sustenance, till the ensuing spring[*]. Cuvier makes the period of gestation about seven months, stating that they couple in June, and that the birth takes place in January; and the same number of months is assigned in the article in the old *French Encyclopédie*, taken from observations of the bears kept at Berne. The cubs, when first born, are not much larger than puppies. They are long lived, for it appears that one of the Berne bears had been confined there one-and-thirty years; and another, born there, is spoken of at the age of forty-seven in the menagerie at Paris. They are excellent swimmers, notwithstanding their uncouth appearance. Mr. Lloyd, in his *Field Sports of the North of Europe*, gives a very interesting account of the habits of this species, and of his adventures in hunting it.

That the brown bear was at one time common in the British islands there can be no doubt. The Caledonian bears (another name for British with the Romans) were imported to make sport for the Roman people, to whom the excitement of witnessing the suffering of man and beast, in its most distressing shape, seems to have been but too welcome. From the well-known lines of Martial, descriptive of the dreadful punishment of the malefactor Laureolus, it appears that they were sometimes used as instruments of torture.

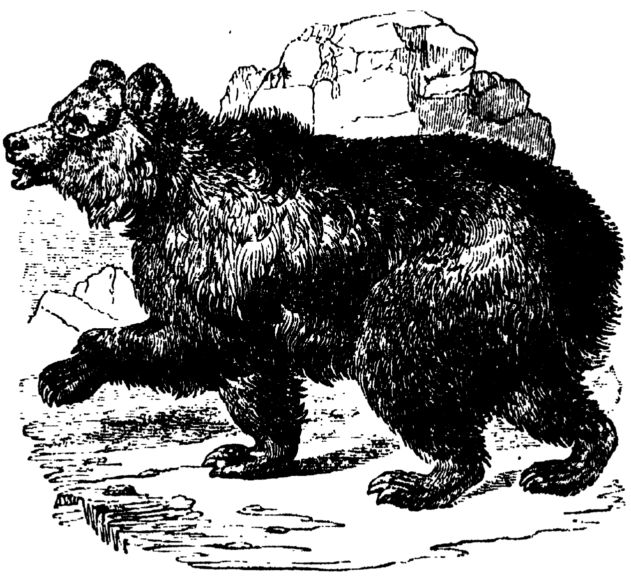
Nuda Caledonio sic pectora præbuit urso
Non falsâ pendens in cruce Laureolus[†].

Ray quotes authority for the brown bear having been one of the Welsh beasts of chase, and Pennant adduces the places which retained the name of Pennarth, or the Bear's Head, as evidence that it existed in that principality. In the *History of the Gordons* it is stated that one of that family, so late as the year 1057, was directed by the king to carry three bears' heads on his banner, as a reward for his valour in slaying a fierce bear in Scotland.

For many years it has been swept away from our islands so completely that we find it imported for baiting, a sport in which our nobility, as well as the commonalty, of the olden time—nay, even royalty itself, delighted. A bear-bait was one of the recreations offered to Elizabeth at Kenilworth, and in the Earl of Northumberland's Household Book we read of 20*s*. for his bear-ward: —'Item. My Lorde usith and accustomyth to gyfe yerly when his Lordshipe is at home to his bar-ward, when he comyth to my Lorde in Cristmas with his Lordshippe's beests, for makynge of his Lordschip pastime, the said xij days, xx*s*.' In Southwark there was a regular bear-garden, that disputed popularity with the Globe and the Swan Theatres on the same side of the water. Now however, so much do tastes alter (in this instance certainly for the better), such barbarous sports are banished from the metropolis[‡].

The firm support afforded by the well-developed sole of the foot enables the bears to rear themselves with comparative facility on their hind feet; and this has been taken advantage of to teach the animal to dance in an erect posture. The discipline put in force to produce this accomplishment is said to be so severe that it is never forgotten. There is a well-known story, introduced with the happiest effect in *The Bride of Lammermoor*, of a terrified gentleman who was pursued by a bear. The bear gained on him—was close upon him—with the resolution of despair he turned upon his pursuer with his uplifted cane, when the enraged animal reared itself up, the posture of attack, and instantly began—to shuffle a saraband.

Baron Cuvier, in his 'Ossemens Fossiles,' distinguished the *black bear* of Europe under the title of *Ursus niger Europæus*, observing that the frontal bone was flattened, and that the well-marked depressions and ridges of the skull, for the reception of the strong muscles of the lower jaw, were evidence of its being more decidedly carnivorous than the brown bear: but, in the last edition of his *Règne Animal*, he confesses his doubts about the data on which he had come to this conclusion; and it is probably a variety only. The usual size of the brown bear is about four feet in length, by about two feet and a half in height. The claws are two inches long, very much curved and nearly equal. The gambols of the individuals kept in the Garden of the Zoological Society in the Regent's Park are too well known to need description.

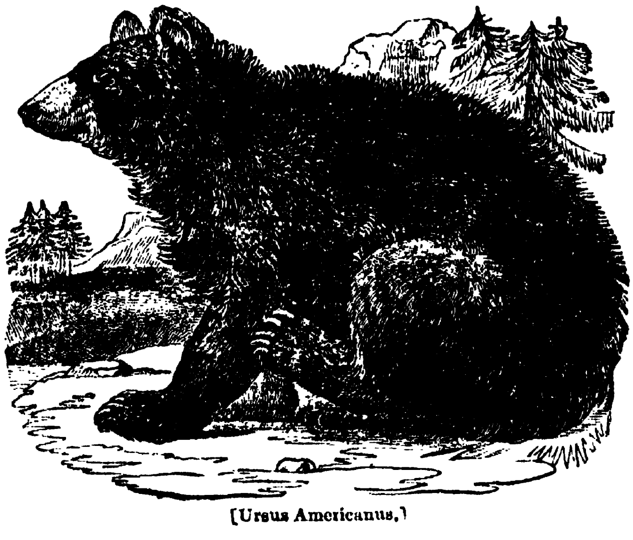


[Ursus Arctos.]

Pyrenean Bear, Ursus Pyrenaïcus.—F. Cuvier has figured the bear of the Pyrenees and of the Asturias, whose fur, in its youth, is of a yellowish white colour. The hair of the feet is an intense black. This, it is considered, is only a variety, though perhaps a distinct one, of *Ursus Arctos.*

AMERICAN BEARS.

American Black Bear, Ursus Americanus.—Pallas first described this species (the Sass of the Chippewayan Indians,



[Ursus Americanus.]

---

[*] While upon the subject of hybernation, we must not omit to notice the plug (in Norway termed the Tappen), found in the rectum of fat hybernating bears. It appears that if the bear loses this prematurely, it becomes meagre, and that in the ordinary course of things, the tappen is not voided till the hybernation is over.

Dr. Buckland possesses one of these enveloped in the rectum, which was presented to him by Mr. Lloyd, whose work is hereafter alluded to, from a bear of Mr. Lloyd's own shooting.

[†] We are quite aware that some commentators are of opinion that Martial is here speaking of a mimic scene, and that the verses which follow those above quoted are not genuine; but the expression 'non falsâ cruce' is pretty strong; and if the rest of the verses are allowed to be Martial's, there is no doubt that he here describes a real spectacle. Whichever be the truth, the horrible use to which these bears were occasionally put in the arena is but too evident.

[‡] See Stat. 3 W. IV. cap. 19, sec. 29.

and the Musquaw of the Crees), whose general proportions are smaller than those of *Ursus Arctos*. The head of the American black bear is narrower, the ears more distant, and the muzzle more prominent, and it wants the depression above the eyes. The fur is composed of soft smooth hairs, which are of a glossy black for the greater part of their length, instead of possessing the shaggy and woolly character of the comparatively grizzled fur of the brown bear, except on the muzzle, which is clothed with short thickset hairs, brown on the upper part and paler on the side. The tail is apparently more prominent, and the sharper and more curved claws are nearly hidden in the hair.

'The black bear,' says Dr. Richardson, 'inhabits every wooded district of the American continent from the Atlantic to the Pacific, and from Carolina to the shores of the Arctic Sea.' A friend informs us that it still occurs, though not very often, in the Blue Ridge, in Virginia. Other authorities place its southern boundary at the Isthmus of Panama. Man has, however, gradually driven it from its haunts to make way for his works, and has compelled it to take refuge in the mountains and the immense inland forests. In Canada it is still abundant, and it is tolerably numerous on the western coast as far as California. Dr. Richardson gives the following interesting account of this species:—

'The black bear is smaller than the other American bears which we have to describe, the total length of an adult seldom exceeding five feet. Its favourite food appears to be berries of various kinds, but when these are not to be procured it preys upon roots, insects, fish, eggs, and such birds or quadrupeds as it can surprise. It does not eat animal food from choice; for when it has abundance of its favourite vegetable diet, it will pass the carcass of a deer without touching it. It is rather a timid animal, and will seldom face a man unless it is wounded, or has its retreat cut off, or is urged by affection to defend its young. In such cases its strength renders it a dangerous assailant. I have known the female confront her enemy boldly until she had seen her cubs attain the upper branches of a tree, when she made off, evidently considering them to be in safety, but in fact leaving them an easy prey to the hunter. The speed of the black bear when in pursuit is said not to be very great, and I have been told that a man may escape from it, particularly if he runs into a willow grove or amongst loose grass; for the caution of the bear obliges it to stop frequently, and rise on its hind legs for the purpose of reconnoitring. I have, however, seen a black bear make off with a speed that would have baffled the fleetest runner, and ascend a nearly perpendicular cliff with a facility that a cat might envy. This bear, when resident in the fur countries, almost invariably hibernates, and about 1000 skins are annually procured by the Hudson's Bay Company, from black bears destroyed in their winter retreats. It generally selects a spot for its den under a fallen tree, and, having scratched away a portion of the soil, retires to it at the commencement of a snow-storm, when the snow soon furnishes it with a close, warm covering. Its breath makes a small opening in the den, and the quantity of hoar frost which occasionally gathers round the aperture serves to betray its retreat to the hunter. In more southern districts, where the timber is of a larger size, bears often shelter themselves in hollow trees. The Indians remark that a bear never retires to its den for the winter until it has acquired a thick coat of fat; and it is remarkable that when it comes abroad in the spring it is equally fat, though in a few days thereafter it becomes very lean. The period of the retreat of the bears is generally about the time when the snow begins to lie on the ground, and they do not come abroad again until the greater part of the snow is gone. At both these periods they can procure many kinds of berries in considerable abundance. In latitude 65° their winter repose lasts from the beginning of October to the first or second week of May; but on the northern shores of Lake Huron the period is from two to three months shorter. In very severe winters great numbers of bears have been observed to enter the United States from the northward. On these occasions they were very lean, and almost all males: the few females which accompanied them were not with young. The remark of the natives above-mentioned, that the fat bears alone hibernate, explains the cause of these migrations. The black bears in the northern districts couple in September, when they are in good condition from feeding on the berries then in maturity. The females retire at once to their dens, and conceal themselves so carefully, that even the lyncean eye of an Indian hunter very rarely detects them; but the males, exhausted by the pursuit of the females, require ten or twelve days to recover their lost fat. An unusually early winter will, it is evident, operate most severely on the males, by preventing them from fattening a second time: hence their migration at such times to more southern districts. It is not, however, true that the black bears generally abandon the northern districts on the approach of winter, as has been asserted, the quantity of bear skins procured during that season in all parts of the fur countries being a sufficient proof to the contrary. The females bring forth about the middle of January; and it is probable that the period of their gestation is about fifteen or sixteen weeks, but I believe it has not been precisely ascertained. The number of cubs varies from one to five, probably with the age of the mother, and they begin to bear long before they attain their full size.'

It will be observed that the period of gestation attributed to the brown bear is seven months. Cuvier says that they couple in June, and produce their young in January. Sixteen weeks is the probable time allotted to the American black bear for the same purpose by Dr. Richardson, who had the best opportunities of collecting evidence on the subject. The bears kept in the fosse at Berne furnished the proof of gestation for seven months; but it is so characteristic of the family for the females to conceal themselves, that, in a state of nature, little evidence to be depended upon for its accuracy can be obtained. 'No man,' according to Brickell, 'either Christian or Indian, ever killed a she-bear with young;' and Dr. Richardson's numerous inquiries among the Indians of Hudson's Bay ended in the discovery of only one hunter who had killed a pregnant bear. The same observation was long ago made by Aristotle, for he says, in chap. xxx. book vi., *Κύουσαν δὲ αρκτον ἔργον ἐστι λαβεῖν*, 'it is difficult to capture a pregnant bear;' and again, in chap. xvii. book viii., *Κύουσα δ᾽ἄρκτος, ἢ ὑπ᾽οὐδενὸς, ἢ πάνυ ὑπ᾽ ὀλίγων εἴληπται*, 'but a pregnant bear has never been taken by anybody, or at least by very few;' and this accounts for his own error, for he makes the period of gestation only thirty days. Mr. Lloyd, in his *Field-Sports of the North of Europe*, states that he was present at the death and dissection of one (*Ursus Arctos*) which had a cub in her womb, she having previously produced three, and he relates other instances, but they are very rare.

Upon the whole, though the American black bear may be considered a well-defined species, distinct from the brown bear (*Ursus Arctos*), it is not very probable that, in two species so nearly allied, the period of gestation should be only sixteen weeks in the one instance, while it is seven months in the other. Cuvier says that the American black bears produced young in the Paris menagerie: the young were of a uniform bright ash colour, and without a collar.

The value attached to the skin of the black bear, a value very much decreased, for the skin that once fetched from twenty to forty guineas is now hardly worth more than from twenty to sixty shillings*, and the high esteem in which the Indians held their flesh, caused great havock among them. The importation into England in 1783 amounted to 10,500 skins, and ascended gradually to 25,000 in 1803, since which time there has been a considerable decline. That an animal from which the wild Indian derived so much benefit, an animal, moreover, particularly to be dreaded in the perilous hour of the chase, and when encountered unexpectedly, should be the subject of much attention, or the parent of particular customs, and the object of great superstitious regard, was to be expected. Accordingly we find that, as the New Hollanders have their kangaroo dance and dog dance, the Indians had their bear dance.

The limits of a work of this nature will not permit us to go at large into the subject of bear hunting, and the ceremonies which accompanied it among the different tribes, but, as it may be expected that something should be said on the subject, we select the account of an eye-witness, who visited the fur countries soon after Canada had yielded to Great Britain. Alexander Henry thus writes in his *Travels*, whilst at Wawatam's wintering ground near Lake Michigan:—

'In the course of the month of January I happened to observe that the trunk of a very large pine-tree was much torn by the claws of a bear, made both in going up and down. On further examination I saw that there was a large opening in the upper part, near which the smaller branches were broken. From these marks, and from the additional circumstance that there were no tracks in the snow, there was reason to believe that a bear lay concealed in the tree. On returning to the lodge I communicated my discovery; and it was agreed that all the family should go together in the morning to assist in cutting down the tree, the girth of which was not less than three fathoms. The women at first opposed the undertaking, because our axes, being only of a pound and a half weight, were not well adapted to so heavy a labour; but the hope of finding a large bear, and obtaining from its fat a great quantity of oil, an article at the time much wanted, at length prevailed. Accordingly, in the morning we surrounded the tree, both men and women, as many at a time as could conveniently work at it; and there we toiled like beavers till the sun went down. This day's work carried us about half-way through the trunk; and the next morning we renewed the attack, continuing it till about two o'clock in the afternoon, when the tree fell to the ground. For a few minutes everything remained quiet, and I feared that all our expectations would be disappointed; but as I advanced to the opening there came out, to the great satisfaction of all our party, a bear of extraordinary size, which I shot. The bear being dead all my assistants approached, and all, but particularly my old mother (as I was wont to call her), took the head in their hands, stroking and kissing it several times; begging a thousand pardons for taking away her life; calling her their relation and grandmother; and requesting her not to lay the fault upon them, since it was truly an Englishman that had put her to death. This ceremony was not of long duration, and if it was I that killed their grandmother, they were not themselves behindhand in what remained to be performed. The skin being taken off we found the fat in several places six inches deep. This, being divided into two parts, loaded two persons; and the flesh parts were as much as four persons could carry. In all, the carcass must have exceeded five cwt. As soon as we reached the lodge, the bear's head was adorned with all the trinkets in the possession of the family, such as silver arm-bands, and wrist-bands, and belts of wampum; and then laid upon a scaffold set up for its reception within the lodge. Near the nose was placed a large quantity of tobacco. The next morning no sooner appeared than preparations were made for a feast to the manes. The lodge was cleaned and swept; and the head of the bear lifted up, and a new Stroud blanket which had never been used before spread under it. The pipes were now lit; and Wawatam blew tobacco-smoke into the nostrils of the bear, telling me to do the same, and thus appease the anger of the bear on account of my having killed her. I endeavoured to persuade my benefactor and friendly adviser that she no longer had any life, and assured him that I was under no apprehension from her displeasure; but the first proposition obtained no credit, and the second gave but little satisfaction. At length the feast being ready, Wawatam made a speech resembling, in many things, his address to the manes of his relations and departed companions; but having this peculiarity, that he here deplored the necessity under which men laboured thus to destroy their friends. He represented, however, that the misfortune was unavoidable, since without doing so they could by no means subsist. The speech ended, we all ate heartily of the bear's flesh; and even the head itself, after remaining three days on the scaffold, was put into the kettle. It is only the female bear that makes her winter lodging in the upper parts of trees, a practice by which her young are secured from the attacks of wolves and other animals. She brings forth in the winter season, and remains in her lodge till the cubs have gained some strength. The male always lodges in the ground, under the roots of trees. He takes to his habitation as soon as the snow falls, and remains there till it has disappeared. The Indians remark that the bear comes out in the spring with the same fat which he carries in in the autumn; but after the exercise of only a few days becomes lean. Excepting for a short part of the season the male lives constantly alone.'

---

* The retail price of an American black bear's skin in London, at present (spring of 1835), is from one to three guineas.

The following are considered to be varieties of this species, which is almost equal to the polar bear in its powers of swimming, and is said to be very fond of fish:—

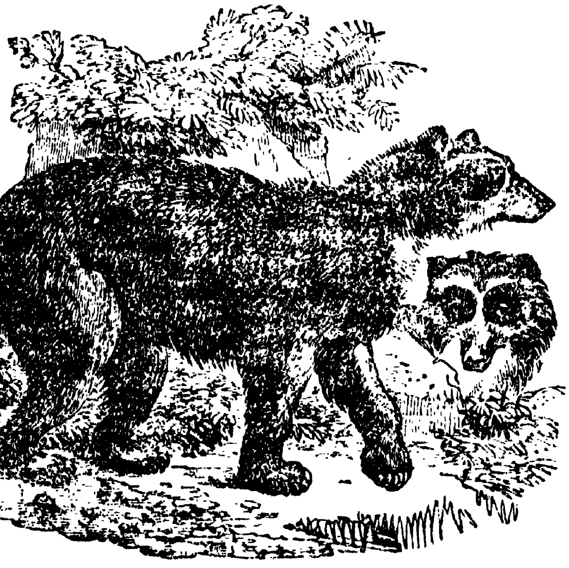
The Cinnamon Bear, which, with the black variety, may be seen in the Zoological Garden at the Regent's Park.

The Yellow Bear of Carolina, a specimen of which was in the Tower of London in 1788, and is figured by Catton.

The Ours Gulaire of Geoffroy, with a white throat. The white markings on the throat of Geoffroy's bear are, perhaps, as Dr. Richardson observes, analogous to the white collar which many of the European brown bears exhibit when young; and the Doctor cites Cartwright to show that the cubs of the black bear on the Labrador coast are often marked with white rings round the neck; and Pennant, to prove the same as to the bears of Hudson's Bay. An American black bear was kept for some time in the Tower of London in the same den with a hyæna. They agreed very well together except at meals, when the hyæna, though much the smallest, was generally master; 'and the bear,' says Mr. Bennett, 'would moan most piteously, and in a tone somewhat resembling the bleating of a sheep, while his companion quietly consumed the remainder of his dinner.'

The Spectacled Bear, Ursus Ornatus of F. Cuvier, inhabits the Cordilleras of the Andes in Chili. Its fur is smooth, shining, and black, with the following exceptions:—Its short muzzle is of a dirty yellow, or buff colour, and there are two semicircular marks of the same hue, reminding the observer of a pair of spectacles above the eyes; the under parts of the throat and neck and the upper part of the breast are whitish. This species, which may be now seen at the Garden of the Zoological Society in the Regent's Park, is about three feet and a half in length.

Sir R. Ker Porter describes a bear brought from the Andes and living at Caracas in 1833 somewhat differing in its markings from the ordinary individuals of *Ursus ornatus*; but it is probably only a variety. (See *Proceedings of the Zoological Society*, part i. p. 114.)



[Ursus ornatus.]

Before we proceed to the consideration of the true grizzly bear, we must notice the

Barren-ground Bear.—This, which appears to be the grizzly bear of Hearne, and the brown bear, variety δ, grizzly of Pennant, was stated by Dr. Richardson to be the brown variety of *Ursus Americanus*; but, in the *Fauna Boreali-Americana*, he corrects himself, and seems inclined to consider it a variety of the brown bear (*Ursus Arctos*).

'From the inquiries I made,' writes the Doctor in the last-mentioned work, 'throughout the woody country from Lake Superior to Great Slave Lake, being 10° of latitude, I learnt that the natives of those districts are acquainted with only two species of land bear, viz., the *common black bear*, including the cinnamon-coloured and other varieties, and the *grisly bear*, which is confined to the lofty chain of the Rocky Mountains, and the extensive plains that skirt their bases. The barren lands, however, lying to the northward and eastward of Great Slave Lake, and extending to the Arctic Sea, are frequented by a species of bear which differs from the American black bear in its greater size, profile, physiognomy, larger soles, and tail; and from the grisly bear, also, in colour, and the comparative smallness of its claws. Its greatest affinity is with the brown bear of Norway; but its identity with that species has not been established by actual comparison. It frequents the sea-coast in autumn in considerable numbers, for the purpose of feeding on fish. The general colour of this bear is a dusky, or sometimes yellowish-brown, but the shoulders and flanks are, in the summer season at least, covered with long hair, which is frequently very pale towards the tips. The Indians and their interpreters, who are not very precise in their application of the few terms they have to express varieties of colour, often denominate them "white bears."'

These are, not improbably, the 'silver bears' (*silber-bär* of the Germans), which Pennant considers to be the same as those which inhabit the north of Europe, though he describes them as a variety of the American black bear.

Dr. Richardson says that the barren-ground bear does not possess the boldness of the true grisly bear (*Ursus ferox*), as all the individuals seen by his party fled at once. He says that it resorts to the coast of the Arctic Sea in the month of August, and that it preys indiscriminately upon animal and vegetable food.

To an eminence which had been much ploughed up by the bears in quest of *Arctomys Parryi* (Parry's marmot), termed by Hearne 'ground hog,' according to the same author, Hearne gave the name of Grizzle-Bear Hill; and in the stomach of one of these bears which he opened the Doctor found the remains of a seal, a marmot, a large quantity of the long, sweet roots of some *astragali* and *hedysara*, together with some berries, and a little grass. Many long, white worms adhered to the interior of the stomach. He also observes that the tail of the barren-ground bear is longer than that of the black bear, which is conspicuous nough.

Subgenus Danis.

The Grisly or Grizzly Bear. Ursus (Danis) *ferox.*—Cuvier, in the last edition of his 'Règne Animal,' expresses a doubt as to the specific distinction of this formidable bear. 'Il n'est pas encore bien prouvé pour nous que l'ours cendré, l'ours terrible de l'Amerique Septentrionale, soit différent, par l'espèce, de l'ours brun d'Europe,' says the note appended to *Ursus Arctos*; and the species is not mentioned among the others recorded in the work. This is certainly great authority, but it is more than balanced; and with all due submission to so great a name, an examination of the animal will prove it to be as strongly defined a species as any which Cuvier has himself admitted. These differences indeed are so well marked, as to have induced Mr. Gray to separate it from its congeners as a subgenus.

[Ursus ferox.]

The *Grizzle Bear* of Umfreville, *Grisly Bear* of Mackenzie, *Grizzly Bear* of Warden, *Ursus cinereus* of Desmarest, *Ursus horribilis* of Say, *Meesheh Musquaw* or *Meechee Musquaw* of the Cree Indians, *Hohhost* of the Chopunnish Indians, and *Ursus ferox* (Lewis and Clarke who first accurately described the animal, calling it often 'White Bear'), is nearly double the size of the black bear. Lewis and Clarke give the measurement of one as nine feet from nose to tail, and state that they had seen one of larger dimensions. Eight hundred pounds is reported to be the weight to which it attains. The length of the fore-foot in one of those measured by the travellers above quoted is given as exceeding nine inches, that of the hind-foot at eleven and three-quarters without the talons, and the breadth seven inches. The claws of the fore-feet, which are a good deal longer and less curved than those of the hind-feet, measured in another individual more than six inches. This part of its organization is well adapted for digging, but not for climbing, and the adult grisly bear is said not to ascend trees. The muzzle is lengthened, narrowed, and flattened, and the canine teeth are highly developed, exhibiting a great increase of size and power. The tail is very small, and so entirely lost in the hair which covers the buttocks, that it is a standing joke among the Indian hunters, as Dr. Richardson observes, when they have killed a grisly bear, to desire any one unacquainted with the animal to take hold of its tail. The fur, or rather hair is abundant, long, and varying through most of the intermediate gradations between grey and blackish brown, which last is prevalent and more or less grizzled. On the muzzle it is pale and short, on the legs it is darker and coarser. The eyes are small and rather sunk in the head.

Unwieldy as this animal appears, it is capable of great rapidity of motion, and its strength is overpowering. The bison contends in vain with the grisly bear. The conqueror drags the enormous carcase (weighing about one thousand pounds) to a chosen place, digs a pit for its reception, and repairs to it till the exhausted store compels him to renew the chase. And yet he will be satisfied with fruits and roots; and on his diet depends the aggravated or mitigated ferocity of his disposition. The bears on the western side of the Rocky Mountains, which feed for the most part on a vegetable diet, are mild, when compared with those of the eastern side, whose appetite for blood is whetted by the abundant supply of animal food which is there offered to them. The accounts given of the tenacity with which the grisly bear clings to life would be almost beyond belief, were they not related by witnesses worthy of all credit. It is recorded, that one whose lungs had been pierced with five balls, and whose body was suffering under five other wounds, swam a considerable distance to a sand-bar in the river, and survived twenty minutes;—that another, shot through the centre of the lungs, pursued for half a mile the hunter by whom the wound was given, then returned more than twice that distance, dug a bed for itself in the earth, two feet in depth and five feet in length, and was apparently in full life at least two hours after the shot was fired;—and that a third, though shot through the heart within twenty paces, as he was rushing on the hunter, fell indeed, but got up again. 'We then,' say the travellers, 'followed him one hundred yards and found that the wound had been mortal.' These, and many other instances are recorded by Lewis and Clarke.

Numerous, indeed, and interesting are the relations of contests with this ferocious animal. The following narrative by Dr. Richardson is selected, as being comparatively modern, and throwing some light on its habits. 'A party of voyagers, who had been employed all day in tracking a canoe up the Saskatchewan, had seated themselves in the twilight by a fire, and were busy in preparing their supper, when a large grisly bear sprang over the canoe that was tilted behind them, and seizing one of the party by the shoulder, carried him off. The rest fled in terror, with the exception of a metif, named Bourasso, who, grasping his gun, followed the bear as it was retreating leisurely with its prey. He called to his unfortunate comrade, that he was afraid of hitting him if he fired at the bear, but the latter entreated him to fire immediately, without hesitation, as the bear was squeezing him to death. On this he took a deliberate aim, and discharged his piece into the body of the bear, who instantly dropped its prey to pursue Bourasso. He escaped with difficulty, and the bear ultimately retreated to a thicket, where it was supposed to have died; but the curiosity of the party not being a match for their fears, the fact of its decease was not ascertained. The man who was rescued had his arm fractured, and was otherwise severely bitten, but finally recovered. I have seen Bourasso, and can add, that the account which he gives is fully credited by the traders resident in that part of the country, who are best qualified to judge of its truth from their knowledge of the parties. I have been told that there is a man now living in the neighbourhood of Edmonton-house, who was attacked by a grisly bear, which sprang out of a thicket, and with one stroke of its paw completely scalped him, laying bare the skull, and bringing the skin of the forehead down over the eyes. Assistance coming up, the bear made off without doing him further injury, but the scalp not being replaced, the poor man has lost his sight, although he thinks his eyes are uninjured.' Mr. Drummond, in his excursions over the Rocky Mountains, had frequent opportunities of observing the manners of the grisly bears, and it often happened that in turning the point of a rock or sharp angle of a valley, he came suddenly upon one or more of them. On such occasions they reared on their hind legs, and made a loud noise like a person breathing quick, but much harsher. He kept his ground, without attempting to molest them; and they on their part, after attentively regarding him for some time, generally wheeled round and galloped off; though, from their known disposition, there is little doubt but he would have been torn in pieces, had he lost his presence of mind and attempted to fly. When he discovered them from a distance, he generally frightened them away by beating on a large tin-box, in which he carried his specimens of plants. He never saw more than four together, and two of these he supposes to have been cubs; he more often met them singly, or in pairs. He was only once attacked, and then by a female, for the purpose of allowing her cubs to escape. His gun on this occasion missed fire, but he kept her at bay with the stock of it, until some gentlemen of the Hudson's Bay Company, with whom he was travelling at the time, came up and drove her off. In the latter end of June, 1826, he observed a male caressing a female, and soon afterwards they both came towards him, but whether accidentally, or for the purpose of attacking him, he was uncertain. He ascended a tree, and as the female drew near, fired at and mortally wounded her. She uttered a few loud screams, which threw the male into a furious rage, and he reared up against the trunk of the tree in which Mr. Drummond was seated, but never attempted to ascend it. The female, in the meanwhile retiring to a short distance, lay down, and as the male was proceeding to join her, Mr. Drummond shot him also. From the size of their teeth and claws, he judged them to be about four years old. The cubs of a grisly bear can climb trees, but when the animal is fully grown it is unable to do so, as the Indians report, from the form of its claws.'

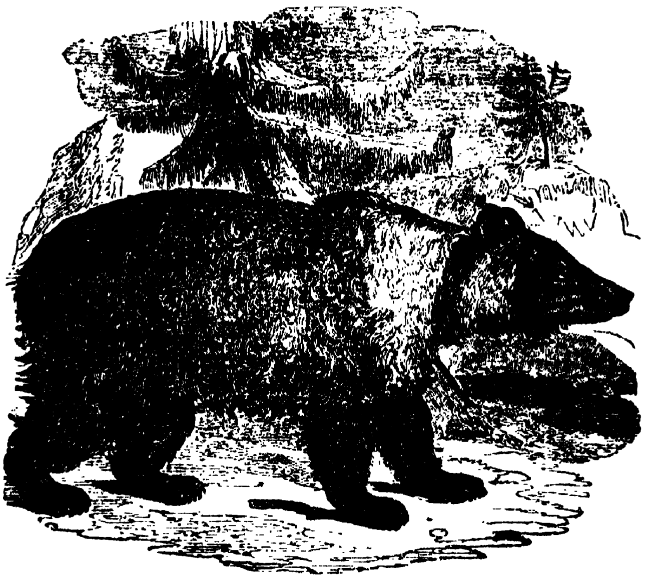
The Rocky Mountains, and the plains to the eastward of them, particularly, according to Mr. Drummond, the districts which are interspersed with open prairies and grassy hills, are the chief haunts of the grisly bears. To the north they have been observed as far as 61° of latitude, and it is supposed that they are to be found still farther. To the south it is said that they extend as far as Mexico. The cubs and the pregnant females hybernate, but the older males often come abroad for food during winter. The following dimensions have been given of a den or winter retreat,—ten feet in width, five feet in height, and six feet in length.

The fine grisly bear now in the Garden of the Zoological Society in the Regent's Park was presented to George III. by the Hudson's Bay Company, and was long a resident in the Tower under the name of Martin, and latterly of Old Martin. His present Majesty William IV. graciously presented it to the Zoological Society with the rest of the royal collection.

The brown bear mentioned by Pennant, on the authority of Condamine and Ulloa, as an inhabitant of the Peruvian Andes, must not be forgotten; but it is not known whether it belongs to this species. Cuvier thinks that the Peruvian bears of Acosta and Garcilasso may have been the great ant bears (*Myrmecophaga*). It is not impossible that these Peruvian bears may have been *Spectacled Bears* (*Ursus ornatus*).

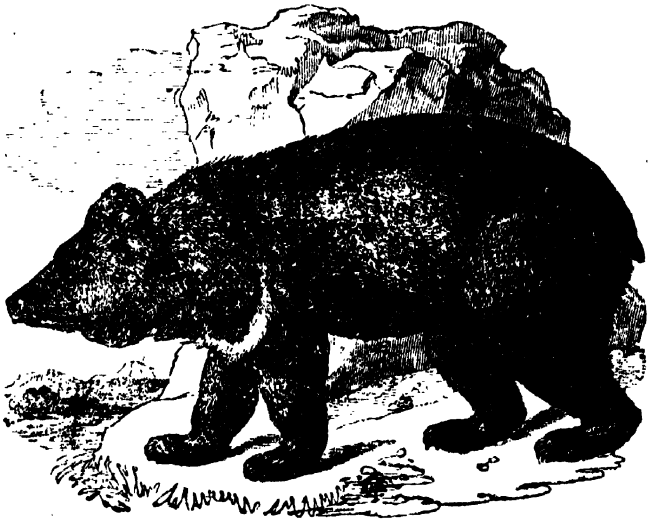
ASIATIC BEARS.

The ***Siberian Bear***, ***Ursus collaris*** of F. Cuvier, approaches closely to the brown bear (*Ursus Arctos*). The hair in quality and colour is much the same with that of the brown bear, with the distinction of a large white collar which passes over the upper part of the back and the shoulders, and is completed upon the breast. It is not improbable that this may be a variety of the brown bear.



[Ursus collaris.]

Thibet Bear.—M. Duvaucel discovered this species, *Ursus Thibetanus* of F. Cuvier, in the mountains of Sylhet, and Dr. Wallich found it in those of Nepaul. The Thibet bear has the neck remarkably thick, and the head flattened, the forehead and muzzle forming almost a straight line. The ears are of a large size. Its clumsy limbs support a compact body, and the claws are comparatively weak. Its general colour is black; but the lower lip is white, and there is a large mark of the same colour, somewhat in the form of the letter Y, supposing the stem of the letter to be placed in the middle of the breast, and the forks to pass up in front of the shoulders. In bulk it is about intermediate between the sloth bear (*Prochilus labiatus*) and the Malayan bear (*Ursus Malayanus*). Mr. Bennett, in his *Tower Menagerie*, gives a figure and description of one which was brought from Sumatra, and could not be prevailed on to touch flesh either raw or cooked, bread and fruits forming his only food. In his disposition he was moderately tame, and particularly fond of play.

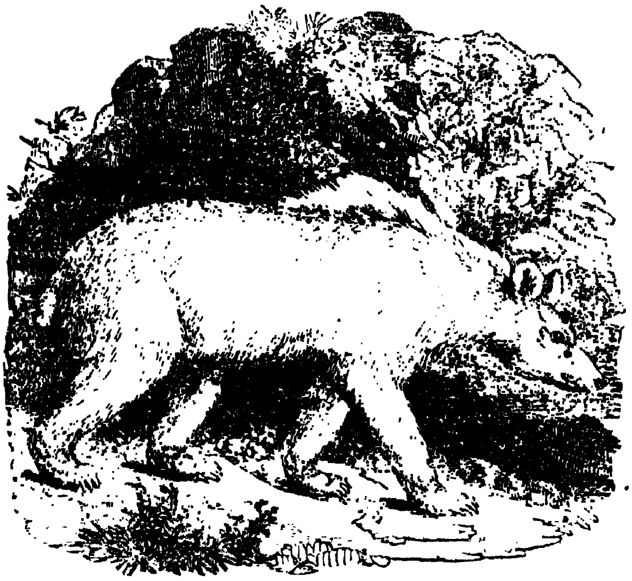


[Ursus Thibetanus.]

Isabella-coloured Bear, ***Ursus Isabellinus***.—Dr. Horsfield has described this species in the *Transactions of the Linnæan Society*, from a skin forwarded from the mountains of Nepaul. The skull had been removed, but the front teeth in both jaws and the claws remained.

'Our animal,' says Dr. Horsfield, 'is of a habit decidedly different from that of several species of *Ursus* from the same part of the world, which have been recently added to the systematic catalogues, namely, the *Ursus Thibetanus*, the *Ursus labiatus*, and the *Ursus Malayanus*. All these have a jet-black fur, a semilunar mark of a white colour on the breast, and other peculiarities affording types of subgenera, among which *Prochilus* and *Helarctos* have been defined. Our animal, on the contrary, appears to resemble the European bears in its structure, as far at least as can be determined from the parts which have been preserved in the specimen. Among these, the claws afford the best means of comparison; they are small, obtuse, and straight, while those of the Asiatic bears above mentioned are large, strongly curved, acute, and fitted for climbing.'

The *Syrian Bear, Ursus Syriacus.*—The she-bears which came out of the wood, 'and tare forty and two' of the mockers of Elisha (2 Kings ii. 23, *et seq.*), are probably the first bears on record. These bears of Syria may be occasionally traced in subsequent history. Thus Matthew Paris, in his *England*, relates how Godfrey (*Dux Godefridus*), as he was riding for recreation in a neighbouring wood during the siege of Antioch (*Antiochiam minorem*), saw a poor stranger, who was loaded with a bundle of dry wood, fleeing from an enraged bear, whereupon Godfrey gallantly went to the rescue, and the bear turning upon him he was unhorsed, the horse being wounded by the bear, and fought on foot, when, after a severe struggle, in which he received a most dangerous wound (*vulnus fere letiferum*), he buried his sword up to the hilt in his savage adversary, and killed him. The historian, in continuation, relates the great joy of the army at Godfroy's recovery. (*Hist. of England*, tom. ii. p. 34, folio, London, 1640.)



[Ursus Syriacus.]

Hasselquist makes no mention of a bear in his catalogue of the animals given in his travels in the Levant, in the years 1749, 1750, 1751, and 1752; but Seetzen, some twenty years ago, was informed in the country that bears existed in the mountains of Palestine.

Hemprich and Ehrenberg, in the *Symbolæ Physicæ*, have given a figure (here copied) and a description of a female killed near Bischerre in Syria. The following is the substance of the description.

Bear, of a uniform fulvous white (sometimes variegated with fulvous); ears elongated; forehead but slightly arched; fur woolly beneath, with long straight, or but slightly curled, hair externally; a stiff mane of erected hairs (about four inches long) between the shoulders.

The individual killed was neither young nor old, and measured, from the nose to the tip of the tail, about four feet two, the tail being six inches. Nothing was found in the stomach, nor were any *entozoa* (internal worms) discovered. They saw her den (where there was much bear's dung), formed by great fragments of calcareous rock, that appeared to have been casually thrown together. They ate of the flesh, which they found [illegible], but the liver was sweet and nauseous. The gall appears to be in great esteem; the skins are sold; and so is the dung, under the name of Bar ed dub, the latter being used as a medicine for diseases of the eye in Syria and Egypt.

Mount Lebanon is crowned with two snowy summits, one called Gebel Sanin, the other Makmel, both of which the travellers visited; but there are no bears, except upon Mount Makmel, near the village of Bischerre, to the gardens of which they are said to wander in winter; but in the summer they remain in the neighbourhood of the snow.

The Syrian bear frequently (*non raro*) preys on animals, but for the most part feeds on vegetables. The fields of *cicer arietinus* (a kind of chick-pea), and other crops near the snowy region, are often laid waste by it.

The skin is sometimes fulvous brown, and, as has been stated, sometimes fulvous white, varied with fulvous spots. These changes are supposed to have been occasioned by the abrasion of the long hair, whereby the woolly fur beneath and that of the head become exposed.

In the British Museum is a yellowish bear presented by the Royal College of Surgeons, which has some points of resemblance with Ehrenberg's description; but it is an albino variety of the brown bear (*Ursus Arctos*), and came from Russia.

Those who are familiar with Athenæus will remember the description of the procession of Ptolemy Philadelphus (lib. v. p. 201, Casaub.) at Alexandria, in which one great white bear (*ἄρκτος μὲν λευκὴ μεγάλη μία*) makes a conspicuous figure. Some, and among them Baron Cuvier, have thought that this was the *Ursus maritimus*. Ehrenberg thus writes upon this point, after referring to the opinion of Cuvier:—'But since it is evident from Prosper Alpinus, that white bears, of the size of a sheep (tame if you will) were known in the land of the Arabians and in Egypt, I would rather believe that Ptolemy's bear was distinguished for its size (as it is written) than distinct in species. There is scarce room for hesitating to refer all those evidences of bears seen in Egypt to our Syrian bear.'

To this we can add that, in Rosellini's work (plate M. C. No. 22) there is a representation of two men together,—one, a red man with a red beard and long black hair with a fillet, clad in a white tunic or frock bordered with blue and red stripes and with blue tassels at the neck, supports on the left shoulder a package nearly square, pinkish, and spotted with blue, and holds in the right hand a red vase. His companion, of the same colour, dressed in the same way, but with the fore-part of his head apparently shaven or covered with a cap of the same colour as the skin (the hinder part with the black hair cut close), carries on his left shoulder two elephants' tusks, and with his right hand leads a large yellowish bear, high in the withers and with a red collar.

In the same plate, and immediately before the bear-leaders, is a dark-brown man, naked all but the cincture (which is white patched with red leopard-like spots), a white collar round his neck with a red centre-piece, and white wristbands. He has no beard: his head is covered by a close skull-cap spotted with black: on his left shoulder he bears a log (ebony?), and with his right hand leads a leopard or panther.

There are also two men conducting a giraffe with a monkey climbing up its neck; and there is an elephant with its keeper, and a lion without any guardian.

The bear figured in Rosellini is led apparently in a procession, and Ptolemy's pompa occurs immediately to the observer; but the modern opinion would refer these figures to a date long prior to the Greek occupation of Egypt. If this opinion be correct (and it is considered the better one), Rosellini's plate cannot relate to Ptolemy's pompa.

Subgenus Prochilus.

Labiated Bear, or *Sloth Bear, Ursus* (*Prochilus*) *Labiatus.*—Illiger, it is true, founded this genus on imperfect materials, for the individual which led him to separate it had lost its incisor teeth, a loss to which it is said the species is very subject*. M. de Blainville proved that it was a species of bear; and we think that, though Illiger's description, from the cause above alluded to, was incorrect, his name is expressively characteristic of one of the subdivisions of this family, and should be retained.

The uncouth animal, on its arrival in Europe some forty-five years ago, was taken for a sloth, and obtained the name of *Bradypus pentadactylus* and *Ursinus*, 'Five-fingered Sloth, Sloth Bear, or Ursine Sloth.' By the two last names it is, or very lately was, shown in menageries; and Bewick gave an excellent portrait of it in his *Quadrupeds*, as 'an animal which has hitherto escaped the attention of naturalists.' Meyer called it a *Melursus;* and Fischer a *Chondrorhynchus.* It is the *Bradypus ursinus* of Shaw, though it bears no relation to the true sloths either in structure or habits; the *Ursus labiatus* of M. Blainville; and the *Ursus longirostris* of Tiedemann; the *Ours paresseux,* and *Ours jongleur* of the French, and *Aswail* of the Mahrattas. The short limbs, the depressed air of the head, surmounted by the hillock of a back, and the whole contour of the apparently unwieldy mass, give the idea of deformity, and make it a favourite with the Indian mountebanks or jugglers, who rely on the attraction of its ugliness.

---

* In the proceedings of the Zoological Society for 1830-1831, it is stated, that, in the skulls of many individuals of this species which he examined, Major Sykes had never seen more than four incisor teeth in the upper and six in the lower jaw; the two centre teeth standing a little in front of the line of the rest. One individual, then in his possession, was so young, that he did not conceive that the deficient incisors could have fallen out; nor was there any appearance of dentition having existed in the places which they should have occupied. He considered, therefore, that it might be deemed adviseable to remove this animal from the genus *Ursus*; but we cannot agree with him.

[Ursus (Prochilus) labiatus.]

The cartilage of the nose is capable of extension, and the lips of considerable protrusion, as may be seen if the spectator hold a morsel of fruit or biscuit at a proper distance for exciting the animal to exert this faculty. The muzzle is elongated, and, with the ends of the feet, is whitish or yellowish. The forehead rises almost abruptly from the muzzle. The fur, with the exceptions above noticed and that next mentioned, is deep black, with here and there some brown spots, and is rather long, particularly round the head in old individuals. Upon the under side of the neck and breast is a white mark, resembling the letters V or Y. In bulk it is about the size of the brown bear.

The food of this species in a state of nature is said to consist of fruits, honey, and the white ants, which are so destructive. It inhabits the mountainous parts of India, where its retreat is stated to be in some cavern. Major (now Colonel) Sykes noticed it in Dukhun (Deccan).

In captivity it appears to be mild, but melancholy. A pair were kept for some time in the garden of the Zoological Society, and one still survives. They lived very sociably, and often lay huddled together, uttering a kind of rattling but low whine, or purring, which was continuous and monotonous, but not entirely unmusical: indeed it was termed, by more than one who heard it, their song. The paw was generally at the mouth when they made this noise.

Subgenus Helarctos.

Lady Banks received, as a present, in 1819, a *Malayan Bear,* which was brought from Bencoolen. This individual was examined by Dr. Leach, but it does not appear that his description, if he wrote any, was ever published. In 1821 Sir Stamford Raffles gave, in the 13th volume of the *Transactions of the Linnean Society,* his interesting account of the species, under the name of *Ursus Malayanus.* Soon afterwards Dr. Horsfield described it as it is found in Sumatra, by the same name.

The arrival of another species from Borneo, in or about the year 1825, agreeing with the former in the arrangement of the teeth, the extensibility of the lips, the great length of the tongue, the shortness and smoothness of the fur, and other characters, induced Dr. Horsfield to institute the subgenus above mentioned. 'The range of both species,' says Dr. Horsfield, 'appears to be limited to within a few degrees of the equator.'

Malayan Bear.—This species, the *Bruang* of the Malays, *Ursus Malayanus* of Raffles, *Prochilus Malayanus* of Gray, *Helarctos Malayanus* of Horsfield, is jet-black, with the muzzle of a yellowish tint, and has a semilunar white mark upon the breast. Dr. Horsfield observes, that the largest prepared specimen which he had examined measured four feet six inches along the back.

[Ursus (Helarctos) Malayanus.]

The sagacity of the Malayan bear is said to be great, and its liking for delicacies extreme. The honey of the indigenous bees of its native forests is supposed to be a favourite food; and certainly the extreme length of the tongue is well adapted for feeding on it. Vegetables form the chief diet of this bear, and it is said to be attracted to the vicinity of man by its fondness for the young shoots of the cocoa-nut trees, to which it is very injurious; indeed Sir Stamford Raffles found those of the deserted villages in the Passumah district of Sumatra destroyed by it. It has not unfrequently been taken and domesticated.

In confinement it is mild and sagacious. Sir Stamford Raffles thus describes the manners of one which appears to have been deservedly a great favourite.

'When taken young,' writes Sir Stamford in the *Linnean Transactions,* 'they become very tame. One lived for two years in my possession. He was brought up in the nursery with the children; and, when admitted to my table, as was frequently the case, gave a proof of his taste by refusing to eat any fruit but mangosteens, or to drink any wine but champagne. The only time I ever knew him to be out of humour was on an occasion when no champagne was forthcoming. It was naturally of an affectionate disposition, and it was never found necessary to chain or chastise him. It was usual for this bear, the cat, the dog, and a small blue mountain bird or lory of New Holland, to mess together, and eat out of the same dish. His favourite playfellow was the dog, whose teasing and worrying was always borne and returned with the utmost good humour and playfulness. As he grew up he became a very powerful animal, and in his rambles in the garden he would lay hold of the largest plantains, the stems of which he could scarcely embrace, and tear them up by the roots.'

There is an individual in the garden of the Zoological Society in the Regent's Park. The specimen presented to Lady Banks is preserved in the British Museum.

M. Lesson considers this species to be identical with the sloth-bear, *Prochilus labiatus.* We cannot agree with him, and we have had the best opportunities of examining both, while alive and after death. Few species of bear are, in our opinion, more distinct.

Bornean Bear.—This, the *Helarctos Euryspilus* of Horsfield, differs from the Malayan bear principally in having a large orange-coloured patch, deeply notched at its upper part, upon the chest. In size it is supposed to be rather less than the last. The individual which was exhibited in the Tower of London, and from which Dr. Horsfield wrote his description, measured, along the back from muzzle to tail, three feet nine inches. It was obtained in Borneo when very young, and during the voyage was the constant associate of a monkey and other animals. In confinement its manners greatly resembled those of the Malayan bear. Its habits in a state of nature do not appear to be known, but are most probably similar to those of the Malayan species. Dr. Horsfield gives the following account of the Bornean bear in captivity, to the correctness of which we can bear testimony, for we watched the animal narrowly:—'Our animal has been shown to be completely plantigrade: it rests with facility on the posterior feet, and its robust thighs not only support it while sitting, but even enable it to raise itself without difficulty to a nearly erect posture. But it is more generally seen in a sitting attitude, at the door of its apartment, eagerly surveying the visitors, and attracting their notice by the uncouthness of its form or the singularity of its motions. Although it appears heavy and stupid, most of its senses, particularly those of sight and smelling, are very acute. The keeper has frequently observed that it attentively regards whatever passes before it in the court. But the olfactory organs are peculiarly strong, and appear to be in a state of constant excitement. The *Helarctos* has considerable command over the fleshy extremity of its nose, and the parts adjacent, which it often displays in a very ludicrous manner, particularly when a morsel of bread or cake is held at a small distance beyond its reach. It expands the lateral aperture of the nostrils, protrudes its upper lip by a strong effort, thrusting it forward as a proboscis, while it employs its paws to seize the object. After obtaining it and filling the mouth, it places the remainder with great calmness on the posterior feet, bringing it in successive portions to its mouth. It often voluntarily places itself in an imploring attitude, turning the head in different directions, earnestly regarding the spectators and extending the paws. The *Helarctos* readily distinguishes the keeper, and evinces an attachment to him. On his approach it employs all its efforts to obtain food, seconding them by emitting a coarse, but not unpleasant, whining sound. This it continues while it consumes its food, alternately with a low grunting noise; but if teased at this time, it suddenly raises its voice and emits at intervals harsh and grating sounds. Our animal is excessively voracious, and appears to be disposed to eat almost without cessation. When in a good humour, it often amuses the spectators in a different manner. Calmly seated in its apartment, it expands the jaws, and protrudes its long and slender tongue as above described. It displays on many occasions not only much gentleness of disposition, but likewise a considerable degree of sagacity. It appears conscious of the kind treatment it receives from its keeper. On seeing him, it often places itself in a variety of attitudes to court his attention and caresses, extending its nose and anterior feet, or suddenly turning round exposing the back, and waiting for several minutes in this attitude with the head placed on the ground. It delights in being patted and rubbed, and even allows strangers to do so; but it violently resents abuse and ill treatment, and having been irritated, refuses to be courted while the offending person remains in sight.'

[Ursus (Helarctos) euryspilus.]

The individual whose manners are here so well described fell a victim to its voracity. During the hot weather of the summer of 1828 it overgorged itself one morning, and died within ten minutes after the meal. Its skin is preserved in the Museum of the Zoological Society.

African Bears.

The existence of bears in Africa has been more than doubted. Even Cuvier, who saw the weak points of the negative evidence on this subject, says, 'the existence of bears in Africa is not so indisputable.'

Pliny (viii. 36) observes, that it was recorded in the Annals that Domitius Ænobarbus, the curule Ædile, in the consulship of M. Piso and M. Messala, B.C. 62, exhibited a hundred Numidian bears, and as many Æthiopian hunters in the circus, and adds his wonder that the bears should have been called Numidian, as it was evident that no bears were produced in Africa. In the 57th chapter of the same book he makes the broad assertion, that in Africa there are neither boars, nor stags, nor goats, nor bears.

Ursinus Lipsius and Vossius have tried to make out that these Numidian bears were lions, and adduce, in proof, medals of Ænobarbus with a man fighting a lion. But, as Cuvier well observes, how could the Romans, who, according to this same Pliny, had seen such multitudes of lions, have confounded the two animals? He further observes, that Aldrovandus and Zimmerman support the annalist, maintaining that a bear exists in Africa, but that it is rare, and that Solinus even asserts that the bear is finer there, being covered with longer hair, and of a very furious disposition.

Shaw speaks of bears of Barbary, but without particularizing them.

Desfontaines who remained so long at Algiers, and visited Atlas, never saw a bear, and only heard a vague report that there might be some in the forests, 'des environs de la Calle.'

'Prosper Alpinus,' says Cuvier, 'attributes bears to Egypt, but which were assuredly no bears at all, for he states that they are of the size of a sheep, and of a white colour. Never did one of the naturalists of our expedition see there any true bears.' [But see Syrian Bear.]

Poncet, indeed, says that one of his mules was wounded in Nubia by a bear. But Bruce thinks that he confounded the Arabian word *dubbah*, which signifies a hyæna, with *dubb* (whence probably the name of the star in the constellation), which signifies a bear. He goes farther, and says positively that there is no bear in any part of Africa.

All these authorities are enumerated by Cuvier, who alludes also to Dapper as placing bears in Congo, but with no reliance on him.

The inclination of Cuvier's mind, then, seems to have been against the existence of bears in Africa: and yet the record of the annalist quoted by Pliny, and the numerous passages concerning Libyan bears in Herodotus, Virgil, Juvenal, Martial and others, make a strong case for that existence.

It was reserved for Ehrenberg to solve these doubts in great measure. In the work above quoted he thus writes 'Moreover, we ourselves have seen in the mountains of Abyssinia, and therefore in Africa itself, an animal most like to a bear (nay, why had I not said—a bear?) and hunted it repeatedly, but in vain. It is called by the natives *Karrai*.' He then goes on to state, that he can give to those who are interested in the geographical distribution of the bear, true tidings of a blackish plantigrade wild beast most like unto a bear, in the mountains of Abyssinia, though neither Bruce nor Salt makes mention of it; and that, according to the description of the inhabitants, the mountains of Arabia Felix are inhabited by a similar or the same blackish bear, said to be remarkable for its lengthened muzzle. He adds, 'Forskal, moreover, has brought tidings of an indigenous Arabian bear.'

Marine Bear.

Subgenus Thalarctos.

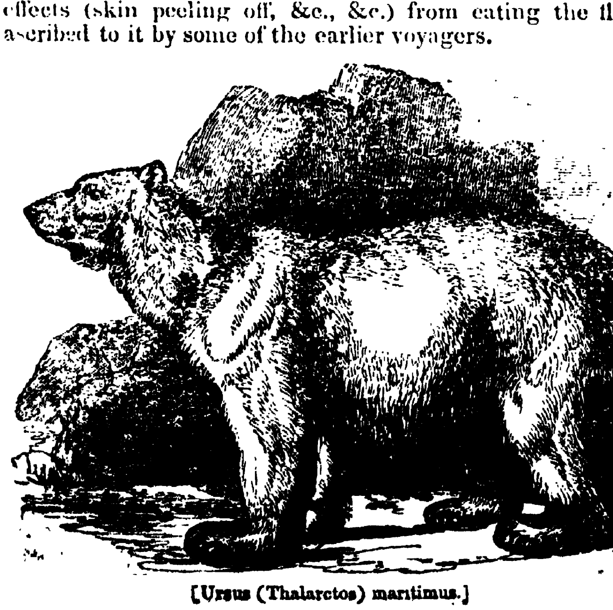
Polar Bear.—Martens was one of the first who distinguished this species from actual observation. The brown bear, as has been stated, appears to have been the only species known to Linnæus. It is not, indeed, till his tenth edition that he shows any suspicion that the Polar bear was distinct; and, in his last, he only ventures to say, in a notice appended to the description of Ursus Arctos, 'Ursus *maritimus* albus major arcticus. Martens. *Spitzb.* 73. t. o. f. c. forte distincta species est, nobis non visa, capite longiore, collo angustiore.'

The habits, and many parts of its organization adapted to those habits, of the *Polar* or *Sea Bear*, *l'Ours Polaire* of the French, *Wawpusk* of the Cree Indians, *Nannook* of the Esquimaux, *Nennook* of the Greenlanders, *Ursus maritimus* of Erxleben, *Ursus marinus* of Pallas, *Ursus albus* of Brisson, *Thalarctos maritimus* of Gray, according to the testimony of all zoologists, have confirmed the accuracy of Martens.

An inhabitant of the dreary regions which surround the North Pole with eternal frost, and of those coasts which are rarely free from ice, the Polar bear is almost entirely carnivorous, in a state of nature. Animals of the land and of the sea, birds and their eggs, the dead and the living, are alike devoured. An admirable swimmer and diver, and of great strength, he chases the seal with success, and is said to attack the *Walrus* itself. Cartwright relates an anecdote in proof of his agility in the water. He saw a Polar bear dive after a salmon, and the bear dived with success, for he killed his fish. Captain Lyon gives the following account of its hunting the seal: 'The bear on seeing his intended prey, gets quietly into the water, and swims until to leeward of him, from whence, by frequent short dives he silently makes his approaches, and so arranges his distance, that, at the last dive, he comes to the spot where the seal is lying. If the poor animal attempts to escape by rolling into the water, he falls into the bear's clutches; if, on the contrary, he lies still, his destroyer makes a powerful spring, kills him on the ice, and devours him at leisure.' The same author informs us that this bear not only swims with rapidity, but is capable of making long springs in the water. Captain Sabine states that he saw one about midway between the north and south shores of Barrow's Straits, which are forty miles apart, though there was no ice in sight to which he could resort for rest.

The floating carcasses of whales and other marine animals form a considerable part of its food, and the smell of the burning *kreng* often brings it to the whale ships. Dr. Richardson says, that it does not disdain, in the absence of other food, to seek the shore in quest of berries and roots. The Polar bear moves faster on firm ground than might be supposed from his appearance. Captain Lyon describes its pace when at full speed, as 'a kind of shuffle, as quick as the sharp gallop of a horse.'

This species is of a more lengthened form than that of the others, the head is very much elongated and flattened, the ears and mouth comparatively small, the neck very long and thick, and the sole of the foot very large. The fur is silvery white tinged with yellow, close, short and even on the head, neck, and upper part of the back; long, fine, and inclined to be woolly on the hinder parts, legs, and belly. The sole of the foot exhibits a beautiful instance of adaptation of means to an end, for it is almost entirely covered with long hair, affording the animal a firm footing on the ice. The claws are black, not much curved, thick and short. Captain Lyon's crew found none of the terrible effects (skin peeling off, &c., &c.) from eating the flesh, ascribed to it by some of the earlier voyagers.



[Ursus (Thalarctos) maritimus.]

The accounts given of the size, strength, and ferocity of this animal by the early navigators are appalling; but the accuracy of modern investigation has dissipated a good deal of the awe with which it was regarded, and has gone far to prove, that the excited imagination of some of the narrators has led them beyond the truth. That the polar bear when pressed will attack man there is no doubt, and that such an attack must be most formidable, every one who has seen the fine specimen, killed in 70° 40′ N. lat. and 68° 00′ W. long., brought home by Captain (now Sir John) Ross, from his first voyage (1818), and exhibited on the staircase of the British Museum, will allow. But when one informs us that the skin of a Polar bear slain by him and his comrades was twenty-three feet long; and another, that he and his party were frequently attacked by them, that they seized on the seamen, carried them off with the greatest ease, and devoured them at their leisure within sight of the survivors; we must be permitted to pause before we give entire credence to the stories.

The gallant adventurers who conducted the modern northern expeditions penetrated far beyond the points formerly reached, and had opportunities of observing numbers of Polar bears. The greatest length from nose to tail, recorded by Captain Phipps, is seven feet one inch, the weight of the beast being six hundred and ten pounds. Captain Ross records the measurement of seven feet ten inches, and the weight of eleven hundred and sixty pounds; and Captain Lyon states, that one which was unusually large, measured eight feet seven inches and a half, and weighed sixteen hundred pounds. The greater number of full grown individuals are spoken of as far inferior to these in dimensions and weight.

The testimony of zoologists is to the same effect. The adult female mentioned by Pallas was only six feet nine inches from nose to tail; and that in the French menagerie, alluded to by Cuvier, measured about six feet English on its arrival, and gained nothing in size at the end of seven years. The individual which has been kept for a considerable time in the garden of the Zoological Society is familiar to many of our readers, and furnishes another instance of the average proportions of these animals.

Pennant states that Polar bears are frequent on all the Asiatic coasts of the Frozen Ocean, from the mouth of the Obi eastward, and that they abound in Nova Zembla, Cherry Island, Spitzbergen, Greenland, Labrador, and the coasts of Baffin's and Hudson's Bays, but that they are unknown on the shores of the White Sea. Captain (now Sir Edward) Parry, saw them within Barrow's Straits as far as Melville Island; and, during his daring boat-voyage, beyond the 82° north latitude. Dr. Richardson says, that the limit of their incursions southward on the shores of Hudson's Bay and of Labrador, may be stated to be about the 55th parallel. Captain (now Sir John) Franklin learnt from the Esquimaux to the westward of Mackenzie River, that they occasionally, though rarely, visited that coast. Captain Beechey did not meet with any in his voyage to Icy Cape.

As the Polar bear resides principally on the fields of ice, he is frequently drifted far from the land. 'In this way,' says Dr. Richardson, 'they are often carried from the coast of Greenland to Iceland, where they commit such ravages on the flocks, that the inhabitants rise in a body to destroy them.' The same author gives the following observations, confirmatory of Hearne, from Mr. Andrew Graham's MSS. 'In winter,' says Graham, 'the white bear sleeps like other species of the genus, but takes up its residence in a different situation, generally under the declivities of rocks, or at the foot of a bank where the snow drifts over it to a great depth; a small hole for the admission of fresh air is constantly observed in the dome of its den. This, however, has regard solely to the she-bear, which retires to her winter quarters in November, where she lives without food, brings forth two young about Christmas, and leaves the den in the month of March, when the cubs are as large as a shepherd's dog. If perchance her offspring are tired, they ascend the back of the dam, where they ride secure either in water or ashore. Though they sometimes go nearly thirty miles from the sea in winter, they always come down to the shores in the spring with their cubs, where they subsist on seals and sea-weed. The he bear wanders about the marshes and adjacent parts until November, and then goes out to the sea upon the ice, and preys upon seals. They are very fat, and though very inoffensive if not meddled with, they are very fierce when provoked.'

The Esquimaux account of the hybernation of this species is thus related by Captain Lyon: 'From Ooyarrakhioo, a most intelligent man, I obtained an account of the bear, which is too interesting to be passed over.

'At the commencement of winter, the pregnant she-bears are very fat, and always solitary. When a heavy fall of snow sets in, the animal seeks some hollow place in which she can lie down, and then remains quiet while the snow covers her. Sometimes she will wait until a quantity of snow has fallen, and then digs herself a cave: at all events, it seems necessary that she should be covered by and lie amongst snow. She now goes to sleep, and does not wake until the spring sun is pretty high, when she brings forth her two cubs. The cave, by this time, has become much larger, by the effect of the animal's warmth and breath, so that the cubs have room enough to move, and they acquire considerable strength by continually sucking. The dam at length becomes so thin and weak, that it is with great difficulty she extricates herself, when the sun is powerful enough to throw a strong glare through the snow which roofs the den. The Esquimaux affirm, that during this long confinement the bear has no evacuations, and is herself the means of preventing them by stopping all the natural passages with moss, grass, or earth. (See *note* on the bear's *tappen.*) The natives find and kill the bears during their confinement by means of dogs, which scent them through the snow, and begin scratching and howling very eagerly. As it would be unsafe to make a large opening, a long trench is cut, of sufficient width to enable a man to look down, and see where the bear's head lies, and he then selects a mortal part into which he thrusts his spear. The old one being killed, the hole is broken open, and the young cubs may be taken out by hand, as, having tasted no blood, and never having been at liberty, they are then very harmless and quiet. Females which are not pregnant roam throughout the whole winter in the same manner as the males. The coupling time is in May.'

That part of these accounts which relates to the non-hybernation of some of these bears is corroborated by Captain Parry, who saw them roaming in the course of the two winters which he passed on the coast of Melville Peninsula.

That the Polar bear will subsist on vegetable diet was proved in the case of two which lived and throve for years in the French menagerie without being allowed to touch animal food. The individual kept in the Tower in the reign of Henry III. seems to have been indulged in diet and recreation more congenial to its habits, for there are two of the king's writs extant in choice Latin, directing the sheriffs of London to furnish four-pence a day for 'our white bear in our Tower of London, and his keeper,' and to provide a muzzle and iron-chain to hold him when out of the water, and a long and strong rope to hold him when he is fishing in the Thames.[*]

FOSSIL BEARS.

The fossil remains of these animals, when first found, ministered, as might have been expected from the spirit of the age, to the speculations of the lovers of the marvellous, and figured in the medical prescriptions of the time. The caverns of the neighbourhood of the Hartz were ransacked for them; and their supposed virtue as medicines, under the title of fossil Unicorns' Bones, procured a ready sale. In the *Protogæa* of Leibnitz, there is a figure of one of these fossil unicorns, the product of an imagination sufficiently lively.

But it was not till the year 1672, as Cuvier observes, that any notice, truly osteological, appeared on the subject, when Hayn gave some representations of their bones brought from a cave of the Carpathians, as those of dragons; and, by way of helping the evidence, informed his readers that there were still to be found in Transylvania dragons alive and flying.

These were the remains of the extinct bear of the caves (*Ursus spelæus*), an animal which must have approached a large horse in size, some of whose bones are given by Esper, in his *Description des Zoolithes et des Cavernes dans le Margraviat de Bareuth* (1774). Rosenmüller, in 1794 and 1795, gave the figure of a cranium from Gailenreuth; and John Hunter, in the *Philosophical Transactions* (1794), described the bones found there; and the Margrave of Anspach the caves. In 1804 Rosenmüller again returned to the subject.

The amount of information had now arrived to such a point, that Blumenbach distinguished the skulls found in the caverns as those of two distinct species, and gave them severally the names of *Ursus spelæus* and *Ursus arctoideus*, which Cuvier adopted, expressing, however, his opinion that they were only varieties of the same species.

Without entering largely into a detail of all the caverns where these remains were found, it may be as well shortly to notice some of the different districts where they occur. Those in the neighbourhood of the Hartz furnished the fossil unicorns' bones above alluded to. The principal of these are those of Scharzfeld and Baumann, the latter of which owes its name (Baumanns Höhle) to a wretched miner, who, in 1670, lured by the hope of finding ore, sought its recesses. There he wandered, alone and in darkness, three days and three nights. At length he found his way out, but in so exhausted a condition, that he only returned to the light of day to die.

The caverns of the Carpathians supplied the dragons' bones above mentioned.

In Franconia, near Muggendorf, the caves are numerous, and abound in bones. Here are the caverns of Gailenreuth, Rabenstein, Kühloch, &c.

The south-west border of the Thuringerwald has those of Glücksbrunn and Leibenstein, near Meinungen, and Westphalia those of Klüterhöhle and Sundwick.

In these caves, it appears, successive generations of bears, now swept from the face of the earth—absolutely extinct as species—were born, lived, and died, for a very long series of years. Rosenmüller, Hunter, Blumenbach, Cuvier, and Buckland, all agree in this point. The first of these found bones of a bear so young, that its death must have almost immediately followed its birth, and other remains of individuals which must have died in their youth. It would be out of place here to give an account of the remains of the other animals, many of them also extinct, found in the same places; but it is agreed on all sides, that the proportion of bears, in relation to the others, must have been great. Buckland (*Reliquiæ Diluvianæ*) thus expressively describes the scene in the cavern of Kühloch. 'It is literally true, that in this single cavern (the size and proportions of which are nearly equal to those of the interior of a large church) there are hundreds of cart-loads of black animal dust, entirely covering the whole floor, to a depth which, if we multiply this depth by the length and breadth of the cavern, will be found to exceed 5000 cubic feet. The whole of this mass has been again and again dug over in search of teeth and bones, which it still contains abundantly, though in broken fragments. The state of these is very different from that of the bones we find in any of the other caverns, being of a black, or, more properly speaking, dark umber colour throughout, and many of them readily crumbling under the finger into a soft dark powder, resembling mummy powder, and being of the same nature with the black earth in which they are imbedded. The quantity of animal matter accumulated on this floor is the most surprising and the only thing of the kind I ever witnessed; and many hundred, I may say thousand, individuals must have contributed their remains to make up this appalling mass of the dust of death. It seems, in great part, to be derived from comminuted and pulverised bone; for the fleshy parts of animal bodies produce, by their decomposition, so small a quantity of permanent earthy residuum, that we must seek for the origin of this mass principally in decayed bones. The cave is so dry, that the black earth lies in the state of loose powder, and rises in dust under the feet: it also retains so large a proportion of its original animal matter, that it is occasionally used by the peasants as an enriching manure for the adjacent meadows.' The following is added by the Professor in a note:—'I have stated, that the total quantity of animal matter that lies within this cavern cannot be computed at less than 5000 cubic feet; now allowing two cubic feet of dust and bones for each individual animal, we shall have in this single vault the remains of at least 2500 bears, a number which may have been supplied in the space of 1000 years, by a mortality at the rate of two and a half per annum.'

---

[*] These writs are such curiosities, that we subjoin them as given by Madox in his 'Exchequer.'

'Rex Vicecomitibus Londoniæ salutem. Præcipimus vobis, quod cuidam Urso nostro Albo quem mittimus usque Turrim nostram Londoniæ ibidem custodiendum, et custodi ipsius singulis diebus quamdiu fuerint ibidem, habere faciatis quatuor denarios ad sustentationem suam.'

'Rex Vicecomitibus Londoniæ salutem. Præcipimus vobis quod custodi Albi Ursi nostri, qui nuper missus fuit nobis de Norwagiâ et est in Turri nostrâ Londoniæ, habere faciatis unum musellum et unam cathenam ferream, ad tenendum Ursum illum extra aquam, et unam longam et fortem cordam ad tenendum eundem Ursum piscantem in aqua Thamisiæ; et custum, &c. computabitur, &c.'

The remains of *Ursus spelæus* are not confined, in Germany, to the caverns, for, in 1820, the author last quoted found in the collection of the monastery of Kremsminster, near Steyer, in Upper Austria, skulls and bones of the species in consolidated beds of gravel, forming a pudding stone, and dug for building near the monastery. Necker de Saussure found them also in the clefts of the rocks containing iron ore at Kropp, in Carniola.

The remains of bears have been detected in the cave at Kirkdale, in that at Paviland, in Kent's hole, Banwell cave, &c. in England; and generally in the ossiferous caverns of the south of France. The bones found in the largest proportion at the Grotte d'Echenoz, on the south of Vesoul, by M. Thirria, and examined by Cuvier, were those of *Ursus spelæus*. Bones of bears have been also found in the osseous breccia at Pisa, Nice, &c.

Great Cavern Bear.—*Ursus spelæus* (Blumenbach). The skull of this extinct species is considerably raised above the root of the nose, so that the forehead, which presents two convex elevations, is a good deal curved. Its size is about one-fifth larger than the largest of those of the *Brown Bear* (*Ursus arctos*), or of the Polar bear.

Ursus arctoideus (Blumenbach). The skull of this approaches nearest to the black bear of America, but it has less vertical elevation, and the muzzle is more elongated. It is equal in size to that of *Ursus spelæus*. The remains of these two fossil bears are found in the same localities; and Cuvier is of opinion, as has been observed, that they are only varieties of the same species.

A third species of cavern bear has been figured by Goldfuss, under the name of *Ursus priscus*, in his work upon the environs of Muggendorf, where it was found. Its skull is smaller, and differs less from the crania of living bears than those of the preceding species.

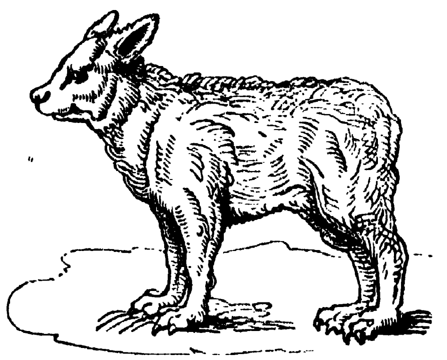
Those dentelated canine teeth which were attributed to bears, under the name of *Ursus Etruscus* and *Ursus cultridens* by Cuvier, Croizet and Jobert, and others, and to cats (*felis*) by Bravard, belong, according to Kaup, neither to a bear nor to a cat, and he adds his doubt whether they belonged to an animal which had the least affinity either to the one or the other.

He has formed a new genus for their reception, under the name of *Machairodus*, and adds that these canine teeth, and even the dentelations on their concave edge, have a perfect resemblance to the teeth of the *Megalosaurus*. [See MACHAIRODUS.]

We ought not, perhaps, to conclude this article without referring to those hybrids which were supposed to be the offspring engendered between a dog and a bear. Even at the present day there is an inclination to believe in the existence of such animals; nay, it is said that there is a creature now in England to which such a parentage has been attributed. We need hardly observe that it is extremely improbable, to use no stronger term, that two animals differing so widely in their dentition and general structure, in the periods of gestation and in their habits, should produce a mule; and yet whoever reads the following circumstantial account will, we think, come to the conclusion that the animal described and figured by the author was actually seen by him. In the 'Histoires Prodigieuses extraictes de plusieurs fameux autheurs, Grecs et Latins, sacrez et prophanes, divisées en cinq Tomes, Le Premier par P. Boaistuau, Tome Premier, Paris, 1582,' is the description and figure which, by the kindness of a friend, who possesses this curious book, we are enabled to lay before our readers.

'Histoire Prodigieuse d'un chien Monstrueux, engendré d'un Ours, et d'une dogue d'Angleterre, observé par l'autheur à Londres, avec plusieurs autres discours memorables, sur le naturel de cest animal.

CHAPITRE XXX.



'Par-ce (lecteur) que ce fut en Angleterre, en la fameuse cité de Lõdres, que i'observay premier le naturel et la figure de cest animal, lequel tu vois icy depeinct, i'ay bien voulu avant qu'en faire plus ample description (pour n'estre accusé d'ingratitude) celebrer la memoire de ceux desquelz i'ay receu quelque faveur.' The author then mentions 'la maiesté de la Royne Elizabeth,' of whom he states that he had a most gracious audience, speaks with gratitude of the favours which he received from Mõsieur l'Admiral d'Angleterre, Mõsieur Sicile (Cecil), premier secretaire de la Royne; and de Mõsieur le Cõte d'Arfort (Hertford); records the liberality of 'Monseigneur le Cõte de Candalle, de Monseigneur le Marquis de Trans, & de Monseigneur le Marquis de Nesle, qui estoient pour lors en ostage en Angleterre;' and thus returns to his hybrid:—'Mais afin que nous reprenons les erres de nostre matiere, cest animal monstreueux, que tu vois figuré au cõmencement de ce chapitre, est engendré d'une Dogue d'Angleterre & d'un Ours: de sorte qu'il participe de l'une & de l'autre nature: ce qui ne semblera estrange a ceux qui ont observé à Londres, cõme les dogues & les ours sont logez en de petits cachots, les uns aupres des autres: & quand ilz sont en leur chaleurs, ceux qui sont deputez pour les gouverner, enferment une ourse & une Dogue ensemble, de sorte que pressez de lieurs fureurs naturelles, ilz convertissent leur cruauté en amour, & de telles coniunctions, naissent quelquefois des animaux sẽblables a cestuy, encore que soit bien raremẽt: entre lesquelz i'en ay observé deux, quon avoit donné à Monseigneur le Marquis de Trans: l'un duquel il fist present à Monsieur le conte d'Alphestan, ambassadeur de l'Empereur: l'autre qu'il a faict amener en Frãce, sur lequel i'ay fait retirer cestuy au naturel, sãs que le peintre y ait rien obmis*.'

The author then goes on to cite instances of hybrids among quadrupeds, and thus continues: 'Mais afin de retourner à la descriptiõ de nostre animal, duquel tu vois la figure si mõstrueuse, qui ressemble à un ours racoursy aussi avoit les gestes, le muglemẽt, & toutes ses autres façons de faire plus aprochantes de l'ours que du chiẽ, mais ie te puis asseurer que c'est l'une des plꝰ furieuses bestes que l'on puisse regarder: car il n'y a espece d'animal auquel il ne s'attache, soit Ours, Lyon, Taureau & autres semblables: & si est si ardent en ses combatz, que depuis qu'il a mis la dent sur quelque beste, il se feroit plustost demembrer que laisser prise, cõme i'ay veu par experience à Londres quand on le fist combatre contre l'ours.' M. Boaistuau then alludes to the story of the hybrid engendered between a tiger and a bitch presented to Alexander the Great in India, and refers to Ælian, Diodorus Siculus, Strabo, Plutarch, and others.

The author of this description, is the Pierre Boaistuau, ou Boistuau, dit Launay, the subject of the following eulogy by Lacroix du Maine:—'Boaistuau a été homme très docte et des plus eloquens orateurs de son siècle, et lequel avoit une façon de parler autant douce, coulante, et agréable qu'autre duquel j'aye lu les ecrits.' He is also said to have been one of the first writers who recommended mothers to suckle their children.

The probability is, that he was deceived by the English bear-wards and dog-fighters of Elizabeth's time, and that some dog, selected for its bear-like appearance in certain points, an appearance aided by cropping the ears and tail, and other skilful artifices, was palmed upon him and upon others as a hybrid engendered between a dog and a bear,

BEARBERRY. [See ARCTOSTA'PHYLOS.]

BEAR LAKE. The great sheet of water to which the name of the Great Bear Lake has been given is situated in the north-west part of North America, near the arctic circle. Its shape is very irregular, the entire lake being formed by five arms or bays which have a common centre. The greatest diameter of the lake is in a direction north-east from

---

* La mère qui le portat estoit chienne, & le Masle qui la couvrit estoit Ours.

Fort Franklin, which is placed on the south-western extremity of the lake, in 65° 12′ N. lat., and 123° 12′ W. long. The measurement from this point across the lake in the direction just mentioned to the north-eastern part of Dease's Bay, is about 150 geographical miles. The diameter taken in the direction south-east by east, from the western shore of Smith's Bay to the eastern shore of M'Tavish Bay, is rather more than 120 geographical miles. The depth of this great collection of fresh water has not been ascertained, but it is known to be very great; no bottom was found with 270 feet of line near to the shore in M'Tavish Bay. The water, which appears of a light-blue colour, is so transparent, that a piece of white rag let down into it was visible at the depth of ninety feet.

The exact height of the surface of Bear Lake above the arctic sea has not been ascertained with exactness, but a careful computation made by Dr. Richardson leads him to believe that it is not quite 200 feet above the ocean; and in this case the bottom of the lake must be below the surface of the sea, as is known to be the case with other of the great lakes in this quarter of America, and with lakes in other parts of the globe also. The bottom of the three great American lakes, Huron, Michigan, and Superior, is said to be 300 feet below the level of the Atlantic; and the lowest part of Loch Ness in Scotland is more than 700 feet below the level of the Murray Firth.

At the bottom of Dease's Bay, which forms the north-eastern arm of the lake, it receives the water of Dease River, which is the principal feeding stream. At the bottom of Keith Bay is the Bear Lake River, the outlet stream, which flows in a south-west direction for seventy miles to its junction with the Mackenzie River, in 64° 59′ N. lat., which point is about 500 miles from the mouth of that river in the arctic ocean. The breadth of Bear Lake River, throughout its whole course, is never less than 450 feet, except at one remarkable place, called the Rapid, about midway between the lake and Mackenzie River. The depth of the stream varies from one to three fathoms, and flows six miles per hour. It is joined in its course by several considerable branches of muddy water. The rapid just mentioned is caused by the river 'struggling through a chasm bounded by two perpendicular walls of limestone over an uneven bed of the same material.' The walls of the rapid are about three miles long and 120 feet high. The Bear Lake River flows into the Mackenzie at a right angle, and its entrance is distinguished by a very remarkable mountain, whose summit displays a variety of insulated peaks, crowded in an irregular manner. From the base of this mountain two streams of sulphureous water flow into the Mackenzie, and from the lower cliffs which front that river a dark bituminous liquor issues and discolours the rock.

Great Bear Lake contains an abundance of fish. Captain Franklin relates, that towards the end of summer and in autumn the produce of from fifteen to twenty nets kept in use at Fort Franklin was from three to eight hundred fish daily, of the kind called 'the herring-salmon of Bear Lake,' and occasionally some trout, tittameg, and carp.

(*Narrative of a Second Expedition to the Shores of the Polar Sea*, 1825-1827, by Captain Franklin: *Topographical and Geographical Notices of the North-west Territory*, read before the Geological Society of London, by Dr. Richardson.)

BEAR'S-FOOT. [See HELLEBORUS.]

BEAR'S WHORTLE-BERRY, the generic and specific characters of which have been given under the article ARCTOSTAPHYLOS UVA URSI, was used in medicine by the antients, fell into neglect, and was restored about the middle of the last century. It possesses manifest astringent and, under certain circumstances, diuretic properties. The leaves are the part of the plant which is used. These are destitute of smell, but have an astringent, bitter taste. Analysed by Meissner, 100 parts contained

Gallic acid	1·20
Tannin, combined with gallic acid	36·40
Resin	4·40
Chlorophylle	6·35
Extractive, with malates and other salts	3·31
Ditto, with citrate of lime	0·86
Gum and extractive	33·30
Lignin	9·60
Water	6·00
	101·42

The leaves are frequently intermixed with those of the *Vaccinium vitis Idæa*, or cow-berry, from which they may be distinguished by not being spotted nor having the margin revolute. The watery infusion of the cow-berry leaves treated with muriate of iron merely becomes green. The watery infusion of the bear-berry so treated throws down a blackish-grey precipitate; also with the leaves of the *Vaccinium uliginosum*, or bog whortle-berry. To distinguish them from these last is more important than from the foregoing, as the leaves of the bog whortle-berry are poisonous. They do not possess the leathery texture, or the reticulated character of the leaves of the *Uva ursi*. The leaves of the *Buxus sempervirens*, or common box, are often fraudulently intermixed with it. They may be distinguished by the veins of the leaves running from the mid-rib to the margin, not being reticulated like the *Uva ursi*, having an unpleasant smell, and yielding on analysis the principle called *buxin*.

The power of the leaves is greatest over the mucous membranes and the kidneys. The leaves rubbed with cold water yield up all their tannin and gallic acid, and thus afford an infusion of great efficacy in hæmorrhages from the prostate gland. In cases of tendency to calculous diseases, especially of the phosphatic diathesis, it is of great use when persevered in; also in catarrh of the bladder. It has been thought useful in consumption, and indeed its tonic power may render it occasionally serviceable. It is administered in powder, in the form of an infusion or decoction; but the best form in which it can be longest used is that of extract, as recommended by Dr. Prout.

(See Prout *On Diseases of the Urinary Organs*, second edit., p. 185.)

BEARD, the hair which grows upon the chin and contiguous parts of the face in men, and sometimes, though rarely, in women. With men its growth is the distinctive sign of manhood.

The fashion of the beard has varied greatly in different times and different countries; and some of the learned in curious trifles have spared no pains to record the changes. Hotoman wrote a treatise expressly on the beard, entitled *Pogónias* (ΠΟΓΩΝΙΑΣ), first printed at Leyden in 1586, and which, on account of its rarity, was reprinted at length by Pitiscus in his *Lexicon*.

The earliest notice of attention to its growth is probably in Leviticus, where the lawgiver of the Jews (chap. xix. 27) says, 'thou shalt not mar the corners of thy beard.'

Generally speaking, the growth of the beard was cultivated among the nations of the East, although it must be observed that most of the Egyptian figures in the antient paintings are without beards. In Rosellini's work we have a series of portraits of Egyptian kings, nearly all without beards. (See Plate No. x. &c.) The antient Indian philosophers called Gymnosophists were solicitous to have long beards, which were considered symbolical of wisdom. The Assyrians and Persians also prided themselves on the length of their beards; and St. Chrysostom informs us (*Opera*, edit. Montfauc. tom. xi. p. 378) that the kings of Persia had their beards interwoven or matted with gold thread. The figures on the Babylonian cylinders are usually represented with beards; and those on the reliefs from Persepolis in the British Museum.

Aaron Hill, in his *Account of the Ottoman Empire*, folio, London, 1709, p. 45, draws this distinction between the Persians and the Turks: 'the Persians never shave the hair upon the upper lip, but cut and trim the beard upon their chin, according to the various forms their several fancies lead them to make choice of; whereas the Turks preserve with care a very long and spreading beard, esteeming the deficiency of that respected ornament a shameful mark of servile slavery.' The slaves in the seraglio are shaved as a mark of servitude.

The Chinese are said to affect long beards, but nature having denied their natural growth, they are sometimes supplied to the chin artificially. (See *Nouveaux Memoires sur l'Etat de la Chine*, par le R. P. Louis le Comte, tom. i. p. 209.)

Athenæus (xiii. p. 565, edit. Casaub. Lugd. 1657) observes from Chrysippus's treatise *De honesto et voluptate*, that the Greeks wore their beards till the time of Alexander. The first person who cut his beard at Athens, he adds, was ever after called *κόρσην*, *the shaven.* Plutarch, in his *Life of Theseus*, mentions incidentally that Alexander cut off the beards of the Macedonian soldiers, that they might not be used as handles by their enemies in battle. The Greeks continued to shave the beard till the time of Justinian, under whom long beards came again into fashion, and so continued till the taking of Constantinople by the Turks, in 1453. The Greek philosophers usually made the beard a distinguishing feature in their appearance, whence the proverb *ἐκ πάγωνος σοφοί*. Persius (*Sat.* iv. 1) terms Socrates *magister barbatus*, the 'bearded master;' and Prudentius (*Apoth.* ii. 200) bestows the same title of *barbatus* upon Plato.

Varro (*De Re Rustica*, lib. ii. c. 11, edit. Commelin. 8vo. 1595, p. 126) and Pliny, following his authority (*Hist. Nat.* edit. Harduin, lib. vii. c. 59), say that the Romans did not begin to shave till the year of the city 454, when Publius Ticinius Mena brought over barbers from Sicily. Scipio Africanus, Pliny adds, was the first Roman who shaved every day. The first day of shaving among the Romans was subsequently considered as the entrance upon the state of manhood, and was kept with festivities like a birth-day. This practice is alluded to by Juvenal (*Sat.* iii. 186). Alexander ab Alexandro (*Genial. Dier.* lib. v. § 18) says the Roman youth consecrated the first fruits of their beards to some god, a custom which is illustrated by passages in Martial, Statius, and other authors.

Augustus, and the Roman emperors his successors, till Hadrian, shaved, as appears by their coins. Hadrian was the first emperor who wore a beard. (See *Dion. Cassius*, edit. 1750, lib. lxviii. p. 1132.) Plutarch says he wore it to hide the scars in his face. The emperors who followed Hadrian continued to wear beards. (*Pancirollus de Rebus Memorabilibus*, edit. Francof. 1660, p. 163.) Rasche, however, in his *Lexicon Rei Num.*, notices the circumstance of Augustus suffering his beard to grow as a mark of grief for the death of Julius Cæsar; and says that certain coins struck about this time at Aria, A.U.C. 710, present the portrait of Augustus bearded. Dion. Cassius, lib. xlviii. (edit. Hamb. 1750, tom. i. p. 551) says that Augustus put off his beard about A.U.C. 717, with great ceremony and feasting. Antoninus Pius and Marcus Aurelius wore lengthened beards as philosophers; though Aurelius, when young, is represented without a beard. [See ANTONINUS.] Some of the Africans wore long beards, as may be seen upon the coins of Juba. (See Rasche, *Lexicon Rei Num.* tom. ii. p. 2, col. 1018.)

It would require no small space to enter minutely into the history and vicissitudes of the beard among the nations of modern Europe. The Lombards, or Longobardi, derived their name entirely from its length: and Eginhard, the secretary of Charlemagne, informs us that the Merovingian or first race of French kings were equally solicitous to nourish its growth; though at a later period among the French it should seem that the common people shaved the whole beard.

The antient Britons, according to Cæsar (*De Bello Gall.* lib. v. c. 11), wore no beards except upon the upper lip. He probably spoke of the Kentish Britons only, or of the tribes who immediately adjoined them. Strabo speaks of the beards of the inhabitants of the Cassiterides, the Scilly islands, as in his time like those of goats. (*Geogr.* edit. Falconer, Oxf. 1807, fol. lib. i. p. 239.)

Tacitus, speaking of the Catti, one of the antient German nations, says, from the age of manhood they encouraged the growth of the hair and beard, nor would lay them aside till they had slain an enemy. (*De Mor. Germanorum*, c. xxxi.)

The Anglo-Saxons, at their arrival in Britain, and for a considerable time after, wore beards. Dr. Henry (*Hist. Gr. Brit.* 4to. Edinb. 1774, vol. ii. p. 585), however, says that after the introduction of Christianity their clergy were obliged to shave their beards in obedience to the laws, and in imitation of the practice of all the Western churches. This distinction, he adds, between the clergy and the laity subsisted for some time; and a writer of the seventh century complains that the manners of the clergy were then so corrupted, that they could not be distinguished from the laity by their actions, but only by their want of beards. By degrees the English laity began to imitate the clergy so far as to shave all their beards except the upper lip.

The English spies who were sent by Harold to discover the strength and situation of the Duke of Normandy's forces returned with the account that almost all his army had the appearance of priests, as they had the whole face with both lips shaven. (See Malmesbury, lib. iii.) The Normans, indeed, not only shaved their beards themselves, but when they became possessed of authority, they obliged others to imitate their example. It is mentioned by some of our historians as one of the most wanton acts of tyranny in William the Conqueror, that he compelled the English (who had been accustomed to let the hair of their upper lips grow) to shave their whole beards; and this was so disagreeable to many of them, that they chose rather to abandon their country than to lose their whiskers. (See *Mat. Paris*, edit. 1640; *Vit. Abbat. S. Albani*, tom. i. p. 46.) Ordericus Vitalis, p. 815, relates a curious anecdote of Henry I. submitting to lose his beard at the remonstrance and by the hands of Serlo, archbishop of Sees.

In the higher classes of society the beard, in a greater or a less degree, was encouraged by the English for a series of centuries, as is evident from the sepulchral monuments of our kings and chief nobility, and from portraits where they remain. Edward III. is represented upon his tomb at Westminster with a beard which would have graced a philosopher. Stowe, in his *Annals*, edit. 1631, p. 571, in his account of the reign of Henry VIII. under 1535, says, 'The 8th of May the king commanded all about his court to poll their heads, and, to give them example, he caused his own head to be polled, and from thenceforth his beard to be knotted, and no more shaven.' The practice of wearing the beard continued to a late period; and the reader will readily call to recollection the portraits of Paulet Marquess of Winchester, Cardinal Pole, and Bishop Gardiner, all ornamented with flowing beards, in the reign of Mary I. The commentators on Shakspeare show that in the reign of Elizabeth beards of different cut were appropriated to different characters and professions. The soldier had one fashion, the judge another, the bishop different from both. Malone has quoted an old ballad, inserted in a miscellany entitled *Le Prince d'Amour*, 8vo. 1660, in which some of these forms are described and appropriated. (See Reed's *Shaksp.* 8vo. Lond. 1803, vol. xii. p. 399.) Taylor, the Water-Poet, in his *Whip of Pride* (Works, fol. 1630, p. 43), likewise describes the fashions of the beard as they still continued to subsist in his time:

> 'Now a few lines to paper I will put,
> Of men's beards' strange and variable cut;
> In which there's some do take as vain a pride
> As almost in all other things beside.
> Some are reap'd most substantial like a brush,
> Which makes a nat'ral wit known by the bush;
> (And in my time of some men I have heard,
> Whose wisdom have been only wealth and beard.)
> Many of these the proverb well doth fit,
> Which says, "Bush natural, more hair than wit."
> Some seem as they were starched stiff and fine,
> Like to the bristles of some angry swine;
> And some (to set their love's desire on edge)
> Are cut and pruned like to a quickset hedge.
> Some like a spade, some like a fork, some square,
> Some round, some mow'd like stubble, some stark bare;
> Some sharp, stiletto fashion, dagger like,
> That may with whisp'ring, a man's eyes outpike;
> Some with the hammer cut, or Roman T,
> Their beards extravagant reform'd must be;
> Some with the quadrate, some triangle fashion,
> Some circular, some oval in translation;
> Some perpendicular in longitude,
> Some like a thicket for their crassitude,
> That heights, depths, breadths, triforme, square, oval, round,
> And rules geometrical in beards are found.'
>
> * * * * * *
>
> The barbers thus (like tailors) still must be
> Acquainted with each cut's variety.'

The beard now gradually declined, and the court of Charles I. was the last in which even a small one was cherished. After the restoration of King Charles II., mustachios or whiskers continued, but the rest of the face was shaven; and in a short time the process of shaving the entire face became universal.

The beard went out of fashion in France in the reign of Louis XIII., and in Spain when Philip V. ascended the throne. In Russia it continued somewhat longer. Butler, in his *Hudibras* (part ii. canto i. Grey's edit. 8vo. Cambr. 1744, vol. ii. p. 299), alludes to the beard 'cut square by the Russian standard;' which Grey illustrates by the following extract from *The Northern Worthies, or the Lives of Peter the Great and his illustrious Consort Catherine*, 8vo. Lond. 1728, pp. 84, 85: —'Dr. Giles Fletcher, in his *Treatise of Russia*, observes, that the Russian nobility and quality accounting it a grace to be somewhat gross and burly, they therefore nourished and spread their beards to have them long and broad. This fashion continued among them till the time of the Czar Peter the Great, who compelled them to part with these ornaments, sometimes by laying a swingeing tax upon them, and at others by ordering those he found with beards to have them pulled up by the roots, or shaved with a blunt razor, which drew the skin after it, and by these means scarce a beard was left in the kingdom at his death: but such a veneration had this people for these ensigns of gravity, that many of them carefully preserved their beards in their cabinets, to be buried with them, imagining perhaps that they should make but an odd figure in the grave with their naked chins.'

The reader who desires further information on the history of beards may consult the lexicons of Hoffmann and Pitiscus for the classic times; and in Bulwer's *Anthropometamorphosis, or Artificial Changeling*, 4to. Lond. 1653, p. 193-216, Scene xii. is a whole chapter 'On the opinion and practice of diverse nations concerning the naturall ensigne of manhood appearing about the mouth;' quoted from innumerable authors, antient and modern.

Shaving the beard in derision was, throughout the East, considered to be the greatest mark of ignominy which could be inflicted upon an enemy; and to pluck a man's beard was the highest mark of insult. The Eastern origin of some of our old romances is, perhaps, in no circumstance more visible than in the descriptions which are so frequently given of giants cutting off the beards of princes who fell into their hands. Drayton alludes to this practice in his *Polyolbion*, Song iv.:

> 'And for a trophy brought the giant's coat away,
> Made of the beards of kings.'

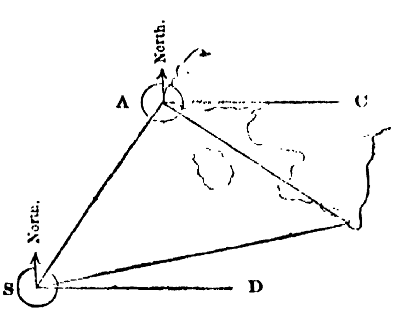
See also Warton's Observations on Spenser's *Fairy Queen*, edit. 1762, vol. i. p. 24.

The suffering of the beard to grow in the time of mourning is a custom which has been already incidentally alluded to. Levi, in his *Succinct Account of the Rites and Ceremonies of the Jews at this present time*, 8vo. Lond. says, that for the seven following relations, viz. a father or mother, brother or sister, son or daughter, husband or wife, they must not shave their beards, nor cut their nails neither of their hands or feet, nor bathe for the term of thirty days; which term is called in Hebrew *Shyloshim*, which means thirty days.

To beard, in modern English, means to set at defiance, to oppose face to face in a hostile manner. Shakspeare, in Henry IV. act iv. scene 4, makes Douglas say,

> 'No man so potent breathes upon the ground
> But *I will beard him*.'

BEARING, the direction of the line drawn from one point to another. It is a term usually applied to the points of the compass, as follows:—If the line B A be in a N.W. direction from B, A is said to *bear* N.W. of B, or the *bearing* of A is N.W. To take *bearings* is to ascertain the points of the compass on which objects lie. The following example will serve to familiarize the word, by connecting it with a simple problem of trigonometry:—



Cape B is 20 miles from Cape A, and bears S.E. of it. On board a ship S, Cape A is observed to bear N.N.E., and B bears E. by N.: required the position of the ship. Draw S D, A C, both east; then the angle D S B is one point of the compass, and the angle D S A six points: consequently A S B is five points of the compass, or 56° 15′; but C A S and A S D are together equal to two right angles, or sixteen points, of which A S D is six points, therefore C A S is ten points; but C A B is four points, therefore S A B is six points, or 67° 30′: therefore, in the triangle A B S, the side A B and two angles are known, whence the other sides, or the ship's distance from the two capes, can be found. The easiest method of solving this problem is by actual construction, the results of which are generally as accurate as the data.

In a manner somewhat similar, the distance of a ship from a headland might be found by observing its bearings at two different hours of the day; and knowing the course and the distance sailed in the intermediate time. If all the bearings are by compass, as in the second problem, the magnetic variation need not be allowed for, because all the bearings are equally wrong: but if one or more be true bearings, taken from a map, as in the first problem, then the bearings observed by the compass must be corrected. [See AZIMUTH; COMPASS, AZIMUTH.]

BE'ARN, one of the thirty-two provinces into which, previously to the Revolution, France was divided. It constitutes now, with Les Pays des Basques [see BASQUES], the department of Basses Pyrénées or the Lower Pyrenees. The name Béarn is derived from Beneharnum, an antient town in this country, first mentioned in the *Itinerary* of Antoninus: its exact position is undetermined.

The greatest part of Béarn lies amidst the Pyrenees, the summits of which form its southern boundary, and separate it from Spain. On other sides, with reference to the old territorial divisions of France, it is bounded by different parts of Gascogne, or Gascony, viz., by Bigorre on the east, by the Pays des Basques on the west, and by Armagnac and Chalosse *on the north*[*]. It is a very mountainous country, as may be supposed from its being occupied by the branches of the Pyrenees. The Pic du Midi (9732 feet) and Mount Billari (8475 feet) are upon or within its frontier. From the mountains numerous streams descend, which drain different valleys, and fall into the Adour, of whose basin Béarn forms a part. The name Gave, which is synonymous with river, is common to the streams of this country: they are distinguished from one another by some additional designation, such as the name of a town on the bank. The rapidity of these Gaves prevents their being used for navigation, but they abound with fish, especially trouts, salmons, pikes, and a kind of small salmon of exquisite flavour called toquans. The two principal streams are the Gave d'Oléron and the Gave de Pau. The Gave d'Oléron is formed by the Gave d'Aspe and the Gave d'Ossau, or d'Osseau, which latter rises in the Pic du Midi: these unite close to the town of Oléron, and flow in a north-west direction. The Gave de Pau rises in Mont Perdu in Spain, crosses the country of Bigorre, and flows north-west through Béarn, passing Pau and Orthès, till it unites with Gave d'Oléron. Their joint stream falls into the Adour soon after their union. The length of the Gave d'Oléron (measuring from the source of the Gave d'Ossau) may be estimated at 75 to 80 miles, and that of the Gave de Pau at 100 to 110: these measurements are, however, only approximations. Some of the smaller streams which flow into the Gaves d'Oléron and de Pau contain particles of gold.

The soil is dry and in many parts unsuited to tillage, though the banks of the Gave de Pau contain some plains fertile in grain. Little wheat or rye is grown; but millet and maize are the principal kinds of grain cultivated, and afford subsistence to the bulk of the people. The hills yield a good deal of wine, of which those of Jurançon and Gan near Pau hold the first rank. Flax is also an article of considerable importance in the agriculture of Béarn, and serves to supply the linen manufacture. Many of the mountain-tops are mere heaths covered with fern, which the inhabitants use for manure; but some afford good pasturage, and others are covered with woods which yield timber for the carpenter or the shipwright, and furnish the masts which are floated down by the tributaries of the Adour, and by the Adour itself, to Bayonne, from whence they are sent to different parts of France. The horses of Béarn are much esteemed; they are small, but strong and lively.

The mineral treasures of this district are considerable. Lead, iron, and especially copper are found in several places; and very fine marble is worked. Three brine springs, one near the town of Saillies, not far from the left bank of the Gave de Pau; a second towards St. Jean Pied de Port[†]; and a third near Révenac, a few miles south of Pau, supply the neighbourhood with salt. Talc, bitumen, and asphaltum are also found. There are mineral waters at Aigues-Caudes or les Eaux Chaudes in the Valley of Ossau. The temperature of these waters is 35° of Réaumur or 111° nearly of Fahrenheit; they are recommended for disorders of the head and stomach. The spring called the 'fountain of Arquebusade' is recommended for the cure of ulcers and wounds. There are other mineral waters at les Eaux Bonnes in the immediate neighbourhood of those just mentioned; and in one or two other places, as Escot in the Valley of Aspe, and Ogou or Ogeu, near Oléron.

---

[*] In the Map of France in Provinces, published by the Society for the Diffusion of Useful Knowledge, the district of Chalosse is not marked. It is included in the larger division of Les Landes.

[†] We insert this second spring, as belonging to Béarn, with considerable diffidence. Our authority is the *Encyclopédie Méthodique*; but unless the phrase, 'du côté de St. Jean Pied de Port,' is used with considerable latitude, the spring must be beyond the frontiers of Béarn.

The principal manufacture carried on in the district seems to be that of linen. In the *Voyage dans les Départemens du Midi de la France*, by Aubin Louis Millin (Paris, 1811), the number of weavers in and around Pau was estimated at nearly a thousand, who were chiefly if not wholly occupied in manufacturing the large square handkerchiefs called, from the district, mouchoirs de Béarn. The uniformity of price, pattern, and workmanship in these articles made them appear like the production of the same manufactory. The hams which go by the name of Bayonne hams, because exported from that town, are cured in Béarn, and are considered to owe their exquisite flavour to the salt of Saillies already noticed.

The capital of Béarn was Pau, on the Gave de Pau, the birth-place of Henry IV. of France and of many other eminent persons. Pau had in 1832 a population of 10,597 for the town, or 11,285 for the whole commune. Orthèz or Orthès, on the Gave de Pau, had at the same time 5195 inhabitants for the town, or 7121 for the whole commune. Saillies or Salies had 4730 for the town, or 8420 for the whole commune; and Oléron, at the junction of the Gaves d'Aspe and Ossau, had 5850 for the town, or 6458 for the whole commune, or, including the suburb of St. Marie and its commune, 9829. [See Pau, Ole'ron, Orthe's, and Salies.] Besides these more important places there are within the boundaries of the district Nay or Nai, on the Gave de Pau above Pau, which carries on a considerable trade in linen cloths and handkerchiefs, and gave birth to Abbadie, a celebrated Protestant theological writer. We have no authority for the population of Nay later than the *Dictionnaire Universel de la France* (Paris, 1804), which gives it as 2262. Navarreins, on the Gave d'Oléron, is a fortified place, and contained in 1826 a population of 1385. It owes its origin to Henry d'Albret, maternal grandfather of Henry IV., and is of a square form, regularly built, in the midst of a fertile plain.

The Béarnois are a lively race, of industrious habits, sober and frugal, but they are charged with selfishness and dissimulation. According to Piganiol, who wrote above a century ago, a number of the peasantry used to go to Spain, to till the ground or gather in the hay harvest, and to bring back their earnings to their own land. Their patois or dialect is agreeable, copious, and expressive, well suited to poetry or music.

Béarn was included in the country of the Aquitani, according to the threefold division of Gaul laid down by Julius Cæsar in the beginning of his *Commentaries*. It was subjugated by the Romans, and upon the downfall of their empire came into the hands of the Goths, from whom it was wrested by the Franks under Clovis. It was, however, subsequently lost by the Franks, but came again into their possession in the time of Charlemagne. In 820, Louis le Debonnaire, son of Charlemagne, conferred the vice-county of Béarn on the son of the Duke of Gascony, and it continued in the possession of his family till 1134. By failure of the male line of his posterity it passed into other families, as those of the Viscounts of Gavaret, the Moncades, who were among the chief nobles of Catalonia, and the Counts of Foix. These last acquired possession of the district of Bigorre, and intermarried with the royal family of Navarre. By this intermarriage the kingdom of Navarre, the principality of Béarn, and the counties of Foix and Bigorre came into the hands of one possessor. On the failure of heirs male they were conveyed by marriage into the family of D'Albret, and augmented by the inheritance of that family. Of this family sprang Henry IV., who inherited the country of Béarn and Lower Navarre, and, as it seems, of Foix, with the title of king of Navarre; but the country of Upper Navarre, south of the Pyrenees, had been wrested from his great-grandfather by the ambition of Ferdinand V., King of Arragon. On the accession of Henry to the throne of France, Béarn was united with France, and has continued to be so united ever since. It was one of the provinces which enjoyed the privilege of a local house of assembly of the nobility, clergy, and commons.

According to Expilly, the population of Béarn was ascertained in 1698 to be 198,000. Expilly estimated it at 210,000 in 1762. From the entire change of the territorial divisions of France, it is difficult to give the present population; but the three arrondissements of Pau, Oléron, and Orthès, which nearly coincide with Béarn, had in 1832 a population of 277,106.

(*Encyclopédie Méthod.*, *Géog. Physique;* Piganiol de la Force *Nouvelle Description de la France; Voyage dans les Départemens du Midi de la France*, par A. L. Millin, &c.)

BEATIFICATION, an act by which the pope permits a 'servus Dei,' *i. e.* an individual who died in good repute as a virtuous and holy man, to be worshipped, and his image to be placed on the altar within the limits of some diocese, province, or town, or within the houses of the religious order to which the deceased belonged, defining at the same time the peculiar mode of worship allowed, by prayers, masses, &c., until the time he may be duly canonized as a saint. The distinction between beatification and canonization is this: the first is a mere permission to honour and worship in some particular district, and the object of this veneration is styled Beatus; canonization is an injunction to venerate the object of it as a saint, 'Sanctus,' acknowledged by the whole church. Originally it was the bishop of the diocese who allowed the veneration or worship of deceased individuals whom he deemed worthy of it, and when the worship extended to other dioceses, and by degrees to the church in general, 'with the consent, tacit or expressed, of the supreme pontiff,' then the worship, which was before that of simple beatification, acquired the character of canonization. But when, in after times, the question both of beatification and canonization was referred to the Roman See, the pontiffs, in granting the first, always made the distinction: 'dummodo propter præmissa canonizatus, aut canonizata, non censeatur.' (Benedicti XIV., *Opera*, vol. i. *de Servorum Dei Beatificatione.*) In the same chapter Benedict XIV. determines the regulations as to the proceedings, evidence, &c., to be gone through previous to granting the writ of beatification. It may be granted to two classes of individuals, martyrs and confessors. After beatification has been obtained, a new suit and fresh evidence of sanctity are required in order to obtain the canonization of the same individual. In May, 1807, five Beati were canonized, or declared Saints, in St. Peter's church, by Pius VII. The ceremony is very expensive, and therefore is not performed very frequently. It is only since the pontificate of Alexander VII. that the ceremony of beatification has been performed in St. Peter's church, with great solemnity. Applications for the honour of beatification are generally made by the friends or relations of the deceased, or by the brethren of the religious order of which he was a member; evidence of his conduct and merits is collected, and laid before a congregation of cardinals and prelates; counsel is employed by the applicants, while another counsel opposes the petition and endeavours to find flaws in the evidence. This latter office is performed by a legal officer of the Roman See, who has been nicknamed *l'Avvocato del Diavolo*, 'the devil's advocate,' as he performs what is considered an ungracious part, by opposing the admission of a candidate into the category of the saints.

BEATON, CARDINAL DAVID, Archbishop of St. Andrew's, and Lord High Chancellor to Mary Queen of Scotland, was a younger son of John Beaton or Bethune of Balfour, in the shire of Fife, by a daughter of David Monypenny of Pitmilly in the same shire; and nephew to Bishop James Beaton, Lord Chancellor to King James V. He was born in 1494 (Keith's *Bishops*, p. 36), and after passing through his grammar education, was, on the 26th October, 1511, matriculated of the university of Glasgow (M'Crie's *Melville*, vol. i. App. Note M.), whence he was sent to France[*] to study the civil and canon laws. On the death of Secretary Panter in 1519, he was appointed resident for Scotland at the French court; and about the same time his uncle the chancellor bestowed on him (then designated only clericus S. Andreæ diocesis) the rectory of Cambuslang, in the diocese of Glasgow. In 1523 his uncle, now translated from that see to the primacy of St. Andrew's, resigned in his favour the rich monastery of Arbroath in commendam, and also prevailed on the pope to dispense with his taking the habit for two years: this time he spent in France, and then returned to Scotland, where we immediately find him in parliament as abbot of Arbroath; and in October, 1527, John Beaton of Balfour and others having been indicted for an assault upon the sheriff of Fife, and found bail for their appearance, the abbot became bound to relieve John Wardlaw of Torry of the cautionry. (Pitc. *Crim. Trials*.) On the fall of the Earl of Angus, and the surrender of George bishop of Dunkeld, he was appointed Lord Privy Seal, in 1528—the same year in which the great convent of Blackfriars at Edinburgh, in the immediate neighbourhood of which Beaton and his uncle had their magnificent abode, was burnt down to the ground by a sudden fire. In February, 1533, Beaton, now prothonotary apostolic, was sent ambassador to France, with Secretary Erskine, to treat of a league with that crown, and also of a matrimonial alliance with the Princess Magdalene; and when the King of Scots proceeded thither on the same object, Beaton was one of the lords of the regency appointed by commission, of date 29th August, 1536, to conduct the government in his absence. On Queen Magdalene's decease, he was joined in an embassy to the house of Guise, to treat of a match with Mary, widow of the Duke of Longueville; and we find that, agreeably to the common practice of that time, he, before going abroad, obtained the king's special protection for his friends and dependants in his absence. (*Reg. Privy Seal*, x. 163-4.) It is probable that, when in France on this occasion, he procured the papal bull of date 12th February, 1537, for the erection of St. Mary's College at St. Andrew's. In November, 1537, he was made a denizen of France, and on the 5th of next month consecrated Bishop of Mirepoix in Languedoc. On his return home he was made coadjutor in the see of St. Andrew's, and successor to his uncle, who being now much advanced in years, devolved on him the charge of church affairs. He seems afterwards to have gone abroad again, for on the 20th December, 1538, Pope Paul III. advanced him to the cardinalate, by the title of Sancti Stephani in Monte Cœlio, the same style which was borne by Cardinal John de Salerno, who presided at a council of the Scottish clergy in 1201; and on the 20th June, 1539, the King of France directed new letters of naturalization in his favour, with a further clause allowing his heirs to succeed to his estate in France, though born and living in Scotland. About this time also we find him 'legatus natus' of the Roman See. On the death of his uncle in the autumn of 1539, he was fully invested in the primacy of St. Andrew's, the privy seal being again returned to the Bishop of Dunkeld. These accumulated honours he no doubt mainly owed to the influence of his deceased uncle; but Beaton was already both an able and zealous son of the church. His authority, zeal, and ability now made him truly formidable: and that he might devote them all to the politics of the church, with consent of the king and pope, he devolved his diocesan duties on the dean of Restalrig, as his suffragan. On the 28th May, 1540, he convened a large assembly of ecclesiastics and others in the cloisters of St. Andrew's, and on their conviction of Sir John Borthwick for heresy in holding Protestant opinions, pronounced sentence of outlawry and forfeiture against him, with solemn burning of his effigy at the market-cross of the city. But not liking the odium which must ensue to the clergy if they continued to put their sentences in execution, a promise was made to the king of 30,000 ducats of gold yearly, and 100,000 ducats more out of the estates of condemned heretics, if he would appoint a judge in heresy. The avaricious James consented, and named Sir James Hamilton, natural brother of the Earl of Arran, to the office, in which, however well fitted for it by his intolerance and ferocity, he fortunately did not long remain, being attainted of treason and beheaded.

---

[*] Both Crawford and Keith say this was in his sixteenth year; but from the preceding date, furnished by Dr. M'Crie's work, this appears to be a mistake.

On the 20th December, 1542, the king died, leaving an infant daughter, eight days old, heir to the throne, but for whose safety or that of the kingdom during her minority he had made no provision. Beaton had in the interval gone abroad; for in the Lord Treasurer's accounts we find a large sum entered 'for expenses made upon the *Great Unicorn*, Jul. 11, 1541, at her passing to France with the cardinal:' but he returned before the death of James, and on the king's demise he produced a testament, which he affirmed was subscribed by his majesty, appointing him regent of the kingdom and guardian to the infant queen. The document was a base forgery; and as the nobility had experienced enough of Beaton's rule, they roused from his inactivity James, Earl of Arran, next heir to the queen, and appointed him to the regency. The power, however, which Beaton failed to obtain directly, he obtained by his address; and not only got the nobles to accede to his views of government, but also induced the timid regent publicly to abjure the doctrines of the Reformation.

In December, 1543, the great seal was taken from the Archbishop of Glasgow and bestowed on Beaton, whom also, on very strong letters from the regent, Pope Paul III., by bull of 30th January following, constituted his legate *à latere* in Scotland. Thus he was placed at the head both of church and state, including also the whole civil judicature of the kingdom, being *ex officio* principal of the Court of Session, the supreme judicatory in civil causes; and as he did not scruple to employ these extensive powers for furthering his own views, he appears to have been looked upon as a sort of wild beast whom it was not murder to destroy. The king of England, in particular, whose friendship was renounced at the instigation of the cardinal and the popish faction, for an alliance with France, anxiously desired his death; and in the instructions of the English privy council of date 10th April, 1544, the Earl of Hertford was commanded, in his inroad into Scotland, to sack and destroy Edinburgh and Leith, 'and this done, pass over to the Fife-land, and extend like extremities and destruction to the towns and villages there, not forgetting amongst all the rest so to spoil and turn upside down the cardinal's town of St. Andrew's, as the upper part may be the nether, and not one stone stand upon another, sparing no creature alive within the same, specially such as either in friendship or blood be allied unto the cardinal.' Henry soon found in Scotland spirits congenial with his own; for on the 17th of the same month we find the Earl of Hertford communicating to him a design by Wishart and others to seize or slay the cardinal, could they secure his majesty's protection and support.

Beaton was haughty to all; but to the reformers he was particularly oppressive. In the beginning of 1545-6 he held a visitation of his diocese, and had great numbers brought before him, under the act which had passed the parliament in 1542-3, forbidding the lieges to argue or dispute concerning the sense of the holy scriptures. Convictions were quickly obtained; and of those convicted, five men were hanged and one woman drowned; some were imprisoned, and others were banished. He next proceeded to Edinburgh, and there called a council for the affairs of the church; but they had scarce assembled when tidings were brought that George Wishart, an eminent reformer and worthy man, was at the house of Cockburn of Ormiston. The cardinal instantly left the meeting, and went personally to the sheriff of the county to have Wishart apprehended, which being done, Wishart was carried over by the cardinal to St. Andrew's, and shut up in the tower there. The following month the Lord Justice General of Scotland held a court at Perth at the instigation of the cardinal, and 'condemned to death and gart hang four honest men for eating of an goose in lent. Likeways they caused drown ane young woman because she wald not pray to our ladie and other sancts in the tyme of her birth.' (Pitscottie, 453.) Beaton afterwards returned to St. Andrew's, and called a convention of his clergy, at which Wishart was condemned for heresy, and adjudged to be burnt; a sentence which (so violently were the clergy bent on the accomplishment of their ends) was passed in the face of a command by the regent that the trial should proceed at Edinburgh, and was put in force by the cardinal and his clergy in defiance of the regent, and without the aid of the civil power. For this conduct the cardinal was loudly applauded by his creatures. The cardinal afterwards proceeded to the abbey of Arbroath, to the marriage of his eldest daughter by Mrs. Marion Ogilvy of the house of Airly, with whom he had long lived in scandalous concubinage, and there, with infamous effrontery, he gave her in marriage to the eldest son of the Earl of Crawford, and with her 4000 merks of dowry. The marriage articles subscribed by him are yet extant. (Keith's *Hist.* p. 42.) He then returned to St. Andrew's, where, on Saturday, 29th May, 1546, he was put to death in his own chamber by a party of reformers, headed by Norman Leslie, heir of the noble house of Rothes, who, we find, had on the 24th April, 1545, given the cardinal a bond of *manrent*[*], and who, on private grounds, had a personal quarrel with the cardinal. His death was fatal to the ecclesiastical oligarchy, which, under him, trampled alike on law, liberty, and reason.

Three works of the cardinal's are named: *De Legationibus*

---

[*] Bonds of manrent were long common in Scotland. They were in the nature of the obligations of homage and fealty by a tenant to his feudal lord.

suis; De Primatu Petri; and *Epistolæ ad diversos.* We have said that he was at the head of the civil judicature of the kingdom, being, in his capacity of Lord Chancellor, principal of the College of Justice or Court of Session. We now add, that in his time two remarkable alterations appear to have been made in the customs of that court, and both manifestly derived from the papal tribunals, with which the cardinal appears to have been very familiar. The first of these was the custom (continued to this day) of the judges of the Court of Session changing their name on their elevation to the bench, in imitation, no doubt, of the like custom on elevation in the papal hierarchy. The first judges of the court were indeed called *lords* of session, as the judges of the previous court were called *lords* of council; but the individual judges of the court of daily council were never designated as the present judges of the Court of Session are, nor were the early judges of the latter court so designated. The first we have yet noticed bearing the present style is James Balfour, parson of Flisk, whom we find called 'My lord of Flisk.' (Pitcairn's *Criminal Trials*, January, 1566.) The other change we have to notice was the appointment of lords ordinary to sit in the *outer house* to hear and determine causes; in conformity, perhaps, to a like practice in the tribunals of Rome. It is almost certain that there was no such distinction as an Outer and Inner House at the first institution of the Court of Session: no trace of any such is perceived in the documents of that time, but, on the contrary, every thing tends to demonstrate that all the judges sat only in the *council house;* but soon after the cardinal's time an outer house appears.

BEATS, in music (a term always used in the plural), are the pulsations, throbbings, or beatings, resulting from the joint vibrations of two sounds of the same strength and nearly the same pitch; that is, of two sounds differing but little, if at all, in intensity, and which are almost, but not exactly, in unison. When two organ-pipes, or two strings sounded together, are nearly, but not accurately of the same pitch, *i.e.* are not in perfect tune, they produce throbbings that may be compared to the rapid beating of the pulse; and to these, Sauveur, the discoverer of the phenomenon, applied the term *battemens*, or beats, which has since been adopted by all writers on the subject.

Dr. Smith has, in his *Harmonics*, entered fully into the subject of *beats*, and founded hereon his well-known system of temperament. [See TEMPERAMENT.] In his ninth proposition he says, that 'if a consonance of two sounds be uniform without any beats or undulations, the times of the single vibrations of its sounds have a perfect ratio; but if it beats or undulates, the ratio of the vibration differs a little from a perfect ratio, more or less, according as the beats are quicker or slower.' His experiment in demonstration of this is practical, easy, and satisfactory. 'Change,' says Dr. Smith, 'the first string of a violoncello for another about as thick as the second. Then screw up the first string, and while it approaches gradually to a unison with the second, the two sounds will be heard to beat very quick at first, then slower and slower, till at last they make a uniform consonance without any beats or undulations. At this juncture, either of the strings struck alone, by the bow or finger, will excite large and regular vibrations in the other, plainly visible; which show that the times of their single vibrations are equal.' For the vibrating motion of a musical string puts other strings in motion, whose tension and quantity of matter dispose their vibrations to keep time with the pulses of air propagated from the string that is struck; a phenomenon explained by Galileo, who observes, that a heavy pendulum may be put in motion by the least breath of the mouth, provided the puffs be often repeated, and keep time exactly with the vibrations of the pendulum. 'Alter the tension,' continues Dr. Smith, in pursuing his experiment, 'of either string a very little, and the sounds of the two will beat again. But now the motion of one string struck alone makes the other only start, exciting no regular vibrations in it; a plain proof that the vibrations of the strings are not isochronous.' And while the sounds of both are drawn out with an even bow, not only an audible but a visible beating and irregularity is observable in the vibrations, though in the former case the vibrations were free and uniform. Now measure the length of either string between the nut and bridge, and when the strings are perfect unisons, mark, at the distance of one-third of that length from the nut, one string with a speck of ink. Then place the edge of the nail on the speck, or very near it, and press the string, when, on sounding the remaining two-thirds with the other string open, a uniform consonance of fifths will be heard, the single vibrations of which have the perfect ratio of 3 to 2. But on moving the nail a little downwards or upwards, that ratio will be increased or diminished; and in both cases the imperfect fifths will beat quicker or slower, accordingly as that perfect ratio is more or less altered.

Dr. Young remarks of *Beats*, that they furnish a very accurate mode of determining the proportional frequency of vibrations, when the absolute frequency of one of them is known; or the absolute frequency of both, when their proportion is known; for the beats are usually slow enough to be reckoned, although the vibrations themselves can never be distinguished. Thus, if one sound consists of 100 vibrations in a second, and produces with another acuter sound a single beat in every second, it is obvious that the second sound must consist of 101 vibrations in a second. (Young's *Philosophy*, i. 390.)

In tuning unisons, as in the case of two or more pipes, or strings, the operator is guided by beats. Till the unison is perfect, more or less of beating will be heard, as the sounds more or less approach each other. 'When the unison is complete,' observes Sir John Herschel, 'no beats are heard: when very defective, the beats have the effect of a rattle of a very unpleasant kind. The complete absence of beats affords the best means of attaining by trial a perfect harmony. Beats will also be heard when other concords, as fifths, are imperfectly adjusted. (Herschel on *Sound.*)

Dr. Smith, in the learned work of which we have here availed ourselves, gives some useful practical rules for tuning by means of beats, the substance of which will be found under the head of TUNING.

BEATTIE, JAMES, a poet and metaphysician of the 18th century, was born in Scotland, at Lawrencekirk, a village in the county of Kincardine, Oct. 25, 1735. His parents kept a small farm, and were esteemed, not only for their honesty, but for a degree of cultivation and intellect not common in their station. James Beattie received his first education at the village school. He entered the Marischal College, Aberdeen, in 1749; obtained a bursary, or scholarship, and other honours; and after completing his course of study was appointed, August 1, 1753, schoolmaster to the parish of Fordoun, at the foot of the Grampians, six miles from Lawrencekirk. In this solitary abode his poetic temperament was fostered by the grand scenery which surrounded him; and his works evince the zeal and taste with which he studied the ever-changing beauties of nature. He attracted the favourable notice of a neighbouring proprietor, the celebrated Lord Monboddo, with whom he ever after maintained a friendly intercourse. In June, 1758, he was elected usher to the grammar-school of Aberdeen; and in 1760, it seems rather by private interest than in consequence of any distinction which he had then attained, he was appointed professor of moral philosophy and logic in the Marischal College.

His first and chief business was to prepare a course of lectures, the substance of which, as they were remodelled by long study and frequent revision, was given to the world in his *Elements of Moral Science.* His first poetical attempts were published in London in 1760, and received with favour; but most of the pieces contained in this collection (which is now very rare) were omitted by the author's maturer judgment in later editions of his works. Some will be found in the Appendix to Sir William Forbes's *Life of Beattie.* The same tacit censure was passed by the author upon his *Judgment of Paris*, published in 1765. In 1762 he wrote his *Essay on Poetry*, which, however, he retained a long time in manuscript, until it was published, with others of his prose works, in 1776. The *Minstrel* was commenced in 1766; but during that year all his pursuits, except those which were compulsory, were interrupted by a bad state of health. June 28, 1767, he married Miss Dun, daughter of the rector of the grammar-school at Aberdeen.

During this year he conceived the notion of composing his *Essay on Truth*, written avowedly to confute the moral and metaphysical doctrines advanced by Hume, which at that time were supposed to be making numerous converts; and which, perhaps, derived as much of their popularity from the fashionable acceptation and high repute of their author, as from the arguments on which they rested. Beattie's motives for engaging in this task will be found fully detailed in a long letter to Dr. Blacklock (Forbes's *Life*, vol. i.

p. 129), and they do credit to his sincerity and courage; for it was no slight thing for a young and almost unknown man to attack an author formidable at once from ability, party connexion, and high standing in society; and this he did not in the language of deference, but with the uncompromising hostility of one who believes his antagonist to be not only a mistaken but a mischievous person. If Beattie could not quite attain his own wish of being 'animated without losing his temper,' something must be conceded to his deep feeling of the importance of the subjects in dispute. The *Essay*, however, was received with much anger by Mr. Hume and his friends, as a violent and personal attack; and that Beattie's zeal might require some tempering we may conclude from knowing that an intended preface to the second edition (published early in 1771) was cancelled by the advice of some of his best friends. His work appeared in May, 1770, under the title *Essay on the Nature and Immutability of Truth, in opposition to Sophistry and Scepticism.* The plan of it is thus given by his biographer. 'Dr. Beattie first endeavours to trace the several kinds of evidence up to their first principles, with a view to ascertain the standard of truth, and explain its immutability. He shows, in the second place, that his sentiments on this head, how inconsistent soever with the genius of scepticism, and with the principles and practice of sceptical writers, are yet perfectly consistent with the genius of true philosophy, and with the practice and principles of those whom all acknowledge to have been most successful in the investigation of truth; concluding with some inferences or rules, by which the most important fallacies of the sceptical philosophers may be detected by every person of common sense, even though he should not possess acuteness of metaphysical knowledge sufficient to qualify him for a logical confutation of them. In the third place, he answers some objections, and makes some remarks, by way of estimate of scepticism, and sceptical writers.'—Forbes, p. 167.

The *Essay on Truth* was only the first part of an intended lecture on the evidences of morality and religion. Habitual ill health, and an avowed dislike to severe study, prevented Dr. Beattie from completing his design.

The first canto of the *Minstrel* was published anonymously in 1771. It was most favourably received by the public, and honoured by the warm praise of Gray, the more valuable because the praise was accompanied by a letter of minute criticism. This is preserved in Forbes's *Life* (vol. i. p. 197). In the same year he visited London, for the first time since he had been known as an author; and received distinguished and flattering notice from Dr. Johnson, Lord Lyttleton, and the best literary society of the metropolis.

It was the wish of his friends to obtain some permanent provision for one who had no patrimony, whose literary profits were small, and whose only other resource was the scanty income of his professorship; and it was thought that his exertions in the cause of revealed religion entitled him to this mark of public favour. In 1773 he again visited London to urge his claim, and owing to the powerful interest which he was then able to command, he obtained a pension of 200*l.* The King (George III.) received him with distinguished favour: and the University of Oxford conferred on him the honorary degree of D.C.L. During this visit, Sir Joshua Reynolds painted and presented to him the well-known portrait, which contains the allegorical triumph of Truth over Sophistry, Scepticism, and Infidelity. In the same autumn there occurred a vacancy in the University of Edinburgh, which it was thought would open the chair of moral philosophy to Dr. Beattie; but this preferment, though strongly urged upon him, he declined for the sake of peace and quiet. At this time he was engaged in finishing the second book of the *Minstrel*, which was published in the following spring.

Several of Beattie's friends, and some eminent persons who do not appear to have been influenced by personal regard, were desirous to induce him to take orders in the English church, and more than one living was pressed upon his acceptance. In 1774 he received the offer of a living worth near 500*l.* per annum, from Dr. Thomas, Bishop of Winchester. It appears that Beattie took these proposals into serious consideration, and that he entertained no objections on the score of discipline or doctrine; but he refused them principally on the ground that his acceptance might give a handle to the opponents of revealed religion for asserting that the *Essay on Truth* was written for the sake of preferment. 'Partly,' he says, 'because it might be construed into a want of principle, if, at the age of thirty-eight, I were to quit, with no other *apparent* motive than that of bettering my circumstances, that church of which I have hitherto been a member.' It is not superfluous to praise this delicacy and independence of feeling, because many persons whom it would be harsh to condemn as having sold their opinions for preferment, have at least shown a culpable neglect of their own characters and the interest of truth, by accepting preferment under circumstances which were almost sure to fix the imputation of venality upon them. (See Beattie's *Letter to Dr. Porteus*, Forbes, vol. i. p. 359.)

The *Essay on Truth* was re-published in 1776, with three other essays:—*On Poetry and Music, as they affect the Mind; On Laughter and Ludicrous Composition; On the Utility of Classical Learning.* These were followed at intervals by other essays and dissertations, chiefly taken from his academical lectures:—*Dissertations Moral and Critical, on Memory and Imagination, on Dreaming, on the Theory of Language, on Fable and Romance, on the Attachments of Kindred, and Illustrations of Sublimity*, 1783; *Evidences of the Christian Religion*, 1786; *Elements of Moral Science*, vol. i. containing *Psychology and Natural Theology*, 1790; vol. ii. containing *Ethics, Economics, Politics, Logic*, and a *Dissertation on the Slave Trade*, 1793. But he appears to have engaged in no new investigations or studies; and his letters explain the cause of this to have been ill health, and consequent disinclination to labour, aggravated by mental depression, and a considerable share of domestic disquiet, produced by an hereditary disposition to insanity in his wife. His life passed until 1790 without marked events, in the discharge of his academical duties; varied in his long summer vacations by not unfrequent visits to London, and to many persons eminent by their talents or rank, who sought his society for the sake of his powers as a companion, as much as for his reputation. In 1790 he suffered an irreparable loss in the death of his eldest son at the age of twenty-two, a young man of great promise; and his declining health received another shock in 1796 in the unexpected death of his only surviving son after a week's illness, in the eighteenth year of his age. He said, in looking on the corpse, 'I have now done with the world,' and he never again applied to study of any sort. The closing years of his life exhibit a melancholy scene of gloom and distress, bodily and mental. He was struck by palsy in April, 1799, and after one or two subsequent attacks, expired August 18th, 1803.

In the relations of private life, and in his public duties as a teacher, Dr. Beattie was most amiable; and he commanded, in an unusual degree, the esteem and affection of his pupils, as well as of a large circle of friends. It is to be recorded to his honour, that long before the abolition of the slave trade was brought before parliament, Beattie was active in protesting against that iniquitous traffic; and he introduced the subject into his academical course, with the express hope that such of his pupils as might be led by fortune to the West Indies would recollect the lessons of humanity which he inculcated.

Of his writings, the *Minstrel* is that which now probably is most read. It exhibits a strong feeling for the beauties of nature, which will probably prevent its being entirely forgotten. Beattie's metaphysical writings have the reputation of being clear, lively, and attractive, but not profound. The *Essay on Truth* was much read and admired at the time of its publication, but has fallen into comparative neglect, with the doctrines against which it was especially directed. (*Life of Dr. Beattie*, by Sir W. Forbes, two vols. 4to.)

BEAUCAIRE, a town in France on the right bank of the Rhône in the department of Gard, 432 miles S.S.E. of Paris by Moulins, Clermont, Mende and Nîmes. It is in 43° 48′ N. lat., 4° 36′ E. long.

Beaucaire seems to have existed in antient times under the name of Ugernum. It probably was at first a dependency of Nîmes. In 1734 a Roman road leading from Nîmes towards Beaucaire was discovered by M. Vergile de la Bastide. On this road were several Roman mile-stones, numbered, as it seems, in the direction from Nemausus (or Nîmes) as the capital of the district to Ugernum. Some of these mile-stones not having been displaced afforded the means of ascertaining by actual measurement the length of the Roman mile, which was found to be 752 toises 4 feet French measure, equal to 1604 yards 12 inches English.

Some of the mile-stones had been removed, as it is supposed, by Constantius, general and father-in-law of the Emperor Honorius, and formed into a monument in memory of some person or persons of distinction, who fell in a victory which he gained (A.D. 411) over the Franks and Allemanni, who attempted to force him to raise the siege of Arles. In the seventh century Ugernum was regarded as a place of great strength, and was perhaps rather a castle or military post than a town of any extent. (Millin, Expilly, D'Anville, &c.)

In the eleventh century the name Ugernum gave place to that of Belli-Cadrum or Belcadro (whence the modern Beaucaire), derived either from the square form of the castle or of the towers of the castle, or from the beauty of the district in which it was placed; for Cadré, or Cäiré, in the dialect of Languedoc and Provence signifies a square, or generally a space; and Beaucaire may be translated 'handsome district' (*beau quartier*). (Millin, Malte-Brun.) The name Ugernum, though lost by the town, was traceable in that of an island in the Rhône opposite to it, which was called Gernica, a corruption seemingly of *Ugernica*. This island, by the drying up of the branch of the Rhone which surrounded it on the east side, is now united to the town of Tarascon, the lower part of which is still called Gernegue.

In the middle ages Beaucaire was under the Counts of Provence, until it was ceded in 1125 to the Count of Toulouse; and in the troubles which that illustrious family suffered for their protection of the Albigenses it was twice the scene of contest. In or about the year 1217 it opened its gates to Raymond, son of Raymond VI., Count of Toulouse; and the garrison placed in it by Simon Montfort (leader of the Crusade against Raymond), which retired into the castle, was forced to surrender. Louis VIII., King of France, besieged it within ten years after, but in vain. To the Counts of Toulouse Beaucaire is said to owe its celebrated fair, which constitutes at present its chief claim to notice; but this is doubtful, though the fair, at any rate, existed long before the year 1463, when Louis XI. of France granted certain privileges to those who frequented it.

Beaucaire is situated in a pleasant country; and the view across the Rhône, which is here a magnificent stream, to the picturesque castle and town of Tarascon, is very fine. Tarascon and Beaucaire are just opposite one another, so as to appear like parts of the same town. The communication between them was long maintained by a bridge of boats, or rather by two bridges leading from each bank to a stone causeway, the remains, as it seemed, of a former bridge; but the passage by these bridges of boats was dangerous when the violent mistral or south wind blew. Of late years a suspension bridge of three arches, 441 metres, or 1447 feet, long has been erected: five of these suspension bridges have been erected of late across the Rhône between Lyons and Beaucaire. The situation of Beaucaire on the banks of the Rhône is highly favourable to its commerce. The quay is well built, and convenient for the landing of goods. A canal runs from Beaucaire to Aigues Mortes, and there divides into two branches: one communicating directly with the Mediterranean at the village of Repauset, the other passing through several of the etangs or lakes to the port of Cette. This canal enables boats to avoid the mouths of the Rhône, the navigation of which is uncertain and dangerous, and sometimes impossible.

The town of Beaucaire was, in the middle of the last century, surrounded by walls, which were, however, useless for defence. These walls probably still remain, for later authorities speak of the beauty of the gate which leads towards the Rhône. The streets are crooked and narrow; but for this it would be considered a handsome town. The number of houses is great in proportion to the population, which in 1832 was only 9967. These are fully inhabited only during the fair, and during the greater part of the year the closed apartments and almost deserted streets form a marked contrast to the activity which prevails at the fair time. The high prices then obtained for lodgings and accommodation of every kind, by enabling the inhabitants to subsist during the rest of the year with little exertion, have been fatal to the industry of the town. There are no manufactures, nor are any great commercial undertakings entered into. They cultivate a few vineyards and olive plantations. M. Millin says that they have scarcely a tailor or a shoemaker in the town, and that for clothing they must either wait the return of the fair, or resort to Tarascon for a supply. (*Voyage dans les Départemens du Midi de la France*, Paris, 1808.)

There is an antient church, founded in the ninth century by the Count of Narbonne the portal of which is adorned with sculptures relating to the birth of Christ. Before the Revolution there were two other churches, both antient: two convents for men, one of Cordeliers and one of Capuchins, and an establishment of priests, 'de la doctrine Chrétienne,' who had a college under their direction. There were also an abbey for Benedictine nuns, two other nunneries (one of Ursulines and one of Hospitalieres), and two hospitals. (Expilly, *Dict. des Gaules et de la France*, 1762.)

There are some remains of the antient castle of which mention has been already made. It stood on an eminence commanding the town, and was demolished in 1632, because it had fallen into the hands of some rebels against Louis XIII. It appears to have been an object of contention in the religious wars of the sixteenth century, between the Catholics and the Huguenots, or Protestants: the latter are charged with having committed great disorders here in 1562. (Piganiol de la Force; Expilly.)

The great fair of Beaucaire, in the number of persons who resort to it, is equal to almost any in Europe. It is said that the fair of 1833, confessedly the greatest for some years, was attended by from 70,000 to 80,000 persons, and that business was done to the amount of 160,000,000 francs, or 6,400,000*l.* sterling. Mr. M'Culloch (from whose *Dict. of Commerce* we take this statement) suspects exaggeration, but Malte Brun (*Géographie Universelle*) speaks of 100,000 as the usual number of persons who resort to it. They come from the middle and southern parts of Europe, and from the Levant.

This fair had its origin in the middle ages, and according to some, was established by Raymond VI. Count of Toulouse; and there is no account that it has been suspended since its establishment, except in 1721 and 1722, when the plague devastated Provence and part of Languedoc. At first the fair was held in the town, but the increasing business rendered it necessary to hold it out of the town in a neighbouring meadow, where tents were erected. This alteration had taken place long before Martinière published his *Grand Dictionnaire* (vol. ii. 1730.) Its present extent may be judged of by the statement given above. We take the following particulars from M. Millin. (*Voyage dans les Départemens du Midi de la France*, Paris, 1808.)

Long before the fair the principal merchants hire a house, or an apartment; every room is filled with beds, and the owner contents himself for the time with the garret. The wool merchants and the drapers occupy, in alternate years, the houses in certain streets, so that the householders in each street have alternately a profit by the high prices that the drapers are made to pay. The linen-drapers have their quarter, the leather-sellers theirs; the Jews occupy always the same spot. Not only are the shops filled, but stalls are erected and covered with cloth; and benches of stone serve for the display and sale of small wares. The names of the dealers, their residence, and their trade, are written on squares of linen, &c., which are suspended by ropes across the streets, and form, by the medley of the colours and the variety of their inscriptions, a singular spectacle. The town being insufficient for the thousands who resort to it, a new town of wooden huts and of tents is run up in a meadow on the borders of the river, having also its public places, its streets, &c. The merchants of the same country, or the same town, usually occupy the same street, which has the effect of bringing to the same spot wares of a similar kind. One street contains the drugs, spices, and soap of Marseilles; another the pomatum and wash-balls of the perfumers of Grasse; and a third the perfumes and liqueurs of Montpellier. Goods of all sorts are exposed for sale, including even cameos, medals, and other antiques. One whole street contains nothing but onions and garlic. Not only are the town and the meadow filled with a dense and busy population, but the river is crowded with boats (arranged in regular order according to their form, their cargo, and the place from which they come), in which many persons take up their habitation. Vessels of various forms from Genoa, Catalonia, or Marseilles; the boats which come from the interior down the Rhône; and those which come from the coast of the ocean by the Canal du Midi (which unites the ocean with the Mediterranean), may be seen there. The vessel which first arrives salutes the town with a musket or pistol shot, and receives in return a sheep, the skin of which, stuffed with straw, and accompanied with flags, indicates the superior diligence or good fortune of the ship-master. Besides the merchants who frequent the fair, the business done, and the vast concourse of people draw a number of other persons: there are notaries and legal gentlemen, members of the medical profession to attend to cases of sickness or accident, and undertakers to bury the dead. A small chapel occupies the extremity of the plain where the huts and tents are erected: in this mass is said; and as the worshippers cannot be all contained in the chapel, they kneel in the meadow with their faces turned towards the altar. A great number of rosaries are sold here.

Restaurateurs, cafés, billiard-tables, and places for dancing offer their attractions; jugglers, showmen with wild beasts, and rope-dancers, seek to profit by the opportunity; and gaming and debauchery are prevalent. Pickpockets have taken place of the highwaymen who once infested the roads, and plundered those who came to or left the fair. The government of the fair is in the hands of the Préfet of the department, by whom it is solemnly opened.

The fair was originally established for three days, but the intervention of three saints' days (Magdalen, St. Ann, and St. James), on which, though not reckoned as business days, business goes on, extends the period to six days, viz., from the 22d to the 28th July. At its close the merchants depart, the Jews and Catalonians being usually the last to go; and the town is left to its ordinary dullness till the return of this extraordinary scene.

BEAUFORT, the name of several places in France, of which one only is of sufficient importance to require notice. *Beaufort en Vallée* (or *Beaufort la Ville*), with its suburb *Beaufort en Franchise* (otherwise *Beaufort hors la Ville*), is in the department of Maine-et-Loire, about seventeen miles, measured in a straight line, E. by S. of Angers, the capital of the department. The town and suburb are separated from each other by a branch of the little river Coesnon or Couanon, which soon afterwards falls into the Authion, one of the minor feeders of the Loire. The chief trade of the town in former times consisted in corn; but the more modern authorities speak of manufactures of coarse linens for the use of the army, hempen cloths, serges, druggets, and hats. Hemp is grown in the surrounding district, which produces also corn and vegetables. Before the Revolution there were in Beaufort la Ville two parish churches and a convent of Recollets, a class of Franciscans. The population, in 1832, comprehending, probably, both Beaufort la Ville and its suburb, was 3288 for the town, and 5914 for the whole commune. 47° 25′ N. lat., and 0° 13′ W. long. from Greenwich. (Piganiol de la Force, *Dictionnaire Universel de la France.*)

BEAUFORT, CARDINAL. Henry Beaufort, Bishop of Winchester and Cardinal of St. Eusebius, was a son of John of Gaunt, Duke of Lancaster (father of Henry IV.), by his mistress Catherine Swynford, whom he subsequently married. His children by this woman, all born before wedlock, were legitimated by the name of Beaufort in the twentieth year of the reign of Richard II. We are unable to state the exact year of Cardinal Beaufort's birth; but from the circumstance of his having been consecrated a bishop when 'very young,' in 1397, and that he is spoken of on his death-bed as 'an old man of eighty,' we infer that it was about the year 1370. He studied at Oxford, Cambridge, and Aix-la-Chapelle. In 1397 he was created bishop of Lincoln (he is erroneously called bishop of London in the *Parliamentary History*); became chancellor of the University of Oxford in 1399; and in 1404 succeeded the celebrated William of Wyckham as bishop of Winchester. In the parliaments of 1404 and 1405 he officiated as lord chancellor, an office which he filled four times during his life. The bishopric of Winchester was then, as at present, one of the richest endowments in the English church; and Beaufort, from habits of frugality according to some writers, from sordid covetousness according to others, multiplied his riches so as to become the wealthiest subject in England. He advanced his nephew, Henry V., by way of loan, out of his own private purse not less than 28,000*l.* during his wars in France; and also lent the infant king, Henry VI., 11,000*l.*, sums which, the circumstances of the times being considered, were of enormous magnitude.

On the death of Henry V. in 1422, Beaufort (with his brother, afterwards Duke of Exeter) was appointed guardian of his infant successor: Beaufort was also a member of the council of regency, of which the king's uncle, Humphrey, Duke of Gloucester, was the nominal head. The struggle for supremacy between these ambitious men, which soon assumed the character of a fierce personal contest, is the most prominent feature of the internal history of England from the year 1424 to the year of their death, in 1447. The prelate being a man 'well skilled in all the means prudence suggests to the ambitious to accomplish their ends' (we quote the words of Rapin), ultimately triumphed in the struggle, which on more than one occasion threatened to inflict upon the country all the ills of civil war. The quarrel first assumed a warlike aspect in 1426. The citizens of London were of the party of the duke. To overawe them the bishop strengthened the garrison of the Tower, which the council, under his influence, had intrusted to the care of Sir Richard Wydevile, a creature of his own. This occurred during a temporary absence of Gloucester on the Continent. On his return he demanded lodgings in the Tower, but was refused, Wydevile having orders to admit 'no one more powerful than himself.' In his resentment the duke ordered the gates of the city to be closed against the prelate. The next morning the retainers of Beaufort attempted to force the gates at London Bridge. The citizens flew to arms, and bloodshed was with difficulty averted by the Archbishop of Canterbury and the Prince of Portugal, who happened to be then in England, prevailing upon the two parties to suspend their feuds till the Duke of Bedford, the regent, who had been written to, should arrive from Paris. The bishop's letter to the Duke of Bedford on this occasion is worth quoting:—

'I recommend me unto you with all my heart; and as you desire the welfare of the king our sovereign lord, and of his realms of England and France, and your own health and ours also, so haste you hither; for, by my troth, if you tarry we shall put this land in a jeopardy with a field: such a brother you have here. God make him a good man. For your wisdom knoweth that the profit of France standeth in the welfare of England. Written in great haste on Alhallow Even, by y^r^ true servant to my lives end,

'HEN. WINTON.'

(Hall's *Chronicles*; the letter is also printed in the second series of Ellis's *Hist. Letters.*)

The Duke of Bedford hastened from Paris to reconcile the rivals, but found it expedient to refer the matter to a parliament summoned for the purpose at Leicester. This parliament is known by the nickname of the 'parliament of bats,' a nickname which, in its origin, aptly illustrates the temper of the partizans of the bishop and of Gloucester and throws some light on the state of manners. In order to prevent the consequences of strife among armed men the members of the parliament summoned at Leicester were ordered to leave their swords and other weapons usually worn by the gentry at their inns: their followers however, with a view to defeating this prohibition, attended them with *bats*, or clubs, on their shoulders; and when these also were forbidden they concealed stones and plummets of lead in their sleeves and bosoms. (*Parliamentary History*, vol. i. p. 354.)

Among other charges put forward by the Duke of Gloucester, in a bill of impeachment against his uncle Beaufort, was an accusation that he had hired an assassin to take away the life of the late King Henry V., at the time Prince of Wales; and that he had encouraged the prince to usurp the throne before the death of his father. Gloucester professed to make this charge on the authority of Henry himself; but the bishop triumphantly opposed to that testimony the fact that Henry had, to the last moment of his life, honoured him with his friendship and confidence. After much wrangling and recrimination, the matter was referred to the arbitration of four spiritual and four temporal peers, who awarded that Gloucester should be 'good lord to the bishop, and have him in affection and love,' and that the prelate should preserve to the duke 'trew and sad love and affection, and be ready to do him such service as pertaineth of honesty to my Lord of Winchester and to his estate to do.' A formal public reconciliation then took place between the two disputants; but the bishop felt the award to be so much of a reproof, that he resigned the chancellorship, and obtained leave to go abroad. (The letter of leave is given in the second series of Ellis's *Hist. Letters.*) Beaufort accompanied Bedford in his return to France; and at Calais received the welcome intelligence that the pope had raised him to the dignity of cardinal, and had appointed him legate *à latere*, for the purpose of directing an English force in a crusade against the Hussites in Bohemia. [See **Bedford, Duke of**.]

In 1429 Cardinal Beaufort succeeded in destroying the power of his rival Gloucester, by having the young king crowned, and by inducing the parliament to declare on the occasion that the office of protector, filled by the duke, was, *ipso facto*, at an end. From being at the head of the council of regency, Gloucester was thus reduced to his rank as a peer. From this time till his death the councils of the cardinal predominated in the administration.

A powerful party, however, headed by the Duke of Gloucester, opposed itself to the administration of the cardinal. The spirit of the age was averse to the rule of ecclesiastical statesmen; and the House of Commons in particular had directed its attention to the question of church reform, as essential to good government. In a meeting of peers, in 1431, it was proposed that, as the dignity of cardinal was, by the law of the land, incompatible with the possession of a bishopric in England, Beaufort should be removed from the see of Winchester, and compelled to refund its revenues from the day that he had accepted the cardinal's hat. Gloucester followed up this motion with a series of charges, to the effect that Beaufort had incurred the penalties of præmunire in having accepted the papal bull, contrary to the express prohibition of the late king, and had exempted himself as legate from the jurisdiction of the see of Canterbury. The same charges were renewed in a more formal manner by Gloucester in 1434. (The articles are given at length in Rapin and the *Parliamentary History* from Hall.) He accused the cardinal, also, of having amassed wealth by dishonest means, of having usurped the functions of sovereignty, appointing embassies, and releasing prisoners on his own authority, and estranging from the person of the young king his relatives and the council of the regency. That these charges were founded on truth is evident from the fact that two acts of parliament were passed, one in 1432, the other in 1437, indemnifying Beaufort against the penalties of præmunire, and pardoning him for all crimes committed up to the 20th of July in the last-named year. The arrest and probable murder of Gloucester are usually ascribed to his fierce and courageous denunciation of the ecclesiastical counsellors of the king. Gloucester's death took place on the 28th of February, 1447.

The cardinal survived his great rival but six weeks. His death-bed has been painted in immortal colours by Shakspeare (*Henry VI.* Part 2), but the imagination of the poet has supplied the darkest features of the picture. Shakspeare represents him as expiring in an agony of despair:—

> Lord Cardinal, if thou think'st on heaven's bliss,
> Hold up thy hand, make signal of thy hope.—
> He dies, and makes no sign.'

But we know from the authority, Hall, which Shakspeare has followed in the less harrowing details of the scene, that the cardinal's worldliness was confined to expressing his regret that money could not purchase life, and that death should have cut him off at the moment when his rival to the great object of his ambition (the popedom) had been removed. Hall's version is given on the authority of one Baker, the cardinal's chaplain; and the last words are, 'I pray you all to pray for me.' His will, moreover, to which two codicils are attached, on the 7th and 9th of April (he died on the 11th), is still extant (Nichols's *Royal and Noble Wills*, p. 311), indicating a state of feeling more worthy of a Christian prelate. His great wealth was distributed, according to the provisions of his will, in charitable donations. Not less than 4000*l.* was allotted for the relief of the indigent prisoners in Newgate, Ludgate, the Fleet, Marshalsea, King's Bench, and the prison attached to the Southwark manor of the diocese of Winchester; and the hospital of St. Cross at Winchester still exists as a monument of his munificence. Cardinal Beaufort was buried in the beautiful chantry which bears his name in Winchester Cathedral.

(Hall's *Chronicles;* Turner's *Modern History of England*; Rapin's *History;* Lingard's *History;* and Milner's *History of Winchester*. In the two last-named works the reader will find a much more favourable account of the last moments of the cardinal, given on the authority of an eye-witness, in the *Continuation of the History of Croyland*, than we have adopted in the text.)

BEAUFORT, MARGARET, COUNTESS OF RICHMOND AND DERBY, is entitled to honourable mention as an eminent patroness of literature, after the manner of the age in which she lived. She was of royal descent, being the daughter and heiress of John Beaufort, Duke of Somerset, grandson of John of Gaunt, Duke of Lancaster, third son of Edward III. This descent was not strictly legitimate, the name of Beaufort having been first given by John of Gaunt to his natural children by Catherine Swynford, who were legitimated by act of parliament under Richard II. Margaret Beaufort was born in 1441; and was thrice married. first to Edmund Tudor, half brother to Henry VI., created Earl of Richmond, by whom she had one son, afterwards Henry VII.; secondly to Sir Henry Stafford, a younger branch of the ducal house of Buckingham; thirdly to Lord Stanley, afterwards Earl of Derby. By the two last marriages she had no issue. She died in 1509, and is buried at Westminster, where her tomb may be seen in the south aisle of Henry VIIth's Chapel.

The Countess of Richmond was rich, pious, charitable, and generous. Her attention to the formal observances of religion prescribed by the Papal church was strict even to rigour. To her bounty Christ's College, Cambridge, founded in 1505, and St. John's College, Cambridge, projected and endowed by her, but not chartered till 1511, owe their existence. The latter, however, was deprived of the greater portion of its revenues, that which consisted of the foundress's estates, by Henry VIII., who sued for and recovered them as heir-at-law; and the wealth which this distinguished college now enjoys is chiefly due to the liberality of later benefactors. The Countess of Richmond also established a professorship of divinity, with a salary of 20 marks, in each university; the holders of which are called Lady Margaret's professors. Their incomes have been increased, at Cambridge by the annexation of the rectorial tithes of Terrington in Norfolk, by James I.; and at Oxford, by the revenues of a prebendal stall in Worcester Cathedral. The Countess of Richmond also appointed a public preacher at Cambridge, salary 10*l.*, whose duties are now confined to the delivery of one Latin sermon yearly.

Walpole has given this noble lady a place in his *Catalogue of Royal and Noble Authors*, as the translator of two books:—1. *The Mirroure of Golde to the Sinfull Soul*, translated from a French translation of the *Speculum Aureum Peccatorum*, printed by W. de Worde in 1522; 2. Translation of the fourth book of Dr. J. Gerson's *Treatise on the Imitation and Following the Blessed Life of our Most Merciful Saviour Christ*, printed at the end of Dr. William Atkinson's translation of the three first books—Pynson, 1504. The following treatises are said to have been published by her desire or encouragement:—

Scala Perfeccionis, Englysshed, the Ladder of Perfection, by Walter Hilton—W. de Worde, 1494. fol.

Treatise concernynge the Seven Penetencyall Psalmes, by Fisher, Bishop of Rochester, printed by W. de Worde in 1509, and Pynson, 1510. 4to.

The Ship of Fooles of this World, translated by Henry Watson into prose, and printed by W. de Worde, 1517. 4to.

Bishop Fisher preached her funeral sermon, entitled *A Mornynge Remembraunce*, printed by W. de Worde, and reprinted in 1708, with a biographical preface by the Rev. Mr. Baker. (Walpole's *Catalogue*, continued by Park, 1806; and Kippis's *Biog. Britannica*.)

BEAUFORT, LOUIS DE, was born of a French family, settled in Germany or Holland, as far as we may presume from the scanty information we can find of his early life. He was for a time tutor to the young prince of Hesse Homburg; but he became known to the learned world by his *Dissertation sur l'Incertitude des Cinq Premiers Siècles de l'Histoire Romaine*, 8vo. 1738. He was one of the first modern writers who carried the spirit of critical investigation into the narrative of the first five centuries of the Roman commonwealth; he showed that both Livy and Dionysius could not be implicitly trusted, and that it required a process of very acute and careful discrimination to separate the truth from the legendary fables of early Roman history. Among other things he maintained that Porsenna did really conquer Rome after the expulsion of Tarquinius. Niebuhr remarks, when speaking of Beaufort's dissertation (vol. i. p. 539, note), 'that the critical examination of this war is the most successful part of that remarkable little work.' His next work was *La République Romaine, ou Plan Général de l'Ancien Gouvernement de Rome*, 2 vols. 4to. La Haye, 1766. The author treats at length and systematically of the institutions of that celebrated republic, of its senate, its populus and plebs, its comitia, its consuls and tribunes, of the laws and tribunals, of the religion of the country and its ministers, of the various classes of society and their respective rights, and the condition of the allies and subjects of Rome. This work met with great approbation, and maintained its ground as one of the best works upon the Roman republic previous to Niebuhr's *History of Rome*, which, however, was left unfinished by the author. Auger's work, *Sur la Constitution de Rome*, and Adrien de Texier's *Du Gouvernement de la République Romaine*, 3 vols. 8vo. Hamburg, 1796, are perhaps the only works written in the last century that deserve to be mentioned together with Beaufort's. He wrote also *Histoire de Germanicus*, 12mo. 1741, which he dedicated to the Landgrave of Hesse Homburg. Beaufort was a member of the Royal Society of London. He died at Maestricht in 1795.

BEAUGENCY, a town in France, in the department of Loiret, on the road from Paris through Orleans to Blois and Tours, eighty-six miles S.S.W. of Paris and fourteen or fifteen miles S.W. of Orleans, in 47° 47′ N. lat., and 1° 36′ E. long. from Greenwich. It is situated at the foot of a hill on the right or N.W. bank of the Loire, over which is an antient bridge of twenty-two arches, according to the older authorities (Piganiol de la Force, Expilly, *Encyclopédie Méthodique*), or of thirty-nine, according to the last edition of Malte Brun's *Géographie Universelle*, Paris, 1832. This bridge is divided into two parts by an island in the centre of the river. The town contains the remains of an old castle, the antiquity of which some would carry up to the time of the Gauls; it has been ruined by time and by the various sieges which the town has sustained. Before the Revolution there was a chapter of the regular canons of St. Augustin, the successors of a much larger number of religious of that order, who were established here in former days. The monastery in which they lived was destroyed by the Calvinists in the civil war of the sixteenth century; and though a part of the building was repaired, the establishment seems never to have recovered its greatness. There are two hospitals for the children and the aged among the poor.

The manufactures of the town consist of leather, woollen stuffs, and hats; there are some distilleries, and several mills for the supply of the town and neighbourhood with flour. A considerable trade is carried on in wine (which is of superior quality), brandy, corn, and the goods manufactured in the place. The population, in 1832, was 4182 for the town, and 4883 for the whole commune. At Beaugency are quarries of a calcareous freestone, which has been used for the foundation of the cathedral of Orleans, and that of the bridges of Orleans and Tours.

Two councils were held in this town: at the latter of these the marriage between Louis VII. (*le Jeune*) and his queen, Eleanor of Guienne, was annulled on the plea of relationship: her subsequent marriage with the Count of Anjou, afterwards Henry II. of England, added largely to the possessions of the English kings in France. (*Dictionnaire Universel de la France*; Expilly's *Dictionnaire des Gaules et de la France*.)

BEAUHARNOIS, EUGE'NE, son of Viscount Alexandre Beauharnois, was born in September, 1780, and received his early education at the College of St. Germain-en-Laye. His father was a member of the National Assembly, in which he embraced the popular side, and afterwards served with distinction in the army of the Rhine, in 1792. He was, however, accused by the Jacobins, taken before the revolutionary tribunal, condemned, and beheaded, in July, 1794, when he was only thirty-four years of age. His widow Josephine married, in 1796, Napoleon Bonaparte, who treated her children, Eugene and Hortense, as if they had been his own. Eugene accompanied Bonaparte to Italy, and afterwards, in 1798, to Egypt, where he acted as his aide-de-camp. After Bonaparte became first consul, Eugene was made chef-d'escadron in the Consular Guards, in which capacity he was present at the battle of Marengo. In 1804 he was made colonel-general of the Chasseurs of the Guards. When Bonaparte became emperor, Eugene was created a prince of the new empire; and in 1805, on being appointed viceroy of the (so called) kingdom of Italy, which comprised Lombardy and the northern Papal provinces, he fixed his residence at Milan. He was adopted by Napoleon in January, 1806, and soon after married Augusta Amelia, daughter of the king of Bavaria. In 1809, when war broke out again between Austria and France, Eugene took the command of the French and Italian army on the frontiers towards Carinthia, but he was obliged to retire before the superior forces of the archduke John, and, after sustaining considerable loss from the Austrians at the battle of Sacile on the river Livenza, he withdrew to the banks of the Adige, where he received reinforcements. Upon the defeat of the great Austrian army in Germany, the archduke marched back for the protection of Vienna, and was closely followed by Eugene. A battle took place between the two armies near the river Piave, where the Austrians were worsted, and obliged to hasten their retreat. Eugene followed them through Carinthia and Styria, and on the 27th of May made his junction with Napoleon's grand army at Ebersdorf, near Vienna. He was thence sent into Hungary to check the rising *en masse* of the people of that country. On the 14th of June he defeated the archduke John at Raab in Hungary.

The battle of Wagram in July following put an end to the war. After the peace of Vienna, Eugene returned to Milan, from whence he repaired to Paris in December, 1809, to be present at the declaration of divorce between his mother and Napoleon. He made a speech to the senate, in which he dwelt on the duty of obedience to the will of the emperor, to whom he and his family were under great obligations. In 1812, he joined Napoleon in the campaign of Russia with part of the Italian army, during which service he took the command of the fourth corps of the grand army, and was engaged at the battles of Mohilow and of the Moskwa. In the disastrous retreat from Moscow, Eugene succeeded in keeping together the remnants of his own corps, and maintaining some order and discipline among them; and after Napoleon and Murat had left the army, he took the command of the whole. At Magdeburg he collected the relics of the various corps; and on the 2nd of May, at the battle of Lutzen, he commanded the left of the new army which Napoleon had raised. Soon after he returned to Milan to raise new conscriptions to replace the soldiers who had perished in Russia, and to make every effort to defend Italy against the threatened attack of Austria. Three levies of 15,000 conscripts each were ordered in the course of one year, in the kingdom of Italy alone: but the people were tired of war, and it was found difficult to collect the men. The news of the battle of Leipzig added to the general discontent; and at the end of October, 1813, the Austrian army entered the Venetian territory, when Eugene was obliged to retreat to the Piave, and, after some sharp fighting, to fall back on the Adige. In March, 1814, being attacked by the Austrians on one side, and by Murat at the head of the Neapolitan army on the other, he withdrew to the Mincio, and removed his family and property from Milan to the fortress of Mantua. On the 16th of April, Eugene and Marshal Bellegarde, the Austrian commander, signed the convention of Schiarino-Rizzino, by which hostilities were suspended, the French troops remaining in Italy were sent away, and Venice, Legnago, and other fortresses, were delivered up to Austria. Napoleon's kingdom of Italy was now at an end, and Napoleon himself had abdicated the crown of France. Some endeavours were made by Eugene's friends to obtain his nomination as king of Lombardy, but a strong party at Milan violently opposed it, and an insurrection took place in that city, in which Prina, one of Prince Eugene's ministers, was murdered by the people. Upon this, Eugene gave up Mantua to the Austrians, and returned with his family to Bavaria.

As viceroy of the kingdom of Italy, Eugene was personally liked by the people and by the army, for his frank bearing and affable temper, and his humane disposition. Entirely devoted to Napoleon, he implicitly obeyed and enforced his often harsh decrees, although he occasionally endeavoured to obtain some mitigation of them. He displayed activity and regularity in the details of administration; his viceregal court was splendid, but he was frugal in his own expenditure. Some of the persons by whom he was surrounded were objects of popular aversion, and thus occasioned an unfavourable feeling towards Eugene's government. He was also accused of having, in some fit of ill-humour during the great reverses of Napoleon's fortunes, used harsh and offensive expressions to the Italian officers around him, men who had devoted their lives to his and his stepfather's service, who had fought the battles of the French empire, and who were now deeply stung by his unmerited reproach. These things may have contributed to the revulsion of feeling that manifested itself at Milan in 1814.

After leaving Italy Eugene lived chiefly at Munich, at the court of his father-in-law, with the title of Prince of Leuchtenberg. He visited Paris after the death of his mother, and was very graciously received by Louis XVIII. He also visited Vienna when the Congress was sitting and was treated with marked attention by the Allied Sovereigns and their ministers, but especially by the Emperor Alexander. Eugene retained, with the consent of the Pope, the possession of some estates in the northern provinces of the Roman stat[illegible] which had formed part of the kingdom of Italy. The restored king of Naples also agreed to pay him five millions of francs. These grants were intended as a compensation for the loss of the yearly income of a million of francs assigned to him by Napoleon on the national domain of Italy. (Colletta, *Storia del Reame di Napoli*, vol. iv.) Eugene died at Munich on the 21st of February, 1824, at the age of 45 years. The Duchess of Braganza, Don Pedro's widow, and Prince Augustus of Portugal, late husband of the Queen Donna Maria, are his children. (*Storia d'Italia di* Carlo Botta; *Storia dell' Amministrazione del Regno d'Italia sotto il Dominio dei Francesi*; *Biographie des Contemporains.*)

BEAUJOLAIS, LE, a district in France under the old regime, and one of the subdivisions of the former province of Lyonnais: it is now included in the departments of Rhône and Loire. It was the most northerly of the subdivisions of the Lyonnais, and was bounded on the north by the duchy of Bourgogne or Burgundy; on the south by the districts of Lyonnais (understanding that name in its most restricted application) and Forez; on the east by the river Saône, which separated it from the principality of Dombes, one of the subordinate territories of Bourgogne; and on the west by the river Loire, which separated it from Forez. Beaujolais is about thirty-five miles from east to west, and about twenty-five from north to south, as measured on the map of *France in Provinces*, published by the Society for the Diffusion of Useful Knowledge; but a reference to the great survey of France by Maraldi and Cassini, in 183 sheets, shows the boundary on the south to be so very irregular that no measurement would give much clue to the size of the district. The dimensions generally assigned by the French geographers are ten leagues (or twenty-eight miles) in length, and eight leagues (or twenty-two miles) in breadth. This country is traversed from south to north by the range of hills which extend from the Cévennes northward to the Côte d'Or, and separate the basins of the Loire and the Rhône. From this range a more level country extends on one side to the Loire and on the other to the Saône, watered by small streams which descend from the mountains and fall into the rivers above-mentioned. Of these streams the chief are the Azergue (which, when its torrent is swollen, is very rapid), and the Ardière, tributaries of the Saône; the Rhin or Reins, and the Trambouzan, which flow into the Loire, and the Trambouze, an affluent of the Rhin.

The district is very fertile, and some of the heights are covered with fine wood, yielding deals and timber for the carpenter and the shipwright. The agricultural produce consists of corn, wine, and hemp: there is abundance of pasturage for cattle. Considerable mining operations were once carried on in Beaujolais; but these seem to have been neglected for a long time, at least such as yielded silver. The stone quarries of Pommiers, near Villefranche, which for twelve centuries supplied Lyon with immense blocks of stone of excellent quality, are now almost, if not quite abandoned.

The chief towns in Beaujolais are Villefranche near the Saône (population, in 1832, 6460), which was the capital of the district while it existed as a subdivision of Lyonnais; Beaujeu (in the interior, upon the river Ardière), from which the territory obtained its name (population, in 1832, of commune, 1596; of town, 1520); Belleville, at the junction of the Ardière with the Saône; St. Symphorien de Lay, on the road from Lyon to Roanne (population of commune, in 1832, 4500); Thizy, near the Trambouze; Perreux, near the Loire; and Amplepuis, on the Rhin (population of commune, in 1832, 4873. [See LOIRE, DEPARTMENT OF; LYONNAIS; RHÔNE, DEPARTMENT OF; and VILLEFRANCHE.]

Beaujeu is seated at the foot of a mountain, and, as already noticed, on the bank of the river Ardière. The lords of Beaujeu had a castle here; but when the lordship came by inheritance to the house of Forez, the nobles of that race patronized Villefranche, and Beaujeu gradually falling into decay gave place to its younger rival. Expilly, in his *Dictionnaire des Gaules, &c.*, Paris, 1762, assigns to it 3000 inhabitants. Its diminished population in 1832, given above, shows its further decay. It had, up to the first French Revolution, a collegiate church, a convent, and an hospital. The church was worthy of note for the sculptures and paintings which it contained. Beaujeu is in 46° 10′ N. lat., and in 4° 34′ E. long.

The first lord of Beaujeu was Wischard or Guichard, who lived in the reign of Robert, son of Hugues Capet (A.D. 996-1031), and the lordship continued to be held by his descendants in the male line till 1265, when, in failure of a male heir, it passed by marriage into the family of the Counts of Forez, a younger branch of which family became lords of Beaujeu. Several of these nobles distinguished themselves in the wars of the middle ages. Humbert IV., of the first race, took an active part in the war against the Counts of Toulouse, the protectors of the persecuted Albigeois; was made constable of France by Louis IX. (St. Louis), whom he accompanied to the Holy Land; and is said to have died in that expedition. Guichard VI., of the second or Forez race, served in the wars of Philip VI. (of Valois), King of France, against the Flemings, and his son Edward in those of the same Philip, and of John II., son and successor of Philip, against Edward III. of England. Edward of Beaujeu, who was in the battle of Crecy, fell in an encounter, in which he defeated the English at Ardres in 1351. Another Edward, one of the successors of this lord, having thrown out of a window an officer who served him with a citation to answer a charge of rape, was arrested and led prisoner to Paris; and only obtained his liberty by purchasing, at the price of his lordships of Beaujolais and Dombes, the protection of Louis Duke of Bourbon, into whose family the territory of Beaujolais consequently came.

The failure of the direct line of the Dukes of Bourbon caused a disputed succession. The claimants were Charles de Bourbon, constable of France, and Louisa of Savoy, mother of Francis I., King of France, whose claims were derived by purchase from a daughter of that Lord Edward who fell in the war with the English. Louisa, unhappily for France, gained the suit; the constable revolted, and in the service of the Emperor Charles V., and in conjunction with his generals, defeated Francis at Pavia and took him prisoner. The house of Bourbon Montpensier gained possession of the lordship of Beaujolais in the reign of Charles IX. of France, and from this house it passed to the family of Orleans, which appears to have held it up to the period of the French Revolution.

BEAULIEU, the name of many places in France. In the *Dictionnaire Universel de la France* (Paris, 1804), thirty-nine towns and villages so called are given. Two of the villages are, however, beyond the boundaries to which France was reduced at the downfall of Napoleon; but as three small villages, also called Beaulieu, appear in the *Dictionnaire des Gaules* of Expilly, which are not inserted in our first-quoted authority, we may consider the name as applying to forty places, large and small. It was also given to several religious houses, whether in towns or in more secluded situations.

Beaulieu, in the department of Corrèze, is a small town, which owes its origin to an antient Benedictine monastery of the congregation of St. Maur, founded by Rodolph, or Raoul de Turenne, Archbishop of Bourges, about the middle of the ninth century, and enriched by Frotaire, successor of Raoul, and others. It is on the right bank of the Dordogne, in the southern part of the department, in 44′ 59′ N. lat., and 1° 48′ E. long: population, in 1832, 2154 for the town, and 2415 for the whole commune. Some have ascribed the foundation of the monastery to Charlemagne, but erroneously. (Martinière; Expuly, *Dictionnaire Universel de la France, &c.*)

Beaulieu, in the department of Indre et Loire, may be considered almost as a suburb of the town of Loches (see LOCHES), from which it is separated by the two channels of the river Indre, which divides a little above this part, and reuniting its waters just below, encloses a small island which lies between the two towns. Beaulieu, previous to the Revolution, consisted of three parishes, which seems to indicate that it was once of greater importance. There were also two religious foundations—a Benedictine abbey of the congregation of St. Maur, and a house of regular canonesses of the order of St. Augustin. The former of these was founded in the beginning of the eleventh century by Fulk Nerra, Count of Anjou and Lord of Loches; the latter was of much later origin, having been founded in 1643. The chief manufactures of the town are woollen cloth and leather: the tanneries are on the river Indre. The population, in 1832, was 1800 for the town, or 2222 for the whole commune. The celebrated Agnes Sorel, mistress of Charles VII., king of France, was lady of this town of Beaulieu. It is in 47° 7′ N. lat., and 1° 0′ E. long.

At the village of *Beaulieu*, near the town of St. Germain Lembron, in the southern part of the department of Puy-de-Dôme, are some alkaline waters, the source of which is intermittent, though the times of flowing and of cessation have not been accurately marked.

BEAUMARCHAIS, PIERRE AUGUSTE CARON DE, was born at Paris in January, 1732. His father was a watchmaker, and brought up his son to the same profession, in which young Beaumarchais showed considerable skill. He was also remarkably fond of music, and attained great proficiency in playing on the harp and the guitar. Beaumarchais played before the daughters of Louis XV., who being pleased with his musical skill admitted him to their concerts, and afterwards to their parties. He now appeared at Versailles in a rich court-dress, which offended a haughty nobleman, who meeting him one day in one of the galleries, asked him abruptly to look at a valuable watch that he wore, which was out of order. Beaumarchais excused himself, by saying that his hand was very unsteady; the other insisting, Beaumarchais took the watch and dropped it on the floor, simply observing: 'I told you so.' Notwithstanding this event he continued to enjoy the patronage of the Court, which gave him the opportunity of becoming connected with some of the Fermiers Généraux and great contractors. It was his bad fortune to be involved in several law-suits, some of which made great noise in the world, and gained considerable notoriety in consequence of the memoirs or pleadings of his case, which Beaumarchais wrote and published. These pleadings, which show considerable skill and oratorical power, are inserted in the collection of his works. But his fame as a writer rests on his plays, and chiefly on the two, 'Le Barbier de Seville,' and 'Le Mariage de Figaro,' which are too well known all over Europe, both as plays and as operas, to require any particular notice here. The character of Figaro was a happy invention, and the other principal characters, in both plays, are drawn with great skill. The 'Mariage de Figaro' alone produced to Beaumarchais 80,000 francs. He wrote a third play, 'La Mère Coupable,' which may be considered as a sequel to the other two, but is inferior to them in many respects, and objectionable in a moral point of view. He also wrote 'Eugenie' and 'Les Deux Amis:' the subject of the first is taken from an adventure which occurred to his own sister, and which he relates in his memoirs. Goethe has treated the same subject in his drama of 'Clavigo.' At the beginning of the revolt of the English-American provinces, Beaumarchais entered into a speculation for supplying the colonies with arms, ammunition, &c.; he lost several vessels, three of which were taken in one day by the English cruisers in coming out of the river of Bordeaux; but the greater number arrived in America, and Beaumarchais enriched himself by his undertaking. Among other speculations he engaged to supply Paris with water and with fire-engines. When the French revolution broke out, Beaumarchais showed himself favourable to the popular cause, and entered into speculations to supply corn, muskets, &c. But his activity in that critical period exposed him to suspicion; he was accused and acquitted, then accused again, and being obliged to run away, he escaped to England and afterwards to Germany. He returned to France after the fall of Robespierre, and then entered into a new speculation in salt, by which he lost a large sum. He died in May, 1799.

Beaumarchais had considerable talent and other good qualities, but he was very vain and fond of distinction. He undertook an edition of all the works of Voltaire, of whom he was a great admirer; but the edition, notwithstanding all his pains and great expense, proved very indifferent, both as to correctness and execution. His correspondence, which is at the end of his works, contains some well-written letters, among others one to Citizen Baudin, of the French Legislative Council, in which he inveighs against the iniquitous system adopted by the Directory of transporting to Guiana those who were obnoxious to them, after the affair of the 18 Fructidor, 1797. (*Œuvres complétes de* Beaumarchais, 1 vol. 8vo. Paris, 1809; *Dictionnaire Universel Historique.*)

BEAUMARIS, a parish and borough, and the county-town of the county of Anglesey, North Wales, in the hundred of Dindaethwy. It is situated on the picturesque bay of Beaumaris, at the northern entrance of the Menai strait, at the distance of 4½ miles from the Menai bridge, 3½ miles from Bangor, and 216 miles N.W. from London. The original name of the site was Bonover, which w[illegible] changed by Edward I., who may be regarded as the foun[illegible] of the town, to Beaumaris, which, according to some authorities, is a French compound (*beau* and *marais*, a fine or beautiful marsh), descriptive of the situation of the place; but others very improbably derive it from *Bi-maris*, in allusion to its situation at a place where two tides or seas meet. The former explanation seems to agree best with the existing name. The castle of Beaumaris is considered to have been the parent of the town. After Edward I. had secured his conquests in Caernarvonshire, by the erection of the castles of Caernarvon and Conway, he built Beaumaris castle in 1295; a low marshy spot was selected for the site, for the purpose of having a large fosse around the castle filled with water from the sea. A canal also was cut to enable small vessels to discharge their lading under the walls, for the use of the garrison. Each of Edward's three castles differs in form. The present, from the lowness of its site and dilapidated state of the walls, presents a far less imposing appearance than the others. It consists of an outer ballium or envelope, flanked with ten circular bastion towers, of which those at the angles are the largest, and having on the south side an advanced work, called the Gunner's Walk. About the centre of this fortified enclosure stands the principal body of the castle. Its height far exceeds that of the envelope, and at a distance appears to rise majestically from it, as from a base. It is nearly quadrangular, with a grand round tower at each angle, and another in the centre of each face. The interior consists of an area 190 feet square, with obtuse corners. The centre of the north-west side contains a great hall, 70 feet long and 23½ broad, with a proportionate height: it has five large pointed windows, which form a handsome front to the inner quadrangle. On the eastern side of the area there are remains of a chapel, the sides of which are ornamented with receding pointed arches. The elegantly-groined roof is supported by ribs springing from pilasters, between each of which is a long narrow window. There was a communication between the several parts of the inner court by means of a narrow surrounding gallery, a considerable portion of which is still entire. Within recesses formed in the thickness of the wall, in the sides of this gallery, are several square apertures, apparently once furnished with trap doors, which opened into rooms beneath; but as there are no vestiges of descending steps, it is difficult to ascertain their use. It is conjectured that these rooms, as well as the two circular eastern towers, were employed for the confinement of prisoners. The principal entrance to the castle faces the sea, and is formed by two circular bastion towers, between which a pointed archway was fortified with four portcullises. The ruins of this castle are plentifully bespread with gilliflowers, which grow nowhere else in the island of Anglesey.

The governor of the castle was generally also captain of the town, and usually had twenty-four men under him. There is nothing remarkable in the early history of the castle, except the frequent quarrels between the garrison and the inhabitants of the vicinity, whose complaints ultimately occasioned its removal in the reign of Henry VII. In the year 1642 the castle was garrisoned for Charles I., for whom it was held by Colonel Bulkeley, the son of Lord Bulkeley the constable, until 1648, when it capitulated on honourable terms to General Mytton. The estimated annual expense of the garrison in 1653 amounted to 1703*l.*

The castle is still the property of the crown. A handsome tennis-court, fives-court, and bowling-green have been formed within its walls for the amusement of residents at Beaumaris.

When Edward I. built the town, he surrounded it with walls, made it a corporation, and gave it great privileges, and some valuable lands. Among the privileges the following are mentioned:—That the inhabitants should have a 'free prison' in the castle; that no Jews should dwell in the town; that if any of the burgesses died, testate or intestate, their goods should not be forfeited to the king, but should be enjoyed by their heirs. The town did not, however, send any member to parliament until the reign of Edward VI. By the Reform Bill, the towns of Llangefni, Amlwch, and Holyhead, with Beaumaris, now send a member. The bill made no alteration in the boundary of the borough, which embraced a district of about ten miles in circuit, and was therefore considered sufficiently extensive.

Beaumaris seems to have flourished under the royal favour, and to have attained some commercial importance; for Sir John W[illegible]ne, in characterising the inhabitants of the three castellated towns of the Menai, upwards of two centuries ago, speaks of 'the lawyers of Caernarvon, the *merchants* of Beaumaris, and the gentlemen of Conway.' An inference to the same effect has been made from the local tokens which were, at a somewhat later time, in use among the opulent tradesmen as a substitute for copper coin; a practice at that time common in places of considerable traffic. 'At present,' says the *Boundary Report*, 'it has not any trade or manufactures, but it derives a considerable profit from being the resort of visiters for sea-bathing, many of whom come from Liverpool.' The bay before the town affords good anchorage for ships, having seven fathoms water at the lowest ebb. Vessels often find security there in hard gales, and occasionally undergo repairs upon the beach. A few sloops belong to Beaumaris, but they are chiefly employed in carrying for other ports.

The town of Beaumaris consists of several streets, of which one, terminated by the castle, is well built, and the houses are in general neat. The chapel, dedicated to the Blessed Virgin, had formerly one aisle distinguished as the chapel of St. Mary, and the other as that of St. Nicholas: it is now known exclusively by the former name. It is a spacious and rather elegant structure, consisting of a chancel, nave, and two aisles, with a square embattled tower. It was formerly a chapelry in the parish of Llandegfan, but is now a distinct parish church. The town-hall is a commodious modern structure; the basement story contains a prison. Above, besides the apartments for the transaction of municipal business, is a handsome apartment, which forms the finest ball-room in the principality. There is also a county-hall, a county prison, and a custom-house, which is the comptrolling-office not only to the different parts of the island, but to those on the Caernarvon side of the Menai. Near the town is a ferry, which belonged to the crown until the reign of Elizabeth, who granted it to the corporation. The other five ferries of the Menai had previously been transferred to private hands by Henry VIII. The last Lord Bulkeley, who did much for the improvement of Beaumaris, made a fine road at his sole expense, from the town, along the banks of the Menai, to the Menai bridge, a distance of 4¾ miles.

In the year 1603 a free school was founded and liberally endowed at Beaumaris by David Hughes, Esq., a native of the town. Among the other establishments for education is an extensive school, the pupils of which pay one penny a-week. There are almshouses for ten poor persons, six of whom are indebted for their provision to the founder of the free school; the other four were added by the last Lord Bulkeley.

The town, as re-incorporated in the fourth year of Queen Elizabeth, is governed by a mayor, two bailiffs, chosen annually, and chief burgesses, forming altogether a governing body limited to twenty-four persons. These twenty-four capital burgesses were the only electors of the parliamentary representative previously to the Reform Bill. The market-days are Wednesday and Saturday. The fairs are on February 13, Holy Thursday, September 19, and December 19, for cattle. The population of the borough, in 1831, amounted to 2675, of whom 1444 were females, according to the Population Abstract; but the recent report on Municipal Corporations estimates the population at only 2497.

(Pennant's *Tour in Wales*; Grose's *Antiquities of England and Wales*, vol. iv.; *Beauties of England and Wales*, vol. xvii.; *Boundary Reports*, part vii.; *Report on Municipal Corporations*, &c.)

BEAUMONT, the name of above sixty towns and villages in France, as we find by a comparison of the *Dictionnaire des Gaules, &c.*, of Expilly (Paris, 1762), with the *Dictionnaire Universel de la France* (Paris, 1804), of which only the following are of sufficient importance to require notice.

Beaumont-de-Lomagne (so called, as being in Lomagne, a district of the antient Armagune), a town in the department of Tarn et Garonne, on the road between Montauban and Auch. It is on the left bank of the little river Gimone, an affluent of the Garonne. Coarse woollen cloths, hats, and leather, are the chief manufactures of this little town, which, in 1832, had a population of 3126 for the town, and 4130 for the whole commune. It is in 43° 53′ N. lat., and 1° 0′ E. long.

Beaumont sur Oise, in the department of Seine et Oise, is about 19 miles north of Paris, on the road to Beauvais, Abbeville, Boulogne, and Calais. It is on the left or south bank of the river Oise, over which there is a very handsome bridge; and on the summit of the hill, on the slope of which the town is built, there are the remains of an antient castle. Some braid (*passementerie*) is made here, and some trade is carried on in corn, flour, and glass. The population in 1832 was 1892.

Beaumont had a collegiate church up to the period of the Revolution. This town was pillaged by the Burgundians in the year 1416, while Charles Duke of Orleans, to whom it then belonged, was a captive in England. It is in 49° 8′ N. lat., and 2° 16′ E. long.

Beaumont-le-Roger, in the department of the Eure, is situated on the right bank of the river Rille, which falls into the Seine near its mouth. The town was built, at least augmented, by Roger, one of the lords of the territory in which it is situated. Louis IX. (otherwise St. Louis) King of France, obtained it of its former lords, and united it to the domains of the crown; but a century afterwards it was alienated by John II. to Louis, brother of Charles of Evreux, King of Navarre. It returned, however, into the possession of the French kings, having been ceded by Charles III., King of Navarre, who had inherited it, to Charles VI. of France.

There is a large village called Vieille, on the opposite bank of the river, which may be considered as a suburb of the town, with which it is connected by a stone bridge. Beaumont had, before the revolution, a Benedictine priory, dependent upon the abbey of Bec, as well as a parish church dedicated to St. Nicholas. Formerly the townsmen manufactured woollen and linen cloths, and nails, and a considerable quantity of linen was bleached in the village of Vieille. (*Le Grand Dictionnaire de* Martinière, 1730.) At present there is a large woollen-cloth manufactory employing 400 workmen; also a glass-work, which employs 100. This last manufactures annually 400,000 bottles, which are chiefly destined to Bretagne. Population, as given in the *Dictionnaire Universel de la France* (Paris, 1804), 1325. We have no later authority.

There was formerly a strong castle here, built upon a precipitous rock. West of the town is a considerable wood, above seven miles long, from N.N.W. to S.S.E. and two and a half miles wide, which takes from it the name of the Forest of Beaumont. (*Dictionnaire Universel de la France*, Paris, 1804.) Beaumont-le-Roger is in 49° 4′ N. lat., and 0° 46′ E. long.

Beaumont-sur-Sarthe, otherwise *Beaumont-le-Vicomte*, is a town in the former province of Maine, and the present department of Sarthe. It lies on the right (which, from the sinuous course of the river, is here the north) bank of the Sarthe; and on the road from Alençon to Tours: 12 miles S. of Alençon, and 127 miles W.S.W. of Paris; 48° 13′ N. lat., and 0° 6′ E. long.

This town takes its distinctive adjunct of *Le-Vicomte*, because built by the former viscounts of Mans. It was considered a place of considerable strength; and was several times taken and retaken in the wars which William the Conqueror, as Duke of Normandy, carried on with the counts of Maine. Henry IV. of France, during the lifetime of his father, and after the death of his elder brother, took from this town the title of Duc de Beaumont.

There are not any remains of the fortifications now. The manufactures of the town consist of linen cloth and serge. The population, in 1832, was 1918 for the town, and 2381 for the whole commune.

BEAUMONT, a commune of Hainault, bounded on the north by that of Thirimont; on the north-east by Streé; on the east by Brabançon and Clermont (the latter in the province of Namur); on the south-east by Solre Saint Gery; and on the west by the commune of Leval-Chaudeville.

The district is watered by the little river Beaumont, known also under the name of Hantes, which falls into the Sambre. In its course through Beaumont it gives motion to several mills, iron works, and establishments for sawing marble.

The town of Beaumont, which is situated on the high road from Mons to Chimay, is built on the summit of a pretty high hill, at the foot of which masses of rock are heaped together. This town is remarkable for the beauty of its site, which commands extensive views over a diversified country. A cattle market is held here on the 17th of every month, and four fairs during the year, at Easter, June, September, and November; there are, besides, two markets weekly.

Beaumont, formerly called *Bellomontium*, was, in the 11th century, the capital of a considerable lordship. The town was strongly fortified in the middle of the 16th century. It suffered much in the wars with France, and its castle was burnt by the French general, Count de Grand Pré, in 1660. The Spaniards ceded the place to the French in 1684; but by the treaty of Utrecht, it came into possession of the House of Austria. The English having taken the town in 1691, blew up the fortifications, of which nothing now remains but some towers and subterraneous passages, which show the former strength of the place.

To the north, west, and south of the town, is a group of steep hills, the sides of which would be inaccessible but by means of zigzag roads. Nearly the whole surface of the commune is broken by limestone and schistose rocks. The land fit for cultivation is of various qualities; the most productive consists of a mellow clay on a substratum of calcareous rock; in other places the soil is composed of decomposed schistus on a substratum of the same in an undecomposed state. The productions are wheat, rye, meslin, barley, oats, vetches, beans, potatoes, and various garden vegetables. Soils of the best quality are cropped without intermission during three, four, or five years, but other lands lie fallow every third year.

A limestone quarry, in which building stone is worked, gives employment to many of the inhabitants; others are employed in sawing blocks of marble brought from Barbançon and Cerfontaine, in Namur. Serges, and other woollens of coarse texture, are woven; and blond lace also is manufactured in Beaumont. The population in 1831 was 1868. (Meisser's *Dictionnaire Géographique de la Province de Hainault*, 1833.)

BEAUMONT, FRANCIS, the dramatist, third son of Francis, one of the judges of the Court of Common Pleas, and of Anne, daughter of George Pierrepoint, of Holme-Pierrepoint, in the county of Nottingham, was born at the family seat at Grace Dieu, in Leicestershire, 1586. The Beaumonts were not only an antient stock, probably of Norman origin, to judge from their name, but claimed to be descended of the kings of France, a claim which antiquaries have disputed. By an easy process, a like claim was made to connexion with the blood royal of England. Neither of the pretences, perhaps, had better foundation than in the lilies and lion rampart which they bore in their coat of arms: but whether just or not, the glory of the family consists in its literature; and the point, except as a matter of antique colouring, would not be worth mention, but that everything becomes interesting in connexion with a great name. We should look with curiosity upon the family seal of Beaumont, if we had it in our hands, just as we do upon the *speare* in the arms of *Shakspeare*. Our author's shield is the same as that which is borne by the family at present, and may be seen in any *Baronetage*.

At ten years of age (for people went earlier to the university in those days) Beaumont was admitted a gentleman-commoner at Broadgate's Hall, now Pembroke College, Oxford. He afterwards became a student in the Temple; married Ursula, daughter and co-heir of Henry Isley, of Sundridge, in Kent, by whom he had two daughters; died before he was thirty, in the spring of the year 1615; and was buried at the entrance of St. Benedict's Chapel, in Westminster Abbey, without any inscription. One of the daughters of Beaumont, Frances, was living at a great age in the year 1700, at which time she enjoyed an annuity of £100 from the Duke of Ormond, in whose family she had resided (say the biographers) as a "domestic;" by which is meant, perhaps, a companion: though, from the greater dispersion of the younger branches of families in those days, and their inability to pin themselves on public offices and pensions, we hear of them oftener in trades, and other humble situations, than we do now. This lady is said to have had in her possession several poems of her father's writing, which were lost during a voyage she made from Ireland.

The race of the Beaumonts, like that of the Fletchers, which is an interesting coincidence, appears to have abounded in the love of poetry. The biographers have noticed that there were four Francis Beaumonts all living in 1615, and that at least three of them were poets—Francis the dramatist; Francis, his cousin, master of the Charter House; and Francis a 'Jesuit;' the same, we presume, as Francis, one of the sons of his elder brother Sir John, probably too young to be a Jesuit at that time, but who became one after his father's death. This Sir John Beaumont, author of *Bosworth Field*, was a poet of real merit, as the reader may see by the collection of his verses in Chalmers's *English Poets*. His son and successor, another John, inherited his poetical tendency. Dr. Joseph Beaumont, master of Peter House, Cambridge, who lived in the time of the Charleses, and was of a branch of the family, though son of a woolstapler in Suffolk, is also known to poetical antiquaries as one of the writers from whom Pope thought a man might 'steal wisely.' He is furthermore commended for his Latin style, and for his taste in painting. Some pictures of his, we believe, are still extant in Peterhouse Chapel. The grandmother of the witty Villiers, Duke of Buckingham, was a Beaumont, of the same antient stock; the late Sir John Beaumont, the representative of the race, and the friend of poets and artists, was himself an artist; and as if all the blood connected with our dramatist was destined to be sprightly, the famous Lady Wortley Montague was a Pierrepoint, of the same race as Anne Pierrepoint, Beaumont's mother.

As Beaumont's life was so short, and his writings apparently so numerous, it is naturally supposed that he paid little attention to the law; a conclusion which might be drawn from his poetical genius. He probably gave himself up to the literature and amusements of the town. He records, in a celebrated epistle, his intimacy with Ben Jonson, and the other men of genius who assembled at the Mermaid Tavern; where, he says, they used to leave an air behind them, sufficient to make the two next companies witty.

'Methinks the little wit I had is lost,
Since I saw you: for wit is like a rest
Held up at tennis, which men do the best
With the best gamesters. What things have we seen
Done at the Mermaid! heard words that have been
So nimble, and so full of subtile flame,
As if that every one from whence they came
Had meant to put his whole wit in a jest,
And had resolved to live a fool the rest
Of his dull life; then where there had been thrown
Wit able enough to justify the town
For three days past,—wit that might warrant be
For the whole city to talk foolishly,
Till that were cancell'd; and when that was gone,
We left an air behind us which alone
Was able to make the two next companies
Right witty;—though but downright fools, mere wise.'

At this greatest of all literary clubs, he would meet with Shakspeare; and perhaps it was here he became acquainted with the illustrious friend with whom he was destined to become all but identified. The date of their first play is 1607, when our author was one-and-twenty. Fletcher was ten years older. According to Aubrey, the Boswell of those days, their connexion was, in every respect, singularly close. He says they not only lived in the same house, which was near the theatre, on the Surrey side of the river, but had their clothes, cloak, &c., between them, with other things in common, for which the curious reader must consult the original, which gave rise to a ludicrous instance of pious fraud on the part of Mr. Chalmers, when, with the alteration of a single, but important letter, he transferred the account to his *General Dictionary*, and his edition of the *English Poets*. Aubrey was credulous, and perhaps only repeated scandal which others laughed at; and as to the clothes and cloak, the two friends might have been seen to use them accidentally, upon some one or two occasions, which would have been quite enough for rumour to convert into a practice. Not but that a community of property in such a respect, between two such men, would be very possible, and an evidence of affection. The friendships of that age were of a more romantic cast than at present. Its poetry fell with more vigour into the prose of common life, and tinctured the whole stream.

A natural curiosity has existed, to know what were the distinguishing characteristics of the portions furnished to their common writings by these illustrious friends. It has generally been believed that Fletcher contributed the vivacity, and Beaumont the judgment. We can discover no foundation for this opinion, except the report; and suspect that there never was any. 'I have heard,' says Aubrey, 'Dr.

John Earle (since Bishop of Sarum) say, who knew them, that his (Beaumont's) maine business was to correct the overflowings of Mr. Fletcher's witt.' Yet Earle, in his verses upon Beaumont, expressly attributes to him whole plays, in which his genius is quite as exuberant as Fletcher's. Their editors in general are divided as to the property; tradition seems to have distributed it between them at random; and Mr. Seward, in an elaborate attempt to discriminate it, bewilders himself in refinements which end in giving them each other's qualities interchangeably, and protesting against his own distinction. If the miscellaneous poems attributed to Beaumont be his, especially the *Hermaphrodite*, (which Cleaveland claimed as a joint composition of himself and Randolph), there would be reason to suspect that his genius was naturally more exuberant than Fletcher's: and judging from the works which they are known to have produced separately, such as the *Faithful Shepherdess*, the *Masque*, and the *Epistle* just quoted, it appears to us that there is nothing to show for concluding that each might not have written either; except, indeed, that in the only undramatic copy of verses extant in Fletcher's name (*Upon an Honest Man's Fortune*), his muse is the graver of the two. The *Masque* is shorter than the *Pastoral;* but contains evidences of precisely the same moral and poetical tendencies, such as we shall speak of presently, when we characterize their common genius. Perhaps Beaumont, upon the whole, was the less lively of the two in company; and hence a fallacious conclusion might have been drawn, that he was the more critically judicious. The verses we have quoted do not look like it; and Shirley has left a testimony which argues for an equal division of property, even in talk. 'Gentlemen that remembered them,' he says, 'declare, that on every occasion they talked a comedy.' We are therefore inclined to think, that the reason which Aubrey gave for their strong personal attachment, applies with equal force to this question, and settles it in favour of our conclusion. 'There was a wonderful consimility of phansy,' he says, 'between him (Beaumont) and Mr. John Fletcher, which caused the dearenesse of friendship between them.' The 'wonderful consimility of phansy' was seen in their friendship, and in their plays. They loved one another fully and entirely, and exhibited the only great spectacle existing of two men writing in common, and puzzling posterity to know which was which, precisely because their faculties were identical. The case may be thought unlikely; in other words, the coincidence is unique; but who will deny that such chances of coincidence must exist? In this instance the two men actually happened to meet; and here, we think, ends the whole mystery.

Mr. Lamb, in his *Dramatic Specimens*, has assumed that Fletcher is the author of many plays which have been attributed to both writers; and he has criticised him by himself accordingly; we know not on what ground; probably from taking the authority of some edition for granted, for he is not likely to have read all the plays through, as Seward did, for the purpose of assigning the respective property; though nobody could have brought the question to a likelier conclusion, had he done so.

Another, and apparently more perplexing mystery remains, in the wonderful praises lavished by the writers of those times upon the decency and chastity of a muse, which to our eyes appears the strangest mixture of delicate sentiment and absolute prostitution. Beaumont and Fletcher are the dramatists of all others whom a liberal modern reader could the best endure to see in a castigated edition. Their ideas are sometimes even as loathsome as they are licentious. Schlegel has expressed his astonishment, how two poets and gentlemen could utter the things they do, nay, whole scenes; in some measure, whole plays; and Dryden, who availed himself in his dramas of all the license of the time of Charles II., said, in defending himself on that point, that one play of Beaumont and Fletcher's (the *Custom of the Country*) contained more indecency than all his put together. Yet these are the writers whom their contemporaries, including divines as well as fine gentlemen, compliment in the most emphatic manner upon their decorum and purity. Harris, then or subsequently Greek professor at Oxford, and called a 'second Chrysostom,' panegyrizes their muse for being 'chaste.' Dr. Maine, celebrated for his piety as well as wit, speaks of their 'chaste scene,' which

> 'Taught loves so noble, so reform'd, so clean,
> That they who brought foul fires, and thither came
> To bargain, went thence with a holy flame,'

Sir John Birkenhead says that Fletcher (who was son of a bishop) wrote

> 'As if his father's crosier awed the stage;'

and Dr. Earle (afterwards a bishop himself), not content with declaring that Beaumont's wit is 'untainted with obscenity,' protests that his writings are too 'pure,' and 'chaste,' and 'sainted,' to be called plays.

The solution of this mystery gives us an extraordinary idea of such plays of the time as have not come down to posterity, and of the distinction drawn by our ancestors between license of speech and conduct; for the panegyric appears to be almost wholly founded upon the comparative innocence of double meanings.

> 'Here, ye foul speakers, that pronounce the air
> Of stews and sewers,'

cries the gallant Lovelace, the Sir Philip Sydney of his day, speaking of the very comedy above-mentioned,—

> 'View here a loose thought said with such a grace,
> Minerva might have spoke in Venus' face;
> So well disguis'd, that 'twas conceived by none,
> But Cupid had Diana's linen on;'

and so he goes on, *objecting nothing to the thought, but* holding the example to be spotless, and desiring it to spread, as if for its own sake. It thus appears, that other writers used language,—homely words, or grosser images,—such as Beaumont and Fletcher never uttered; and if it were objected that Shakspeare, as well as several other dramatists, did not allow themselves a twentieth part of the license even of Beaumont and Fletcher, the reply would be, that the accomplished duumviri more expressly set themselves to represent the manners and conversation of high life and the town elegance, and that their ingenuity in avoiding cause of offence was therefore the more singular and meritorious. In truth, the language permitted in the circles of those days was very gross, and the license of behaviour corresponding. It is a great fallacy to suppose that loose manners among the English gentry originated with the court of Charles II. That of James I. was extremely licentious; and the consequences of it were only suppressed, and that chiefly in appearance, by the greater personal decorum of his son, and the powerful discountenance of the Puritans. It was nothing but the old stream that burst forth in the reign of Charles II., taking advantage of the weak points and fallen influence of the Puritans, to contrast its candour with their alleged hypocrisy, and pretend that impudence itself was a virtue.

Beaumont and Fletcher were two open-hearted men and genuine poets, spoilt by town breeding and the love of applause. It is a pity that two such poets could have been so spoilt; but still, in the best part of their genius, they survived the contamination, strong in their sympathy with the great nature that bestowed it, and 'pure in the last recesses of the mind.' Their muse is like some fair creature of exuberant temperament but invincibly good heart, who has retained the fineness of her disposition in spite of her bad habits and of the very superiority of her animal spirits to remorse, and who, in the midst of a vicious life, has still a belief in innocence and virtue. Even the purest characters in their plays are not free from an intermixture of things which they ought not to know or talk about; while the practical chastity is overwrought, and put to absurd and gratuitous trials, as if there could be no faith in it but from the most extravagant proof. In short, a something not entirely true to nature pervades almost all their writings, running side by side with the freshest and loveliest passages; and while one half of a scene, or sometimes of a speech, or even a couple of sentences, gushes out from the authors' heart, the other is brought from some fantastic fountain of court manners and talk, and produced for the sake of town effect. In this, we conceive, lies the whole secret of the inferiority of Beaumont and Fletcher to Shakspeare, and in some respects to Webster and others. To be sure, they may have wanted, by nature, a certain robustness of moral constitution like his, not unconnected perhaps with physical; but unlike any other great dramatists of their time, they were born and bred 'fine gentlemen,' educated in all the conventionalities and artificial manners of their time; and the applause that they gained from the world of fashion had too great an effect upon them, and divided their inspiration with nature.

A selection from the works of Beaumont and Fletcher would make as exquisite a volume, or two volumes, of refined sentiment, lofty and sweet poetry, excellent sense, humour and pathos, as any in the language, excepting Shakspeare and Chaucer. Nothing can surpass the tender delicacy of the page's scenes in 'Philaster,' the dignified sentiment in the 'Elder Brother,' the wit and happy extravagance in the 'Woman Hater' and the 'Little French Lawyer,' the pastoral luxuriance in the 'Faithful Shepherdess,' or the exquisite and virgin poetry scattered throughout the whole collection, sometimes in the midst of the most artificial and even disgusting passages.

In lyrics they have no equal, not Shakspeare himself, nor Milton. A miniature volume of the truest lyrical poetry might be collected out of their dramas,—of compositions which sing their own music. (*Dramatic Works of Beaumont and Fletcher*, 1778; *Biographia Britannica;* Chalmers's *British Poets;* Aubrey's *Letters and Lives of Eminent Men*, &c. &c.; and Lamb's *Specimens of English Dramatic Poets*, which contains some masterly criticism on those writers).

BEAUNE, a town of considerable size, and the capital of a sub-prefecture, or arrondissement, in the department of Côte d'Or, in France. It lies nearly under the S.E. slope of the ridge of Côte d'Or, and upon the little stream the Bouzoise[*], which rises just above the town, and uniting with the Meuzin, flows into the Saône. It is 23 miles S.S.W. of Dijon, and 206 miles S.E. of Paris; in 47° 2′ N. lat., and 4° 50′ E. long.

Beaune is situated in a fertile and agreeable country, celebrated for the wines which it produces. Both the red and white *Beaunois* wines are considered among the best in this part of France. They include the growth of Meursault, Mont Rachet, Pomard, and Volnay. The town itself, considered apart from its suburbs, is of an oval form, surrounded with an old wall ruined in many places, but the ramparts afford to the townsmen a good promenade. Our old authorities speak of four gates, those of St. Nicholas, St. Martin, La Bretonniere, and La Madeleine. Millin (*Voyage dans les Dép. du Midi de la France*, Paris, 1807) speaks of the 'new gate,' which, he says, is of tolerably good architecture. This is either a new entrance, or a re-erection of the gate of St. Nicholas.

The town is well built, with streets which are described by M. Millin as spacious. Before the revolution (we know not what change has taken place since), the town and suburbs consisted of five parishes, two in the town, and three in the suburbs. The parish church of Notre Dame, in the town, was collegiate before the revolution; it was the most antient in the diocese of Autun (in which Beaune was included), and one of the handsomest in the kingdom; but whether from any injuries sustained by it during the revolution, or from some other cause, it is now considered to be surpassed in beauty by the church of St. Pierre (or St. Peter), also in the town. Before the revolution, Beaune possessed several religious establishments. There were monasteries of Carthusians, Jacobins or Dominicans, Cordeliers, Capuchins, and Minims; nunneries for Carmelites, Dominicans, Ursulines, and nuns of the Visitation; and an abbey for Cistertian nuns. There was also a college, large and well built, conducted by the priests of the oratory; as well as a commandery of the order of Malta. Several of these establishments were in the suburbs.

Besides these institutions, now wholly or in great part suppressed, Beaune possessed two hospitals, which, so far as we can gather, still remain. One of these, for the sick, founded in 1443 by Nicholas Rollin, chancellor of the Duke of Burgundy, and farther enriched and embellished by his son Cardinal John Rollin, bishop of Autun, is of vast extent. Its architecture contains some remains in the Gothic style; and it constitutes the most remarkable edifice of Beaune. In the *Dictionnaire des Gaules*, &c., of Expilly (Paris, 1762), it is described as consisting of nine wards (*salles*), five of which were for the sick of the humbler classes, and four for invalids of a wealthier class, who paid for the attendance given them. How far this arrangement is still continued we are not aware: but a later authority, M. Millin, who travelled in 1804, attests that the hospital was then very well kept up. Louis XI., king of France, when he was looking over this hospital, is said to have replied to some one who was praising the charity of its founder, the Chancellor Rollin, 'It is just that he, who has made so many poor, should provide an hospital for their reception.' The duties of attendance at this hospital were performed by females bound by a religious vow, which they took only for a year, and when any one of them took her vows for the first time, she presented the establishment with twelve dozen turkeys, and the same number of chickens, of pigeons, of partridges, and of hares.

The other hospital is for orphans of both sexes, and for such poor persons as cannot maintain themselves. The inmates are employed in carding and spinning wool. There was formerly an establishment called 'La Chambre des Pauvres,' for affording relief to those destitute persons who were ashamed to beg, and to teach children of both sexes some trade. We know not whether it still exists.

Besides the hospitals, Beaune has a library, but it does not contain any valuable treasures (M. Millin); a *collège*, or high school; an agricultural society; a theatre; and a Vauxhall. It has a *Tribunal de première instance*, a court of justice which may perhaps be compared with our quarter sessions, and a *tribunal de commerce*, a committee of leading merchants or dealers, which takes cognizance of disputes in commercial affairs. Woollen cloths, serges and druggets, leather, cutlery, casks, and vinegar are among the articles manufactured here. There are in the neighbourhood quarries of granite, and of what our authority (the *Dictionnaire Universel de la France*) terms, 'pierre polie,' polished stone, perhaps marble.

Beaune has been asserted by some, but without reason, to be the Bibracte of Cæsar. (*Comment de B. G.*, lib. i. and vii.) It is not known to have existed in the time of the Romans, and is first mentioned in the *Chronicles of the Monasteries of Burgundy*. There are traces of a Roman road in the neighbourhood running east and west (on the east as far as the river Doubs), but this passed to the north of Beaune. The district was known under the designation of Pagus Belnisus, in the time of the kings of France of the Carlovingian race. Beaune was raised from being a mere petty place, or a castle, to the rank of a town, by Eudes III., duke of Burgundy, in the year 1203. Several of the dukes of Burgundy held their court here; and here also the parliament of Burgundy at one time sat. When the Burgundian States came into the hands of the French kings, Louis XII., king of France, built a castle here, which was considered the strongest place in Burgundy; but it was dismantled in 1602, by order of Henry IV., who feared that the party of the Maréchal de Biron would avail themselves of it in their projected revolt. Only the ruins of it now remain.

The inhabitants of Beaune amounted, in 1832, to 9272 for the town, or 9908 for the whole commune. They are reproached by the inhabitants of Dijon for their stupidity, and the most ridiculous stories are current respecting them. Piron, the dramatist, a native of Dijon, nearly lost his life when on a visit to Beaune; so much had he irritated the Beaunois by his sarcastic witticisms.

The arrondissement of Beaune comprehends 199 square miles, or 127,360 acres, and had, in 1832, a population of 117,996. There are in it 10 cantons, and 203 communes or parishes. (Martinière; Expilly; Millin; *Dictionnaire Universel de la France.*)

There is a small town (bourg) called Beaune (with the distinctive appendage *la-Rolande*, to distinguish it from the foregoing), in the arrondissement of Pithiviers, in the department of Loiret. It is on the road from Pithiviers to Montargis, and upon a small stream which falls into the Loing, an affluent of the Seine: in 48° 5′ N. lat., and 2° 26′ E. long.

It is said to have been once a place of greater importance, and to have belonged to the nephew of Charlemagne, the chivalric Roland (the Orlando of Ariosto), who gave it to the monks of the abbey of St. Denis. The growths of wine in the neighbourhood, though tolerably good, are yet far inferior to those of Beaune in the department of Côte d'Or. The population given in the *Dictionnaire Universel de la France* (Paris, 1804), was 2028. We have no later account.

The name of Beaune applies to several other places, all of inferior importance.

BEAUNE, commentator on Des Cartes. [See DES CARTES.]

BEAUPRE'AU, a town in France, the capital of a sub-prefecture or arrondissement in the department of Maine et Loire; perhaps about 213 road miles from Paris. It is in 47° 12′ N. lat., and 1° 0′ W. long. Beaupréau is on the right bank of the little river Evre, a tributary of the Loire, which falls into that river on its left or south bank, and is situated in a rich soil. It is a place of considerable trade: there are several manufactories of linens and handkerchiefs, of flannels, and other woollen fabrics. There are also dye-houses and tan-yards. The population in 1832 was 3207 for the whole commune.

---

[*] This name of the river we give from the great *Map of France*, by MM. Maraldi and Cassini. It is called in several of our authorities, Bougeoise, Boujoize, or Bourgeoise. It is distinctly stated by Martinière and Expilly, that Beaune is on this river, and herein they are supported by Maraldi and Cassini; but in the maps of A. H. Brué, (Paris, 1818,) and of the Society for the Diffusion of Useful Knowledge, the river is called Bouzoire, and is not made to pass within two or three miles of Beaune. This last discrepancy probably arises from the name being given to different branches of the same stream, and that laid down as the Bouzoire in the maps of Brué and the Society is undoubtedly the principal.

Prior to the Revolution there were two parish churches, and a third, a collegiate church; but the revenues of the latter were small, and its clergy far from numerous. The territory of Beaupréau gave successively the title of baron, marquis, and duke, to its possessors.

The arrondissement of Beaupréau comprehends 560 square miles, or 358,400 acres; and had in 1832 a population of 104,947.

BEAUSOBRE, ISAAC, was born in 1659 at Niort, in the province of Poitou. His ancestors had emigrated from France on account of their being Protestants, at the time of the St. Bartholomew, but returned afterwards in consequence of the edict of Nantes. Young Beausobre studied at Saumur, was afterwards ordained, and took charge of the Protestant church of Châtillon sur Indre, in Touraine. When Louis XIV. renewed the persecution against the Protestants, by the revocation of the edict of Nantes, in 1685, the church of Châtillon was closed, and the gates sealed by the King's officers. Beausobre broke the seals, and preached as usual on the Sunday, in consequence of which he was obliged to take refuge in Holland. From Holland he went to Dessau, in 1686, as chaplain to the Princess of Anhalt Dessau. His first work was *Défense de la Doctrine des Réformés*, Magdeburg, 1693. In 1694 he removed to Berlin, and took charge of one of the French Protestant churches in that capital. He was afterwards made chaplain to the court, inspector of the French college, &c. He enjoyed the favour of the King, Frederic William I., whose son, the Crown Prince, afterwards the Great Frederic, also conceived great regard for him. Beausobre passed the remaining forty-six years of his life at Berlin, where he died in June, 1738, much regretted, both on account of his personal character and his extensive learning. He wrote numerous works, the principal of which is his *Histoire critique de Manichée et du Manichéisme*, 2 vols. 4to. 1734-9. The first part of this work is historical. The author derives his account of Manes, or Mani, from Syrian, Persian, and Arabic authorities, and exhibits the great discrepancy existing between their narratives and those of the Greek and Latin writers. He characterizes the history of Manes, which is attributed to Archelaus Bishop of Cascar or Carcar, in Mesopotamia, as a romance published 60 years after Manes' death. (*Acta Disputationis Archelai Episcopi Mesopotamiæ et Manetis Heresiarchæ*, in Zuccagni's *Monumenta Ecclesiæ*, Rome, 1698.) The second part treats of the doctrines, rites, church discipline, and morals of the Manicheans. Beausobre discards many absurdities attributed to that sect, and refutes many odious charges brought against it. He exposes and examines impartially their real tenets, their practices, and their superstitions. The work is full of varied and interesting erudition. The second volume was edited by Formey after Beausobre's death, with a short biography of the author by the editor. Beausobre intended to add a third volume, relative to the modern sects which have been accused of Manicheism. He undertook, with L'Enfant, a French version of the New Testament from the Greek text, which contains a long and valuable introduction, and numerous explanatory notes: 2 vols. 8vo. Amsterdam, 1718, reprinted in 1741. The introduction was translated into English, London, 1726, and is used in some colleges in the English Universities. He also began a history of the Reformation on a very large scale, which he left in an imperfect state. It was published at Berlin in 1785, in 4 vols. 8vo. In conjunction with other literary men, he began the journal and review called *Bibliothèque Germanique*, the first volume of which appeared in 1720, and which was carried to the fiftieth volume. Beausobre continued to the last to be one of the principal contributors, and wrote nearly half of each volume. This work was chiefly engrossed by notices of works of German writers, and also of writers of the northern kingdoms, Denmark, Sweden, Poland, &c. The chief object was to make these writers known to the rest of Europe through the medium of the French language, in which the journal was written. A sequel to this work was begun after Beausobre's death by Mr. Formey, under the title of *Nouvelle Bibliothèque Germanique*. Beausobre wrote also *Remarques critiques et philologiques sur le nouveau Testament*, published after his death at la Haye (the Hague), 2 vols. 4to. His *Sermons*, in 4 vols. 8vo., are considered worthy to be placed by the side of the *Sermons* of Saurin. Beausobre left several other works in MS., complete and incomplete, especially on the various sects of the dark ages, the Paulicians, the Albigenses, &c.

BEAUSSE, or **BEAUCE,** or, as it is written in some very old maps, **BEAULSE,** a district in the former province of Orléannois in France. As this district never formed a distinct jurisdiction, either civil or ecclesiastical, its limits are very vague and undetermined. It included, at any rate, the territories of Chartrain, Dunois, and Vendômois (Expilly, *Dictionnaire des Gaules*); and according to other authorities it included also portions of Orléannois Proper, and Gâtinois, and even of Hurepoix and Mantois, which were in the Ile de France. It extended from about 25 miles south of Paris, on one side to the Loire, and on the other to the Canal de Briare. (*Dictionnaire Universel de la France*, and *Encyclopédie Méthodique*.) The country consists of an elevated plain, or table-land, marked in some maps as the Plateau d'Orléans, in which not a mountain is seen; and though it lies between two of the principal rivers of France (the Seine and the Loire), yet the running waters are very few. From the scarcity of springs and streams, the inhabitants are obliged to have tanks and pools to preserve the rain water. They have also some wells, which the elevation of the surface obliges them to make very deep, but the water is not good. Notwithstanding the want of water, the country is however so productive in wheat, that it has acquired the title of the granary of Paris. (Piganiol de la Force.) A great quantity of sheep are also fed here; and the shepherds were formerly in high repute among the simple peasantry for knowledge which was really neither within their possession nor their reach. Mutton and wheat appear to be the only products of the district of any consequence. There are no vines or woods to any extent.

Chartres, the principal city in this district, contained in 1832 13,576 inhabitants in the town, or 14,439 in the whole commune. The other chief places are Châteaudun, formerly capital of Dunois (population 6461), and Vendôme (population 6590 for the town, or 7771 for the whole commune), capital of the Vendômois. [See Chartres, Chateaudun, and Vendôme.]

The name Beauce, in a more restricted application, is given to the district of Chartrain. The Latin form of it is Belsia, or Belsa, and it occurs in the writings of Fortunatus, an author of the latter part of the sixth century.

BEAUTY is that quality in visible objects in consequence of which their colours and forms are agreeable to the human mind. The word *beauty* (as Mr. D. Stewart observes, *Essay on Beauty*, c. ii.) was first applied to objects perceptible by the sight; and, by an easy transition, it has been extended to objects perceptible by the hearing; as when we speak of beautiful music, a beautiful tune, voice, &c. The instances of words which properly signify an impression on one sense being used to signify an impression on another sense are very numerous: thus we sometimes pass from the sight to the touch, as when we speak of lightness or heaviness of form and of colour; from the touch to the hearing, as a sharp, piercing, thrilling, penetrating, or heavy sound; from the touch to the smell, as a pungent smell; from the touch to the sight, as harsh and soft colouring; from the hearing to the sight, as monotony of colour, tone of a picture, harmony of colours; from the taste to the sight, as mellow colouring; from the taste to the hearing, as sweet music.

This proneness to transfer words from one object of sense to another does not, however (as Mr. Stewart remarks), explain why the word *beauty* should be extended only to agreeable *sounds*, and not to agreeable *tastes* or *odours*. That, however, there is a closer affinity between the perceptions of sight and hearing than between those of sight and any other sense, it is not difficult to perceive; and the fact is satisfactorily traced by the same writer to the following causes:—1. The *picturesque* effect which custom, in many instances, gives to sounds; as when a tune calls up the image of a person's home or the haunts of his childhood. 2. The *expressive* power of sounds, as in the case of the human voice, when the expression of the countenance corresponds with the tones of the voice and the meaning of the words which it utters. 3. The significant power of sounds, in consequence of conventional speech. In this way they every moment present pictures to the imagination; and we apply to the description as to the thing described (with hardly any consciousness of speaking figuratively) such words as *lively*, *glowing*, *luminous*, *splendid*, *picturesque*. 'To these considerations should be added (as the same writer justly observes), as a cause conspiring powerfully to the same end, the intimate association which, in our apprehensions, is formed between the eye and the ear, as the great inlets of our acquired knowledge, as the only *media* by which different minds can communicate together, and as the organs by which we receive from the material world the two classes of pleasures which, while they surpass all the rest in variety and in duration, are the most completely removed from the grossness of animal indulgence, and the most nearly allied to the enjoyments of the intellect. The unconsciousness we have in both these senses of any local impression on our bodily frame may perhaps help to explain the peculiar facility with which their perceptions blend themselves with other pleasures of a rank still nobler and more refined.' (Ibid. c. vi.)

But although the epithet *beautiful* is never applied to the perceptions of any sense except those of seeing and hearing, yet it is extended to the results of some intellectual processes, as when we speak of a beautiful chain of reasoning, a beautiful poem, a beautiful metaphor, a beautiful language, a beautiful machine, a beautiful contrivance of nature, &c. When the word *beauty* is thus employed, it is merely a vague term of praise, and is nearly synonymous with *admirable*. 'The word beauty (as Mr. Knight remarks) is often applied to a syllogism or a problem; but then it means clearness, point, or precision, or *whatever else be the characteristic excellence of that to which it is applied*.' (*Inquiry into the Principles of Taste*, p. 259.) As the effect of beauty in visible objects is to produce admiration, all beautiful objects are also admirable; and thence it was an easy step to apply the epithet beautiful to things which produced admiration, although this feeling did not arise from the cause which produces it in the contemplation of visible objects. Similar transfers may be observed in other words: thus the word *law* properly signifies a general command given by one intelligent being to another; but because the *effect* of such a command is to produce an uniformity of conduct in the persons to whom it is addressed, the term *law* has been extended to those operations of nature in which an uniformity of phenomena prevails, although the *cause* of the uniformity is altogether different. [See ANALOGY.]

In the following remarks on the nature and causes of beauty, we shall limit ourselves to the original and appropriate meaning of the word in question, viz., the beauty of *visible objects*.

The beauty of visible objects consists of two parts, viz., the *beauty of colour* and the *beauty of form*, which, although closely connected with each other, arise from different sources, and from sources of a different character, inasmuch as the one appears to be, in most cases, a simple emotion, and therefore an ultimate fact, of which no explanation can be given, while the other is a pleasure derived from association, which is susceptible of analysis.

There cannot, in our opinion, be any doubt that certain colours, and certain arrangements of colours, are naturally, and in themselves, pleasing to the eye. Children are observed to take delight in brilliant colours before they have learnt to connect any agreeable ideas with them. The analogy of the other senses would, *à priori*, lead to this conclusion: for as there are certain odours, tastes, and sounds, which are naturally pleasing or displeasing to the nose, the tongue, and the ear, so it may be presumed that there are certain colours, and combinations of colours, which are naturally pleasing or displeasing to the eye. Although, as will be presently shown, one branch of beauty is entirely founded on association, the feeling of beauty cannot be derived from association *alone*. 'It is the province of association (as Mr. Stewart has justly observed) to impart to one thing the agreeable or disagreeable effect of another; but association can never account for the *origin* of a class of pleasures different in kind from all the others we know. If there was nothing originally and intrinsically pleasing or beautiful, the associating principle would have no materials on which it could operate.' (*Essay* i. c. 6.)

This origin of the feeling of beauty appears to us to consist in the pleasure derived from the contemplation of colours, a pleasure, in most cases, purely sensual and organic, and as incapable of explanation as the pleasure derived to the mind through the medium of the ear from the harmony of sweet sounds. An instance of purely sensual beauty is afforded by *precious stones*, which all ages and nations, antient and modern, barbarous and uncivilized, have agreed in admiring. That their beauty does not arise from any collateral associations of their durability and hardness is evident from this, that in the unpolished state, when they are equally hard and durable, they excite no admiration. The precious *metals* also are beautiful for the same reason; though they have other qualities besides their beauty which give them exchangeable value: whereas the value of precious stones is almost exclusively owing to their beauty. Flowers, the plumage of birds, the rainbow, the setting sun, the clear blue expanse of the sky or the sea, also derive their beauty in great measure from the mere sensual impression on the organ of sight. Indeed, there are only a few cases (such as that of the beauty of complexion, which will be mentioned below), in which the beauty of colour is derived from association, and therefore admits of a resolution into simpler elements.

The beauty of *form* belongs altogether to a different category, and is derived (as we shall attempt to show) from an association inseparably connected with the form of any object, and necessarily and instantaneously suggested by it, viz., its adaptation to the purpose which it is intended to fulfil. The beauty of form, as arising from this source, is however subject to certain conditions, the chief of which is, that the object should either possess the beauty of colour, or at least should be of such a colour as is completely inoffensive to the eye. The manner in which the organic emotion works back upon the pleasure of association is well illustrated by the following remarks of Mr. Payne Knight:—'The habit,' he says, 'which we acquire of spontaneously mixing associated ideas with organic perceptions, in contemplating objects of vision, is the principal reason why the merely sensual pleasures of this organ are in adult persons very limited and feeble. Children are delighted with every gay assemblage of colours, but as the intellect and imagination acquire strength by culture and exercise, they obtain so much influence over the sense as to make it reject almost every gratification in which one of them does not participate. But nevertheless the sense acquires a similar negative power, in its turn, by the same habit of association; and if there be anything in the object of contemplation to offend or disgust, it effectually mars the gratification of every other faculty. Thus, in the higher class of landscapes, whether in nature or in art, the mere sensual gratification of the eye is comparatively so small as scarcely to be attended to; but yet if there occur a single spot, either in the scene or the picture, offensively harsh and glaring, all the magic instantly vanishes, and the imagination avenges the injury offered to the sense. The glaring and inharmonious spot, being the most prominent and obtrusive, irresistibly attracts the attention, so as to interrupt the repose of the whole, and leave the mind no place to rest upon. It is in some respects the same with the sense of hearing. The mere sensual gratification arising from the melody of an actor's voice is a very small part, indeed, of the pleasure which we receive from the representation of a fine drama; but, nevertheless, if a single note of the voice be absolutely cracked and out of tune, so as to offend and disgust the ear, it will completely destroy the effect of the most skilful acting, and render all the sublimity and pathos of the finest tragedy ludicrous.'—p. 95.

The beauty of form, although in strictness not connected with the colour of any object, is nevertheless so far dependent on it, that if the colour should be offensive to the eye, the pleasure derived from the beauty of form is much impaired, or is even destroyed. Beauty of form, as arising from the fitness of the form for its end, requires that the colour of the object should be such as shall not interfere with the effect produced by the mutual relations of its parts.

There is, however, another condition for the existence of beauty of form, beyond the perception of its fitness to its purpose, the statement of which will complete our definition of this kind of beauty. If, then, those colours are either absent or present, whose absence or presence is essential to the perception of beauty in any object, simply as an organic impression, the beauty of form in any object mainly depends on our sense of its adaptation to the end for which it is destined, provided that this end is *agreeable to contemplate*, and is such that the mind *dwells on it with pleasure.* Hence the form of the antelope, the swan, or the tiger, is considered beautiful, because we take a satisfaction in contemplating the movements which those forms are admirably fitted to produce; but the form of the pig's snout is not considered beautiful, because the mind flies with disgust from the filthy purposes for which that animal employs it. So likewise we call the outward form of the arms, legs, neck, &c., of the human figure beautiful, when their form is suited to their respective uses; but no one finds any beauty in the form of the human stomach, or intestines, or liver, though equally well fitted for their several ends, because they suggest the notion of processes which men do not willingly contemplate. (Burke's *Sublime and Beautiful,* part iii. s. 6—8.)

Perhaps, in strictness, it might be thought that the simple emotion derived from the *colour* of objects is alone properly entitled to be considered as the feeling of beauty; and that the beauty of *form* in any object, derived from a sense of its fitness to its end, is only a pleasing association, allied indeed to the feeling of beauty by a close analogy, but still distinct from it. This question (which in fact is merely verbal) we have not sufficient space to discuss at length; nevertheless it appears to us that all ages and nations have agreed in speaking of the beauty of *form* as well as of *colour,* and that we are justified in considering as included in the feeling of beauty those emotions which are susceptible of analysis, as well as those which are not.

Having made these general remarks, we will proceed to explain, with somewhat more detail, the application of the principles last stated.

The *beauty of form,* arising from a perception of utility, or of fitness of certain means to produce a certain end, may be observed both in animate and inanimate objects – in the works both of nature and of art. In animate beings we are gratified by the recognition that a certain form is suited to the wants of the animal, and that certain desired effects or motions are produced with ease and little effort. It is on this principle that we admire the beauty of the human form, every part of which is perfectly fitted for its intended purposes, and that we admire the motions of a horse, a stag, a greyhound, or a cat, as being made without any apparent trouble or difficulty, and as the result of a power which accomplishes its end with the least possible expense of exertion. The same feeling which makes us take pleasure in movements and forms which indicate ease, leads us likewise to dislike those which express constraint and toil: hence, both in nature and art, all forced and laboured attitudes, all tension of muscle, all visible and overstrained efforts to produce a certain effect, or to express a certain feeling (which is the source of affectation in art), are offensive to the taste. And thus all angular and jerking action, and all heavy dragging of the limbs, are devoid of beauty, as being signs of violent and toilsome effort, and as equally removed, though in contrary ways, from that equable, flowing, and easy motion in which grace consists. Nor is it only in animals that the marks of ease are agreeable to us; the varied, flowing, and irregular outline which characterizes the free growth of plants, is beautiful on the same principle: 'wherever (as Mr. Alison remarks) we find vegetables, or any other delicate body, assume a winding form, we are impressed with the conviction of its being easy, agreeable to their nature, and free from force or constraint. On the contrary, when such bodies in the line of their progress assume angular forms, we have a strong impression of the operation of force, of something that either prevents them from their natural direction, or that constrains them to assume an unnatural one.' (*Essay on Taste,* vol. i. p. 334.) It was the perception of this fact which induced Hogarth to imagine that beauty of outline consists in its serpentine direction, which is true of those animate and organized beings whose wants require them to assume this shape; but does not apply to other objects, such as buildings or walks, in which convenience requires a straight or angular form, and in which a straight or angular form is therefore beautiful. The beauty of *proportion* or *symmetry* in the forms of animals is likewise derived from a sense of utility; for it is manifest that small limbs would not suit the wants of a large body; that a large foot would be an incumbrance to a small leg; that a large hand would be an incumbrance to a small arm, &c. For the same reason different animals have different proportions, as their bodies are formed on different scales and adapted to different purposes; and thus the form or size which is beautiful in one animal would be monstrous in another, as if the long neck of the camelopard, an animal living on the leaves of trees, were given to the lion, whose teeth and claws are adapted to seizing and tearing the flesh of animals; or if the antlers of a stag were fixed on the forehead of a dog. (Horace, *De Arte Poet.*, at the beginning; on some exceptions to this principle, see Hogarth's *Analysis of Beauty,* c. 6; Müller's *Archæologie der Kunst,* p. 11.) And thus the limbs of the human body, or the features of the human face, are beautiful only in their proper places, when they are taken in combination with the other parts of the body, and so manifestly suggest the notion that they are fitted to perform their respective offices.

> ''Tis not a lip or cheek we beauty call,
> But the joint force and full result of all.'

All incongruous combinations in animate beings are contrary to beauty: for example, the pink and white complexion, which suits the delicacy and weakness of the female form and character, is less becoming to man than the dark-red and brown, which characterize the sun-burnt cheek of a person accustomed to rural labours, to athletic exercises, to field-sports, and to a military or naval life. Feminine forms and colours are sometimes admired in young men; and in women, as in gipsies, a dark complexion is often extremely beautiful: but an effeminate appearance is not in general more approved in men than an effeminate mind; and muscular or athletic forms in women are commonly considered coarse and clumsy, a judgment confirmed by the taste of the Greek artists, who, in representing Diana as a huntress, with her dogs, her arrows, and her garments girded up for running, never give her a masculine form.

Hence the *middle* form in the different species of animals is the most beautiful; that is to say, it is that abstract form at which the painter or sculptor arrives by rejecting all the faulty extremes, and which he takes as the type from which the varieties of individuals diverge in different directions. Thus the most beautiful size in man is between a giant and a dwarf; or, to take an instance in a single feature, the most beautiful form of the nose is when the outline is straight: any deviation from this form on either side, so as to make it like that of the fauns in Greek sculpture, or to give it a protuberance, is injurious to the beauty of the human countenance. (See Müller, *Archæol. der Kunst,* s. 329, n. 5.) And as it is with the general form of the human race, or of the several limbs and features, so is it with particular classes. Thus, 'though the forms of childhood and age differ exceedingly, there is a common form in childhood and a common form in age, which is the more perfect, as it is the more remote from all peculiarities.' (Reynolds' *Discourse* 3.) Reynolds, however, is mistaken when he goes on to say that the middle form is beautiful because it is the most common (see *Idler,* No. 82); for, as has been truly remarked, there are many forms of frequent and ordinary occurrence which are by no means beautiful. The beauty of the middle form arises from its being that which is the most suited to the purposes and wants of the animal: thus if a nose, a mouth, or an eye was very much above, or very much below the average size, it would either be inconvenient from its magnitude, or incapable of performing its functions on account of its smallness. Having once established this maxim in our minds, we forget, as in many other instances, the principle on which it is founded; and although a nose, for example, would be equally fitted for its purposes if it deviated slightly from the straight line, yet we consider that line alone as the standard of ideal beauty.

The reason why we are gratified by the perception of congruity or fitness in the general structure of an animate body and of its several component parts, by the appearance of ease and grace in the movements of animals, and universally by all the marks of activity, vigour, energy, and health, is that we are gratified by the absence of suffering, as we are pained by its presence, as when a person not hardened by custom to such sights witnesses an execution, a surgical operation, the slaughter of animals, a field of battle covered with the dead and dying, a hospital, &c. Hence all those objects which suggest the notion of pain, discomfort, or decay, are devoid of beauty. Such is the case with animals, as the elephant or the hippopotamus, which are heavy and cumbrous in their shape and appear to drag their limbs with difficulty and effort; suggesting none of those impressions of joy and satisfaction in the animal, exulting in its strength and agility, which are occasioned by the unshackled movements of the horse, the antelope, or the stag. (See the comparison of the horse at the end of the 6th *Iliad.*) Hence likewise all deformity in animals is inconsistent with beauty, and is ugly in proportion as the shape of the limb or body deviates from the standard form, and is unfitted for the purposes for which it is intended. 'The disgust,' says Mr. Stewart, 'which monstrous animal productions produce seems to arise principally from some idea of pain or suffering connected with their existence; or from the obvious unfitness of the structure of the individual for the destined purposes of his species. No similar emotion,' he continues, 'is excited by an analogous appearance in the vegetable or in the mineral kingdoms; or even by those phenomena which contradict the uniform tenor of our past experience with respect to nature's most obvious and familiar laws.' (c. 7.) The reason of this difference is, that in inanimate objects which deviate from their ordinary and natural form there is no cause for painful sympathy, as the object is unconscious of its defective structure. In the cultivation of flowers and ornamental trees, the object indeed is for the most part to produce an artificial, and to a certain degree a monstrous size; which all must admit to be more beautiful than the natural and unimproved state of the plant. But even in this respect there is a limit; and although the size consistent with beauty in the vegetable kingdom is indefinite, it is not quite unlimited. An oak as high as a mountain would probably cease to be beautiful; and even the diseased growths and protuberances in trees would become displeasing to the sight, if they were enlarged to an excessive size.

For the same reason that deformity in animals is inconsistent with beauty, all appearance of disease, decay, and death is loathsome and hideous: as the ghastly look of a bleeding wound, the convulsive movements of agony, the pale, livid, or emaciated countenance of a person expiring under the rapid progress of a pestilential disease, or wasting away with famine, atrophy, or consumption, the mouldering remains of a dead body, or the empty frame of a skeleton. Hence, when Romeo is described by Shakspeare as descending into the vault, in order to see Juliet's corpse, he says, on discovering that the bloom had not faded from her face,

'O my love! my wife!
Death, that hath suck'd the honey of thy breath,
Hath had no power *yet* upon thy beauty.
Thou art not conquered: beauty's ensign yet
Is crimson in thy lips, and in thy cheeks,
And death's pale flag is not advanced there.'

The same feelings are transferred by us to the vegetable kingdom, though with a great diminution of their intensity: thus the yellow or brown colour of the faded leaf is for the most part less beautiful than the brilliant and vivid green of spring and summer vegetation; nevertheless, there is probably no person at all alive to the beauties of external nature who has not admired the rich and varied tints of an autumn landscape, produced by the irregular discolouration of the leaf. When, however, decay has completed its work, all beauty vanishes; and a tree quite bared of its leaves has nothing more to recommend it to the eye than if it were actually dead. And when a tree has through age or by accident undergone a partial decay, its beauty is impaired, though its wreck may still suggest agreeable notions of power and grandeur, the memory of former vigour, of resistance to time and the elements, or to the destructive agents of nature. Such are in part the feelings excited by the sublime picture of Milton:—

'As when heaven's fire
Hath scathed the forest oaks or mountain pines,
With singed top their stately growth, though bare,
Stands on the blasted heath.'

In general, however, all appearance of poverty, meagreness, or decline of vegetation is, unless compensated by countervailing circumstances, unfavourable to beauty. (See Price's *Essay on Beauty*, p. 29.)

The beauty derived from a perception of utility is not confined to the works of nature, but is common to the works of constructive art, in which the adaptation of means to ends is equally observable, and in which there is a similar correspondence of the constituent parts. Thus in buildings each different part has a manifest and visible purpose—as the column to support a weight on the ground, the arch to support a weight over an opening, the windows to admit light and air, the projection of the roof to throw the rain-water from the walls, &c. Every part of a building has therefore its peculiar form and beauty, dependent on its destination. And the same is the case with different *kinds* of building: the disposition of parts which would be beautiful in a church or a palace, would be displeasing and absurd in a cottage or a fortified castle. 'Grecian temples, Gothic abbeys, and feudal castles,' says Mr. Payne Knight, 'were all well adapted to their respective uses, circumstances, and situations: the distribution of the parts subservient to the purposes of the whole; and the ornaments and decorations suited to the character of the parts, and to the manners, habits, and employments of the persons who were to occupy them: but the house of an English nobleman of the eighteenth or nineteenth century is neither a Grecian temple, a Gothic abbey, nor a feudal castle; and if the style or distribution, or decoration of either be employed in it, such changes and modifications should be admitted as may adapt it to existing circumstances; otherwise the scale of its exactitude becomes that of its incongruity, and the deviation from principle proportioned to the fidelity of imitation.' (*On Taste*, part ii. ch. 2. §. 54; see also Lord Aberdeen on *Grecian Architecture*, p. 26-35.)

For a similar reason all ornament in architecture should be subordinate to use, and should grow out of and be suggested by it: whence professed architects, with whom the idea of decoration is predominant, often fail in their attempts to produce beauty, and in many cases seem rather to adapt the building to the ornaments than the ornaments to the building. Accordingly it may be observed, that engineers whose attention is solely directed to the *use* of that which they plan, often construct more *beautiful* buildings than persons with whom beauty is the chief consideration. And generally it may be observed, that all ornament, if accumulated to an excessive degree, either from a love of gaudy magnificence, or for the sake of ostentation, is devoid of beauty.

' 'Tis use alone that sanctifies expense,
And splendour borrows all her rays from sense.'

For the same reason that neatness, freshness, and regularity are pleasing to us in buildings, as being associated with the ideas of comfort and enjoyment, 'we require,' as Mr. Knight has observed, 'that immediately adjoining the dwellings of opulence and luxury, everything should assume its character, and not only be, but appear to be dressed and cultivated. In such situations neat gravel walks, mown turf, and flowering plants and shrubs, trained and distributed by art, are perfectly in character.' (ii. 2. 29.) In laying out the direction of roads or walks, the beauty of the line is likewise determined by its fitness. Thus in an open and level plain a straight line is most agreeable to the eye; in broken and irregular ground, the line which adapts itself to the shape of the country, by constantly keeping the same level, is to be preferred. The pleasure which is felt in following the windings of a road carried through a mountain-pass, and creeping round the declivities of the rocks, is enhanced by a sense of skill in the contriver and executor, and of difficulty successfully overcome.

The beauty of furniture and dress is likewise in a great measure derived from their *fitness*; though, with regard to dress in particular, our taste is liable to be determined by many independent, and often conflicting, considerations, as novelty, fashion, &c., some of which will be mentioned below. Symmetry of parts, which the eye often so rigidly exacts in architecture, in gardening, in the internal decoration of a house, in dress, &c., arises in great measure from a sense of utility: thus, for example, in the construction of a house, the entrance is obviously best placed in the centre of the wall, as it affords the easiest communication to the various parts of the building: the windows are most convenient if they are at nearly equal distances from each other, and are not crowded together in some places and separated by wide intervals in others: the columns best perform their work if they are separated by equal spaces, and therefore support equal weights*. The pleasure derived from symmetry in works of art is, however, not confined to its *beauty*, but in part arises from the evidence which it affords of an uniform and extensive plan having been conceived and executed, and in part from that satisfaction which we take in the perception of resemblances, as well in outward objects as in the efforts of wit and imagination. It was probably the latter feeling (combined, however, with an excessive attempt to imitate in the garden the forms of architecture) which gave rise to the style of gardening described by Pope, in which

---

* The principle of the *sufficient reason* by which Mr. Stewart, c. 2 and 4, explains the beauty of symmetry in works of art, appears to us to be included in that of fitness; for if there is no reason why a door should be placed nearer one than the other end of a house, why a picture should be hung nearer one than the other end of a room, the middle is evidently the fittest place. Hence in cases where there is an evident fitness in irregularity, symmetry is not beautiful. 'An irregular castellated edifice (says Mr. Stewart) set down on a dead flat, conveys an idea of whim or folly in the designer. . . . The same, or yet greater irregularity, would not only satisfy but delight the eye in an antient citadel, whose groundwork and elevations followed the rugged surface and fantastic projections of the rock on which it is built. The oblique position of a window in a house would be intolerable; but utility, or rather necessity, reconciles the eye to it at once in the cabin of a ship.'—c. 2.

> 'Grove nods at grove, each alley has its brother,
> And half the platform just reflects the other.'—(*Epist.* 4.)

This formal style of gardening was founded on a just sentiment of what is suited to the immediate neighbourhood of a house, both in respect of the comfort of the inhabitants and the agreement with architectural forms; but in clipping shrubs into unnatural and fantastic shapes, and in laying out the ground in over-minute and complicated patterns, it sometimes carried a just principle to a vicious excess. (See Walpole's history of the modern taste in gardening in his *Anecdotes of Painting;* and Whately *On Gardening*, §. 139—47.)

The garden, in fact, forms the *transition* from the forms of architecture to those of landscape, and is a sort of middle term by which the hard, angular, and precise forms of art are melted into the flowing, irregular, and infinitely varied outlines of nature. Hence the quantity and character of the ornament in a garden ought to depend on the style of the building to which it belongs; and thus a richly decorated garden would not harmonize with a perfectly plain house: and, on the other hand, a large building loaded with architectural ornament seems to require something more than a few shrubs, planted irregularly around it, which scarcely differ in character from the neighbouring country. It is on this principle that small cottages and houses, which make no pretension to architectural beauty, are much improved by the growth of creepers and other plants upon their walls, which, as it were, makes them a part of the surrounding vegetation. On the other hand, in buildings which, from their imposing size and elaborate execution, have an independent character of their own, creepers usually suggest a notion of discomfort and neglect, a feeling which has no place if the building is not inhabited by man, and which, therefore, is not awakened by the sight of an antient mouldering ruin overgrown with ivy. (See Price *On the Picturesque*, vol. i. p. 287, vol. ii. pp. 134, 170, 177, 218; Lord Aberdeen *On Grecian Architecture*, p. 45.)

The perception of fitness or congruity appears to us to account for the beauty of form in nearly all cases, and occasionally for the beauty of colour: there are, however, other circumstances which contribute to produce or heighten that feeling, or are conditions necessary to its existence. Such, for example, is the beauty of *expression* in the human countenance when the notion conveyed to the mind is that of benevolence, cheerfulness, tranquillity, innocence, simplicity, or affection. (See Bacon's *Essay on Beauty*.) The distinctness and rapidity with which the eyes express the emotions of the mind contribute very powerfully to their beauty. *Novelty* likewise is, to a certain extent, essential to the perception of beauty; and as the most beautiful object would, by its continual presence, soon pall upon the sight, and produce complete indifference, so objects, whose beauty will not bear close examination, and is only calculated to please for a time, are agreeable merely from their novelty and freshness. This is the case to a great extent with fashions in dress, which are continually changing, and in which the newest fashion often seems the most beautiful, although it may have no other recommendation than its novelty. It does not, however, seem to us satisfactory to explain the beauty of modes of dress by saying, that 'while they were in fashion they were the forms and colours which distinguished the rich and the noble, the eminent, the envied, the observed in society; they were the forms and the colours in which all that was beautiful, and admired, and exalted, were habitually arrayed. They were associated therefore with ideas of opulence, and elegance, and gaiety, and all that is captivating and bewitching in manners, fortune, and situation, and *derived the whole of their beauty from those associations*.' (*Encycl. Britan.*, art. 'Beauty,' Suppl. vol ii. p. 186.) For, in the first place, there is always a certain regard to utility in all kinds of dress and ornament for the person: colours are selected with reference to the colour of the complexion or hair, different dresses become the young and old, &c.; and those forms are usually chosen which, if not the *most* adapted to the motion of the limbs and the display of the natural beauties, are at least *consistent with them*. (See Hogarth's *Analysis of Beauty*, c. 6, ad fin.) Caprice or bad taste may sometimes introduce such fashions as hair-powder, pomatum, and hoops, and habit may reconcile the eye to such monstrous disguises; but it seems incredible that any person should maintain that modes of dress are in themselves indifferent, and that the powdered and plastered hair and stiff hoop of an English or French lady of the eighteenth century are intrinsically as beautiful as the loose and flowing locks and graceful drapery of a Grecian statue. New modes of dress are worn, not because they are *beautiful*, but because they are *fashionable*. Ladies not unfrequently lament that the new fashion is ugly and unbecoming, though they abandon the old fashion as being obsolete. Brilliant colours, moreover, are almost universally considered beautiful for dress, especially for female dress; and therefore they are worn by the rich, who can afford a frequent succession of clothes: the poor, who cannot, are consequently forced to clothe themselves in dark and dingy colours, which are not so soon soiled and spoilt. So likewise fine, soft, and smooth textures are not only more convenient, but more beautiful for clothing, as being better fitted to show the form of the body: in this respect the taste of all ages has agreed, from the Romans, who admired the cobweb garments, the *textilis aura*, which they imported from the East, and who bartered gold for an equal weight of silk, down to the modern purchasers of the delicate fabrics of Paisley and Lyons: and hence the rich clothe themselves in fine linen and woollen, in silk, in velvet, and in lace; while the poor, unable to purchase such luxuries, content themselves with coarser and thicker textures. Mr. Alison, therefore, in the following remarks, completely inverts the cause and the effect. 'The colours (he says) which distinguish the ordinary dress of the common people are never considered as beautiful. It is the colours only of the dress of the great, of the opulent, or of distinguished professions, which are ever considered in this light. The colours of common furniture, in the same way, are never beautiful; it is the colours only of fashionable, or costly, or magnificent furniture, which are ever considered as such.' (Alison *On Taste*, vol. i. p. 302.) In fact, however, the dress of the rich is not beautiful because it is the dress of the rich, but it is the dress of the rich because it is beautiful: costly furniture is not beautiful because it is costly, but it is costly because it is beautiful. The dress of the poor is not plain because it is the dress of the poor, but it is the dress of the poor because it is plain. In countries where the peasants ornament their dress with taste and fancy, as in some cantons of Switzerland, their dress is thought beautiful; in countries, as in antient Venice, where the upper orders wore black clothes, black might have been considered a mark of nobility and rank, but could scarcely, even by the natives, have been considered as beautiful: nor in this country does any one think a barrister's wig and gown, or a clergyman's surplice, as having any title to be called beautiful because they are the dress of distinguished professions. (See Alison, vol. i. p. 107; *Edinburgh Review*, vol. vii. p. 299.)

Variety, likewise, is a condition of the beauty of colour nearly allied to novelty. Combinations of colours, if they are not so mixed as to be confused, and if their tints harmonize well together, are for the most part agreeable to the eye: while large and unbroken masses of an uniform hue, such as long flat walls, wide expanses of sand or water, or green plain, are devoid of beauty. The beauty of the human hair arises, in great measure, from the irregularity of its movements, its flexibility and variety of outline, and the changeability of its tint, as its glossy surface reflects the light in different parts: while a bald head is not only deprived of this ornament, but also seems to be shorn of its fair proportions, and to want something which belongs to its integrity.

The most remarkable exception to the ugliness of uniform colours is the beauty of the blue sky and the blue sea; in which cases the sensual delight derived from the soft and at the same time brilliant colouring appears to compensate for its want of variety. For when the sky and sea are of a grey and dingy hue their beauty is gone, and we are then conscious of the monotonous effect produced by a large unvaried surface of a dull colour. Even, however, when the sea is most brilliant in its colour, how much do a few white sails, scudding along its surface, add not only to the interest but also to the beauty of the scene!

Some writers have thought that a certain *size* is an essential element of beauty: thus Aristotle, in his *Poetic*, says, that beauty consists in *magnitude* and *proportion*; and, therefore, a very small or a very large animal would be devoid of beauty, the former because the eye could not *distinguish*, the latter because the eye could not *comprehend* its parts[*]. This notion of Aristotle's doubtless arose from his predominant love of making the excellence of everything to consist in a mean between two extremes; but in the case which he puts the mean is the beautiful form, because it is the best suited to the nature and wants of the animal. That beauty *generally* does not depend on the size of the object which makes the impression on the sense, is proved by the admiration which we equally bestow on the delicate frame and brilliant plumage of a humming-bird, and on the vast expanse of an Alpine view. Burke, on the other hand, makes *smallness* an essential element of beauty (*Sublime and Beautiful*, part iii. § 13); but the arguments which he adduces are equally untenable, as being founded on a partial view of the subject. Among other considerations he alleges the practice of giving diminutive names to the objects of our affection; but this arises not from any sense of the connexion of beauty with smallness of size, but from the incompatibility of the passion of *love* with that of *fear*—that is, so far as fear means an anticipation of evil; for by using diminutive names, expressive of weakness and inferiority, men signify their consciousness that the persons whom they love are things in their power, of which they entertain no apprehension and do not stand in awe. [See FEAR.]

The feeling of beauty is, moreover, increased, if not awakened, by antient recollections, which spread a charm over places illustrated by the arts, the learning, and the civil and military glories of former ages. It is, however, necessary to distinguish between the quality of *beauty* and the feelings excited by *interesting* historical associations. There is no doubt that the first time that a scholar beholds Athens or Rome, he is affected far more powerfully and agreeably than a person to whom antient history is a blank. But these emotions cannot be considered as arising from the perception of beauty. It seems to us quite conceivable that a painter who did not know that Pericles or Socrates were Athenians, or that the Parthenon was the Temple of Minerva, should be as much alive to the *beauty* of the view of Athens as the historian, though his feelings would not be so strongly moved by the sight before his eyes. (See Knight *On Taste*, part 2. ch. ii. § 70-73.) This distinction between associations which give an *interest* to an object, which make us *curious* to see it, and those which make it *beautiful*, has not always been sufficiently attended to. Thus Mr. Alison cites Runnymede and the Rubicon as instances of beauty conferred or enhanced by historical associations. (Vol. i. pp. 25, 27.) But beauty never arises from such a source as this. No man would think a plain green field or an ordinary stream more beautiful than any other such field or stream, simply because King John had signed Magna Charta in the one, or Julius Cæsar raised the standard of rebellion on the banks of the other. A sincere Roman Catholic might be led into trains of the tenderest pathos and the loftiest religious enthusiasm by the sight of a fragment of the true cross, but would find no beauty in it. The iron crown of Charlemagne, or the stone on which the Scottish kings were crowned at Scone, would suggest historical recollections of deep interest, but would be devoid of beauty. The same may be said of badges of distinction, as orders, crowns, coronets, mitres, &c.: they may call up ideas of nobility, magnificence, grandeur, courage, or power; and yet they may not be beautiful. No one probably ever found any beauty in the Garter or the Cross of the Legion of Honour, however lofty or agreeable their associations may be. Feelings of this kind may make the mind susceptible to impressions of beauty, but cannot alone produce it. What can have less pretensions to beauty than a modern fortress, with its bare walls and heavy unornamented masonry? Yet it is inseparably connected with all those ideas of power, grandeur, martial prowess and courage, to which Mr. Alison in other cases refers the origin of beauty.

Having thus attempted to give a general account of the origin and causes of beauty in outward objects, we shall next consider the *state of mind* which is most favourable to the perception of it.

In the first place it may be remarked that a *certain degree of cultivation* is necessary to the perception of beauty. Savage nations appear to be nearly or quite destitute of any notion of it, in the works both of nature and art, or at least their admiration, as in children, is confined to gaudy and shining trinkets and ornaments of the person. The practice of tattooing, however, is doubtless founded on notions of beauty, more mistaken even than those which led the ladies of Europe to cover their hair with powder and pomatum. In the lower orders of civilized nations the same indifference to beauty may be generally observed, in proportion to their coarseness and ignorance. The early development of the sense of beauty among the Greeks, which is so strikingly shewn both in their mythology and poetry, and in their works of art (see *Philological Museum*, vol. ii. p. 165-166), is a proof of their early culture and of their great superiority, even in a half savage state, to the barbarous nations by which they were surrounded.

Another thing essential to the perception of beauty is *sensibility of mind*, arising from the development of the social affections, and the cultivation of the benevolent feelings. The custom, prevalent in some countries, of planting flowers on graves, and of offering nosegays to the images of saints or of the Virgin, is a mark at once of a feeling of beauty and of sensibility of mind. On the other hand, persons of a sour, phlegmatic, morose, and misanthropic temperament, are little alive to the beauty of outward objects or works of art. It was, doubtless, from a sense of the incompatibility of a feeling for beauty with absence of all social and benevolent sympathies, that Milton represents the Devil as insensible to the beauties of Paradise:

> 'The Fiend
> Saw undelighted all delight, all kind
> Of living creatures, new to sight and strange.'

As on the one hand, all the antisocial passions, as anger, jealousy, envy, fear, &c., are inconsistent with the perception of beauty; so the social passions sharpen and facilitate it, as love and pity, which, as Dryden says, 'melts the soul to love.' Hence *loveliness* in the human race is intimately connected with beauty, as the desire of sex is heightened and stimulated by the beauty of form, colour, and expression; but it is not identical with it, for lovers are often not only blind to the defects of their mistresses, but sometimes even admire them on that very account[*]: whence love is proverbially said to be blind.

A third requisite to the perception of beauty is *serenity* and *cheerfulness of mind*, and the absence of overpowering care or affliction, which engrosses the faculties and prevents them from taking pleasure in the relations of outward objects. This inconsistency is well illustrated by the reflections of Hamlet, when he is oppressed with a sense of the painful task imposed upon him by his father's spirit. (Act ii. sc. 2.) (See Alison *On Taste*, vol. i. p. 10.)

On the relation of the beauty of outward objects to the beauty of works of art, more will be said under the heads of the several arts. Here it is only necessary to observe, that of the three arts of design, viz., architecture, sculpture, and painting, the two last are purely *representative* arts, while the first alone creates objects which have a *use* beyond the mere gratification of the taste. The beauty of buildings therefore belongs to the class of objects which we have been above examining; while the beauty of pictures and statues, though closely connected with the same range of ideas, yet forms a class apart, and requires the consideration of additional elements peculiar to itself. These are derived in great measure from the capabilities of the respective arts, as dependent on the materials which they work with and the effects which they are thus able to produce. There are many objects beautiful in nature which cannot be represented with advantage by the painter or sculptor; on the other hand, there are many objects disagreeable in nature which are beautiful in a picture, because a picture is an abstraction, a representation of the colour and outline of an object, without any of those accompanying circumstances which in the reality may cause disgust to the other senses, and thus prevent the mind from enjoying that pleasure which it might otherwise derive through the organ of sight alone. Hence those things in nature which are peculiarly fitted to be subjects for a painter, are properly said to have *picturesque beauty*, as those forms and postures which would appear to most advantage in marble might, as has been truly remarked, be said to have *sculpturesque beauty*. There are certain general characteristics of these two arts, as that painting best represents expression, while sculpture best represents character; that painting embraces a vast variety of subjects, while sculpture confines itself almost exclusively to the human figure and some of the nobler animals, which may be here pointed out; but to determine the peculiar provinces of these two arts respectively requires a separate investigation, with reference not to the general subject of beauty, but to the capabilities and advantages of each, and would be materially assisted by a knowledge of those mechanical processes and mysteries of art which the professed sculptor or painter can themselves alone possess.

---

[*] Τὸ γὰρ καλὸν ἐν μεγέθει καὶ τάξει ἐστί, &c., *Poet*. chap. vii.; and see Twining's translation, note 61, where several passages are cited showing the opinions of the Greeks as to the close connexion of large size and beauty. Our word *handsome*, in like manner, includes an idea of size above the ordinary standard.

[*] . . . . ἦ γὰρ ἔρωτι
Πολλάκις, ὦ Πολύφαμε, τὰ μὴ καλὰ καλὰ πέφανται.

(On the difference between painting and sculpture, see Price *On the Picturesque*, vol. ii. pref. p. xii-xiv.; Müller, *Archæol. der Kunst*, § 27; *Philological Museum*, vol. ii. pp. 95-98.)

[On the relation of the beautiful and the sublime, see the article SUBLIMITY.]

BEAUVAIS, a city in France, capital of the department of Oise, upon the little river Thérain or Terrein, at the point where it receives the Avelon, another small stream. The Thérain is a feeder of the Oise. The town is on the road from Paris to Abbeville and Calais, 41 miles N. by W. of Paris, in 49° 27′ N. lat., 2° 4′ E. long. While the old territorial division of France remained, it was included in the Ile de France, but was near the border towards Picardie.

Beauvais is a very antient town, and was known to the Romans by the name of Cæsaromagus, which was afterwards changed for that of Bellovaci, the name of the Gallic tribe whose chief town it was. The Bellovaci were distinguished among the Belgic Gauls for number, valour, and influence; and took an active part in the resistance to Julius Cæsar, when he first carried his arms into that part of the country. They agreed to contribute 60,000 men to the confederate army of natives, but the skill and perseverance of the Romans triumphed over all opposition; and the Bellovaci with their neighbours submitted to a foreign yoke. Several writers of great learning, Sanson, Scaliger, and Valois, have considered that Bratuspantium, the town into which the Bellovaci retreated with their effects on Cæsar's approach, was identical with Cæsaromagus, or Beauvais; and D'Anville himself was at first of the same opinion, though he afterwards considered the site of Bratuspantium to be in the neighbourhood of Breteuil in Picardie. (D'Anville, *Notice de l'Ancienne Gaule*; Expilly, *Dictionnaire des Gaules et de la France*.)

Beauvais is of considerable size, but ill built; the streets are tolerably wide, but the number of wooden houses presenting their gables to the street, and destitute of any regularity, gives to the place a shabby appearance. The great *place*, or square, has at one end the town hall, the front of which is adorned with Ionic pilasters. But the building which is most worthy of notice is the beautiful Gothic cathedral. The edifice is, however, imperfect, having neither nave nor steeple. The steeple was erected in the year 1564, but, within ten years after its completion, was destroyed by a tempest; and this accident prevented the completion of the church. The choir is of great beauty, and appears more lofty than that of Amiens, though not really so. It is adorned with richly painted windows, as antient as the time of Louis IX. (or St. Louis) of France. (A.D. 1226-1270.) (Mrs. C. Stothard's *Letters during a Tour in Normandy, &c.*)

Before the Revolution Beauvais had, besides its cathedral, six collegiate churches and thirteen parish churches. There were three abbeys for men; one of the Benedictines of the Congregation of St. Maur, one of the order of St. Augustin, and a third occupied first by the Benedictines, and afterwards by the Lazarists; a seminary for priests, directed by the Lazarists; seven convents for religious of both sexes, viz., four for men and three for women; a commandery of the order of Malta; two hospitals, the Hôtel Dieu and the Hôpital General. The bishops of Beauvais (who were also temporal peers, with the title of Counts of Beauvais) entered upon their bishopricks with great solemnity. The church of St. Etienne is more antient than the cathedral. The windows of this church, and especially those of the chapels which surround the choir, are of great beauty; they are of the sixteenth century. M. Malte Brun speaks of a large and fine hospital erected not long since, but whether on the foundation of either of those already mentioned is not stated. The antient episcopal palace, a Gothic edifice, has been made the seat of the prefect. The site of the old walls of the town has been converted into a promenade, but some round towers and the relicts of the wall are still standing near the river Thérain. There are a handsome theatre, a *collège*, or high school, a seminary for priests, and a public library of no great extent. (Malte Brun; Balbi; Expilly.)

Beauvais is a town of considerable note for its manufactures. There is a royal manufactory of carpets, founded by Colbert in 1664, and still in the hands of government. A certain quantity is made every year for the furnishing of the royal palaces and the public establishments, and the surplus is sold to the public. These carpets are in great repute, and fetch a high price. Woollen cloths, shawls, flannels, and coarse woollen fabrics of various kinds are made, and the washing and spinning of wool are also carried on. Linens are manufactured to a considerable extent, especially the kind called *demi-Hollande* (half-Holland), from being half the length of the Dutch linens. The linen manufacture, as carried on in the town, includes the spinning of the yarn, and the weaving and bleaching of the linens. To the foregoing articles may be added braid, and felt for the paper-makers. Printed cottons, formerly one of the staple manufactures of the town, are now made only to a small extent, but some cotton yarn is spun. The fuel consumed in these manufactories is, partly at least, peat, which is procured in great quantity at Bresles in the neighbourhood, and in several other places in the department. Within a few years courses of instruction in geometry and mechanics applied to the arts have been established with success. There is a *Tribunal de Commerce*, or committee for deciding disputes in commercial affairs. (Dupin, *Forces Productives et Commerciales de la France*.)

The population in the year 1832 was 12,867. The arrondissement of Beauvais had, at the same time, a population of 131,385, part of whom were employed in various branches of manufacturing industry. Fans, toys, glass, pottery, hosiery, ribbons are among the productions of the arrondissement, which comprehends 694 square miles, or 444,160 acres; and is subdivided into 12 cantons, and 244 communes or parishes.

Beauvais was formerly a place of great strength. It was unsuccessfully besieged by the English in 1443. Jean Lignière by his heroic valour succeeded in repulsing them. Nearly thirty years afterwards (viz., in 1472), Charles le Temeraire (the Rash), Duke of Bourgogne (Burgundy), again attacked it with an army of 80,000 men, but the valour of the inhabitants defeated the attempt. The women, under the conduct of Jeanne Laîné (called also Fourquet, or Fouquet, or Jeanne la Hachette), displayed the greatest courage in the defence of the place, and are said even to have exceeded the men. The exploits of Jeanne form the subject of a picture in the town-hall; and, in memory of this event, the women took precedence of the men in a yearly procession, which was kept up till the time of the Revolution. Beauvais has produced some persons of note, as Lenglet du Fresnoy, a considerable writer on history, geography, ecclesiastical affairs, &c.; and Philippe de Villiers de l'Ile—Adam, grand-master of the Knights of St. John of Jerusalem or Malta, distinguished by his gallant but unsuccessful defence of Rhodes against Soliman I. (the Magnificent), emperor of the Turks, in the year 1522.

The bishoprick of Beauvais was founded about the middle of the third century. It comprehends at present the department of Oise. The bishop is a suffragan of the archbishop of Reims. Several councils have been held at Beauvais. At one, held in 1114, the emperor of Germany, Henry V., was excommunicated.

The name Beauvais belongs to several other places in France of little note.

BEAUVAISIS, or **BEAUVOISIS**, in France, the district of which Beauvais was the capital. It was formerly included in Picardie, but was taken from Picardie and annexed to the Ile de France, with which it continued incorporated, till the old territorial divisions in Franc weere superseded by the departments. The conterminous districts were, on the north, the Amienois and Santerre, in the province or government of Picardie; on the south, the Vexin François and the Ile de France (taken in the most restricted sense), both in the government of the Ile de France; on the east, the Valois and the Quartier de

Noyon, both in the same government; and on the west, the Vexin Normand, in Normandie. (Maps in the *Atlas of the Encyclopédie Méthodique.*)

The Beauvaisis is watered by the Oise, which bounds it on the south-east; by the Epte, which bounds it on the west; by the Thérain, and some other streams of less importance. The air is rather cold, but healthy; the surface unequal, made up of plains and hills, fertile in corn, but producing little wine. There is no want of wood, and the pasturage is abundant. A considerable number of sheep are fed, and the butter and cheese made here are in great request. There is plenty of game, poultry, and fish. Flax and hemp are grown in great quantity. We have seen [see BEAUVAIS] that the linen manufacture is one important branch of industry at Beauvais. There are some mineral springs. The principal places in Beauvaisis are, Beauvais, the capital (population in 1832, 12,867), and Clermont (population in 1832, 2715 for the commune, 2594 for the town itself), on a small feeder of the Oise, east by south of Beauvais.

BEAUVOIS, AMBROSE MARIA FRANCIS JOSEPH PALISOT DE, a celebrated French naturalist and traveller, was born at Arras on the 27th of July, 1752. His father, who was an advocate, educated him for the legal profession, but his bias for the study of natural history was so strong that from an early age he was more frequently in the fields with his friend and preceptor Lestiboudois than in the courts of law. In the year 1772 he was appointed receiver-general of crown rents, which he held for about five years. Upon the suppression of this office in 1777, he appears to have abandoned his profession, and to have determined upon devoting himself exclusively to his favourite pursuits. The French government had planned an expedition to the west coast of Africa, for the purpose of founding a settlement which might serve as a counterpoise to the mercantile influence of the English in that part of the world. Palisot de Beauvois eagerly embraced what appeared a favourable means of exploring a country rich in every branch of natural history, and never before trod by the foot of an European naturalist: without regarding the extreme insalubrity of a climate from which scarcely more than one European in four ever returns, he obtained permission to accompany the expedition at his own charge. On the 17th July, 1786, he sailed from Rochefort for Benin, in which, and the neighbouring kingdom of Oware, he spent about fifteen months, investigating its natural productions with a zeal that even the dreadful fevers of the country, with which he was attacked, were insufficient to destroy. While here, he planned a journey across Africa to Abyssinia; but after having penetrated the interior for a considerable distance, he was compelled to return in consequence of the timidity (prudence?) of his companions, who were frightened at the dangers of the route, and at the multiplying difficulties by which they found themselves opposed at every step. On his return to the coast, he was attacked so severely by scurvy and yellow fever, that, to use his own words, after seeing more than five-sixths of his companions perish, and having been himself several times in the very jaws of death, it became indispensable for him to abandon the country, leaving behind him the principal part of his collection, which consisted of skins of animals, insects, dried plants, and minerals, to be forwarded to France. Fortunately a part of these had previously been sent to M. de Jussieu, and a part was put on board the ship in which he embarked for St. Domingo, otherwise the whole fruit of so much zeal and suffering would have perished; for what he left behind him was soon after burned, along with the settlement, by an English expedition. Upon his arrival at Cape François in St. Domingo, in 1788, his health became speedily re-established. Here having an opportunity of witnessing the practical working of the slave system, he formed an opinion so decidedly adverse to emancipation, that to his latest hour he continued to oppose the granting of freedom to the negroes, except under very strict conditions, and after the lapse of a considerable number of years, during which they might be gradually prepared to make a proper use of their liberty. He seems to have been always extremely tender of the interests of the colonists, from whom indeed he had received the greatest kindness during his residence in the island. When it was found impossible any longer to keep the blacks in subjection, M. de Beauvois was deputed by the French authorities of St. Domingo to proceed to the United States, in the hope of obtaining assistance from the American government. Upon his return from this fruitless mission in 1793, he found the island in confusion; his collections, which had become very large, were consumed in the conflagration of Cape François; and the negroes, now become the masters, who naturally saw nothing in him but a persecutor, threw him into prison.

While lying in prison, in daily expectation of being taken out for execution, he was enabled to escape by the faithfulness of a mulatto woman, to whom, some time before his departure for the United States, he had humanely granted her freedom: she not only effected his liberation, but procured him the means of reaching the United States. Thus was his life preserved by the devotion of one of that very race which he thought worthy of little short of eternal bondage. On his arrival at Philadelphia, penniless and friendless, he learned that his name had been inserted in the lists of proscriptions, and that it was no longer safe to return to France. One of the great traits in De Beauvois' character was his unconquerable perseverance, and an elasticity of spirit which no misfortunes could destroy. Undismayed at his apparently hopeless condition, he bethought him of accomplishments which in his happier days had made him the delight of his friends, but which he had never dreamed might be the only resource for procuring a morsel of bread. By the teaching of music and languages he supported himself honourably; and soon succeeded in attracting the notice of the few persons who at that time, in North America, occupied themselves with natural history.

Upon the arrival in the United States of the French Minister Adet, De Beauvois no longer found himself straitened for means. He forthwith abandoned his occupations, and determined upon exploring the more remote parts of North America. He accordingly examined the Appalachian Mountains, and penetrated into the country of the Creek and Cherokee Indians, still collecting objects of natural history in all its branches. Among other things he discovered the jaws and molar teeth of the great mastodon on the banks of the Ohio, and he brought the tooth of a megalonyx from the west of Virginia. Upon his return to Philadelphia loaded with acquisitions, he learned that his proscription had been erased, and that, by singular good fortune, his patrimony had not been sold. He immediately repaired to France, where he found his affairs in lamentable disorder, and his wife unfaithful. He divorced his wife, sold a portion of his property in order to free the remainder from incumbrances, renounced the perils of travelling, and thenceforward devoted himself to the examination and publication of his collections. But of these he found only a miserable wreck. The English in Benin, and the negroes at Cape François, had destroyed everything; he had only what he brought with him from Philadelphia, and the small collections which he had forwarded while in Africa to M. de Jussieu. These, however, sufficed to occupy him, in conjunction with general questions of natural history, for the remainder of his life. In 1806 he was called to the Institute as the successor of Adanson; in 1815 he was created titular councillor of the University of Paris by Napoleon, upon his return from Elba; and in January, 1820, he died from an attack of diarrhœa.

After his return to France, Palisot de Beauvois was the author of a considerable number of works, some of which were inserted in the transactions of learned societies, some in the *Encyclopédie Méthodique*, and the remainder were published separately. All these, except his *Æthéogamie*, may be supposed to have contributed more or less to the progress of science; but the works on which his reputation chiefly depend are his *Flore d'Oware* and *de Benin*, published in twenty parts, in folio, between 1804 and 1821; his *Insects* of the same country, of which fifteen parts in folio appeared between 1805 and 1821; and his *Agrostographie*, which appeared in one volume 8vo. in 1812. In the *Flora* of Oware are several extremely curious plants, especially one called after the author *Belvisia;* and the work abounds in good observations, showing De Beauvois to have been well versed in some of the more difficult parts of botany. It is scarcely fair in an English biographer to say that the book is extremely meagre in species, considering that the bulk of what he had collected for it was destroyed by our own countrymen, in their zeal for crippling the resources of France by the destruction of the property of peaceable French subjects: or to complain that it affords no general view of the vegetation of this still unknown and most interesting country; for the work itself was not completed when the author died. Whatever defects may be found in the *Flora* of Oware was more than compensated by the merits of the *Agrostographie*. At the time of its publication all that related to the systematic arrangement of grasses was in great disorder. The genera of this important natural order, with the exception of what had been done by Dr. Robert Brown in his *Prodromus Floræ Novæ Hollandiæ* (and this had been well done), were nearly as they had been left by Linnæus, although the number of species had prodigiously increased. It was necessary to recast the whole order; in doing which new principles had to be established, and antient prejudices to be unsparingly attacked. This was done by Palisot de Beauvois in a manner which reflected the greatest honour both upon his skill and knowledge. It is true that men like Smith, and those of his retrogressive school, cried out at the innovations of this bold reformer, and were amazed at the unceremonious manner with which what they had imagined imperishable was assailed: all their criticisms, protests, sneers, and anathemas were in vain; the public accepted the new arrangement, and it has become the basis of the more perfect system, which at this day seems to be everywhere recognized as the most conformable to reason and to nature.

If Palisot de Beauvois cannot be said to have been one of the great luminaries which cast a light over the whole extent of science, he certainly deserves the praise of having been a sensible, well-informed, and skilful naturalist, who did well what he undertook, and a most zealous and intrepid traveller, whom neither danger nor difficulty could deter. He was handsome in person, gentlemanly in deportment, mild in manner, and indefatigable in his labours, and he deserves to be recorded as one of those who have the most contributed to the progress of natural science in these latter days.

His biography, strictly speaking, ought to have been given under Palisot; but we are unwilling to separate it too widely from the genus (Belvisia) which has been so named to commemorate his merits.

(*Biographie Universelle*; *Flore d'Oware*; and *Essai d'une Nouvelle Agrostographie*.)

BEAVER (Zoology), the English name for the genus *Castor* (Cuv.), one of the order of rodent or gnawing animals (*Rodentia*, Cuv., *Glires*, Linn.), with two incisor, or cutting teeth, and eight molars in each jaw, twenty in all; and particularly distinguished from all the rest of that order by a broad, horizontally flattened tail, which is nearly oval and covered with scales. There are five toes on each of the feet, but those of the hinder ones only are webbed, the webs extending beyond the roots of the nails. The second toe of these last is furnished with a double nail, or rather with two, one like those of the other toes, and another beneath it, situated obliquely with a sharp edge directed downwards. There is also, as Dr. Richardson observes, a less perfect double nail on the inner toe of the hind feet.

The incisor teeth of the beaver are broad, flattened, and protected anteriorly by a coat of very hard orange-coloured enamel, the rest of the tooth being of a comparatively soft substance, whereby a cutting, chisel-like edge is obtained; and, indeed, no edge tool, with all its combination of hard and soft metal, could answer the purpose better. In fact, the beaver's incisor tooth is fashioned much upon the same principle as that followed by the tool-maker, who forms a cutting instrument by a skilful adaptation of hard and soft materials till he produces a good edge.

But the natural instrument has one great advantage over the artificial tool; for the former is so organized that, as fast as it is worn away by use, a reproduction and protrusion from the base takes place, and thus the two pair of chisel-teeth working opposite to each other are always kept in good repair, with their edges at the proper cutting angle. When injury or disease destroys one of these incisors, its antagonist, meeting with no check to resist the protrusion from behind, is pushed forward into a monstrous elongation. So hard is the enamel, and so good a cutting instrument is the incisor tooth of the beaver, that, when fixed in a wooden handle, it was, according to Dr. Richardson, used by the Northern Indians to cut bone, and fashion their horn-tipped spears, &c., till it was superseded by the introduction of iron, when the beaver-tooth was supplanted by the English file.

The power of these natural tools is well described by Lewis and Clarke, who saw their effects on the banks of the Missouri. 'The ravages of the beaver,' say they, 'are very apparent: in one place the timber was entirely prostrated for a space of three acres in front on the river and one in depth, and great part of it removed, although the trees were in large quantities, and some of them as thick as the body of a man.'

Dr. Richardson thus speaks of this part of their operations: 'When the beaver cuts down a tree it gnaws it all round, cutting it however somewhat higher on the one side than the other, by which the direction of its fall is determined. The stump is conical, and of such a height as a beaver, sitting on his hind quarters could make. The largest tree I observed cut down by them, was about the thickness of a man's thigh (that is, six or seven inches in diameter), but Mr. Graham says, that he has seen them cut a tree which was ten inches in diameter.' The beavers have no canine teeth. F. Cuvier once thought that the molars had no true roots, but that they were increased from their bases like the incisors. The source of his error was a skull in which the molars were not entirely developed; but he has since admitted that they have roots, and that they are incapable of additional growth when once entirely formed.

American Beaver.

[Castor Fiber.]

The American Beaver, *Castor Fiber* of Linnæus, *Castor Americanus* of F. Cuvier, *Ammisk* of the Cree Indians, and *Tsoutayè* of the Hurons, is the animal of whose sagacity, and even social polity, such wonderful tales have been told. It has been represented as an accomplished architect, gifted by Nature with a head to design and instruments to execute well-planned houses containing chambers, each set apart for its appropriate purpose. The lovers of the marvellous, when they had once given the reins to their imagination, soon converted its tail into a sledge and a trowel, and astonished the world with an elaborate account of the mode in which the plaster was laid on with this, according to them, masonic implement: nay, they even turned it into an instrument of office. With it the overseers (such officers, according to the accounts given of their civil institutions, it was the custom of the community of beavers to appoint) were said to give the signal to the labourers whose employments they superintended, by slapping it on the surface of the water. All this, and more than this has faded away before the light of truth. Their houses have sunk into rude huts, in the construction of which their tails are never used, their pile-driving (for, among other feats, they were said to drive stakes of the thickness of a man's leg three or four feet deep into the ground) has turned out to be a mere fable, and their polity has proved to be nothing more than a combination of individuals, such as we see among many of the inferior animals, impelled by an instinct common to all to perform a task in the benefit of which all participate.

But, after discarding all exaggerations, there remains enough to make the works actually carried on by these animals a subject of deep interest, as we shall presently see.

Where there has been so much fable it becomes of importance to select that account of the habits of the beaver which accords with fact. Such an account, from the testimony of those best informed on the subject, is to be found in Hearne; and as Dr. Richardson, who had the best op portunities for forming a right judgment, has given it the preference, we proceed to lay it before our readers in Hearne's own simple language :—

'The beaver being so plentiful, the attention of my companions was chiefly engaged on them, as they not only furnished delicious food, but their skins proved a valuable acquisition, being a principal article of trade as well as a serviceable one for clothing. The situation of the beaver-houses is various. Where the beavers are numerous they are found to inhabit lakes, ponds, and rivers, as well as those narrow creeks which connect the numerous lakes with which this country abounds: but the two latter are generally chosen by them when the depth of water and other circumstances are suitable, as they have then the advantage of a current to convey wood and other necessaries to their habitations, and because, in general, they are more difficult to be taken than those that are built in standing water. They always choose those parts that have such a depth of water as will resist the frost in winter, and prevent it from freezing to the bottom. The beavers that build their houses in small rivers, or creeks, in which water is liable to be drained off when the back supplies are dried up by the frost, are wonderfully taught by instinct to provide against that evil by making a dam quite across the river, at a convenient distance from their houses. The beaver-dams differ in shape according to the nature of the place in which they are built. If the water in the river, or creek, have but little motion, the dam is almost straight; but when the current is more rapid, it is always made with a considerable curve, convex toward the stream. The materials made use of are drift-wood, green willows, birch, and poplars if they can be got; also, mud and stones intermixed in such a manner as must evidently contribute to the strength of the dam: but there is no other order or method observed in the dams, except that of the work being carried on with a regular sweep, and all the parts being made of equal strength. In places which have been long frequented by beavers undisturbed, their dams, by frequent repairing, become a solid bank, capable of resisting a great force both of water and ice; and as the willow, poplar, and birch generally take root and shoot up, they by degrees form a kind of regular planted hedge, which I have seen in some places so tall that birds have built their nests among the branches.

'The beaver-houses are built of the same materials as their dams, and are always proportioned in size to the number of inhabitants, which seldom exceeds four old and six or eight young ones; though, by chance, I have seen above double the number. Instead of order or regulation being observed in rearing their houses, they are of a much ruder structure than their dams; for, notwithstanding the sagacity of these animals, it has never been observed that they aim at any other convenience in their houses than to have a dry place to lie on; and there they usually eat their victuals, which they occasionally take out of the water. It frequently happens that some of the large houses are found to have one or more partitions, if they deserve that appellation, but it is no more than a part of the main building left by the sagacity of the beaver to support the roof. On such occasions it is common for those different apartments, as some are pleased to call them, to have no communication with each other but by water; so that, in fact, they may be called double or treble houses, rather than different apartments of the same house. I have seen a large beaver-house built in a small island that had near a dozen apartments under one roof; and, two or three of these only excepted, none of them had any communication with each other but by water. As there were beavers enough to inhabit each apartment, it is more than probable that each family knew their own, and always entered at their own doors, without any further connexion with their neighbours than a friendly intercourse, and to join their united labours in erecting their separate habitations, and building their dams where required. Travellers who assert that the beavers have two doors to their houses, one on the land side and the other next the water, seem to be less acquainted with these animals than others who assign them an elegant suite of apartments. Such a construction would render their houses of no use, either to protect them from their enemies, or guard them against the extreme cold of winter.

'So far are the beavers from driving stakes into the ground when building their houses, that they lay most of the wood crosswise, and nearly horizontal, and without any other order than that of leaving a hollow or cavity in the middle. When any unnecessary branches project inward they cut them off with their teeth, and throw them in among the rest, to prevent the mud from falling through the roof. It is a mistaken notion that the wood-work is first completed and then plastered; for the whole of their houses, as well as their dams, are, from the foundation, one mass of mud and wood mixed with stones, if they can be procured. The mud is always taken from the edge of the bank, or the bottom of the creek or pond near the door of the house; and though their fore paws are so small, yet it is held close up between them under their throat: thus they carry both mud and stones, while they always drag the wood with their teeth. All their work is executed in the night, and they are so expeditious that, in the course of one night, I have known them to have collected as much as amounted to some thousands of their little handsful. It is a great piece of policy in these animals to cover the outside of their houses every fall with fresh mud, and as late as possible in the autumn, even when the frost becomes pretty severe, as by this means it soon freezes as hard as a stone, and prevents their common enemy, the wolverene, from disturbing them during the winter; and as they are frequently seen to walk over their work, and sometimes to give a flap with their tail, particularly when plunging into the water, this has, without doubt, given rise to the vulgar opinion that they used their tails as a trowel, with which they plaster their houses; whereas that flapping of the tail is no more than a custom which they always preserve, even when they become tame and domestic, and more particularly so when they are startled.

'Their food consists of a large root, something resembling a cabbage-stalk,* which grows at the bottom of the lakes and rivers. They also eat the bark of trees, particularly those of the poplar, birch, and willow; but the ice preventing them from getting to the land in the winter, they have not any barks to feed on in that season, except that of such sticks as they cut down in summer, and throw into the water opposite the doors of their houses; and as they generally eat a great deal, the roots above-mentioned constitute a principal part of their food during the winter. In summer they vary their diet, by eating various kinds of herbage, and such berries as grow near their haunts during that season. When the ice breaks up in the spring the beavers always leave their houses, and rove about until a little before the fall of the leaf, when they return again to their old habitations, and lay in their winter stock of wood. They seldom begin to repair their houses till the frost commences, and never finish the outer coat till the cold is pretty severe, as hath been already mentioned. When they erect a new habitation they begin felling the wood early in the summer, but seldom begin to build until the middle or latter end of August, and never complete it till the cold weather be set in.

'Persons who attempt to take beaver in winter should be thoroughly acquainted with their manner of life, otherwise they will have endless trouble to effect their purpose, because they have always a number of holes in the banks, which serve them as places of retreat when any injury is offered to their houses, and in general it is in those holes that they are taken. When the beavers which are situated in a small river or creek are to be taken, the Indians sometimes find it necessary to stake the river across, to prevent them from passing; after which they endeavour to find out all their holes or places of retreat in the banks. This requires much practice and experience to accomplish, and is performed in the following manner:—every man being furnished with an ice-chisel, lashes it to the end of a small staff about four or five feet long; he then walks along the edge of the banks, and keeps knocking his chisel against the ice. Those who are acquainted with that kind of work well know by the sound of the ice when they are opposite to any of the beavers' holes or vaults. As soon as they suspect any, they cut a hole through the ice big enough to admit an old beaver, and in this manner proceed till they have found out all their places of retreat, or at least as many of them as possible. While the principal men are thus employed, some of the understrappers and the women are busy in breaking open the house, which at times is no easy task, for I have frequently known these houses to be five or six feet thick, and one, in particular, was more than eight feet thick in the crown. When the beavers find that their habitations are invaded, they fly to their holes in the banks for shelter; and on being perceived by the Indians, which is easily done by attending to the motion of the water, they block up the entrance with stakes of wood, and then haul the beaver out of its hole, either by hand, if they can reach it, or with a large hook made for that purpose, which is fastened to the end of a long stick. In this kind of hunting, every man has the sole right to all the beavers caught by him in the holes or vaults; and as this is a constant rule, each person takes care to mark such as he discovers by sticking up a branch of a tree, by which he may know them. All that are caught in the house are the property of the person who finds it. The beaver is an animal which cannot keep under water long at a time, so that when their houses are broke open, and all their places of retreat discovered, they have but one choice left, as it may be called, either to be taken in their house or their vaults; in general they prefer the latter, for where there is one beaver caught in the house, many thousands are taken in the vaults in the banks. Sometimes they are caught in nets, and in summer very frequently in traps.

---

* *Nuphar luteum*, according to Dr. Richardson; a kind of water-lily.

'In respect to the beaver dunging in their houses, as some persons assert, it is quite wrong, as they always plunge into water to do it. I am the better enabled to make this assertion from having kept several of them till they became so domesticated as to answer to their name and follow those to whom they were accustomed in the same manner as a dog would do, and they were as much pleased at being fondled as any animal I ever saw. In cold weather they were kept in my own sitting-room, where they were the constant companions of the Indian women and children, and were so fond of their company that when the Indians were absent for any considerable time, the beaver discovered great signs of uneasiness, and on their return showed equal marks of pleasure by fondling on them, crawling into their laps, lying on their backs, sitting erect like a squirrel, and behaving like children who see their parents but seldom. In general, during the winter, they lived on the same food as the women did, and were remarkably fond of rice and plum-pudding; they would eat partridges and fresh venison very freely, but I never tried them with fish, though I have heard they will at times prey on them. In fact there are few graminivorous animals that may not be brought to be carnivorous.'

Having thus presented the reader with a narrative of the habits of the American beaver in a state of nature principally, we now proceed to give one descriptive of its manners in captivity. The account is from the pen of Mr. Broderip, whose pet the beaver was, and is interesting inasmuch as the faculties displayed by the animal must, from its extreme youth, have proceeded from unassisted instinct.

'The animal,' says Broderip, 'arrived in this country in the winter of 1825, very young, being small and woolly, and without the covering of long hair which marks the adult beaver. It was the sole survivor of five or six which were shipped at the same time, and it was in a very pitiable condition. Good treatment quickly restored it to health, and kindness soon made it familiar. When called by its name, 'Binny,' it generally answered with a little cry, and came to its owner. The hearth-rug was its favourite haunt, and thereon it would lie stretched out, sometimes on its back, sometimes on its side, and sometimes flat on its belly, but always near its master. The building instinct showed itself immediately it was let out of its cage, and materials were placed in its way, and this before it had been a week in its new quarters. Its strength, even before it was half-grown, was great. It would drag along a large sweeping-brush, or a warming-pan, grasping the handle with its teeth so that the load came over its shoulder, and advancing in an oblique direction till it arrived at the point where it wished to place it. The long and large materials were always taken first, and two of the longest were generally laid crosswise, with one of the ends of each touching the wall, and the other ends projecting out into the room. The area formed by the cross brushes and the wall he would fill up with hand-brushes, rush baskets, books, boots, sticks, cloths, dried turf, or any thing portable. As the work grew high, he supported himself on his tail, which propped him up admirably, and he would often, after laying on one of his building materials, sit up over against it, appearing to consider his work, or, as the country people say, 'judge it.' This pause was sometimes followed by changing the position of the material 'judged,' and sometimes it was left in its place. After he had piled up his materials in one part of the room (for he generally chose the same place), he proceeded to wall up the space between the feet of a chest of drawers which stood at a little distance from it, high enough on its legs to make the bottom a roof for him, using for this purpose dried turf and sticks, which he laid very even, and filling up the interstices with bits of coal, hay, cloth, or any thing he could pick up. This last place he seemed to appropriate for his dwelling; the former work seemed to be intended for a dam. When he had walled up the space between the feet of the chest of drawers, he proceeded to carry in sticks, cloths, hay, cotton, and to make a nest; and when he had done he would sit up under the drawers and comb himself with the nails of his hind feet. In this operation, that which appeared at first a mal-formation was shown to be a beautiful adaptation to the necessities of the animal. The huge, webbed, hind feet of the beaver turn in so as to give the appearance of deformity; but if the toes were straight instead of being incurved, the animal could not use them for the purpose of keeping its fur in order and cleansing it from dirt and moisture.

'Binny generally carried small and light articles between his right fore-leg and his chin, walking on the other three legs; and large masses, which he could not grasp readily with his teeth, he pushed forwards leaning against them with his right fore-paw and his chin. He never carried any thing on his tail, which he liked to dip in water, but he was not fond of plunging in the whole of his body. If his tail was kept moist he never cared to drink; but if it was kept dry it became hot, and the animal appeared distressed and would drink a great deal. It is not impossible that the tail may have the power of absorbing water, like the skin of frogs, though it must be owned that the scaly integument which invests that member has not much of the character which generally belongs to absorbing surfaces.

'Bread, and bread and milk and sugar, formed the principal part of Binny's food; but he was very fond of succulent fruits and roots. He was a most entertaining creature, and some highly comic scenes occurred between the worthy but slow beaver and a light and airy macauco that was kept in the same apartment.' This narrative, with some additions, appeared in *The Gardens and Menagerie of the Zoological Society*, to whose editor it was given by the author. The work is full of useful and interesting information, and the cuts are beautifully executed.

Little need be said of the value of the fur of the beaver in commerce, a value greatly heightened by the proclamation of Charles I. in 1638, expressly prohibiting the use of any materials except beaver-stuff or beaver-wool in the manufacture of hats, and forbidding the making of the hats called 'demi-castors,' unless for exportation. This proclamation was an almost exterminating death-warrant to the poor beavers. They were speedily swept away from the more southern colonies, and the traffic became, for the most part, confined to Canada and Hudson's Bay. The havoc made among them, even at that period, may be imagined by an inspection of the imports of 1743. In that year the Hudson's Bay Company offered for sale 26,750 beaver-skins, and, in the same year, 127,080 were imported into Rochelle. These, it will be remembered, are only the legal returns, making no allowance for smuggling. In 1788 upwards of 170,000 were exported from Canada, and in 1808 126,927 were sent from Quebec alone to this country. The value of these last has been estimated at 118,994*l.* 1*s.* 3*d.* sterling, at an average of 18*s.* 9*d.* for each skin. These numbers, as might be expected, could not be kept up without total extermination; and we find, accordingly, that in 1827 the importation into London from a fur country of more than four times the extent of that which was occupied in 1743 (as Dr. Richardson has observed) was but little beyond 50,000. *When the reader looks at this statement, and considers the* population of London alone, he will probably inquire of what materials beaver-hats are made, so totally inadequate to its wants must such an importation be, allowing for the most complete adulteration. There is, however, another rodent animal *Myopotamus Bonariensis* (*Mus Coypus*, Gm.) [see COYPU] now (spring of 1835) to be seen in the gardens of the Zoological Society in the Regent's Park, whose skins, under the name of Neutria skins, are imported in great numbers from South America for the purpose of hat-making; nor are they the only animals that contribute to the manufacture of the so-called beaver hats.

Such a reduction as that above stated appears to have startled the Hudson's Bay Company, who took measures for insuring an adequate supply of beaver fur. But notwithstanding their endeavours, and the care of the Iroquois, the greatest beaver takers, who, according to Dr. Richardson, only trench the beaver dams of a particular quarter once in five years, and always leave a pair at least in a dam to breed, it is not likely that these animals can ever be so plentiful as they were formerly. The same author observes that the Indians farther north, when they break up a beaver lodge, destroy as far as they are able both young and old.

In 1829 there was an increase; for in that year 72,199 beaver skins were imported from the British North American colonies, and 4200 from the United States.

The earliest notice of the European beaver (κάστωρ) is in Herodotus (book iv. c. 109), who describes it as inhabiting a large lake in the country of the Budini, a nation whom he places on the east side of the upper Don (iv. 21). He says that the skin was used for clothing, and the testicles (of which we shall presently speak again) for affections of the womb. Aristotle (book viii. c. 5) mentions the European beaver under the name of κάστωρ (castor), but only mentions it; while Pliny (book viii. c. 30 and xxxii. c. 3, &c.) well describes it, and is diffuse on the subject of the celebrated castoreum, so much valued as a medicine among the antients, and which long held a high place in the materia medica of the moderns, causing the persecution of this unfortunate animal before its fur became an object of traffic. Pliny is very sage in pointing out the frauds of dealers, and shows thereby that he did not know what the castoreum really was. 'Castorea testes eorum,' writes Pliny (book xxxii. c. 3), and the antients inform us that the animal used to bite off the part (the testicles) when hunted, well knowing that with the possession of the desired castorea the persecution would cease. The only objection to this tale, which however absurd is gravely stated by Pliny himself (book viii. c. 30), though he afterwards (book xxxii. c. 3) says that Sextius, who appears to have known something of the anatomy of the animal, denies it, is, that from the organization of the animal such a distressing feat is all but impossible; and we should not deem the absurdity worthy of notice did we not daily see attempts to revive old fables, and the success which not unfrequently follows, for a time at least, such attempts. Cuvier gives the following account of the organs which secrete this substance:—'De grosses poches glanduleuses qui aboutissent à leur prépuce, produisent une pommade d'une odeur forte, employée en médicine sous le nom de castoreum.' Dr. Richardson thus speaks of this substance: 'I have not had an opportunity of dissecting a beaver, but I was informed by the hunters that both males and females are furnished with one pair of little bags containing *castoreum*, and also with a second pair of smaller ones betwixt the former and the anus, which are filled with a white fatty matter, of the consistence of butter and exhaling a strong odour. This latter substance is not an article of trade; but the Indians occasionally eat it, and also mingle a little with their tobacco when they smoke. I did not learn the purpose that this secretion is destined to serve in the economy of the animal; but from the circumstance of small ponds when inhabited by beavers being tainted with its peculiar odour, it seems probable that it affords a dressing to the fur of these aquatic animals. The *castoreum* in its recent state has an orange-colour, which deepens, as it dries into bright reddish-brown. During the drying, which is allowed to go on in the shade, a gummy matter exudes through the sack, which the Indians delight in eating. The male and female *castoreum* is of the same value, ten pairs of bags of either kind being reckoned to an Indian as equal to one beaver skin. The *castoreum* is never adulterated in the fur countries.' As the animal alluded to by Herodotus, Aristotle, and Pliny was of course the European beaver, this part of the article might perhaps have been looked for under the European section; but, as will be seen from the foregoing quotation, the subject is so intimately blended with the history of the American beavers, that it has been thought advisable to give it the place which it now occupies[*].

Dr. Richardson, who says that the call of the beaver in the pairing season is a kind of groan, gives the following as the dimensions of a full grown beaver killed at Great Slave Lake, and now in the museum of the Zoological Society:—

	Inches.	Lines.
Length of head and body . .	40	0
„ head alone . .	7	3
„ tail, scaly part . .	11	6
Distance from tip of nose to anterior part of eye . . .	2	10
Distance from the posterior part of the orbit to anterior part of the ear	2	5

He also gives the following account of the flesh, which, as much has been said of its delicacy as food, is interesting. 'The flesh of the beaver is much prized by the Indians and Canadian voyagers, especially when it is roasted in the skin, after the hair has been singed off. In some districts it requires all the influence of the fur trader to restrain the hunters from sacrificing a considerable quantity of beaver fur every year to secure the enjoyment of this luxury; and Indians of note have generally one or two feasts in a season, wherein a roasted beaver is the prime dish. It resembles pork in its flavour, but the lean is dark-coloured, the fat oily, and it requires a strong stomach to sustain a full meal of it. The tail, which is considered a great luxury, consists of a gristly kind of fat, as rich but not so nauseating as the fat of the body.'

Pennant says that the geographical range of the American beaver commences in latitude 60° or about the River of Seals, in Hudson's Bay, and terminates in latitude 30° in Louisiana; but Say places their limit at the confluence of the Ohio and Mississippi, about seven degrees further to the northward of Pennant's southern boundary. Dr. Richardson observes that their most northern point is probably on the banks of the Mackenzie (the largest American river that falls into the Polar sea, and the best wooded, owing to the quantity of alluvial soil by which it is bordered), as high as 67½° or 68° lat.; and that they extend east and west from one side of the continent to the other, with the exception of the barren districts. He further states that they are pretty numerous to the northward of Fort Franklin, and that, from the swampy and impracticable nature of the country, they are not likely to be soon eradicated from thence.

The following are the varieties of the American beaver:—

Var. α. *Nigra, the black beaver.*—Hearne says that these are more plentiful at Churchill than at any other factory in the bay, but that it is rare to get more than twelve or fifteen of their skins in one year's trade.

Var. β. *Varia, the spotted beaver.*—Dr. Richardson did not see one of these, and Say records that an Indian during his whole life caught but three. They had a large white spot on their breasts.

Var. γ. *Alba, the white beaver.*—Hearne saw but one of these albinos in twenty years, and that had many reddish and brown hairs along the ridge of the back, though its sides and belly were of a silvery white. Dr. Richardson says that when the Indians find an individual of this kind they convert the skin into a medicine bag and are very unwilling to dispose of it: there is also a yellowish variety.

The little beaver, as it is sometimes called, *Castor Zibethicus* of Linnæus, *Fiber Zibethicus* of Cuvier, *Ondatra* of Lacépède, the *Musk-rat* of Canada, and *Musquash* of the Cree Indians, is an animal generically different from the true beaver. [See MUSQUASH.]

EUROPEAN BEAVER.

F. Cuvier has pointed out some slight differences in the skulls of the European and American beavers which he had examined, for the purpose of showing that they are distinct, but, in our opinion, not conclusively. Baron Cuvier, in the last edition of his *Règne Animal*, expresses his uncertainty, notwithstanding scrupulous comparison, whether the beavers which live in burrows along the banks of the Rhone, the Danube, the Weser, and other rivers, are specifically different from those of America, or whether their vicinity to man is the cause that hinders them from building. He does not appear to have been aware of the colony described by M. de Meyerinck in the *Transactions of the Berlin Natural History Society* for 1829, as having been settled for more than a century on the small river Nuthe, a short distance above its confluence with the Elbe in a lonely canton of the Magdeburg district. This little association, it appears, amounted in 1822 to fifteen or twenty individuals only; but they were co-operative and industrious beyond what might have been expected from their numbers. Burrows of thirty or forty paces in length on a level with the river, having one opening beneath the surface and another on land; huts eight or ten feet high, formed of branches and trunks of trees laid irregularly and covered with earth; and a dyke of the same materials, so well wrought that it raised the water more than a foot, were the results of the persevering and ingenious labours of the little band. M. de Meyerinck, indeed, who seems to have had his ideas raised by the marvellous accounts of the architectural habits of the American species, asserts that his colony differed from them in many particulars; but, upon reading his memoir, and comparing it with the unvarnished account of those who have most truly related the habits of the American beavers, we think that these Europeans, considering their numbers and the materials within their reach, will be found not a whit behind their Transatlantic brethren.

---

[*] In Landt's description of the Feroe Islands is the following account of a somewhat extraordinary application of this drug, under the head of 'Balæna Mysticetus' (common or Greenland whale):—'The Feroese fishermen entertain a great dread of these and other large whales, as they would easily overset their boats and dash them in pieces. In order to drive away these unwelcome guests, they fix a piece of castoreum to the fork on which they wind up their fishing-lines, and it is very remarkable, that when this fork, with the castoreum adhering to it, is placed in the water before the boat, the whales plunge immediately to the bottom and are never more seen. Oil of Juniper is employed for the same purpose.'

In truth, the American beaver near the settlements is sad and solitary; his works have been swept away, his association broken up, and he burrows like the European. Such beavers are called *terriers.* Pennant indeed mentions them as a variety which wants either the sagacity or the industry of others; but he is much nearer the truth when he says, in the same paragraph, 'beavers which escape the destruction of a community are supposed often to become *terriers.*' We have read somewhere (in Henry's *Travels*, we believe) that these solitaries are also called 'old bachelors.'

If an additional proof of the sagacity of the European beaver be required, we call the attention of our readers to the following anecdote related by Geoffroy St. Hilaire in the twelfth vol. of the *Mémoires du Muséum d'Histoire Naturelle.* One of these beavers from the Rhone was confined in the Paris menagerie. Fresh branches were regularly put into his cage, together with his food, consisting of legumes, fruits, &c., to amuse him during the night and minister to his gnawing propensity. He had only litter to shield him from the frost, and the door of his cage closed badly. One bitter winter night it snowed and the snow had collected in one corner. These were all his materials, and the poor beaver disposed of them to secure himself from the nipping air. The branches he interwove between the bars of his cage, precisely as a basket-maker would have done. In the intervals he placed his litter, his carrots, his apples, his all, fashioning each with his teeth so as to fit them to the spaces to be filled. To stop the interstices he covered the whole with snow, which froze in the night, and in the morning it was found that he had thus built a wall which occupied two-thirds of the doorway.

Upon the whole evidence, we are of opinion that the American and European beaver are only varieties of the same species.

That the beaver was formerly an inhabitant of the British islands there is no doubt. Giraldus Cambrensis gives a short account of their manners in Wales; but, even in his time (he travelled there in 1188), they were only found on the river Teify. 'Two or three waters in that principality,' says Pennant, 'still bear the name of *Llyn yr afangc*, or the beaver lake. * * * I have seen two of their supposed haunts; one in the stream that runs through *Nant Francon*, the other in the river *Conwy*, a few miles above *Llanrwst;* and both places, in all probability, had formerly been crossed by beaver dams. But we imagine they must have been very scarce even in earlier times. By the laws of *Howel dda*, the price of a beaver's skin, *Croen Llostlydan* (broad-tailed animal), was fixed at a hundred and twenty pence, a great sum in those days.'

Fossil Beavers.

Castor trogontherium.—Fischer has established this species from a single skull found in the beds near the sea of Azof. It is said to present the most striking analogy to the cranium of the European beaver, from which it does not differ except in its increased dimensions.

Fossil beaver of the Upper Val d'Arno.—Lyell, upon the authority of Mr. Pentland, mentions a fossil beaver from the Upper Val d'Arno, as being among the mammifers from that locality, in the museums at Paris. We have no means of judging whether this differs from Fischer's species.

BECCAFI'CO (Zoology), the Italian name for Beccafigo, or Fig-eater; Bec-figue of the French; Ficedula of the Latins; and Συκαλὶς of the Greeks. This name, as Charles Bonaparte, Prince of Musignano, observes, in his *Specchio Comparativo*, is applied to different birds of the genus *Sylvia* (Sylvan Warblers), whenever they are fat, and in a good state for the table. These are generally fruit-eaters in the season; but the true beccafico, with its 'carne squisita,' is, according to the Prince, the *Sylvia hortensis* of Bechstein.

The *Beccafigo*, or *Fig-eater*, of Willughby; *Ficedula septima Aldrovandi*, *Petticliaps Eboracensibus*, *Beccafigo Italis*, of Ray; appears to be the *Lesser Pettychaps*, *Sylvia hippolais* of Latham; *Motacilla hippolais* of Linnæus. The bird described by Willughby was shot in Yorkshire, and, on dissection, grape-stones and other seeds were found in its stomach.

[Sylvia hortensis.]

The Greater Pettychaps seems to have been first described as a British species by Latham, who received it from Sir Ashton Lever. The bird was obtained in Lancashire. It has since become better known, and its arrival with the other warblers in April and May, has been regularly noticed. Montagu, who observes that he traced it through the greater part of England, fixes the Tyne as its northern boundary; but he is corrected by Selby, who says, "I have often seen it on the north of the river Tweed."

All who have heard the bird agree in their praise of its song, which is little inferior to that of the nightingale. Montagu states that it frequently sings after sunset. "Some of the notes," says that ornithologist, "are sweetly and softly drawn; others quick, lively, loud, and piercing, reaching the distant ear with pleasing harmony, something like the whistle of the blackbird, but in a more hurried cadence." Selby corroborates this, observing that its song, although inferior in extent of scale, almost equals that of the nightingale in sweetness. It is seldom seen; for, like the rest of the tribe, it haunts the shadiest coverts, and usually sings from the midst of some close thicket. Lewin says that it makes its nest, for the most part with fibres and wool, sometimes with the addition of green moss, often in the neighbourhood of gardens, which it frequents, with the *White-throat* and *Black-cap*, for the sake of currants and other fruits. Montagu, who has recorded this habit, states also that it inhabits thick hedges, where it makes a nest near the ground, composed of goose-grass (*Galium Aparine*, Linn.) and other fibrous plants, flimsily put together, like that of the common *White-throat*, with the addition sometimes of a little green moss externally. Selby gives much the same description. It lays four, sometimes five eggs, about the size of a hedge-sparrow's, or hedge-warbler's, of a dirty white, blotched with light brown (Selby says wood-brown), the blotches being most numerous at the larger end. Its alarm-call, according to Selby, is very similar to that of the white-throat. Early in September it leaves us, and C. Bonaparte notes it as common near Rome in the autumn.

The following description of the Greater Pettychaps, whose length Montagu makes six inches, and its weight about five drachms, is by Selby.

"The whole of the upper parts oil-green, with a shade of ash-grey. On each side of the lower part of the neck is a patch of ash-grey. Throat greyish-white. Breast and flanks yellowish-grey, inclining to wood-brown. Belly and vent greyish-white. Orbits of the eyes white. Sides brown. Bill wood brown. Legs and claws bluish grey.

The female is similar in plumage to the male bird.

"The young of the year have the region of the eyes greyish-white. Head, upper part of the neck, back, rump, and wing coverts, yellowish-brown, passing into oil-green. Quills greenish-grey, edged with oil-green. Cheeks and sides of neck yellowish-grey. Throat, breast, sides, and under tail-coverts, wine-yellow. Middle of the belly white. Legs, toes, and claws, pearl-grey."

"Beccafigos," writes Willughby, after describing "the *fourth Beccafigo* of Aldrovand," "abound in Candy, as Bellonius witnesses, and also in the island of Cyprus, where they are salted up in great numbers, and transported into other countries. With us in England they are called by a general name, *Cyprus-birds*, and are in no less esteem with our merchants for the delicacy of their taste, than they were of old with the Italians; and that deservedly (saith Aldrovandus); for feeding upon two of the choicest fruits, viz., figs and grapes, they must needs become a more wholesome food than other birds, yielding a better nourishment, and of more easy concoction. Beccafigos are accounted best, and most in season in the autumn, as being then fattest by reason of the plenty of meat that season affords them. At which time they are highly prized, and coveted by the Italians even now-a-days."

The passage in *Aristotle*, book ix. ch. 49, where he speaks of the metamorphosis of birds, and says that the Συκαλὶς (fig eater) is a Συκαλὶς at the commencement of autumn, but a Μελαγκόρυφος (black-cap) at the end of that season, may very probably relate to the change of plumage in the *Black cap warbler*, '*Atricapilla* sive *Ficedula* Aldrov. Συκαλὶς et Μελαγκόρυφος Græcis. The *Black-cap*,' Ray; the young males of which resemble the female in plumage. [See BLACK-CAP.]

BECCARIA, CESARE BONESANA, MARQUIS OF, was born at Milan in 1735. The political speculations of France having spread to Italy, co operated with the instructions of Genovesi at Naples, and the perusal of the political works of Montesquieu, in directing Beccaria to the study of moral and political philosophy; and the patronage of Count Firmian, the Austrian governor of Lombardy, encouraged Beccaria, Count Verri, Frisi, and others to form a society in Milan, for the diffusion of literature and liberal opinions. In his 27th year, Beccaria published his first work, entitled *Del disordine e de' remedii delle monete nello stato di Milano*, nel 1762, con 4 tavole, 8vo. Lucca, 1762. 'Of the Abuses of the Coinage in the State of Milan and their Remedies.' In 1764 and 1765 the society, in imitation of the 'Spectator' of Addison, published *Il Caffè*, a periodical, which was completed in two vols. 4to., and consisted chiefly of papers on men and manners, with occasional discussions of important moral and political topics. The best papers are by Beccaria—his most humorous is on *smells*, and his most original on *style*. The last is an attempt to prove that nothing but the practice of proper rules is required for the attainment of excellence in eloquence and poetry. While this work was going on, Beccaria read in 1764, to the literary society, the MSS. of his work on 'Crimes and Punishments,' and in the same year, at their request, published it under the title of *Trattato dei delitti e delle pene*, 12mo. The work had great success. In Italy three editions were sold within six, and six editions within eighteen, months. In a few years it was translated into almost all the languages of Europe. It has been twice translated into French. The Abbé Morellet published a translation in 1766, which was undertaken at the recommendation of Malesherbes; the translation of M. Chaillou de Lisy was published in 1773, in 12mo. In 1797 a second edition of Morellet's translation was published, with notes by Diderot; and St. Aubin's translation of Jeremy Bentham's 'Theory of Penal Law.' Testimonials of approbation were sent to Beccaria by Catherine of Russia, the princes, and the people of Prussia and Tuscany; and a learned society of Berne, in Switzerland, sent him a medal. It was translated, in 1802, into modern Greek by Coray, for the benefit of his countrymen. An anonymous English translation appeared in 1766, with a translation of a commentary attributed to Voltaire.

The immethodical arrangement of this work renders an analysis difficult. In style it is clear, and occasionally eloquent. It breathes a fervid love of freedom and of humanity. In thought it is deep and original. We can only attempt to sketch its leading doctrine. Law is the restraint imposed by society. Punishment is the counter-action which society provides to prevent its members from violating its restraints. It ought to be a system of motives to counterbalance the motives to crime. The necessity of this counterbalance creates the right to punish—a necessity by which punishment ought to be measured and regulated. The due proportion between punishment and this necessity constitutes justice. If punishment oversteps this necessity it becomes tyranny, and when it does not come up to it, the motives to crime have a predominance, and crimes are consequently produced. This proportion society alone by its laws ought to determine. Hence, since society, the maker of the laws, is always in existence, the laws ought not to be interpreted by any other than the legislative body. If the interpretation of laws is left to judges, the rule of right becomes uncertain. To have a preventive influence on crime laws ought to be clearly expressed and well known. The standard of crime is the injury which it does to society. The best punishments are those which best prevent crimes. Pecuniary punishments are bad, in so far as they are apt to induce exaction instead of justice. Punishments ought to be immediate, to make the association between crime and punishment as close as possible. Transportation, by depriving the community, injured by the crime, of the example of the punishment, is therefore objectionable. The punishment of robbery ought to be pecuniary to counteract the cupidity, and corporal to counteract the violence of the crime. Infamy ought to be the punishment of crimes against honour. Since fanaticism is increased by corporal punishments, its punishments ought not to be corporal; and the proper punishment of persons who will not submit to the restraints of the community, is to send them out of it. Confiscation is unjust, because it falls upon the family or heirs of the offender, who are innocent of his offence. If the evil to the offender arising from the punishment is greater than the good he obtains from the crime, an increase of the certainty is more influential than an increase of the severity of the punishment. Severity destroys the sense of justice, and produces impunity, a fruitful source of crime. Hence the question of capital punishments. No one can give to society what he has not himself—a right to take away his life. History shows that this punishment does not prevent crime the most sanguinary governments have always had the most criminal population. Capital punishment is not a continued example of the evil of crime, and the character of individuals and communities is not changed by momentary but by continued impressions. Capital punishments cause by their severity compassion for the criminal to predominate over the terror of law and the fear of crime. For the benefit of every example, in the case of capital punishments, society first suffers the injury of a crime, and at best there is only a succession, not a perpetuity of the examples of the evil resulting to criminals from their misconduct; permanent examples of a long and durable punishment, such as perpetual slavery, and hard labour, for instance, must necessarily have more influence than examples of short duration, or examples scattered over different periods of time. The feeling of indignation which the punishment of death excites, is evinced by the contempt everywhere felt for the executioner; and since these truths have a universal bearing on the government of communities, Beccaria infers from the abolition of human sacrifices, once equally prevalent, the triumph of his benevolent principles.

Such is an outline of the principal doctrine of this work. It is far from being the only thing in the book, however, which contains several chapters on subjects not strictly connected with crimes and punishments. There are some valuable remarks on the processes and evidences on which convictions ought to be founded—the duties of nations to each other in regard to their criminals—espionage—suggestive interrogations—on the absurdity as well as cruelty of torture—on the power of forgiveness with which the sovereign is clothed, and several other topics; all of which are handled with considerable acuteness and originality. He concludes with urging the advantages of an improved system of education, and sums up in this general theorem: in order that a punishment may not be an act of violence of one or of many against a private member of society, it should be public, immediate, and necessary—the least possible in the case given: proportioned to the crime and determined by the laws.

Beccaria's success in this publication was not unalloyed. Accusations of impiety and sedition were brought against him in Milan, from the effects of which nothing but the powerful friendship of Count Firmian protected him. In 1768 the Austrian government founded a professorship of political philosophy for him at Milan, which he filled with distinguished success. In 1769 he published a 'Discourse on Commerce and Public Administration,' which was translated into French by J. A. Comparet; and in 1781 a Report of a plan for producing uniformity in the weights and measures of Milan. He died of apoplexy, in November, 1793. The lectures which he delivered as a professor were published at Milan in 1802, and they form a part of the series of 'Italian Economists,' published at Milan in 1804.

BECCARIA, GIOVANNI BAPTISTA, born at Mondovi, 1716, went to Rome and began theological studies in 1732, and was afterwards professor of philosophy at Palermo and Rome till 1748, when the King of Sardinia invited him to Turin. He published, in 1753, *Dell' Elettricismo naturale ed artificiale*, Turin. In 1758 he published *Lettere sull' Elettricismo*, addressed to Beccari, president of the Institute of Bologna. In 1759 he was engaged to measure a degree of the meridian in Piedmont, which he began in 1760, and finished before 1774, in which year the result was published at Turin, in a work entitled *Gradus Taurinensis*. He afterwards replied to some objections of Cassini in *Lettere d'un Italiano ad un Parigino*, Florence. There are some papers of his in the *Phil. Trans.* 1766—1769. He published also *Experimenta atque Observationes*, &c., Turin, 1769, *Dell' Elettricismo artificiale*, 1772, of which an English translation was published, at the recommendation of Franklin; *Dell' Elettricità terrestre atmosferica à cielo sereno*, 1755; besides various other smaller pieces, of which a catalogue is in *Memorie storiche intorno à gli studi del P. Beccaria*, by the Abbé Landi. He left a large number of manuscripts to M. Balbe, who wrote the account of him in the *Biographie Universelle*, from which the preceding is abridged. He died May, 1781.

Beccaria is principally known by his experiments on electricity, to which he was led by Franklin's writings. He showed that the passage of electricity is not instantaneous through the best conductors; that water, in small tubes, is a very imperfect conductor, and that its power in that respect increases as the tube becomes larger: he also first showed the electric spark in its passage through water, by confining the fluid in small tubes. (See Priestley's *History of Electricity*, v. i. p. 245, and the history in the *Encyclopædia Metropolitana*.)

The Piedmontese measure of the meridian is not now considered as entitled to much confidence. At the time it was observed that the two ends of the arc were in the neighbourhood of mountain masses, and though the local attraction had been for some time suspected, the discrepancy between the degree deduced by Beccaria and that of others required a supposition of more disturbance than was attributed to Chimboraço by Bouguer. [See ATTRACTION.] It has been of late years remeasured by Plana and Carlini, and the astronomical part proved to be erroneous: some anomaly still remains, but of a degree which is more likely to have been the correct amount, arising from local attraction. The remeasurement is published, entitled *Opérations Géodesiques*, &c. (See *Rep. Brit. Ass.*, v. i., p. 166.)

BECCLES, a market-town of the county of Suffolk, in the hundred of Wangford. It has a separate jurisdiction, and is considered the third town in the county. Beccles is situated on the river Waveney, which is navigable from Yarmouth: it is 32 miles N.N.E. from Ipswich, and 98 miles N.E. from London. The manor of Beccles, with an adjoining common of about 1400 acres, formed part of the possessions of Bury Abbey. On the dissolution of monasteries, the manor, with the common, was granted to William Rede, with a stipulation that the common was to be held for the use of the inhabitants. The poor are still allowed to pasture their cattle upon it on very easy terms. The management of the common is vested in a corporation, called the Corporation of Beccles Fen. The town sustained great injury in 1586 from a fire, which destroyed eighty houses, damaged the church, and occasioned loss of property to the amount of 20,000*l.*, as estimated at the time.

Beccles has a corporation consisting of a portreeve and thirty-six burgesses, distinguished as *the twelves* and *the twenty-fours*, the office of portreeve being held in rotation by the twelves. In consequence of its water communication with Yarmouth, the town carries on with the vicinity a considerable trade in coals, groceries, &c. The market-day is Saturday; and the fairs are on Whit-Monday, June 29, and October 2: the last for horses and pedlary. The population amounted, in 1831, to 3862 persons, of whom 2068 were females.

Beccles is a well-built town, consisting of several streets which terminate in a spacious area, where the market is held. The parish church, dedicated to St. Michael, appears to have been founded about the year 1369. The porch is of later date, and the steeple still later. The first legacy bequeathed for the erection of the steeple is dated 1515, from which time till 1547 there were many legacies towards 'building Becclys stepul.' The church stands on an eminence overlooking the level of meadows through which the Waveney flows. The west end of the church approaches so near to the edge of the cliff, that no room was left for the safe foundation of the steeple: which is, therefore, placed at a small distance from the south-east angle of the chancel. It is a fine tower of freestone: but it appears never to have been completed, the height not being proportionate to the size, and a parapet at the top being wanting, which seems to indicate that it was the intention of the architect to raise it higher than at present. The church itself is a fine Gothic structure. It consists of a nave, two aisles, and a chancel. The porch is a very beautiful specimen of the florid Gothic, differing in its style both from the church and the steeple. The living is a rectory, valued in the king's book at 21*l.* 12*s.* 3½*d.* Beccles formerly consisted of two parishes, St. Mary Endgate and St. Michael; but they were consolidated in 1419; and St. Mary's church was afterwards demolished by order of Queen Elizabeth. The dissenters have two chapels in the town.

Beccles has a handsome town-hall, in which the quarter-sessions are held; there is also a well-managed gaol, a theatre, and an assembly-room. A free-school was founded here in the reign of James I. by Sir John Leman, alderman of London, who endowed it with 100 acres of land for the maintenance of a master and usher to instruct 48 poor boys in writing and arithmetic. There is also a good grammar-school, founded in the year 1713 by Dr. Falconberg, who resided several years in the parish, and at his death bequeathed for this purpose an estate at Corton, in the same county, of the yearly rent of 40*l.* This school has ten exhibitions at Emanuel College, Cambridge. (*Beauties of England and Wales*, vol. xiv.; *Gentleman's Magazine*, vol. lxxxvii., part 2.; *Excursions in Suffolk*, 1819.)

BECKER, FERDINAND WILHELM, was born on the 24th of April, 1805, at Höxter on the Weser, where his father, the distinguished philologi

Becker, lived as a physician. In co

changes of which Northern Germa

by the French invasion, the famil

to Göttingen, and it was in the high school of that town, that Becker received his first classical education, while his father led him to collect minerals and plants, and thus to lay an early foundation for his subsequent studies in natural science. In 1816 the family left Göttingen, and settled at Offenbach, near Frankfort on the Main. Here Becker continued to devote his attention chiefly to botany, chemistry, and natural philosophy, partly under the guidance of his father, and partly by attending lectures on various branches of natural science, and also on anatomy, in Senkenberg's Institution at Frankfort. In 1820 Becker accepted the proposal of a young Scotchman, whose acquaintance he had made at Offenbach, to go as private tutor to his family at Glasgow. After a year he proceeded from Glasgow to Edinburgh, where he obtained the situation of assistant librarian in the Advocates' Library, and availed himself of the opportunities afforded by the university to pursue his studies in medicine and in the natural sciences. Early in 1825 he returned to Germany, and after visiting several of the universities, and the principal medical institutions there, he proceeded to Berlin, where (in January, 1826) he took his degree of doctor in medicine, and passed with high credit through the examinations necessary to enable him to practise as a physician in the Prussian dominions. In the autumn of the same year he returned to Edinburgh, at the invitation of his kind friend, Dr. John Thomson, the distinguished professor of pathology, who wished to avail himself of Becker's assistance in several literary undertakings, and especially in preparing an edition of Cullen's works. In March, 1828, he quitted Scotland, in order to accompany, in the capacity of physician, a German nobleman on a journey through Italy and France, and remained with him for nearly a year at Paris. Towards the end of 1829 Becker returned to Germany, and established himself as physician at Berlin, and in the following year as private lecturer on medicine, in the university of that capital. His lectures on various branches of practical medicine, especially on general pathology, met with great approbation, and with a success rarely experienced by public teachers in a German university, so soon after their first appearance. In 1833 the Prussian ministry for medical affairs intrusted him with the superintendence of an extensive inquiry concerning the efficacy of vaccination; and he was devoting himself with the utmost zeal to this difficult and important duty, when he died, after a short illness, on the 22d of June, 1834. His early loss was deplored by all who knew him, and his success in getting into extensive practice so early was the best proof of the estimation in which he was held. His only works, published separately, are his inaugural dissertation *De Glandulis Thoracis atque de Thymo* (Berlin, 1826, 4to.), and an essay *De Historica Medicinæ Explicatione* (Berlin, 1830, 8vo.), and also a very able pamphlet on Cholera, published in London expressly for the purpose of making known his ideas on the nature and treatment of that formidable disease, derived from extensive observation during the zealous discharge of his duty in attending a district of Berlin confided to his care; but his contributions to various German, English, and French periodical publications are numerous and valuable, and the preface to his German translation of Andral's *Pathology* (Berlin, 1832, 8vo.) may be considered as an original essay of high interest to medical science. Shortly before his death, Dr. Becker had undertaken to furnish some medical biographies for this work: all that he lived to execute are Archiater, Archigenes, Aretæus, Astruc, and Athenæus of Attalia.

BECKET, THOMAS, was born of English parents, in London, in 1117, where his father Gilbert was a merchant. He was first educated at Merton Abbey in Surrey, and afterwards in London, Oxford, and Paris. When employed in the office of the sheriff of London, his manners and talents recommended him to Theobald, archbishop of Canterbury, an acquaintance of his father, by whom he was sent to study civil law, first under Gratian at Bologna, and then at Auxerre in Burgundy. On his return, his patron gave him the livings of St. Mary-le-Strand, and Otteford in Kent; and sent him to manage the business of the see of Canterbury at the court of Rome. His success in two negociations, in restoring the legatine power to the see of Canterbury, and in obtaining from the pope the letters of prohibition, by which the design of crowning Prince Eustace the son of Stephen was defeated recommended him powerfully both to the archbishop and to King Henry II. Theobald made him archdeacon of Canterbury, provost of Beverly, and a prebendary of Lincoln and St. Paul's; and Henry made him chancellor in 1158, Becket being the first Englishman after the conquest who was appointed to any high office. At that time the chancellorship had no separate court of judicature attached to it; yet the place was one of great trust and dignity: the chancellor sat in the courts of the justiciary, to seal royal grants, to take care of the royal chapel, to hold the custody of vacant baronies and bishopricks, to look after the exchequer and revenue, and to discharge the duties which now devolve upon the secretaries of state. While performing these duties satisfactorily, Becket conformed himself in dress, manners, and splendour to the habits of a courtier. His table was sumptuous; his retinue splendid. To please the military taste of the king, he accompanied him in a campaign into France; headed his own 1200 horse and 700 knights; took the command of them at several sieges, and with his lance unhorsed in single combat a French knight of distinguished bravery and skill. About this time the king made him the tutor of his son. In 1160 Becket negociated at Paris, advantageously for his master, a marriage between Prince Henry and Margaret, daughter of the king of France.

When he had been little more than four years chancellor, the archbishop of Canterbury died, and the king, who was then in Normandy, took measures which almost compelled the monks and clergy to elect Becket to the vacant archbishopric. Foliot, bishop of London, alone opposed him openly: the rest were overawed by the threats of the king. Being only in deacon's orders, he was ordained priest the day before he was consecrated archbishop, in 1162, in presence of Prince Henry and many of the nobility. His first step on receiving his pall from Pope Alexander III. was to send his resignation as chancellor to the king; a step at which Henry showed his displeasure, on his return to England, by receiving him coldly, and compelling him to resign his archdeaconry, which he wished to keep.

Becket now changed his conduct. His biographers ascribe his conversion to the Divine blessing on the ceremony of consecration. The courtier changed into the monk; his manner of life became austere; he submitted to mortifications; gave much away in charity, and washed the feet of the poor. In 1163 he was received with great distinction at the council of Rheims, and laid a complaint before the assembly, on the usurpations by the laity of the rights and property of the church of England. On his return he prosecuted the usurpers, demanded the custody of Rochester castle from the crown, claimed the homage of Earl Clare for the manor of Tunbridge, and even excommunicated William, lord of the manor of Aynsford in Kent, for ejecting by force of arms a priest collated to the rectory of that manor by the archbishop.

He soon came to a rupture with the king. Henry, who wished to subject the clergy to the authority of the civil courts for murder, felony, and similar crimes, endeavoured, in 1164, to get the consent of the archbishop to the celebrated *Constitutions of Clarendon.* On Becket's refusal Henry took his son from under his care, and the archbishop solemnly swore he never would comply. When the compliance of several bishops, the threats of the nobles, and the interference of the pope, at last compelled him to violate his oath and set his seal to these restrictions, he expressed his penitence by retiring from the court, and privately suspending himself from officiating in the church, until he obtained the absolution of his holiness. [See CLARENDON.]

Finding himself the object of the king's displeasure, he attempted to escape to France, upon which Henry summoned a parliament at Northampton, in 1165, and charged him with breaking his allegiance. He was sentenced to forfeit all his goods and chattels; a penalty which was immediately commuted into a fine of 500*l.* Next morning he was ordered to refund 300*l.* of the rents which he had received as warden of Eye and Berkhamstead, and 500*l.* which he had received from the king before the walls of Toulouse. On the third day he was requested to give an account of all his receipts from vacant abbeys and bishoprics during his chancellorship: the balance due to the crown was said to be 41,000 marks. Becket appealed to the pope in vain, and his episcopal brethren deserted, abused, and opposed him. During the trial, when many of his retainers left him, he invited all the beggars in the neighbourhood to his table; and on another occasion he entered the parliament carrying the cross, to signify that he had put himself under its protection, and refused to listen to the sentence of the parliament. When all went against him, he escaped from Northampton by night, and after lurking some time on the coast, embarked at Sandwich in Kent, on the 10th of November, 1164, and reached Gravelines in Holland. After several changes, he lived for nearly two years at Pontigny in France.

On his escape Henry confiscated his revenues, and used all his influence to get him banished from Flanders and France. The king of France and the pope, however, took up the cause of Becket, though Henry sent a splendid embassy of bishops and nobles to advocate his cause at the court of Rome. In an interview with his holiness, Becket resigned his see into his hands, which was immediately restored to him. During his retirement he occupied himself in religious exercises, but this was not sufficient to keep him employed: he wrote to the king and the prelates of England, telling them that the pope had annulled the Constitutions of Clarendon, and he excommunicated several violators of the rights of the church, not sparing some of the principal officers of the crown. Exasperated at this, Henry erased his name from the liturgy; banished all his relations to the number of 400, binding them by oath to show themselves to their kinsman; forced the Cistertian monks to turn him out of the shelter they gave him, by threatening to seize their property in England, and made it a criminal offence to write or correspond with him in any

Becket, on his part, wrote letters of severe recrimination to the prelates of England; and about the beginning of June, 1166, prepared himself by religious rites for the excommunication of the English king, which he was only vented from carrying into effect by hearing of his dangerous illness. After this, having obtained the legatine power of all England, except the see of York, he found means, in spite of the watchfulness of the king's emissaries at all the English ports, to send letters to the bishop of London, commanding him to publish his appointment, and to go over on pain of excommunication with all the rest of the prelates to France, and tender their obedience to their legate. The terrified bishop implored the king to permit his compliance; but the king, it is said, produced secret letters from the pope, nullifying the authority of Becket.

Several of the French and English nobles, the bishops of the province of Canterbury, the pope and the king of France tried to reconcile Becket and Henry; but the obstinacy of the former in refusing to make an unconditional submission, and of the latter in upholding his innovations, rendered all their negociations useless. They met themselves, for the purpose, three times. The second interview failed because the king refused Becket the kiss of peace. Next year Henry ordered the ceremony of crowning his son, Prince Henry, a prerogative of the archbishop of Canterbury, to be performed by the archbishop of York. When Becket complained to the pope, the archbishop of York and all the prelates who assisted him were suspended.

At length, in 1170, a reconciliation took place at Freitville on the borders of Touraine, when the king restored Becket to his see with all its privileges, and held the bridle of the archbishop's horse while he mounted and dismounted. Becket entered Canterbury amidst the shouts of the people. But after all his sufferings he was rash enough to publish the suspension of the archbishop of York and all the bishops who had assisted at Prince Henry's coronation; and the king, who was then in Normandy, is said to have expressed his vexation that none of his followers had revenged him on this insolent priest. Reginald Fitzurse, William de Tracy, Hugh de Moreville, and Richard Brito, four barons, accordingly formed a resolution either to effect the submission or the death of the archbishop. They set out by different routes, and met on the 28th of December, 1170, at Ranulp de Broc's castle, six miles from Canterbury, where they formed their plan. Early next morning they entered Canterbury with a body of men, whom they stationed at different places to keep down the citizens. They had an interview with the archbishop in his palace in the morning, when high words passed between them; and in the evening they entered the cathedral while Becket and some of his clergy were at vespers. When the alarm was given some of the priests would have shut the door, but Becket would not let them 'make a castle of a church.' He boldly faced the conspirators, and replied to their threats by declaring that he was willing to die, and earnestly charging them not to hurt any one but himself. The assassins trying to drag him out of the church, he clung to a pillar near the high altar, collared De Tracy, and almost threw him down. De Tracy aimed a blow at him, which slightly wounded him, but broke the arm of Edward Grimes, his crossbearer. The archbishop then putting himself in a devout posture, the blows of the other assassins clove his skull and scattered his brains over the pavement.

After the murder the assassins retired to Knaresborough, and soon found themselves shunned by every one. They all ended their days as penitents at Jerusalem, and this inscription in Latin was put on their tomb:—

'Here lie the wretches who murdered St. Thomas of Canterbury.'

The pope suspended divine service in the cathedral for a year. Two years afterwards Becket was canonized. In 1221 his body was taken up in presence of Henry III., and deposited in a rich shrine on the east side of the church. It became the resort of pilgrims, and numerous miracles were said to be performed at the spot; but the shrine was despoiled at the reformation of Hen. VIII., and the saint's name erased from the calendar.

There are several MS. lives of Becket in the British Museum, and in the libraries of Lambeth and Oxford.

In 1666 a pamphlet appeared, called *The Prophecie of Thomas Becket, Archbishop of Canterbury, in the Reign of Henry II., concerning the Wars between England, France, and Holland*, 4to. London.

Becket's letters were published under the following title: *Epistolæ et Vita Divi Thomæ Martyris et Archi-episcopi Cantvariensis, &c.*, Bruxellæ, 1604.

(See Lingard's *History of England*, vol. ii.; and Lord Lyttleton's *History of the Reign of Henry II.*, vol. ii.)

BECKMANN, JOHN, a well-known German author, was born at Hoya, a small town in the kingdom of Hanover, in the year 1739. He went to the school at Stade, and afterwards to the university of Göttingen, where he at first studied theology, but soon acquired a taste for natural philosophy and chemistry. In 1763 he went to Petersburgh, where he was made professor of natural philosophy and history, at the Lutheran gymnasium of that city. He resigned this place in 1765, and made a journey through Sweden, during which he became acquainted with Linnæus, and obtained a considerable knowledge of the working of the mines in Sweden. On his return to Germany, he was appointed professor of philosophy at Göttingen, 1766, and four years afterwards, 1770, ordinary professor of economy at the same university, which place he kept till his death, 1811. Beckmann united an extensive knowledge of nature with a decided turn for applying it to practical purposes; and he published several works which show this tendency of his mind: among others, *Principles of German Agriculture*, which passed through six editions; and a *Technology*, which was reprinted five times. Of his other works, the most remarkable are, *Contributions* (additions) *to the History of Inventions*, which, somewhat shortened, has been translated into English; and *Introduction to the Science of Commerce*. He also published an edition of the work attributed to Aristotle, entitled *De Mirabilibus*, and an edition of the *Collection of Wonderful Histories* by Antigonus Carystius.

BECMAN, JOHN CHRISTOPHER, historian and geographer, was born at Zerbst in Anhalt, September 2nd, 1641. Having finished his earlier studies at Francfort, he travelled through Germany, Holland, and England. He afterwards returned to Francfort, where he was made professor of Greek in the university there in the month of January, 1667, and afterwards professor of history. In 1673 he became librarian to the university, and was chosen professor of Theology in 1690. He died at Francfort, March 6th, 1717. His chief works are: 1. *Historia Orbis Terrarum geographica et civilis*, 4to. Franc. ad. Od. 1673, several times reprinted, the third edition appeared at Leipsic in 1685; 2. *Memoranda Francofurtana*, 4to. Franc. ad Od. 1676; 3. *Catalogus Bibliothecæ publicæ Universitatis Francofurtanæ per cognomina auctorum dispositus*, fol. Franc. ad Viad. 1706; 4. *Notitia Universitatis Francofurtanæ*, fol. Franc. ad Viad. 1707; 5. *Historia Anhaltina*, vii. part. fol. Zerbst, 1710, with numerous plates; 6. *Accessiones Historiæ Anhaltinæ*, with a continuation of the history of the principality from 1709 to 1716, three vol. fol. 1716; 7. *Historia Francofurtana*, fol. (See *Notit. Univ. Francof.* p. 59; *Biogr. Universelle*, tom. iv. 8vo. Par. 1811, p. 33.)

BED OF JUSTICE. This expression (*lit' de justice*) literally denoted the seat or throne upon which the king of France was accustomed to sit when personally present in parliaments, and from this original meaning the expression came, in course of time, to signify the parliament itself. Under the antient monarchy of France, a bed of justice denoted a solemn session of the king in the parliament, for the purpose of registering or promulgating edicts or ordinances. According to the principle of the old French constitution, the authority of the parliament, being derived entirely from the crown, ceased when the king was present; and consequently all ordinances enrolled at a bed of justice were acts of the royal will, and of more authenticity and effect than decisions of parliament. The ceremony of holding a bed of justice was as follows:—The king was seated on the throne, and covered; the princes of the blood-royal, the peers, and all the several chambers were present. The marshals of France, the chancellor, and the other great officers of state stood near the throne, around the king. The chancellor, or in his absence the keeper of the seals, declared the object of the session, and the persons present then deliberated upon it. The chancellor then collected the opinions of the assembly, proceeding in the order of their rank; and afterwards declared the determination of the king in the following words: 'Le roi, en son lit de justice, à ordonné et ordonne qu'il sera procédé à l'enregistrement des lettres sur lesquelles on à délibéré.' The last bed of justice was assembled by Louis XVI. at Versailles, on the 6th of August, 1788, at the commencement of the French revolution, and was intended to enforce upon the parliament of Paris the adoption of the obnoxious taxes, which had been previously proposed by Calonne at the Assembly of

Notables. The resistance to this measure, and the effect it had in leading to the assembly of the States-General, and ultimately to the revolution, belong to another article.

BEDA, or BEDE, an English monk, one of the brightest ornaments of the eighth century, and one of the most eminent fathers of the English church, whose talents and virtues procured him the name of the *Venerable Bede*, was born, according to some, about the year 672, after Malmesbury's calculation in 675, according to Symeon of Durham in 677, upon the estates which afterwards belonged to the two abbeys of St. Peter and St. Paul in the bishoprick of Durham, at Wearmouth and Jarrow, near the mouth of the river Tyne. We have his own authority that at seven years of age he was brought to the monastery of St. Peter, and committed to the care of Abbot Benedict, under whom and his successor Ceolfrid he was carefully educated for twelve years, a favour which he afterwards repaid by writing their lives. In his nineteenth year he took deacon's orders, and in his thirtieth year, at the instance of Ceolfrid his abbot, was ordained priest, both times by John of Beverley, then bishop of Hagustald, or Hexham, who had been one of his early preceptors. The fame of Bede now reached even to Rome, and Pope Sergius made an earnest application to Abbot Ceolfrid that Bede might be sent to assist him in the promulgation of certain points of ecclesiastical discipline; but Bede, who was attached to his studies, remained in his monastery, improving himself in all the learning of his age, and directing his more particular attention to the compilation of an *Ecclesiastical History of the English Nation*, the materials for which he obtained partly from chronicles, partly from annals preserved in contemporary convents, and partly from the information of prelates with whom he was acquainted. Making allowance for the introduction of legendary matter, which was the fault of the age, few works have supported their credit so long, or been so generally consulted as authentic sources. Bede published this history about the year 734, when, as he informs us, he was fifty-nine years of age, but before this he had written many other books on various subjects, a catalogue of which he subjoined to his history. By these he obtained such reputation as to be consulted by the most eminent churchmen of his age, and particularly by Egbert, Archbishop of York, who was himself a very learned man. To him Bede wrote an epistle which illustrates the state of the church at that time. It was one of the last, and indeed probably the very last of Bede's writings. In this letter he expresses himself with much freedom, both in the advice he gave to Egbert, and with respect to the inconveniences which he foresaw would arise from the multiplication of religious houses, to the prejudice both of church and state.

It appears from this epistle that Bede was much indisposed when he wrote it, and probably began to fall into that declining state of health from which he never recovered. William of Malmesbury in his history (*De Gestis Regum*, lib. iii. c. iii.), and Symeon of Durham in his account of the church of Durham (lib. i. c. xv.), chiefly from the relation of one Cuthbert, a fellow monk, have preserved full accounts of the manner in which Bede died: whence we learn that the last stage of his distemper was an asthma, which he supported with great firmness of mind, although in much weakness and pain, for seven weeks, during which time he did not in the least abate his usual employments in the monastery, but continued to pray, to instruct the younger monks, and to prosecute the literary undertakings which were still in his hands. In the nights of his sickness, in which, from the nature of his disease, he had little sleep, he sung hymns and praises to God; and though he expressed the utmost confidence, and was able, on a review of his own conduct, to declare seriously that he had so lived as not to be afraid to die, yet he did not deny his apprehensions of death, and that dread which is natural to man at the approach of his dissolution. He was continually active to the last, and particularly anxious about two works, one his translation of St. John's Gospel into the Saxon language, the other some passages which he was extracting from the works of St. Isidore. From the monks' relation it appears that the day before his death he grew much worse, and his feet began to swell, yet he passed the night as usual, and continued dictating to the person who acted as his amanuensis, who, observing his weakness, said, 'There remains now only one chapter, but it seems difficult to you to speak.' To which he answered, 'It is easy; take your pen, dip it in the ink, and write as fast as you can.' About nine o'clock he sent for some of his brethren, priests of the monastery, to divide amongst them some incense and other things of little value, which he had preserved in a chest. While he was speaking, the young man, Wilberch, who wrote for him, said, 'Master, there is now but one sentence wanting,' upon which he bid him write quick, and soon after the scribe said, 'Now it is finished.' To which he replied, 'Thou hast said the truth, "consummatum est."' Take up my head, I wish to sit opposite to the place where I have been accustomed to pray, and where now sitting I may yet invoke my Father.' Being thus seated, according to his desire, upon the floor of his cell, he said, 'Glory be to the Father, and to the Son, and to the Holy Ghost,' and as he pronounced the last word he expired. He died, according to the best opinion, May 26th, 735, though the exact date has been contested. His body was interred in the church of his own monastery at Jarrow, but long afterwards was removed to Durham, and placed in the same coffin or chest with that of St. Cuthbert, as appears by a very antient Saxon poem on the relics preserved in the cathedral of Durham, printed at the end of Symeon of Durham's history. (Twysden's *Decem Scriptores*, col. 32.)

Malmesbury says, 'With this man was buried almost all knowledge of history down to our times; inasmuch as there has been no Englishman either emulous of his pursuits, or a follower of his graces, who could continue the thread of his discourses now broken short.' He complains, in addition, of the indolence and want of learning of the monks in Bede's monastery, down even to his own time, which he exemplifies in the meanness of the lines so disgracefully suffered to remain upon Bede's tomb:—

> 'Presbyter hic Beda requiescit carne sepultus:
> Dona, Christe, animam in cœlis gaudere per ævum;
> Daque illi sophiæ debriari fonte, cui jam
> Suspiravit ovans, intento semper amore.'
>
> 'Here in the flesh rests Bede the priest; O give
> His soul with joy eternally to live:
> And let him quaff, O Christ, of wisdom's stream:
> This was his wish, his fond, perpetual theme.'

Warton, in the second dissertation prefixed to his first volume of the *History of English Poetry*, has justly observed that Bede's knowledge, if we consider his age, was extensive and profound; and it is amazing in so rude a period, and during a life of no considerable length, that he should have made so successful a progress, and such rapid improvements in scientific and philological studies, and have composed so many elaborate treatises on different subjects. It is diverting, he adds, to see the French critics censuring Bede for credulity; they might as well have accused him of superstition. There is much perspicuity and facility in his Latin style, but it is void of elegance, and often of purity; it shows with what grace and propriety he would have written had his taste been formed on better models. Whoever looks for digestion of materials, says Warton, disposition of parts, and accuracy of narration in this writer's historical works, expects what could not exist at that time. He has recorded but few civil transactions; but besides that his history professedly considers ecclesiastical affairs, we should remember that the building of a church, the preferment of an abbot, the canonization of a martyr, and the importation into England of the shin-bone of an apostle, were necessarily matters of much more importance in Bede's conception than victories and revolutions. He is fond of minute description; but particularities are the fault, and often the merit of early historians.

The first catalogue of Bede's works, as we have before observed, we have from himself, at the end of his *Ecclesiastical History*, which contains all he had written before the year 731. This we find copied by Leland, who also mentions some other pieces he had met with of Bede's, and points out likewise several that passed under Bede's name, though, in Leland's judgment, spurious. (Lel. *de Script. Brit.* ed. Hall, Oxf. 1709, tom. i. p. 115.) Bale, in the first edition of his work on British writers (4to. Gippesw. 1548, fol. 50), mentions 96 treatises written by Bede, and in his last edition (fol. 1559, p. 94) swells these to 145 tracts; and declares at the close of both catalogues that there were numberless pieces besides of Bede's which he had not seen. Pits has enlarged even this catalogue; though, to do him justice, he appears to have taken great pains in drawing up the article on Bede, and mentions many of the libraries in which these treatises are to be found. The catalogues given by Trittenheim, or Trithemius (*Catal. Script. Ecclesiast.* 4to. Col. 1531, fol. 50 b.), and Dempster (*Hist. Ec-*

clesiast. Gentis Scotorum, edit. Edinb. 1829, tom. i. p. 69) are much inferior to these.

The *Historia Ecclesiastica* was printed for the first time about 1474, in the type which passes for that of Conrad Fyner of Esling; a copy of it is preserved in the Bibliothèque du Roi at Paris, and there is another copy in the library of the Right Honourable Thomas Grenville in England. It is a volume of extreme rarity. King Alfred translated this history into Saxon, and the royal version, accompanied by the original Latin, was published first by Wheloc, fol. Cambr. 1644, and subsequently by Dr. Smith, canon of Durham, with greater care, fol. Cambr. 1722. An English translation of this history was first published at Antwerp in 1565, by Thomas Stapleton, a doctor of divinity of the University of Louvain; another and better translation was published, 8vo. Lond. 1723, immediately after the publication of Dr. Smith's edition; and a third has since appeared, translated by the Rev. William Hurst, 8vo. Lond. 1814.

The first general collection of Bede's works was published at Paris in 1544, in three volumes folio. They were printed again at the same place in eight volumes folio, in 1554; in the same size and number of volumes at Basle, in 1563; reprinted at Cologne in 1612; and, lastly, at Cologne in 1688. There is a very clear and distinct account of the contents of these volumes in the 'Notes to the Life of Bede' in the 'Biographia Britannica,' edit. 1747, vol. i. pp. 649-652; and other analyses may be found in the works of Casimir Oudin, and Mabillon, and in Cave's 'Historia Literaria.'

Those treatises of Bede's which are mentioned in his own catalogue of his works were published by the learned and industrious Mr. Wharton, from three MSS. in the valuable library in the archiepiscopal palace at Lambeth, under the title of 'Bedæ Venerabilis Opera quædam Theologica, nunc primùm edita, necnon Historica antea semel edita. Accesserunt Egberti archiepiscopi Eboracensis Dialogus de Ecclesiasticâ Institutione, et Adhelmi Episcopi Sareburnensis Liber de Virginitate, ex codice antiquissimo emendatus.' 4to. Lond. 1693.

The antient and celebrated copy of the Latin Gospels, written before 720, with an interlineary Saxon gloss, originally kept in the monastery of Lindisfarne, afterwards transferred to Durham, and now preserved among the Cottonian MSS. in the British Museum (marked NERO E. IV.), is reputed to have been once the property of the Venerable Bede.

(Besides the works which have been already quoted, Symeon of Durham's *Historia Ecclesiæ Dunelmensis*, Tanner's *Bibliotheca Britannico-Hibernica*, the *Biographia Britannica*, Henry's *History of Britain*, and the life appended to Smith's edition of Bede's *History*, are the chief authorities for the present account.)

BEDARIEUX, or **BEDARRIEUX**, or **BEC D'ARIEUX**, a town in France, in the department of Hérault, about 35 miles nearly due west from Montpellier. It is on the left or east bank of the river Orb, which waters the department in the western part, and at the foot of the great chain of the Cévennes. The Cévennes lie to the N.W. of Bedarieux; and a branch from the principal chain, running southward between the rivers Orb and Lergue (the latter a feeder to the Hérault), passes on the east side of the town, which is thus nearly enclosed by the mountains. It is in 43° 36′ N. lat., and in 3° 12′ E. long.

Bedarieux is not remarkable, except for its woollen manufactures, which were established long ago, and constituted in the early part of the eighteenth century the only claim of the town to notice. (Martinière, *Le Grand Dictionnaire*.) Cloth, for the Levant, and for consumption in the interior of France; mixed fabrics of cotton and wool, and of silk and wool, are made here. Leather, paper, oil, brandy, and glass are also among the productions of the industry of Bedarieux. Population in 1832, of the town, 5781; of the whole commune, 5998. (*Dictionnaire Universel de la France*.)

BEDCHAMBER, LORDS OF THE, are officers of the royal household, under the groom of the stole. The number of lords is twelve, who wait a week each in turn. The groom of the stole does not take his turn of duty, but attends his majesty on all state occasions. There are thirteen grooms of the bedchamber who wait likewise in turn. The salary of the groom of the stole is 2000*l.* per annum, of the lords 1000*l.* each, and of the grooms 500*l.* They are in the royal nomination.

Chamberlayne, in his *Present State of England*, 12mo. Savoy, 1669, p. 249, calls them gentlemen of the bedchamber. 'The gentlemen of the bedchamber,' he says, 'consist usually of the prime nobility of England. Their office in general is, each one in his turn, to wait a week in every quarter in the king's bedchamber, there to lie by the king on a pallet-bed all night, and in the absence of the groom of the stole to supply his place.' In the edition of the same work published in 1716, he adds, 'Moreover, they wait upon the king when he eats in private; for then the cupbearers, carvers, and sewers do not wait. This high office, in the reign of a queen, as in her late majesty's, is performed by ladies, as also that of the grooms of the bedchamber, who were called bedchamber women, and were five in number.'

The title of lords of the bedchamber appears to have been adopted after the accession of the House of Hanover. They are first mentioned by that title in Chamberlayne's *State of England*, for 1718.

Compare also the *New Compan. to the Kalendar*, 8vo. Lond. 1820, p. 63.

BEDDOES, THOMAS, a distinguished physician, was born at Shiffnall, in Shropshire, in April, 1760. His father, who was a tanner, wished to bring up his son to the same business, but his grandfather, perceiving the abilities which he early manifested, prevailed upon his father to educate him for some profession. An accident which befell his grandfather, and required the attendance of a surgeon, determined young Beddoes to study medicine. He received the rudiments of his general education at Brewood, or Brood, in Staffordshire, whence he was removed to Bridgenorth, and afterwards, in 1773, he was placed under the care of the Rev. S. Dickenson, rector of Plym-hill, in Staffordshire. In 1776 he entered at Pembroke College, Oxford, and soon became distinguished for his learning, and his acquaintance with languages, both antient and modern: in the latter he was entirely self-instructed. During his residence at the university, he also devoted much of his time to chemistry and geology. The recent discoveries of Black and Priestley, in respect to the different gases or airs, directed the attention of men of science more especially to these subjects, and Beddoes fully participated in the interest which they excited. He also early formed high expectations of the uses of these discoveries, especially in the treatment of diseases, and had that direction given to his mind which ever afterwards induced him to trust greatly to pneumatic medicine. Mineralogy and botany also occupied much of his attention while at Oxford. Having, in 1781, taken his Bachelor's degree, he proceeded to London to study medicine, and became a pupil of the celebrated Sheldon.

In 1784, while residing in London, he published, but without his name, a translation of Spallanzani's *Dissertations on Natural History*. In the autumn of 1784 he removed to Edinburgh, where he spent two winters and one summer. He was greatly distinguished among the students, and attracted the notice of Dr. Cullen, by whom he was employed to add notes to his translation of Bergman's *Essays on Elective Attractions*, to which work Beddoes affixed his name.

In 1786 he took his degree of Doctor of Medicine at Oxford: and in the course of the following summer he visited France, where he became acquainted with Lavoisier and other celebrated chemists. On his return from the Continent he was appointed reader in chemistry to the University of Oxford, where he maintained the current doctrines of the day with much learning, ingenuity, and eloquence. In his views respecting geology he embraced the theory of Hutton, and was a decided believer in the existence of a central fire, by the agency of which the crust of the earth had assumed its present form. In 1790 he published *Chemical Experiments and Opinions*, extracted from a work published in the last century, in which he endeavoured to obtain justice for the views and discoveries of Dr. Mayow in pneumatic chemistry.

Being of an ardent disposition, and entertaining great expectations of the perfectibility of human nature, he eagerly adopted the views of the partizans of the French Revolution; and it is thought that the freedom with which he expressed his opinions gave so much offence to the superiors of the University of Oxford, as to render his residence there no longer agreeable. It is also probable that some of his religious opinions contributed to determine him to resign his readership in chemistry, which accordingly he did in 1792

Upon retiring from Oxford he took up his abode with a friend in Shropshire, where he wrote a work, entitled *History of Isaac Jenkins*, intended to check drunkenness; and several medical works, in which he embodied his peculiar views regarding the origin and treatment of several diseases. The few and feeble attempts which had, for some years previous, been made to maintain the soundness of the basis of the humoral pathology as the universal cause of diseases, served rather to convince the examining and reflecting part of the profession of its want of foundation, than to add to the number of believers in it. The application of chemistry to the investigation of the composition of the fluids of the human body, and the different condition of these fluids which it demonstrated to exist in different states of disease, seemed to furnish new facts in its favour. Beddoes, with that zeal which marked all his actions, stepped forward as its advocate, and referred all diseases to the predominance or deficiency of some elementary principle. He attributed scurvy to an abstraction of oxygen, and consumption to an accumulation of oxygen. The remedies which he proposed for the cure of these diseases were in conformity with these views; and he believed that breathing an atmosphere charged with the principle which was deficient would cure the one, and with a principle opposed to that which predominated would cure the other. Not only did he write in support of these views, but he sought an opportunity of testing them by experiment. At first he thought of London as the place best fitted for his purpose, but ultimately fixed on Bristol for the scene of his pneumatic hospital. In 1798 a pneumatic institution was established, in effecting which object Dr. Beddoes was materially assisted by Mr. Richard Lovell Edgeworth, one of whose daughters he married in 1794, and Mr. Gregory Watt. His publications at this time prove his activity, as well as the particular direction of his thoughts. They almost all refer to peculiar views respecting the possibility of curing diseases by breathing a medicated atmosphere. That the results did not correspond with the expectations of the founder of this new method is well known; but the undertaking was the means of bringing into notice the talents of Humphrey Davy, who was recommended to Dr. Beddoes by Mr. Gregory Watt, as a fit person to superintend the chemical laboratory connected with the Institution. The first discoveries of this eminent chemist were given to the world in a publication which came from Beddoes's Institution: *Experimental Essays on Heat, Light, and the Combinations of Light*, by Humphrey Davy, appeared among the *Contributions to Medical and Physical Knowledge from the West of England*, Bristol, 1799.

Many publications of Dr. Beddoes about this time referred to the political topics of the day, in which he always embraced the liberal side of the question.

His principal medical publications after this date were: a *Popular Essay on Consumption*, 1779, containing, if we except the author's peculiar doctrines, many valuable remarks on the predisposing causes and means of preventing that disease; *Hygeia, or Essays Moral and Medical*, which is a popular treatise on the 'Causes of Diseases,' and the means of avoiding them, 3 vols. 8vo. 1802. He also wrote at an earlier date a work on *Demonstrative Evidence*, 1792. *An Essay on Fever* was written in 1807, with many others of less note, which he continued to publish in rapid succession till 1808, when, in consequence of an affection of the heart, he died in December of that year, in the forty-eighth year of his age.

He is represented by his biographer and friend, Dr. Stock, as an extremely amiable man, who had only truth for his object, and the good of his fellow-creatures as the end of all his efforts. He was extremely enthusiastic in whatever he undertook; but the ardour of his imagination, and the tendency to hasty generalisation which characterized his mind, prevented him from examining carefully his data, or forming the most correct conclusions. A passage in his *Essay on Fever*, in which he condemns the hasty views of other writers, and the unsuccessful practice founded on them, gives the truest character of his own labours and writings. 'If these systems,' says he, 'have superseded the investigation of phenomena such as, when once ascertained, strike the senses too powerfully to leave the judgment in suspense; if they have prevented us from analysing the mutual relations of these phenomena; if they have tempted ingenuity to waste itself upon the means of correcting imaginary deviations from the standard state of health; we may surely pass them by, after giving a moment of regretful admiration, to the talents by which some of them were constructed.'

(See Stock's *Life of Beddoes*, one vol. 4to. Lond. 1810.)

BEDE-HOUSE, a term used for an alms-house. Hence bede-man, or beid-man, a person who resides in a bede-house, or is supported from the funds appropriated for this purpose. In the *Statistical Account of Scotland*, vol. xiii. p. 412, parish of Rathven in Banffshire, it is said—'There is a bede-house still in being, though in bad repair; and six bede-men on the establishment, but none of them live in the house.' In the Court of Exchequer in Scotland, this term is used to denote that class of paupers who enjoy the royal bounty.

BEDELL, WILLIAM, Bishop of Kilmore in Ireland, one of the most exemplary prelates of the seventeenth century, was descended from a good family, and was born in the year 1570, at Black Notley in Essex. He was matriculated a pensioner of Emmanuel College, Cambridge, March 12, 1584, where he was placed under the care of Dr. Chadderton, for many years the head of that house. He entered early into holy orders, which he received from the suffragan bishop of Colchester. In 1593 he was chosen fellow of his college, and in 1599 took the degree of bachelor in divinity. He then removed from the University to St. Edmundsbury in Suffolk, where he had a church, to the duties of which he assiduously attended for a few years, till an opportunity offered for his going as chaplain to Sir Henry Wotton, the English ambassador to the state of Venice, about the year 1604. While he resided in that city he became intimately acquainted with Father Paul Sarpi, who took him into his confidence, and taught him the Italian language, of which Bedell became so perfect a master, that he translated into that tongue the English 'Common Prayer Book,' which was extremely well received by many of the clergy there, especially by the seven divines who were appointed by the Republic to preach against the pope, during the time of the Interdict, and which they intended to have taken for their model had they broken absolutely with Rome, which was what they sincerely desired. In return for the favours he received from Father Paul, Mr. Bedell drew up an *English Grammar* for his use, and in many other respects assisted him in his studies. He continued eight years in Venice, during which time he not only studied the Hebrew language, but entered deeply into rabbinical learning, under Rabbi Leo. He made acquaintance also with the celebrated Antonio de Dominis, archbishop of Spalatro, who was so pleased with his conversation as to give him his thorough confidence, and showed him his famous book, *De Republica Ecclesiastica*, which was afterwards printed at London. Bedell corrected many misapplications of scripture, and quotations from the fathers in that work, and was highly valued by De Dominis, who even accompanied him to England. At Bedell's departure from Venice, Father Paul expressed a deep concern, and said that both he and many others would have come over with him to England if it had been in their power; but that he might never be forgotten by him, he gave him his picture, with a Hebrew Bible without points, a little Hebrew Psalter, in which he wrote some sentences expressive of his esteem, the MS. of his *History of the Council of Trent*, and the histories of the Interdict and Inquisition; together with the originals of the Letters which Father Paul had received weekly from Rome, during the contests between the Jesuits and the Dominicans concerning the efficacy of grace.

On his return to England Mr. Bedell retired immediately to his charge at St. Edmundsbury, where he continued his ministerial labours; employing himself at the same time in translating into Latin the *Histories of the Interdict and Inquisition*, and the two last books of the *History of the Council of Trent*, Sir Adam Newton having translated the two first. At this time he mixed so little with the world that he was almost totally forgotten. So little, indeed, was he remembered that some years after, when the celebrated Diodati of Geneva came over into England, he could not, though acquainted with many of the clergy, hear of Mr. Bedell. Diodati was greatly amazed that so extraordinary a man, who was so much admired at Venice by the best judges of merit, should not be known in his own country; and he had given up all hopes of finding him out, when, to their no small joy, they accidentally met each other in the streets of London. Upon this occasion Diodati presented his friend to Morton, the learned bishop of Durham, and told him how highly he had been valued by Father

Paul, which engaged the bishop to treat Bedell with particular respect. At length Sir Thomas Jermyn, a Suffolk gentleman, presented him to the living of Horingsheath in 1615; but he found difficulties in obtaining institution and induction. Dr. Jegon, bishop of Norwich, requiring fees on the occasion so large, that Bedell considered the demand to partake of simony. He, in consequence, refused to pay any thing beyond the expense of parchment, writing, and wax; and, declining to take his title to the living upon any other terms, went home, but in a few days the bishop sent for him, and gave him institution without the charge of fees. Here Bedell continued twelve years, and during that time published and dedicated to King Charles I., then Prince of Wales, 'The Copies of certain Letters which have passed between Spain and England in matter of Religion, concerning the general Motives to the Roman Obedience, between Mr. James Waddesworth, a late pensioner of the Holy Inquisition in Sevil, and W. Bedell, a minister of the Gospel of Jesus Christ in Suffolk,' 8vo. Lond. 1624; afterwards reprinted by Bishop Burnet in 1685, at the end of Bishop Bedell's life.

Various causes appear to have delayed the reward which Bedell's merits deserved. He was a Calvinist, says Burnet, in the matter of decrees and grace, and preferments were generally at that time bestowed upon those who held opposite opinions. His firm and faithful friend, Sir Henry Wotton, too, had lost much of his influence at court; and his other patron, Sir Thomas Jermyn, was suspected of favouring the Puritans, and was therefore out of credit. Bedell's fame, however, had reached Ireland, and, in 1627, he was unanimously elected provost of Trinity College, Dublin; a charge which he refused to undertake till the king laid his positive commands upon him, which he obeyed, and on August 16th of that year was sworn provost. He held this office about two years, when, partly by the interest of Sir Thomas Jermyn, and partly by the application of Laud, bishop of London, he was advanced to the united sees of Kilmore and Ardagh, and consecrated on the 13th Sept., 1629, at Drogheda, in St. Peter's Church, in the fifty-ninth year of his age. During his short residence at Trinity College, he did much towards the restoration of order in the college, which on his arrival he found in a very unsettled state. He also revised and improved the college statutes, and introduced prayers in Irish, and a lecture in the chapel of the university. (See *Journal of Education*, Nos. XI. XII. 'On the University of Dublin.') On going to his diocese, he found it, says Burnet, under so many disorders, that there was scarce a sound part remaining. The revenue was wasted by excessive dilapidations, and all sacred things had been exposed to sale in so sordid a manner that it was grown to a proverb. One of his cathedrals, Ardagh, was fallen down to the ground, and there was scarce enough remaining out of the revenues of both sees to support a bishop who was resolved not to supply himself by indirect and base methods. He found, too, the oppression of the ecclesiastical courts excessive, and pluralities and non-residence shamefully prevailing. All these abuses he determined to rectify; and having recovered a sufficient portion of the lands of which his sees had been dispossessed, to enable him to subsist, he set an example for the reformation of further abuses by resigning (in 1630) the bishopric of Ardagh, which he had the satisfaction to see followed in other instances.

Upon the arrival of the lord-deputy Wentworth, in 1633, Bishop Bedell fell under his displeasure on account of a petition sent up by the county of Cavan, to which the bishop had set his hand, and in which some complaints were made of, and some regulations proposed for, the army. A reconciliation, however, took place, and the lord-deputy received him into favour. He then went on cheerfully in doing what he considered his duty for the benefit of the church, and was very successful. He loved the Christian power of a bishop, without affecting either political authority or pomp. Whatever he did was so visibly for the good of his flock, that he seldom failed of being well supported by his clergy, and such as opposed him did it with visible reluctance, for he had the esteem of the good men of all parties.

In September, 1638, he convened a synod, in which he made many excellent canons that are still extant; but offence was taken at this by some who were in power, and who questioned the legality of the meeting; and some talk there was, says his biographer, of calling him in question for it, either in the star-chamber or high-commission court; but his archdeacon, Thomas Price, who was afterwards archbishop of Cashel, gave such an account of the matter as satisfied the state. Archbishop Usher is said to have advised those who moved to have the bishop brought up upon this charge, 'to let him alone, lest he should be thereby provoked to say more for himself than any of his accusers could say against him.'

Amongst other extraordinary things which he did, his biographers have agreed that there was none more worthy of remembrance than his removing his lay-chancellor, and taking upon himself to sit in his own courts, hearing causes, and retrieving thereby the jurisdiction which antiently belonged to a bishop. The chancellor upon this filed his bill in equity, and obtained a decree in chancery against the bishop, with 100*l.* costs. But, by this time, the chancellor saw so visibly the difference between the bishop's sitting in that seat and his own, that he never called for his costs, but appointed a surrogate, with orders to obey the bishop in everything, and so his lordship went on his own way.

'Our bishop,' says the writer of his life in the *Biographia Britannica*, 'was no persecutor of papists, and yet the most successful enemy they ever had; and if the other bishops had followed his example, the Protestant religion must have spread itself through every part of that country. He laboured to convert the better sort of the popish clergy, and in this he had great success. He procured the Common-Prayer, which had been translated into Irish, and caused it to be read in the cathedral in his own presence every Sunday; having himself learned that language perfectly, though he did not attempt to speak it. The New Testament had been also translated from the Greek into Irish, by William Daniel, afterwards archbishop of Tuam, but our prelate first procured the Old Testament to be translated by one King, and because the translator was ignorant of the original tongues, and did it from the English, the bishop himself revised and compared it with the Hebrew and the best translations. He caused, likewise, some of Chrysostom's and Leo's *Homilies*, in commendation of the scriptures, to be rendered both into English and Irish, that the common people might see that, in the opinion of the antient fathers, they had not only a right to read the scriptures as well as the clergy, but that it was their duty so to do. He met with great opposition in this work, from a persecution against the translator, raised without reason, and carried on with much passion by those from whom he had no cause to expect it. But, however, he got the translation finished, and would have printed it in his own house, and at his own charge, if the troubles in Ireland had not prevented it; and, as it was, his labours were not useless, for the translation escaped the hands of the rebels, and was afterwards printed at the expense of the celebrated Robert Boyle.

When the rebellion broke out in October, 1641, the bishop was so popular in his neighbourhood that he did not at first feel the violence of its effects. His was the only English house in the county of Cavan which stood unviolated, notwithstanding that it and its out-buildings, the church and its churchyard, were filled with people who had fled to him for shelter, whom by his preaching and prayers he encouraged to expect and bear the worst with patience. This went on till about the middle of December following, when the rebels, pursuant to orders they had received from the council of state at Kilkenny, required him to dismiss the people who were with him, which he refused to do, declaring that he would share the same fate with the rest. They signified to him upon this that they had orders to remove him, and subsequently seized him, his two sons, and Mr. Clogy, who had married his step-daughter, and carried them prisoners to the castle of Cloughboughter, surrounded by a deep water, where they put all but the bishop in irons. They did not suffer any of them to carry any thing with them; and the moment the bishop was gone from his house, Dr. Swiney, the popish titular bishop of Kilmore, whose brother Bishop Bedell had converted, and who himself wished to be admitted to lodge with Bishop Bedell, took possession of it and all that belonged to it, and on the Sunday following said mass in the church. After some time the rebels abated of their severity, took the irons off the prisoners, and suffered them to be as much at their ease as they could be in so wretched a place, where the ruined state of the castle exposed them to much severity of weather in a rigorous winter. While thus confined, the bishop, his sons, and Mr. Clogy, preached and prayed continually to their small afflicted congregation, and upon Christmas-day the bishop administered the sacrament to them. It was remarkable that rude and barbarous as the Irish were, they gave them no disturbance in the performance of divine service, and often told the bishop they had no quarrel with him, but that the sole cause of their confining him was his being an Englishman. After being kept in this manner for three weeks, the bishop, his two sons and Mr. Clogy, were exchanged for two of the O'Rourke's; but though it was agreed that they should be safely conducted to Dublin, the rebels would never suffer them to be carried out of the country, but sent them to the house of one Dennis Sheridan, an Irish minister and convert to the Protestant religion, to which he steadily adhered and relieved many who fled to him for protection. Notwithstanding this the Irish suffered him to live quietly amongst them on account of the great family from which he was descended. While Bishop Bedell remained there, and enjoyed some degree of health, he every Sunday read the prayers and lessons, and preached himself. The last Sunday he officiated was the 30th of January, and the day following he was taken ill. On the second day it appeared his disease was an ague, and on the fourth, apprehending a speedy change, he called for his sons and his sons' wives, spoke to them a considerable time, gave them much spiritual advice, and blessed them. Bishop Burnet (pp. 210, 216) has detailed his conversation with them. On the 7th of February, 1641-2, he breathed his last, in the seventy-first year of his age, his death being chiefly occasioned by his late imprisonment and the weight of sorrow which lay upon his mind.

As his body could not be buried as he had desired, without the new intruding bishop's leave, Mr. Clogy and Mr. Sheridan went to ask it. They found the bishop in a state of gross intoxication, and a sad change in the house; but after a little hesitation leave was granted, and on the 9th February, 1641-2, Bishop Bedell was buried, agreeably to his own direction, in the churchyard of Kilmore close to his wife's coffin. The rebels gathered their forces to pay honour to the funeral, and would have suffered Mr. Clogy to bury the bishop according to the office prescribed by the church, but it was feared the rabble might be provoked by it, and it was passed over; the Irish, however, discharged a volley of shot at the interment, and cried out in Latin, 'Requiescat in pace ultimus Anglorum:' for, says Burnet, they had often said that as they esteemed him the best of the English bishops, so he should be the last who should be left among them. Edmund Farilly, a popish priest, is said to have exclaimed at his interment, 'O sit anima mea cum Bedello.' His epitaph, as ordered by himself, was simply 'Depositum Gulielmi quondam episcopi Kilmorensis.'

The public character of Bishop Bedell did honour to his high office in the church, and his private life was perfectly consistent with the doctrines which he taught. His actions were such as rendered him beloved and esteemed while he lived, and cannot but secure the highest reverence for his memory. The country, and the times in which he lived, required such examples, and the respect paid him by the Irish sufficiently showed what might have been done among them if all, or the greater part, of the Protestant clergy had been such as he was.

The Books of the Old Testament, translated by the care and diligence of Bishop Bedell into Irish, were first published, 4to. London, 1685, with O'Domhnuill's translation of the New Testament, 4to. London, 1681, appended: both were again printed in the Irish character, 12mo. 1690. O'Domhnuill, pronounced O'Donnell, is the true Irish name of William Daniel, archbishop of Tuam, mentioned above; his translation of the New Testament was first published in Dublin in 1602. (See *Journal of Education*, No. XI.)

Some original letters of Bishop Bedell concerning the steps taken toward a reformation of religion at Venice upon occasion of the quarrel between that State and the Pope Paul V. were printed 12mo. Dublin, 1742. They were found among Archbishop Usher's manuscripts in the library of Trinity College there.

(See Bishop Burnet's *Life of Bedell*, 8vo. London, 1685; *Biogr. Britannica*, edit. 1747, vol. i. pp. 658, 664; *Character of Bishop Bedell* at the end of *Certain Discourses* by Nich. Barnard, D.D., 8vo. London, 1659.)

BEDESMAN, or **BEEDMAN**, from bede, a prayer, and that from the Anglo-Saxon bidd-an, to pray, was a common mode of signature in the time of Henry VIII. at the end of letters; as of a prayer-man, or one who prayed for another. Sir Thomas More, in writing to Cardinal Wolsey, ordinarily styles himself 'Your humble orator and most bounden beedman, Thomas More.' (See Ellis's *Orig. Letters illustr. of English Hist.* first ser. vol. i. pp. 198, 200, 202, 203, 206, 208, 210, 211.) Margaret Bryan, the governess of the Lady Elizabeth, writing to Lord Cromwell, signs herself in the same manner, 'Your dayly *bede-woman.*' (*Ibid.* second ser. vol. ii. p. 82.)

It was not out of use in Shakspeare's time, who in the 'Two Gentlemen of Verona,' act i. scene i., says—

> 'For I will be thy beadsman, Valentine.'

Valentine answers—

> 'And on a love-book pray for my success.'

BEDFORD, a borough, and the county town of Bedfordshire, situated on both sides of the river Ouse, which is navigable to the German Ocean. Bedford is forty-eight miles N.N.W. from London. Camden states the town to be of high antiquity; but doubts if it was the Lactodorum of Antoninus, as some affirm, for it does not stand on a Roman road, nor had Roman coins ever been found there. Nevertheless the plough turns up many coins in various parts of the county, and the vicinity of Shefford in particular has been remarkably productive in Roman pottery, glass, and bronze. Camden proceeds to state that he had read that the British name of the place was Lifwidur, or Lattidur; but he regards the latter as a translation of the English name—'Lettuy, in British, signifying public inns, and Lettidur, inns on a river, as Bedford, in English, beds and inns at a ford.' This account is not very satisfactory. (See *Gentleman's Magazine*, 1794, for a quotation bearing on this point from a work called *England Illustrated.*) It is generally supposed, however, that the town is the Bedicanford of the *Saxon Chronicle*. This signifies 'a fortress on a river,' a designation of which the present name seems a corruption. Bedford appears to have been the scene of a battle in 572 between the Saxon Cuthwulf and the Britons. It afterwards suffered greatly in the wars between the Saxons and the Danes, and was ultimately burned by the latter in 1010. Mention is made of a fortress or citadel built on the south side of the river by Edward the Elder; but it would seem to have been destroyed by the Danes, or was found an inadequate defence, for Paine de Beauchamp, to whom the barony was given by William Rufus, thought it necessary to build, adjoining to the town, a very strong castle, which was surrounded by a vast entrenchment of earth, as well as a lofty and thick wall. 'While this castle stood,' says Camden, 'there was no storm of civil war that did not burst upon it.' In 1137 it sustained a siege against King Stephen and his army; but accounts vary exceedingly both as to who were the defenders and what was their fate. Camden, without entering into particulars, says that Stephen took the fortress, with great slaughter; but Dugdale, who gives details and quotes antient authorities, says that the king obtained it by surrender, and granted honourable terms to the garrison. In 1216, William de Beauchamp, being then possessed of the barony of Bedford, took part with the rebellious barons, and received them as friends into the castle, which they were advancing to besiege. When, however, King John sent his favourite, Faukes de Brent, to summon the castle, it was surrendered to him within a few days, and the king gave it to him, with the barony, for his services. Faukes, having repaired and greatly strengthened his castle, for which purpose he is said to have pulled down the collegiate church of St. Paul's, presumed so far upon its impregnable character as to set all law and authority at defiance. His outrages and depredations on his less powerful neighbours were such, that in the year 1224, Martin Patershul, Thomas de Moulton, and Henry Braybrooke, the king's justices itinerant, then sitting at Dunstaple, felt it their duty to take cognizance of his proceedings, and fined him in the sum of three thousand pounds. Faukes, being greatly provoked at this, sent his brother at the head of a party of soldiers to seize the judges and bring them prisoners to Bedford. They had timely notice of his intention, and two of them escaped; but Braybrooke was taken and carried to the castle, where he was shamefully treated. The king (Henry III.), being highly incensed at this and the other outrageous conduct of De Brent, determined to bring him to punishment. He therefore marched to Bedford in person, attended by Stephen Langton, archbishop of Canterbury, and the principal peers of the realm. On this occasion the Church was so provoked by Faukes's sacrilege, that the prelates and abbots granted a voluntary aid to the king, and for every hide of their lands furnished two labourers to work the engines employed in the siege. Camden quotes from the *Chronicle* of Dunstaple a curious account of the siege, written by an eye-witness, from which it appears that the engines employed in that age for the destruction of man were little less ingenious and effective than those now in use. Faukes de Brent felt great confidence in the strength of the castle, and disputed the ground by inches; but after a vigorous resistance of sixty days, no alternative remained but to surrender at discretion. The success of the besiegers is attributed chiefly to the use of a lofty wooden castle, higher than the walls, which gave them an opportunity of observing all that passed within. Faukes himself was not in the castle when it surrendered; he took sanctuary in a church at Coventry, and, through the mediation of the bishop of Coventry, obtained the king's pardon, on condition of abjuring the realm. His brother William, the acting governor of the castle, with twenty-four knights and eighty soldiers, were hanged; but Culmo, another brother, received the king's pardon. The king, acting on the determination to uproot this 'nursery of sedition,' as Camden styles it, ordered the castle to be dismantled, and the ditches to be filled up. The barony was restored to William de Beauchamp, with permission to erect a mansion-house on the site of the castle, but with careful stipulations to prevent him from construing this into leave to build a fortress. The king's intentions as to the demolition of the castle do not seem to have been executed to the letter: for the 'ruinous castle of Bedford' is mentioned about 250 years later; and Camden speaks of its ruins as still existing in his time, overhanging the river on the east side of the town. At present not one stone of the fabric remains; but a few years ago its site might be very distinctly traced at the back of the Swan Inn. It forms a parallelogram, divided by a lane: and the site of the keep now makes an excellent bowling-green. The domain first became a dukedom when given to John, the third son of Henry IV.

Bedford is considered a borough and corporation by prescription, and is so called in all legal proceedings. The first charter on record was granted to the town by Henry II., and the last by Charles II. The corporation consists of a mayor, recorder, two bailiffs, thirteen common-councilmen, and an uncertain number of aldermen, as every one who has served the office of mayor is afterwards reputed an alderman. The manor of Bedford is vested in the corporation by virtue of antient grants, the earliest of which is that of Henry II., which subjected the burgesses in return to the payment of a fee-farm rent of 40*l.* per annum. This was afterwards raised to 46*l.*; but in the end was gradually reduced to the sum of 16*l.* 5*s.* 8*d.*, which is now payable to the representatives of persons who bought the rent of the crown. The bailiffs for the time being are lords of the manor, and have the right of fishing and taking game to the extent of the bounds, which contains a space of upwards of nine miles in circumference, comprising an area of 2200 acres. The Boundary Commissioners, in 1831, recommended no alteration of the antient limit. The town has sent two members to parliament ever since the year 1295. The right of election was determined, in 1690, to be in the burgesses, freemen, and the inhabitant householders not receiving alms. Under this franchise, the greatest number of electors polled in the first thirty years of this century was 914. In 1831 the borough of Bedford contained 1446 houses, with a population of 6959 persons, of whom 3757 were females. The neighbourhood of Bedford being very productive in wheat and barley, much business is done there in the corn trade: there is also a very considerable trade, by means of the Ouse, between Bedford and Lynn, in malt, coals, timber, and iron. Lace-making affords employment to a great number of poor females and children. The principal market-day is Saturday, when the average sale of wheat is about 600 quarters; there was also a Tuesday market, but it has been discontinued, and one on Monday for the sale of pigs instituted. Fairs are held on the first Tuesday in Lent, April 21, July 6, August 21, October 12, November 17, and December 19. That held in October is of the most importance, and is called the Statute Fair; that in April is also a pleasure fair; the others are only for the sale of cattle.

The town of Bedford lies nearly in the centre of the borough, with a broad belt of pasture-land on every side. It has been greatly improved within the present century under the authority of an act of parliament for rebuilding the bridge, and paving, lighting, and watching the town it is still increasing, and apparently improving; many new houses have been recently built, especially towards the north-west. The communication between the parts of the town separated by the Ouse is by a handsome stone bridge of five arches, which was commenced in 1811, on the site of an old one of seven arches, which was popularly considered to have been built with the materials of the castle demolished by Henry III., but which Grose understood to have been erected in the reign of Queen Mary out of the ruins of St. Dunstan's church, which stood on the south side of the bridge. The town is lighted by gas.

Bedford is divided into five parishes, with as many churches. Those of St. Paul, St. Peter, and St. Cuthbert, are on the north side of the river, and those of St. Mary and St. John the Baptist on the south. The living of St. Paul's is a discharged vicarage, endowed with a portion of the great tithes, and valued at 10*l.* in the king's books: patron, Lord Carteret. This church is the principal architectural ornament of the town. It is large, with a nave and south aisle divided by early English or early decorated piers and arches. The west door, and the tower and octagonal spire are of the decorated character. The windows are mostly perpendicular; all the tracery, except of one or two, had been cut away, but has lately been in part restored. There is one tomb, if not more, with brasses, in the church: the old pulpit is of stone, ornamented with gilt tracery on a blue ground; but it has been removed to the chancel, and a more convenient one of oak substituted. The livings of St. Peter and St. Cuthbert are both rectories in the gift of the crown: the former is rated in the king's books at 11*l.* 13*s.* 1*d.*, and the latter at 5*l.* 9*s.* 4½*d.* The church of St. Peter has a curious old Norman door, a fine antique font, and some curious stained glass in the windows. The living of St. Mary, on the south side of the river, is a rectory, charged in the king's books at 11*l.* 4*s.* 9*d.*, patron, the Bishop of Lincoln. The church is small, with a plain square tower, and with nave and aisles mostly in the perpendicular style. The living of St. John is a rectory, not in charge, of which the corporation is patron. The tower is in the perpendicular style, but the windows and the interior of the church have been modernized. It was formerly an hospital, and contained a master and 60 brethren.

It is calculated that about half the inhabitants of Bedford are dissenters. There are, accordingly, several chapels belonging to the Independents, the Methodists, the Baptists, and the United Brethren (Moravians): there is also a small synagogue for the Jews. The old Independent meeting-house, in Mill Lane, was established in 1650, under the ministry of John Gifford, who had been a major in the king's army. John Bunyan, the celebrated author of the *Pilgrim's Progress*, was ordained co-pastor of this congregation with Samuel Fenn, in 1671, and continued to fill that situation till his death, in 1688. His memory is still greatly venerated by the congregation; and the chair in which he used to sit is preserved in the vestry as a sort of relic. The United Brethren have had an establishment here ever since 1745; but the chapel was not built till 1751. Adjoining to it is the house for the single sisters, who live in community. They chiefly employ themselves in embroidering muslin and cambric. The Moravians have also a female boarding-school attached to their establishment.

The shire-hall, in which the assizes and sessions are held, is a good stone building, erected in the year 1753. In the same part of the town a new county gaol was erected in 1801, towards the building of which the elder Mr. Whitbread left a legacy of 500*l.* The prisoners sleep in separate cells; and the system of tread-mill labour and silence is enforced on the convicts. In this gaol the town-prisoners are now maintained by contract. The house of industry is a large and handsome brick building, completed in 1796. It is fitted up with every useful accommodation, and great attention is paid to the health and comfort of the inmates; but, say the Lysons, 'in point of economical contrivance, perhaps it is inferior to some buildings of a like nature.' A handsome building, erecting by the subscription of shareholders, is now (1835) in progress, and is intended to contain a public library, news-room, ball-room, billiard-rooms, a savings' bank, and rooms for lectures, &c.

There is, perhaps, no English town of similar extent, equal to Bedford in the variety and magnitude of its charitable and educational establishments. Besides the fifty-eight alms-houses under Sir William Harpur's charity, houses for eight poor persons were built by T. Christie, Esq.

who bequeathed them a shilling each weekly, payable out of the great tithes of St. Paul's. The county possesses a spacious lunatic asylum in St. Mary's parish, capable of accommodating sixty-six patients. It was opened in 1812, being the first county institution of the kind erected under the act of parliament to that effect. Private patients pay from one to three guineas per week; and paupers from nine to twelve shillings, the deficiency being made up from the funds of the county treasury. An unusual degree of liberty is allowed to the unfortunate inmates through the good management of the superintendent.

The general infirmary is also a noble building, situated, like the former, at a convenient distance from the town. It was erected in 1803, chiefly from funds bequeathed by Samuel Whitbread, Esq. It was originally intended for fifty patients, but has since been enlarged, and continues to be supported by subscription. The Marquess of Tavistock, after a contested election for the county, in which he refused to expend a shilling, gave towards enlarging the infirmary, the sum (2000*l.*) which would probably have been expended in treating the electors. In cases of need, the surrounding counties are allowed to participate in the benefits of this institution. A charity school for twenty children of the parishes of St. Paul and St. Cuthbert, was founded before 1737, by the Rev. Mr. Leith and others. Bedford is, however, chiefly indebted for its charities to Sir William Harpur, alderman of London, who, in the reign of Edward VI., founded a free-school for the instruction of the children of the town, in grammar and good manners. The donor conveyed to the corporation thirteen acres of land in the parish of St. Andrew, Holborn (London), for the support of this school, and for portioning poor maidens of the town; the overplus, if any, to be given in alms to the poor. The land having been let on building leases, Lamb's Conduit Street, Harpur Street, Theobald's Road, Bedford Street, Bedford Row, New North Street, East Street, Green Street, and some smaller streets, were built upon it; and thus the property has gradually risen in value from below 150*l.* a year to upwards of 13,500*l.* which was its amount in 1833. A property thus greatly increased in value has several times required the interposition of Parliament to regulate its distribution. It at present supports a grammar-school, containing about eighty boys on the foundation, and as many private boarders; a commercial school, containing 100 to 150 boys; and a national-school, containing 350 boys: in the latter 170 girls are received on half-holidays; a regular girls' school, and an infant school are about to be added. Besides which, the girls in the hospital for poor children, another branch of the charity, are taught household duties, needle-work, reading and writing, by the mistress. In these schools provision is made for the gratuitous instruction of the children of all resident parishioners of the five parishes of the town of Bedford. Books, &c., are gratuitously supplied. About twenty-five boys in the national-school are clothed from a fund left by Alderman Newton, of Leicester. A new building, for the English and national schools, containing large school-rooms, a blue-coat hospital, for the board and education of boys and girls, and a committee-room, clerk's house, &c., have lately been erected in the Tudor style of architecture, by the trustees of Sir W. Harpur's charity.

Part of the income from Sir W. Harpur's charity is also appropriated to the support of alms-houses, to the portioning young women in marriage, and to other benevolent objects. The proportions in which the income is distributed will be better understood by reference to the following extract from the account given of the expenditure for the year, from October 1833, to October 1834:—

	£	s.	d.

The grammar-school now contains 76 town boys, and has been brought to a high degree of excellence, through the exertions of the present head-master, the Rev. Dr. Brereton, whose salary is 250*l.* per annum, with a house tax free, coals and candles, together with five guineas from each town boy (paid out of the school fund), and the privilege of taking boarders, at present (1835) amounting to 70. The second master has a salary of 140*l.*, and four guineas with every town boy on the foundation, with a house, &c., as above. A third master has this year been added, with a salary of 150*l.* per annum. The mathematical master has a salary of 100*l.*, and three guineas with every town boy learning mathematics. The salary of the writing master is 80*l.* per annum. The warden and fellows of New College, Oxford, are visitors of the school, and appoint the master and second master. The exhibitions are eight in number, of the value of 80*l.* per annum each; and are designed for boys educated in the school to assist them in completing their education at Oxford, Cambridge, or Dublin. Six of the exhibitions are holden exclusively by town boys; but the examiners from New College are at liberty, as they see fit, to bestow the other two on the most deserving of boarders.

BEDFORD, DUKE OF, Regent of France. John Plantagenet, Duke of Bedford, was the third son of Henry IV. and Mary Bohun, daughter of the Earl of Hereford. He was knighted at the coronation of his father, October 1399, 'by bathing and other sacred ceremonies,' being at the time not quite ten years old. He was created Duke of Bedford in the second year of the reign of his brother, Henry V., 'at the request of the Lords and Commons.' (*Rolls of Parliament*, quoted in Hallam's *Middle Ages*, vol. iii. p. 193.) During the lifetime of his father he was governor of Berwick-upon-Tweed, and warden of the Scottish Marshes; and during his brother's absence in France, he was governor and commander-in-chief of the forces in England.

Henry V. died after a short illness, in 1422, at the early age of thirty-six years, leaving an infant successor only nine months old, with the disputed honour of king of France as a portion of his inheritance. On his death-bed he expressed his earnest desire, that Bedford should 'take up the administration of the affairs of France' during the minority of the young king,—leaving the less difficult administration of affairs at home to the conduct of his younger brother Gloucester, under the title of Protector. In love of martial glory, and in military talents, the Duke of Bedford was little, if at all, inferior to the deceased hero. He was, after the death of Henry, considered, says Rapin, in a portrait, which though highly coloured, has been implicitly adopted by Hume, to be the 'most accomplished prince in Europe. Wise, judicious, of great valour, solidity, and penetration, master of his passions, and of a genius superior to all employed by him; he seemed born for a throne, though Providence had ranked him among subjects. To all these qualities he added a majestic stateliness, which became his birth and high rank in France and England. But this he never carried beyond what was necessary to command a due respect and regard for his person and authority. To sum up his character in a word, he was perfectly like the late king his brother, and in all his actions took him for his pattern.' No greater proof, indeed, of the high estimation in which he was held by his contemporaries need be given, than the circumstance that the Lords and Commons, in contravention of the late king's testament, passed an act, declaring, under certain well-defined limitations, the Duke of Bedford, 'or, in his absence beyond seas,' the Duke of Gloucester, to be protector and defender of the kingdom and the English church, and the king's chief counsellor, during the minority of the young king. The proceedings of the parliament on this occasion may be referred to as of great constitutional importance; furnishing, as they do, the first great constitutional precedent of the right of parliament, in contradistinction to the king, and in this instance, in contravention to the king's will, to name a regent during the minority of his successor; and the equally decisive constitutional precedent, of the right and power of parliament to fix the limitations of that regent's exercise of the prerogative. (See Hallam's *Middle Ages*, vol. iii. p. 276, and *Parl. Hist.* vol. i.)

By the treaty of Troyes, which was concluded between the court of France and Henry V., on the 21st May, 1420, the English king was declared to be regent of France and next heir to the French crown. On his death-bed, Henry, anxious to secure this splendid inheritance for his infant son, earnestly impressed upon Bedford and his council the necessity of cultivating diligently the friendship of the Duke of Burgundy, and to offer to him in the first place the regency of France. This injunction Bedford obeyed to the letter. On the death of Henry, he immediately offered the regency to the Duke of Burgundy; and on his refusal, and at the apparent solicitation of the French king, accepted the office himself. He conferred with Burgundy as to the best mode of observing the terms of the treaty of Troyes, and obtained from him the warmest assurances of good faith as to its observance. He also obtained the adhesion of the Duke of Bretagne to that treaty, and at a meeting which he brought about between that prince, the Duke of Burgundy, and himself, at Amiens, in April, 1423, he prevailed upon them to affirm their professions of friendship with an oath, by which they swore to love each other as brothers, and to afford mutual aid against the attack of enemies. To make their union the more binding, Bedford married a sister of the Duke of Burgundy, and the Duke of Bretagne married another. Bedford led his young bride to Paris, which he had made the centre of his government, and vigorously applied himself to the consolidation of his infant nephew's inheritance.

Had Henry lived a few months longer, he would have been, in virtue of the treaty of Troyes, and the splendour and extent of his conquests, declared king of France. Charles VI., distinguished by the epithet of the 'Well Beloved,' with whom he had concluded that treaty, survived 'his dear son and heir' but a few months; and at his funeral, Bedford had his infant nephew Henry VI. proclaimed 'Our Sovereign Lord, King of France and England.' The south of France, however, was still in possession of the Dauphin and his party, who summoned all the adherents of the antient monarchy to the standard, which that prince, as Charles VII., had raised at Chartres, the place of his coronation. All the country to the north of the Loire may be said to have been in the hands of the English; while every province to the south of that river, with the exception of Gascony, warmly espoused the cause of the heir of their native kings. The history of France accordingly for many years presents a series of battles and sieges, which ended in the expulsion of the English from all their conquests in the French territory.

In the first year of the war, Charles VII. received a great defeat at Crevant. A still more signal disaster befell him next year at the battle of Verneuil (16th August, 1424), at which Bedford commanded in person, and displayed all the qualities of a great general. The French monarchy was only saved from ruin, after this decisive battle, by the conduct of the Duke of Gloucester, Bedford's brother, which deprived the latter of the aid of the forces of the Duke of Burgundy, to which he was mainly indebted for the victory at Verneuil. In his capacity of Regent of France, Bedford was thwarted in every measure which tended to effect the entire subjugation of that country, either by the indiscreet ambition of his brother, or the jealous and parsimonious policy of the English parliament. The administration of affairs in England turned altogether upon the intrigues and contests of two opposite parties, one headed by Cardinal Beaufort [see Beaufort, Cardinal], the other by the Duke of Gloucester; and as the former was the more powerful, and opposed to the war policy of the latter, the supplies of men and money for the prosecution of the war in France were doled out with so frugal a hand, that the offensive operations of the Duke of Bedford were confined to besieging some towns still held by the French king in the northern provinces; and it was only by the fraudulent connivance of Beaufort, for which he received a bribe of 1000 marks, that a force of 5500 soldiers, which he had raised for a crusade against the Hussites in Bohemia, and which were on their way through France under the military command of the Cardinal, were sent as a reinforcement to the English forces, so as to enable the Regent to attempt to check the disasters that ensued from raising the siege of Orleans.

The circumstances which deprived the Duke of Bedford of the aid of the Burgundian forces were these: Gloucester had married Jacqueline, heiress of Hainault, Holland, Zealand, and Friesland. She had previously been married to the Duke of Brabant, first cousin of the Duke of Burgundy, but despising his tame spirit she eloped from him, and sought an asylum in England. Brabant, however, kept possession of her territorial dominions, which Gloucester claimed and sought to recover by force. For this purpose he entered Hainault with 5000 English men-at-arms, besides other forces, shortly after the decisive defeat of the French king at Verneuil. The Duke of Burgundy hastened with his troops to the aid of his kinsman; and Charles VII. was saved from ruin.

The siege of Orleans, memorable as one of the most extraordinary incidents in history, was commenced on the 12th of October, 1428. The fortunes of Charles hung upon the issue, and he was in despair. He was saved by the assistance of Joan of Arc, and the English raised the siege of Orleans. [See Arc, Joan of.] This memorable effect of superstition—of supernatural confidence on the one side, and supernatural awe on the other—was followed by a succession of disasters to the English arms, which, while they deeply afflicted, tasked all the energies of the Duke of Bedford. With a force drawn from the garrison towns of Normandy, and strengthened, as we have stated, by the troops which Cardinal Beaufort was leading to Bohemia, he marched against Charles, who had just been crowned at Rheims, but failed in provoking him to risk a battle. The Regent then challenged Charles to single combat—denounced him as deluding the people with the impostures of 'a woman of a disorderly and infamous life and dissolute manners, and dressed in the clothes of a man;' and offered to fight him hand to hand, in order that the people might judge by the issue whose claim was favoured by Heaven. Charles took no notice of the letter, and moved steadily upon Paris. The Regent hastened after him, and after breaking the spell of the maid's charm, by repulsing her from the walls of Paris, compelled the French army to fall back upon the Loire. After various skirmishes, defeats, and successes, the maid was captured, when attempting a desperate sally from Compiègne, on the 23rd May, 1430.

With the subsequent fate of the Maid of Orleans, we have here no further concern, than to state, that the Regent joined eagerly in bringing her to the stake.

In 1432 the Duchess of Bedford, sister to the Duke of Burgundy, and the great cement of their friendship, died. Within four months after the Regent married Jacquetta, daughter of the Earl of St. Pol, a vassal of the Duke of Burgundy. The precipitateness and secrecy, as well as inferiority of the marriage, gave great offence to the Duke of Burgundy. Cardinal Beaufort laboured to reconcile the two princes; but as both were haughty and unbending, the attempt altogether failed. In this temper of mind, and the war having languished for upwards of two years, overtures were made on the part of Charles to Burgundy; and the result was a treaty of peace between them. This treaty was the death-blow to the English interest in France, and so affected the Regent that he died of mortification and anxiety while it was pending, at Rouen, on the 13th September, 1435, a fortnight before the treaty between Charles and the Duke of Burgundy was formally signed. An anecdote is told with respect to his tomb at Rouen, which is worth notice, as illustrative of the esteem in which he was held by his contemporaries. We shall quote it in the words of Rapin. 'Louis XI., son of Charles VII., being one day in the church at Rouen, and looking upon the Duke of Bedford's tomb, a certain lord of his retinue advised him to demolish that standing monument of the dishonour of the French. "No," replied the king, "let the ashes of a prince rest in peace, who, were he alive, would make the boldest of us tremble. I rather wish a more stately monument were raised to his honour." '

Like most of the immediate descendants of John of Gaunt, the Duke of Bedford was a patron of literature. He purchased and transported to London the Royal Library of Paris, which Charles V. had increased to 'nine hundred volumes:' and his brother Gloucester presented 600 books to the University of Oxford, 120 of which cost £1000. (Hallam's *Middle Ages*, iii., p. 582.) Gloucester indeed was the English Mæcenas of his time, a circumstance which, no doubt, influenced Shakspeare in painting him as the 'Good Duke Humphrey,' and in blackening the character of his rival Beaufort.

(Monstrelet's *Chronicles*, and Rapin's *History*, which is particularly full and accurate with regard to the transactions in the reigns of the Lancasterian princes, may be consulted with advantage for the public life of the Duke of Bedford. Dugdale's *Baronage* also points to several events in his career.)

BEDFORD LEVEL. This district comprehends nearly the whole of a large tract of flat land, extending into the six counties of Northampton, Huntingdon, Cambridge, Lincoln, Norfolk, and Suffolk. It is bounded on the north-east by the German Ocean, and on all other sides by high lands, which encompass it in the form of a horse-shoe. Its length from Toynton in Lincolnshire, to Milton in Cambridgeshire, is sixty miles, and its breadth from Peterborough in Northamptonshire, to Brandon in Suffolk, is nearly forty miles. The tract thus described, includes that part of the south-east division of Lincolnshire called Holland, which consists of flat, low, marshy land, and is supposed to have been reclaimed from the sea by embankments made during the Roman occupation of Britain.

The Bedford Level extends to the north only as far as Tydd-St.-Giles; its length thence to Milton, on the south, is about thirty-three miles. The boundary line is irregular; its course on the south, from Brandon to Peterborough, may be traced by Mildenhall to a short distance north of Newmarket, then by Milton in Cambridgeshire, to Earith, on the borders of Huntingdonshire, Ramsey, Woodwalton, and Yaxley, in the latter county. Returning from Peterborough to Brandon, on the north, the boundary line runs by Peakirk, six miles north of Peterborough, Crowland, Whaplode Drove Chapelry, Parson Drove, Guyhirn, Salter's Lode on the Ouse, about ten miles south of Lynn, and thence by Methwold to Brandon.

The Level is divided into three parts, which are distinguished as the North, the Middle, and the South Levels. The North Level lies between the rivers Welland and Nene; the Middle Level between the Nene and the Old Bedford Rivers; and the South Level extends from the Old Bedford River to Stoke, Feltwell, and Mildenhall. The area of these marshes has been variously stated. Among the authors who originally wrote on the subject, Sir Jonas Moore calls it 300,000 acres, Colonel Dodson and others estimate it at 400,000; an actual survey made in 1605, and given in to Government upon oath, states it to be 307,442 acres; but according to the Lysons, subsequent surveys have shown it to be 400,000 acres.

Peterborough Fen, which is the part of the Level that runs into Northamptonshire, extends between Peterborough and Crowland, and contains between 8000 and 9000 acres. One-seventh part of the Level is in Huntingdonshire. The whole of the Isle of Ely, which forms the north division of Cambridgeshire, and a few parishes in the same county, which lie south-east of the isle, are included in the Level. Norfolk contains 63,000, and Suffolk 30,000 acres of the Level; the remainder is in the south-east division of Lincolnshire.

This tract of land has, in the course of some centuries, undergone remarkable changes. There is abundant evidence to prove that it was once a forest, and that it then became a stagnant morass. It is now, through human industry, converted into rich pastures and fertile corn-fields. From facts which will be stated further on, it does not admit of doubt that this country was once dry land, at a level much below the present surface; and there is reason for supposing that, at the time of the invasion of Britain by the Romans, it consisted of one of those great forests to which the Britons fled for shelter against their invaders. It was the policy of the Romans to cut down and destroy those strong holds of the natives, who were compelled by their conquerors to clear the woods, and embank the fens. (Tacit. *Agric.* 31.) The Emperor Severus, in the beginning of the third century of our æra, caused roads to be made through these marshes. One of these roads, 25 miles in length, extended from Peterborough to Denver in Norfolk; it was 60 feet wide, and composed of gravel three feet deep. This causeway is now covered with soil from three to five feet in thickness. Henry of Huntingdon, who wrote in the middle of the twelfth century, describes this fenny country as being 'very pleasant and agreeable to the eye, watered by many rivers which run through, diversified with many large and small lakes, and adorned with many woods and islands.' William of Malmesbury, who lived about the same period, described the Lordship of Thorney as abounding in lofty trees, fruitful vines, and productive orchards, and having no waste land in any part. He also expressed great admiration of the works of art found in the same place. 'What shall I say,' he writes, 'of the beautiful buildings which it is so wonderful to see the ground amidst those fens to bear?'

Up to the thirteenth century, the waters usually flowed in their natural channels, and the surrounding country was either under tillage or in pasturage.

According to Dugdale, historians who were contemporary with the event, have recorded, that in 1236, on the morrow after Martinmas day, and for the space of eight days after, the wind raged so violently, that the sea rose much higher than usual, broke in at Wisbeach, and other places of the district, so that many people and cattle, together with numerous small craft, were destroyed, and the surviving inhabitants reduced to great distress. After an interval of seventeen years, a similar accident occurred, and on this occasion an order was issued by the king, requiring the inhabitants to repair the banks. This work appears to have been inefficiently performed, for within a few years the sea-banks were again destroyed. Subsequent embankments were improperly made, either through ignorance, or for the benefit of one part to the injury of all the rest. An instance of this kind occurred in the reign of Edward I., when Walter de Langton, bishop of Lichfield, diverted the course of the Nene, and obstructed the navigation, in order that he might drain his own manor of Coldham. Many years afterwards the bishop's representatives were compelled to destroy the dams which he had constructed to the injury of others. From this, and other causes, the waters from the uplands were prevented from discharging themselves into the sea, and this extent of land was at length reduced to the state of a morass. For a long period the greater part of the district was composed of an unhealthy stagnation of putrid and muddy waters, which in some places stood from ten to twenty feet deep. In those few parts where the earth was not covered with water, it was spongy and boggy. The inhabitants of the Fens, and the towns in their neighbourhood, could only have communication by means of boats, and this with some difficulty at all times, in consequence of the sedge and slime with which the ground was covered. In the winter, when there was ice, yet not sufficiently hard to admit of traffic on its surface, the inhabitants were completely isolated, and 'could hardly get help of food for soul or body.'

Evidence has everywhere been found below the actual surface not only of the presence of former vegetation, but to show that these places had previously been inhabited, and that they were suddenly overwhelmed by some violent cause. In digging near Thorney, Lynn, and many other places, trees of large size were found buried in the moss, and lying near their roots, which still remained as they grew, in firm earth beneath the moss. In the year 1764, while digging a little north of Boston (not in the Level, but in a continuation of the fenny district), roots of trees were found in the firm earth, eighteen feet below the then pasturage surface. About a mile west of Magdalen Bridge, over the Ouse, in Marshland, Norfolk, furze bushes and nut trees were found pressed flat down seventeen feet below the surface, with nuts still sound lying by them. In the process of excavating a pool at the edge of Conington Down, Huntingdonshire, in the beginning of the seventeenth century, the skeleton of a large sea fish was found at a great depth below the surface. When in pursuance of the first project for draining these fens, the channel of the Wisbeach river was deepened in 1635 eight feet below the then bottom, a hard stony bottom was discovered, on which were several boats covered with silt. While digging a drain at Whittlesea Moor, a perfect soil was found at the depth of eight feet, with swaths of grass lying upon it just as they were mowed. At Shirbeck sluice, near Boston, a smith's forge was found buried sixteen feet deep; the remains of several antient tan-vats were also found, and a large quantity of horns; there were also some soles of shoes of a peculiar shape, sharp-pointed, and of the fashion which prevailed in the reign of Richard II. At the setting down of a new sluice a little beneath Magdalen fall, half a mile from Magdalen bridge, on the marsh side, and sixteen feet deep in the earth, a cart-wheel and a flat stone about eight feet long were found. Not far from that spot the remains of a church were discovered, about eight feet below the surface; and it is stated by Dugdale that at Wigenhall St. Germans, the floor of the church is seven feet lower than high-water mark of the Ouse: which river, as it runs by the churchyard, is kept by a strong bank from inundating the country.

The principal rivers or drains, which formerly passed through this Level, were eight in number: the Glen, the Welland, the Nene, the Ouse, the Cam, the Mildenhall or Lark, the Brandon or Little Ouse, and the Stoke.

The Glen is a small stream which rises in the south of Lincolnshire, and taking first a S.S.E. and afterwards a N.E. course, falls into the Welland on its left bank, near its mouth. The Welland comes from the S.W. to Market Deeping, continues thence a short distance to the east, and then takes a N.E. course until it joins the Fossdike Wash near Fossdike. The Nene passes by Peterborough, continues thence to Wisbeach, and falls into the Sutton Washway. This river has at different times had its channel so altered and diverted from its original course by numerous cuts, that it is now scarcely possible to trace the line of its natural bed. The Wisbeach river, or Old Nene, which issues from Ramsay Mere, is a branch of this river.

The Ouse passes by St. Ives and Earith, after which it takes an irregular winding course, first east and then nearly north, till it falls into the Wash at Lynn Regis in Norfolk: the Cam, the Lark, and the Little Ouse fall into it on its east bank.

It thus appears that there are three main outlets for the waters of this Level. These have constantly been liable to have their mouths choked up by loose sand thrown up by the tides.

The Level receives the waters of the whole or parts of nine counties from the uplands, and the whole tract being flat, with little or no descent, it has hitherto been a matter of difficulty to provide a sufficient outfall so that the waters may reach the sea without overflowing the country.

The practicability of draining this great morass seems first to have been entertained in 1436, when the attention of many wealthy persons was turned towards the subject. Embankments were made, and ditches were cut at a vast expense, but the next winter proving wet and tempestuous, the Ouse, swollen by its tributaries into a torrent, swept away the barriers, and reduced the whole country to its former condition. These works having been thought perfectly secure, people were led to doubt the possibility of effectually draining the marshes, and the practicability of the undertaking became the subject of much curious controversy.

In the reign of Henry VII. Bishop Moreton made an attempt to drain the North Level and the northern parts of the Middle Level by means of a cut, called Moreton's Leame, which extended from Peterborough to Guyhirn, and is now considered part of the Nene: this cut was forty feet wide, and navigable. The earth of which the embankments were made was loose and sandy, so that they crumbled away. Another attempt was made in the reign of Elizabeth, and a third in the time of her successor; but nothing effectual was done until 1634, in the reign of Charles I., when another attempt to drain these fens was made by Francis Earl of Bedford, and it was in compliment to this nobleman that the tract reclaimed has been named the Bedford Level.

The lordship of Thorney, containing 18,000 acres, was the property of the Earl, and except a hillock upon which the abbey had been built, the whole of this tract was under water. The wish to reclaim this land induced him to embark in the undertaking. As a compensation for the risk and expense, he stipulated that he and his partners in the work should receive as payment 95,000 acres of the reclaimed land. Under this condition a charter was granted to the adventurers, and the work was partially accomplished in the course of three years, at an outlay of 100,000*l*. A cut, now called the Old Bedford River, was made from Earith, communicating with the Ouse at Salter's Lode, near Denver in Norfolk: this river is seventy feet wide, and twenty-one miles long. The other drains then made were Sam's Cut, from Feltwell to the Ouse near Denver, twenty feet wide, and about six miles long: Bevil's Leam, now known as Bevil's River, from Whittlesea Mere to Guyhirn, forty feet wide, and ten miles long: Moreton's Leam was repaired and embanked anew: Peakirk drain, from Peakirk to Guyhirn, seventeen feet wide, and ten miles long. South-eau drain, from Crowland to Clows Cross, and thence the Shire drain to the Nene, six miles below Wisbeach, being antient drains, were enlarged. A small cut was also made from the Lark to the Ouse. Four sluices were made; two at Tydd, one at Wisbeach, and the fourth at Salter's Lode, to keep out the tide.

These embankments also proved defective, in consequence of the loose nature of the earth of which they were formed; and the state of the country, owing to the civil wars, being unfavourable for the prosecution of such projects, the whole tract was again suffered to lie waste till 1649, when William, the son of Francis Earl of Bedford, agreed to make another effort to reclaim the level upon the same conditions. The sum of 300,000*l*. was then laid out in draining, embanking, &c., and with more success than before; the 95,000 acres were allotted to the undertakers, but the sum they had expended on the work was greater than the worth of the land which they received. The New Bedford River, which is 100 feet wide, was cut on the occasion last mentioned: it runs at a short distance from, and nearly parallel to, the Old Bedford River.

A regular system was now established for preserving the reclaimed land, and for improving the draining. A royal charter was granted in 1664, by which the undertakers for the draining were incorporated, and regulations were framed for the management of the 95,000 acres allotted. This corporation has since been kept up, and consists of a governor, six bailiffs, twenty conservators, and a commonalty. The corporation is empowered to impose and levy taxes for the preservation of its land, and for upholding the ways, passages, rivers, cuts, drains, banks, &c. throughout the Level, which are also the property of the corporation. The governor and bailiffs must each possess at least 400 acres of the land granted to the corporation to qualify them for holding those offices. The qualification requisite for the conservators is 200 acres: such of the commonalty as possess each 100 acres are allowed to have a voice in the election of the officers of the corporation.

At the original allotment of the 95,000 acres, the adventurers received assignments proportioned to the sums which each had contributed; so that the whole assignment is not held in common, but each owner holds his allotment or purchase subject to the laws and restrictions of the corporation. At the time the charter was granted by Charles II., that king reserved 12,000 acres for himself out of the 95,000 acres; but this proportion was subject to the same management as the rest of the allotment.

Various means have been adopted for the more perfect draining of these marshes, but until within the last few years the subject has not been well understood. Instead of making a few large and deep channels through which the water would easily find an outfall, numerous small cuts were made, requiring, to produce the same effect, a much greater inclination than would have been requisite for larger channels. It would be useless to enumerate all these small cuts. The channels which it is necessary to mention are,—the sixteen feet drain, which runs about four miles west of and nearly parallel to Old Bedford River, is eight miles long; this terminates in the *forty feet drain*, which runs from Old Bedford River to Ramsay Mere. The Carr Dike, which is a Roman work, runs from Peterborough to Peakirk. The Counter Drain runs parallel to and near the Nene, from Peterborough to Guyhirn. The Cats' Water communicates with the counter drain near Peterborough, on the one side, and with the Old South-eau drain on the other side. The Cats' Water was a very old drain choked by earth and weeds, and served neither for the purpose of draining nor navigation. It was cleared out and repaired by the Earl of Bedford and his Company, with many smaller drains which had been equally neglected. A great part of Carr Dike is now disused, and the Cats' Water is little more than a boundary fence to Thorney: no part of either is navigable at present. The Well Creek runs from Salter's Lode to Outwell, and consists of two cuts forming an obtuse angle with one another.

The original navigation from Lynn Regis to Standground Sluice, near Peterborough, was carried from Salter's Lode Sluice, through Well Creek and the Nene, to Flood's Ferry, and thence through Ramsay, Ugg, and Whittlesea Meres, a passage at all times tedious, and often difficult and dangerous. In 1754 an act was passed for improving this navigation, and a new line was made from Salter's Lode through Well Creek to the town of Outwell, thence through the Old Nene or Wisbeach River by Upwell and March to Flood's Ferry, and thence to Ramsay High Lode. A cut was also then made from Outwell to Wisbeach, and the navigation of the Nene from Wisbeach to Peterborough was improved, by which means a safe navigation was provided from Lynn Regis to Peterborough by Outwell, Wisbeach, and Guyhirn.

By far the greatest and most effectual modern improvement in the draining and navigation of these fens has been completed under acts passed in 1827 and 1829 for improving the outfall of the river Nene, for the drainage of the lands discharging their waters into the Wisbeach River, for improving the navigation of the Wisbeach River from the upper end of Kinderley's Cut to the sea, and for embanking the salt marshes lying between Kinderley's Cut and the sea. The act of 1829 amended and enlarged the powers granted in 1827. Under these acts a new tidal channel has been cut for the discharge of the waters of the Nene into the sea. This channel begins at Kinderley's Cut, near Buckworth Sluice, about six miles below Wisbeach, and extends to Crabhole in Lincolnshire, a distance of six miles and a half; thence the river has shaped for itself a natural channel, about a mile and a half long, into the Wash. The excavation of this channel was begun in 1827, and finished in June, 1830, when the old channel was closed, and the water rushing into the new one carried away the earth at the bottom with so much force as to give to the channel ten or twelve feet greater depth than had already been given by manual labour. The sides of the channel were then secured by a thick lining of stones. The whole course of this new cut is through quicksands of the lightest and least cohesive nature of any on this part of the coast. The width of the channel at bottom is 140 feet at Kinderley's Cut, and at about half its length, at Scate's Corner, 200 feet. The surface width varies from 200 to 300 feet. The depth, measuring from the surface of the adjacent land to the bed of the river, is about 24 feet throughout. The spring-tide rises about 22 feet at the end nearest to the sea, and 18 feet at the junction with Kinderley's Cut. A bridge has been thrown over this channel at Sutton Wash, about eight miles below Wisbeach, and an embankment has been made a mile and a half in length across the sands, forming a new line of road between Norfolk and Lincolnshire, in place of the former dangerous ford through a tidal æstuary, or the very circuitous route through Wisbeach.

Nearly 1500 acres of marsh lands have been reclaimed from the sea, by embankments made under the acts of 1827 and 1829, and are now (1835) nearly all under cultivation: about 6000 acres more are rapidly coming to a fit state for inclosure.

The old channel afforded only a tedious and dangerous passage, and that too at spring tides, and with a favourable wind to vessels of about sixty tons burden, drawing about six feet water. The new channel affords a safe and uninterrupted communication between Wisbeach and the sea at all variations of the tide, and in all weathers, for vessels of the above burden, and at spring tides for ships of much larger dimensions.

Wisbeach is the emporium for a large part of the counties of Cambridge, Norfolk, Lincoln, and Northampton, and the advantages of this improved communication are consequently very great; but by far the most important effects which are expected to follow from this extensive undertaking will result from the judicious system of draining the north level, which there is no doubt will be imitated with equally good effects in the other levels.

In consequence of the more rapid discharge through this new channel—the Nene Outfall—the danger of inundation from a breach of embankment is greatly diminished, as regards the fens on each side of the Nene, between Peterborough and Wisbeach, and the value of the adjacent land is much increased. Its efficiency for draining the land may be appreciated by the fact, that the tide in this new channel ebbs out nearly ten feet lower than it did in the old channel, immediately opposite to the South Holland and North Level Sluices, (both below Wisbeach,) which are the outlets for the waters of about 100,000 acres of fen land. Means are thus afforded for obtaining a perfect drainage for the whole tract of marsh and fen land lying between the Nene and Welland, which hitherto has been only imperfectly drained.

A new sluice has been constructed for the outlet of the waters of the North Level into the Nene Outfall, and laid eight feet deeper than the sluice by which it formerly drained into the Old River Channel. The width of the water-way of the old sluice was seventeen feet; the width of the new sluice is thirty-six feet, and a new main drain has been formed, leading to this sluice from Clow's Cross, at which point all the waters of the North Level are collected. This drain commences and terminates nearly at the same points as the Old Shire Drain, for which it is substituted; it is only eight miles and a quarter long, about two-thirds of the length of the former drain, but it is eight feet deeper, and its capacity, taken in corresponding sections, is more than six times as great: it has a descent from Clow's Cross of four inches per mile. From Clow's Cross two new drains diverge in different lines; one of them, called the New South-eau, is much straighter and wider than the Old South-eau, which it is intended to replace; the New Wryde proceeds first in a curve, and then in a straight line to the counter drain. These cuts possess a superiority over the old ones, fully equal to that stated in the comparison made between Old Shire Drain and the New Main Drain. All these drains may be navigated, and will afford a much readier means of transit for goods, than any hitherto possessed by the districts through which they pass.

The works just described as having been executed under the acts of 1827 and 1829, were begun in 1828, and are now (1835) completed. The Nene Outfall was made at the cost of 200,000*l.*, and the drainage of the North Level, for which the Act was obtained in 1830, occasioned a further outlay of 150,000*l.* The great supporter of both these useful undertakings was the present Duke of Bedford, who carried them through with much patience and perseverance, under circumstances that would have discouraged a person of less steady purpose, and one who could not look forward with confidence to future advantage rather than present gain. In this conduct he was ably supported by the exertions of his confidential friend W. G. Adam, Esq., the accountant-general. But even they could not have carried them into effect without the scientific knowledge, great zeal and activity, and incessant labour which were displayed by Mr. Tycho Wing, his Grace's intelligent and able local agent, the third of his name who in succession have managed that property of the Russell family, and have enabled them to direct their influence to the continual improvement of this district.

Various auxiliary means have been used for the complete drainage of the Level. In many parts windmills have been erected for raising and carrying off the water through a safe channel, and more recently steam-engines have been employed for the same purpose. But the late improvements have rendered windmills and steam-engines unnecessary in the North Level, and if equal skill and enterprise were employed in draining the other levels, all the waters of these marshes might find an outfall with equal facility.

(Sir Jonas Moore's *History of the Bedford Level*; Colonel Dodson's *Design for the perfect Draining of the Great Level of the Fens called Bedford Level*: Burrell's *Brief Relation as to the Practicability, &c. of draining the Level of the Fens*; Dugdale's *History of Embanking and Draining, &c.*; Carter's *History of the County of Cambridge*; Lysons's *Magna Britannia*; Priestley's *Historical Account of navigable Rivers, Canals, &c.*; *Memoir of the Nene Outfall and the North Level Drainage*, printed for (private) distribution on the occasion of the public inspection of those works, 23rd May, 1834.)

BEDFORDSHIRE, an inland county of England, of very irregular shape. It lies between 51° 49′ and 52° 21′ N. lat., and 0° 8′ and 0° 41′ W. long. It is bounded on the N.E. by Huntingdonshire, and on the N.W. by Northamptonshire; on the E. by Cambridgeshire, on the W. and S.W. by Buckinghamshire, and on the S.E. and S. by Hertfordshire. Its greatest length is 36½ miles, measured nearly N. and S., and its greatest breadth is 22½ miles, measured nearly E. and W. Bedford, the county town, is situated near the centre of the county, rather nearer to the N. and W. boundaries. It is 46 miles, measured in a direct line from London (*i. e.* from St. Paul's), from which it lies N. by W., or N.N.W.; but by the road through Barnet, Hatfield, Hitchin, and Shefford, it is 50 miles. The area of the county is 463 square statute miles, or 296,320 acres; or, taking the sum of the areas assigned to the different parishes, 297,632 acres. It is the smallest county in England, except Huntingdon, Middlesex, and Rutland. The population in 1831 was 95,483. (*Population Returns*, 1831; *Enumeration Abstract.*)

Surface, Hydrography, Communications.—Bedfordshire has no high lands of any great extent. The range of the Chiltern hills (under the name of the Dunstable and Luton Downs) crosses it in a N.E. direction, near Dunstable, separating the basin of the Thames from that of the Ouse. Another ridge, having the same general direction, extends from Ampthill to near the junction of the Ivel with the Ouse. Some hills, between which the Ouse winds its course, and in which some of its feeders take their rise, occupy the north-west parts of the county. Between these hills and the Ampthill ridge is the vale of Bedford, a corn district of considerable extent. The woodlands are chiefly of modern origin, having been planted during the latter part of the last century: they consist chiefly of oak, Scotch fir, larch, and underwood of various kinds.

The chief river is the Ouse, which, approaching the county from Buckinghamshire, and forming for a short distance the boundary of the two counties, crosses Bedfordshire with so winding a course, that although the distance from the point where it first enters the county, to the point where it leaves, is, in a direct line, not quite 17 miles, the length of the river itself, between the same points, is probably not less than 45 miles. The average depth of the Ouse is considered to be about ten feet, and it is fordable in several places. It is subject to sudden and destructive inundations at all seasons. In its course through Bedfordshire it is increased by many streams, which flow into it on each bank, but none of these are of any size or importance except the Ivel. The Ivel is commonly considered to have its source near Baldock, in Hertfordshire, but the principal branch of it rises on the N.W. slope of the Chiltern hills, a little to the N.E. of Dunstable, and flowing to the N.E., unites with the Ouse at the village of Tempsford, after a course of about 30 miles. The streams which form another considerable feeder of the Ouse cross the county in its northern part. The river Lea, which falls into the Thames just below London, rises on the opposite slope of the same range of hills as the Ivel, and not far from the springs of that river; but only a small part of its course is in Bedfordshire. The Ouzel, a tributary of the Ouse, separates Bedfordshire from Buckinghamshire, but is to be considered as properly belonging to the latter county. The fish of the Ouse are pike, perch, tench, bream, chub, bleak, crayfish, fine eels, dace, roach and gudgeon. Bleak abound particularly about Bedford bridge. Eels are found in the greatest abundance and of the largest size at Stoke mill, near Melchbourne. The fish of the Ivel are, for the most part, the same as those of the Ouse: it is particularly famous for gudgeon.

The navigation of the Ouse commences at Bedford, and that of the Ivel at Shefford: by means of these rivers the county communicates with Huntingdonshire, Cambridgeshire, and Norfolk; and, more remotely, with other counties. There are no canals in Bedfordshire, but the Grand Junction Canal approaches close to its western border at Leighton Buzzard. The great road to Manchester, Leeds, Carlisle, and Glasgow, passes through it on the S.W. side, and the high north road, through York and Edinburgh, on the eastern side.

Geological character.—The range of the Chiltern hills consists of chalk, which occupies the south-eastern part of the county; and is skirted along its N.W. boundary by a belt of indurated chalk-marl, much covered by the debris of the chalk hills. This chalk-marl is known in the county by the name of clunch, and is extensively quarried at Totternhoe near Dunstable. It affords, by burning, a good lime. The chalk-marl is blended with a blue marl, which may perhaps be identical with the weald-clay of Kent, Surrey and Sussex, or with what has been denominated the Folkstone clay. Iron-sand, the lowest of the formations which intervene between the chalk and the oolites, stretches across the county in the same direction as the other formations, viz., from S.W. to N.E. Beds of fullers' earth, which occur in it, have been extensively worked, and in Fuller's time this mineral was known by the name of *Woburne earth*. The same formation contains also a considerable quantity of fossil wood. This iron-sand rises into a well-defined range of hills.

To the iron-sand succeeds a tenaceous adhesive clay, of a dark blue colour, becoming brown on exposure, and known by the name of Oxford clay. This stratum forms the vale of Bedford, and affords a strong clay soil, occupied chiefly in pasturage. It supplies several brick-kilns in the immediate vicinity of the town, in one of which part of a new species of Plesiosaurus was discovered in 1833. Many vertebræ of fossil Sauri have been found at Nemenham Mill, near Goldington: and an entire Plesiosaurus, of large dimensions, was discovered in 1833, in a brick-field about two miles north-west of Bedford, near the Ouse. The appearance of coal gave rise to some attempts to find that mineral, at Elstow near Bedford, which ended in disappointment. In the N.W. part of the county, the Cornbrash limestone appears, and is quarried in several places. The Oxford clay and the Cornbrash limestone are parts of the oolitic series. (Conybeare and Phillips's *Outlines of the Geology of England and Wales*; Smith's *Map and Delineation of the Strata of England and Wales.*)

Several springs in the county are impregnated with different minerals, but none of them are of any note. Drayton, in his *Poly-Olbion* (22nd song), as quoted by Fuller, speaks of a brook at Apsley Guise, near Woburn, the earth on the banks of which had a petrifying quality: but this account has been ascertained to be incorrect. Drayton's lines are as follows:—

> 'The brook which on her bank doth boast that earth alone,
> Which, noted of this isle, converteth wood to stone.
> That little Aspeley's earth we antiently instill
> 'Mongst sundry other things, a wonder of the isle.'

Late compilers, borrowing probably from Drayton and Fuller, speak of a petrifying spring near Woburn.

Climate, Agriculture.—The climate of this county, partaking of that of the interior of England, is not so wet as the western coast, nor so much exposed to cold winds as the eastern maritime counties. The air in general is mild and healthy, somewhat keen on the chalky hills, and moister on the cold, wet clays. The surface of the county is much varied; but none of the hills rise high or abruptly, with the exception of the chalky ridge, which is a continuation of the Chiltern hills, and which appears high only by comparison with more gentle undulations. Many of the slopes of the hills are skirted with woods and coppice, which add much to the general appearance of the country when viewed from an eminence. The soil varies greatly. On entering the county from the south the soil is composed of chalk, covered with a very thin layer of earth, which is consequently nearly in a state of nature, and only fit for sheep-walks. On descending the hills there occurs a mixture of chalk and clay, known by the name of 'white land,' which is stiff, but tolerably fertile. Various kinds of loam, chiefly clay, succeed, till you arrive at a sandy belt which stretches obliquely across the county from Leighton Buzzard to Biggleswade and Potton on the borders of Cambridgeshire. Along this belt runs the river Ivel, which falls into the Ouse at Tempsford. Between the course of the Ivel and the valley of the Ouse near Bedford lies a tract of stiff soil of various texture and quality, but quite different from the light soils found in the belt. Along the course of the Ouse, especially near Bedford, a gravelly soil prevails, covered in some places with a layer of rich, brown earth, well adapted for every kind of agricultural produce. Proceeding north of Bedford the general character of the soil is stiff, wet, and poor, with very few exceptions. The most fertile spots in the county are in the brown earth before-mentioned in the valley of the Ouse near Bedford, and in the sandy belt, where the soil washed down from the hills has accumulated, in particular basins, on a porous substratum. These soils, composed of rich loam and of great depth, are admirably adapted for market-gardens, for which the county has long been noted. The parish of Sandy in particular, not far from Biggleswade, and some others, produce an abundance of vegetables, not only for the supply of the neighbourhood, but also for distant markets. At the same time there are spots, both in the chalky hills and in the sandy eminences, which are as barren and unproductive as any in England; especially where a grey, loose sand abounds, on which nothing but ling or heath will grow.

These are scarcely of any use but as rabbit warrens, although some of them have been brought into cultivation. Along the river Ivel, in the parishes of Tingrith, Fletwick, Westoning, Hitton, Maulden, &c., a considerable quantity of ferruginous peat is found.

From this brief sketch it will be seen that there is scarcely any county of which the soil is so diversified, and where experiments on the best mode of cultivating various soils could be made with more advantage. With the well-known patronage of the Dukes of Bedford, especially of the late Duke Francis, and other large proprietors, and the example of their stewards and immediate tenants, one would expect a greater progress in the science and practice of agriculture than will be found in the county in general on careful examination. Many improvements have, no doubt, been introduced since the county has been more generally inclosed, which could not be expected while the system of common fields precluded any deviation from the established rotations of crops; but much yet remains to be done before the county of Bedford can vie with the eastern maritime counties, from the Thames to the Humber, in the cultivation of the land, or in the management of stock. The poor, cold clays, which form a considerable portion of the soil of this county, as they are cultivated at present, give no great return to the farmer. The chief produce is corn, and it requires much labour and expense to obtain a very moderate crop. This, together with the gradual depreciation in the value of corn when compared with stock, makes the rents very low. Most of the land north of Bedford does not let for above 10*s.* an acre, and some as low as 6*s.*, in spite of considerable expense incurred by proprietors in fencing and making ditches, an essential improvement on this kind of soil. That a better system could be adopted there can be no doubt, but old prejudices interfere with the better management of cold, wet clays; and while poor light soils, formerly considered as nearly barren, have been greatly improved by the introduction of turnips and the profit on sheep, the poor clays are still managed nearly in the same manner as they were a century ago; and many practical and intelligent men imagine, that no new method can be adopted with any chance of success. The chief cause of this is, perhaps, the difficulty of converting such soils into good pasture after having been once broken up; but this difficulty, however real, is not insurmountable.

On this subject we must refer the reader to the article Grass-land, in which the principles of this important part of agriculture will be discussed. In the account of the agriculture of Berwickshire, also, some useful practical examples are given.

It must be acknowledged by all those who are interested in the letting of land, that there is a great difficulty at present in finding responsible tenants, with sufficient capital, who are inclined to take a farm consisting chiefly of heavy and cold arable land, however low the rent may be; and that, when a tenant is tempted by a very reduced rent to take such a farm, he is soon discouraged and repents of his bargain: whereas light lands, however poor, upon which turnips can be made to grow, and sheep can be kept, soon find respectable tenants.

In the light lands the system is well established, and nothing is required but to follow the regular course of crops, and pay some attention to the sheep; the crops are less precarious, and the weather does not so often interfere with the common operations of husbandry. Hence it is that the chief improvements have been made in the sandy soils; and it will require some new impulse to agricultural speculations to engage either proprietors or tenants to adopt an improved system on the wet clays. But, even according to the old system of fallowing and cropping, the clay soils in Bedfordshire are not cultivated in the most approved manner, as will be seen by comparing the usual operations with those on similar soils in Essex and Suffolk. The old method in Bedfordshire, which is still continued by many farmers, was to fallow the land every third year, and as by this system there was no means of raising a sufficient quantity of manure to dress the land fallowed, recourse was had to the folding of sheep. This system was well adapted to situations where ample commons gave the means of keeping the sheep at a small expense; but where such commons have been inclosed, and the sheep must necessarily be maintained on the farm, it is evident that, unless food for the sheep be raised on the field on which they are folded, one part of the farm is robbed to enrich the other; and the damage done to the sheep by folding them on cold, wet clays in rainy weather, is probably not compensated by the good which their manure does to the following crop. The manner, also, in which the fallows are treated is not perfect. The old custom was to give only three ploughings, which had distinct names: the first was called the *fallow*, the second *stirring*, and the third *laying up*. There seems to have been a prejudice against frequent ploughing of stiff soil, and the drag or harrows were not much used. This is very different from the practice on stiff soils in the county of Essex, where they never think they can plough enough. (See Bachelor's *Survey of Bedfordshire*, p. 329.)

The usual rotation was, first a fallow, of which as much as could be folded over with sheep was sown with wheat; the remainder was slightly manured, and sown with barley. The second crop was beans or oats: and then the land was so foul and exhausted as to require another summer fallow. Better rotations have been introduced since the common fields have been divided and inclosed; but the old and faulty system, under which the ancestors of the present race lived comfortably, and at low rents, is looked back to by many as superior to those which have been introduced since. The great fault lies in the want of balance between the land tilled for corn, and that which is devoted to grass or green crops for cattle. Some farms are managed in a scientific manner, but the example has not been very generally followed.

There are a few meadows along the course of the rivers Ivel and Ouse which are occasionally flooded. Where the subsoil is gravelly and porous, the herbage is good and abundant; where it is composed of clay, and there is not a very ready channel for the water to run off, the herbage is coarse and full of rushes. These meadows might be much improved by banks and sluices judiciously placed. In no other part of the county is there much good grass-land, a few spots near the larger towns excepted. It has been urged, as a reproach to the soil of the county, that there was no pasture in it that would fatten a bullock. Whether this be correct or not, it is certain that no such rich grass is to be found, as may be seen in some of the richer grazing districts.

There is nothing remarkable in the cattle and sheep in this county, there being no indigenous breeds of either. The cows are of every imaginable breed; and as there are few extensive dairies, except some about Ampthill, no particular breed is kept so pure as to deserve a name. Some few individuals have taken pains to introduce choice cattle, but these are exceptions; and, in general, the few oxen that are fatted are bought of drovers at the different fairs, and are chiefly Scots, Welsh, and short-horns. The sheep are mostly Leicesters and South-downs, which have nearly superseded the old horned breed formerly kept; for although these were more hardy, and suffered less from folding on cold wet land, the improved breeds are much more profitable, especially in inclosed fields.

Formerly there were many rabbit-warrens on the poor, light, grey sands, as this was considered the only means of deriving any profit from so poor a soil. Most of these have been converted into farms, whether with much advantage in general we will not say, but in some cases with a decided improvement; and rabbits are now considered more as a nuisance to the adjoining lands, than as a source of profit. An attempt was made lately to breed tame rabbits, and to fat them for the London markets, with food raised purposely for them. Many thousands were kept on this plan by Mr. Fisher, in buildings raised on purpose near Ampthill, but the speculation did not answer, and the establishment was broken up. Whether this species of industry might not be profitable to cottagers on a small scale, is a subject worthy of experiment. The chief thing to be attended to in feeding rabbits is cleanliness and air; and from their prolific nature, and the value of the skin and flesh of the best sorts, it is highly probable that, with good management, a considerable profit might be made from them. The pigs reared and fatted in Bedfordshire are mostly of the Berkshire and Suffolk breeds, but no great pains are taken to keep up their distinguishing qualities, and they are often crossed very injudiciously. No animal varies more in its qualities than the pig, and the different breeds have only one point in common, that of being prolific. The qualities of fattening early, and on a small quantity of food, belong only to very improved breeds, which are not kept sufficiently distinct in this county.

The farms in Bedfordshire are not in general of great extent. Some few contain from 500 to 600 acres, but the average size is under 200. Leases for long terms are not common, which is an obstacle to improvement. Farms held from year to year may be kept in good heart, and well cultivated, on the common established system, provided there be a just confidence in the honour of the landlord, that he will not suddenly or capriciously remove a tenant; but no great and permanent improvements can be expected to be made, except by a proprietor or a lessee for a considerable term. A tenant, liable to be ejected at a short notice, cannot obtain credit to borrow money to lay out on his farm; and if he is prudent, will not lay out his own capital on an uncertainty. Formerly there were many small proprietors and yeomen occupying their own lands to the amount of from twenty to fifty acres, but they are mostly reduced to the state of cottagers and labourers. A very few have had the good fortune to take advantage of the high prices, and to sell their farms to the surrounding larger proprietors; but many, by increasing their occupations, which required additional capital, have been led to mortgage their land, and have gradually been involved, till they were obliged to sell their little property to pay the mortgage. Thus a class in society, between the cottager and the large farmer, has nearly disappeared.

An agricultural society was established at Bedford in 1803, under the patronage of the Duke of Bedford, which has done some good, and distributed rewards and prizes, both for improvements in agriculture, and to encourage industry; but the true stimulus to improvement is profit, and of late years this has been entirely wanting. The disheartened farmer has no spirit to try experiments, which require some outlay, without a rational prospect of an adequate return: and the example of rich proprietors is seldom followed, until the real profit is well ascertained, which it is often very difficult to do.

The following is a list of the fairs held in Bedfordshire:—Ampthill, May 4; Nov. 30. Bedford, First Tuesday in Lent; April 21; July 5; Aug. 21; Oct. 11; Dec. 19. Biggleswade, Feb. 14; Easter Saturday; Whitsun-Monday; Aug. 2; Nov. 8. Dunstable, Ash-Wednesday; May 22; Aug. 12; Nov. 12. Elstow, May 15 and 16; Nov. 5 and 6. Harrold, Tuesday before Old May-day, Old Midsummer-day, and Old Michaelmas-day. Ickwell, parish of Northell, April 6. Leighton Buzzard, Feb. 5; second Tuesday in April; Whitsun-Tuesday; July 26; Oct. 24. St. Leonard's, near Bedford, Nov. 17. Luton, April 18; Oct. 18. Odell, Whitsun-Thursday. Potton, Jan. 27; last Tuesday in April; first Tuesday in July; Tuesday before Oct. 29. Shefford, Jan. 23; Old Lady-day; May 19; Oct. 11. Selsoe, May 13; Sept. 21. Tuddington, April 25; first Monday in June; Sept. 4; Nov. 2; Dec. 16. Woburn, Jan. 1; March 23; July 13; Sept. 25.

Divisions, Towns, &c.—Bedfordshire is divided into nine hundreds: viz., Stodden, Willey, and Barford in the north; Biggleswade and Clifton in the east; Wixamtree in the centre; Redbornestoke in the west; and Manshead and Flitt in the south. The names of all these appear in the Domesday survey, together with the following three half hundreds: Stanburge, Weneslai, and Buchelai. These half hundreds are now incorporated with the hundreds. The town of Bedford also formed a half hundred by itself. The number of parishes is given in Camden's *Britannia* as 116; but by the population returns they appear to amount to 124, besides one district (Chicksands) which is extra-parochial. Of these 124 parishes, one extends into Huntingdonshire, one into Hertfordshire, and one into Northamptonshire.

The number of market towns is ten: Bedford, the county town, on the Ouse, is a parliamentary borough. The population of its five parishes amounted, by the returns of 1831, to 6959. Luton, on the Lea, in the southern part of the county, comes next in respect of population. The township of Luton contained, in 1831, 3961 inhabitants, and the whole parish of Luton 5693. Leighton Buzzard, or Busard (population of township, in 1831, 3330, of the whole parish 5149), is on the Ouzel. Biggleswade is on the Ivel; it had, in 1831, 3226 inhabitants. Dunstable (population, in 1831, 3117), once a parliamentary borough, and still retaining something of the form of a corporation, is in the south part of the county, between Luton and Leighton Buzzard. These are the only towns which have more than 2000 inhabitants. [See BEDFORD, BIGGLESWADE, DUNSTABLE, LEIGHTON BUZZARD, and LUTON.] The others, with their population in 1831, are as follows. Woburn (population 1827), a short distance north by east of Leighton Buzzard, and on the high road to Manchester and Liverpool; Potton (population 1768), in the east part of the county, on the border towards Cambridgeshire; Ampthill (population 1688), on the road between Dunstable and Bedford; Harrold (population 995), on the river Ouse, in the north-west part of the county, on the border of Northamptonshire; and Shefford on the stream described as the principal branch of the Ivel (population 763). The market of Toddington (population 1926), between Dunstable and Ampthill, has been discontinued of late years. Of these smaller places we subjoin a few other particulars.

Woburn, 41 or 42 miles from London, is a well built and well paved town, with broad and handsome streets. It owes much of its appearance to the circumstance of its having been almost entirely rebuilt since 1724, when it was destroyed by fire. It has a good market-house, built by the Bedford family after the great fire just noticed, and much improved by the present duke, from picturesque designs of Mr. Blore. The parish church and school-house have also been enlarged at his Grace's expense, by the same eminent architect; and a beautiful lantern and pinnacles have been added to the church tower. It has a parish church (the living is a perpetual curacy, with a commodious glebe house, in the gift of the Duke of Bedford), two dissenting meeting-houses (Independent and Methodist), some alms-houses, and a large free-school, conducted on the Lancasterian system. The chief employments of the poor are straw-hat and lace-making. There are four fairs in the year; and the market is held weekly on Friday. A divisional or petty session is held in the market-house every fortnight.

There was an abbey of Cistercian monks at Woburn, founded by Hugh de Bolebec, A.D. 1145. It was valued at the dissolution at 430*l.* 13*s.* 11*d.* gross income, or 391*l.* 18*s.* 8*d.* clear yearly value. (Tanner's *Not. Mon.*) The last abbot, Robert Hobs, was executed for denying the king's supremacy; and the site of the abbey was granted to John, Lord Russell, afterwards Earl of Bedford. Part of the old abbey remains, but has been converted into the Duke of Bedford's magnificent mansion which still retains the name. The present abbey was partly put into its present form about the middle, and partly towards the end, of the last century, and occupies four sides of a quadrangle, presenting four fronts of above 200 feet. The west or principal front is of the Ionic order, with a rustic basement. The offices are at a short distance from the mansion; and the park is finely diversified with wood and water. The tree on which Abbot Hobs was hung is still standing, and is carefully preserved. The abbey is adorned with some interesting portraits, including those of Queens Mary and Elizabeth; another of Mary with her husband, Philip of Spain; Lady Jane Seymour, wife of Henry VIII., and mother of Edward VI.; Anne of Denmark, wife of James I.; Sir Philip Sidney; William Lord Russell, beheaded in 1683; Rachel Wriothesley, his admirable wife; General Monk; Cecil, Lord Burleigh; and many others. In the dining-room is a fine collection of portraits by Vandyke; and in the breakfast-room a numerous series of views in Venice, by Conaletti, painted originally for Bedford House. In the sculpture gallery are the antique vase known as the Lanti vase, brought over to England by Lord Cawdor, and a very large marble antient sarcophagus (brought from Ephesus), on the four sides of which are sculptured the sad story of Achilles dragging Hector's body, Priam's ransoming it at its weight in gold, and other post-Homeric traditions of the woes of Andromache and Astyanax. In the park is a farm-yard on the most extensive scale, and furnished with every convenience. It originated with Francis, brother and predecessor of the present Duke of Bedford.

Potton, 50 miles from London, and 6 or 7 from Biggleswade, has a good corn market, though not equal to what it was formerly; the decline is attributed by some to a fire which, in 1783, destroyed above fifty houses, and did damage to the amount of more than 25,000*l.* The living is a vicarage in the gift of the crown. It was once held by the celebrated Stillingfleet, who wrote here his *Origines Sacræ*, a work esteemed one of the best defences of revealed religion.

Ampthill, 45 miles from London, and 8 from Bedford, has an inconsiderable market, and one annual fair. It has a good market-house; and near the middle of the town stands an obelisk of Portland stone, in which is a pump. Near the town is Ampthill House, the seat of Lord Holland. Ampthill Castle, which stood in the park of Ampthill House, was the residence of Catherine of Aragon, queen of Henry VIII. while the business of her divorce was pending. The site of the castle is marked by a cross erected in 1773 by the Earl of Upper Ossory, who then possessed the domain. With Ampthill Park is united Houghton Park, in which are the remains of Houghton House, built by the Countess of Pembroke, sister of Sir Philip Sidney. There is an alms-house for a reader, twelve poor men, and four poor women, about a mile from Ampthill. Divisional or petty sessions are held at Ampthill every alternate Thursday.

Harrold, antiently Harwolde or Harwood (Tanner's *Not. Mon.*), or Harles-wood. (Fuller's *Worthies of England.*) This small town is not upon any main road, its distance from London cannot, therefore, be accurately given, but it is about 9 miles N.W. of Bedford. (Jeffery's *Map of Bedfordshire.*) Its market, which is on Thursday, is little more than nominal, and the only branch of manufacture carried on in the place is that of lace. There is a bridge over the Ouse with a long causeway. The parish church is adorned with a handsome Gothic spire. The living is a vicarage in the gift of the Earl de Grey. Harrold had once a small priory, built in the reign of Stephen, first both for canons and nuns of the order of St. Nicholas of Arrouasia, but afterwards it consisted only of a prioress, and three or four nuns of the order of St. Augustin. At the Dissolution its total income was 47*l.* 3*s.* 2*d.*, its clear income 40*l.* 18*s.* 2*d.* The site was granted in 1544 to William Lord Parr. (Tanner's *Not. Mon.*) The priory is now a farm-house, the property of Earl de Grey. The only part of the conventual buildings which remains is the refectory, now a barn called the Hall Barn.

Shefford is 41 miles from London, and 9 from Bedford. It is on the road between these two, and on the river Ivel. Besides a market on Friday, it has four fairs, the two first (on the 23rd of January and Easter Monday) are considerable marts for sheep and cows. It is a parochial chapelry; the chapel has been lately much enlarged. There is also an endowed Catholic chapel. The navigation of the Ivel commences here. Robert Bloomfield the poet died here in 1823. At Chicksands near Shefford was a priory of Gilbertines, founded about A.D. 1150, by Pain de Beauchamp and Roais his wife. Its gross yearly value at the Dissolution was 230*l.* 3*s.* 4*d.*, the clear yearly value, 212*l.* 3*s.* 5*d.* (Tanner's *Not. Mon.*) The site was granted to R. Snow, from whom it came to the Osborn family. The present residence of the Osborns retains much of the monastic appearance, and indeed consists in part of the remains of the conventual buildings; this house contains some valuable portraits.

Toddington is between Dunstable and Ampthill, about 5 miles from Dunstable, and 38 or 39 from London, nearly 7 miles from Ampthill, and nearly 15 from Bedford. The market, which a century and a half ago was one of the most considerable in the county, has been discontinued, and the market-house pulled down: it has five fairs. The Gothic church contains some antient monuments in its north and south transepts: but these transepts, as well as the monuments in them, are in a very dilapidated state. A curious frieze of grotesque animals runs under the eaves of the church roof There was an hospital at Toddington, founded, in the time of Henry VI., in honour of John the Baptist, by John Broughton. It was for a warden, being chaplain, and three poor men. (Tanner's *Not. Mon.*) There is a Wesleyan meeting-house at Toddington.

Divisions for Ecclesiastical and Legal Purposes.—The number of parishes in this county has been already given as 124, but this will not represent the number of benefices, for several of these have been consolidated. Some of these consolidations are of recent date. Messrs. Lysons (*Magna Britannia*) state, that of 121 parishes (they probably omit the three that are partly in other counties) 63 are vicarages, the great tithes of which were formerly, with few exceptions, appropriated to religious houses, and are now in lay hands.

The county is in the diocese of Lincoln, and is under the jurisdiction of the archdeacon of Bedford. It is divided into six rural deaneries, viz., Bedford, Clapham, Dunstable, Eaton, Fleete, and Shefford.

It is in the Norfolk circuit. The assizes and sessions are held at Bedford, which is also the chief place for the election of the two members for the county. The other polling places for the county are, Sharnbrook in the north, Biggleswade in the east, Leighton Buzzard in the south-west, Luton in the south, and Ampthill. Besides the two county members, two are returned for the borough of Bedford.

Civil History and Antiquities.—At the time of the Roman invasion, Bedfordshire appears to have formed part of the territory of the Cattieuchlani; a people conjectured by Camden to be the same as the Cassii, mentioned by Cæsar among the tribes who submitted to him during his second invasion of the island. In common with the other inhabitants of South Britain they fell under the Roman domination. Three roads, which may be referred to this period, or a still more antient one, crossed this county, and several camps or earth works still remain. Of the roads, the Watling Street runs in a north-west direction, and coincides in this county with the high road from London through Dunstable and Fenny Stratford (Bucks) to Coventry. It was, probably, of British origin, though used and improved by the Romans, who had on it their station of Durocobrivæ (Antoninus), or Forum Dianæ (Richard of Cirencester), now Dunstable. The Ikening or Ikeneld Street, also of British origin, runs in a south-west direction through Dunstable. The third road, a Roman military road, coincides with the present high north road from near Baldock to the vicinity of Biggleswade, where the modern road makes a bend, while the antient one pursues a more direct course through Tempsford Marsh or Cow Common into Cambridgeshire. It is supposed that a Roman road from the Isle of Ely to Cambridge led from the latter place through Bedfordshire towards Fenny Stratford. On the edge of a low range of the Chilterns at Maiden Bower, near Dunstable, are the remains of a British station or town. These remains consist of a vallum, nearly circular, thrown up on a level plain, and inclosing a space of about nine acres. The banks are from eight to fourteen feet high. There is no ditch on the south side, and on the south-west and west only a very small one; on the north-west is a descent to the meadows. Some have assigned to this work a Saxon or Danish origin. About a mile westward of this is another remarkable earth-work, called Toternhoe Castle. It consists of a lofty circular mount, with a slight vallum round its base, and a larger one of an irregular form at some distance from it. On the south-east side of this is a camp, in the form of a parallelogram, about 500 feet long, and 250 feet wide (the length extending from north-west to south-east), secured on three sides by a vallum and ditch (very entire on the south-east side), and protected on the fourth (the south-west) side by a precipitous descent. The irregular work is supposed to have been of British, and the parallelogram of Roman origin. At or near the village of Sandy, or Salndy, about three miles north of Biggleswade, is supposed to have been the British or Roman town called *Σαλῆναι* by Ptolemy, and Salinæ in the Chorography of the anonymous geographer of Ravenna. A large Roman camp (once perhaps a British post), called popularly Cæsar's Camp, may be traced in the immediate vicinity of this place. It is of irregular form, being adapted to the summit of the hill, and incloses about thirty acres. There are circular inclosures of earth on the heath near Leighton Buzzard, and at about four miles east of Bedford near the road to Great Barford and Eaton-Socon. The last is small, but of considerable height, with openings on the north and south sides, resembling an amphitheatre.

In the contest maintained by the Britons against their Saxon invaders, and again by the Saxons against the encroachments of the Danes, Bedfordshire appears to have been the scene of violent contest. At Bedford a battle was fought in 571, 572, or 580, between Cutha, or Cuthwulf, brother of Ceaulin, or Cealwin, King of the West Saxons, and the Britons: in which the latter were routed, and lost, in consequence of their defeat, four principal towns, one of which was Lygeanburgh, supposed to be Leighton in this county. Yet although this success was gained by the West Saxons, the county was comprehended in the subsequently formed kingdom of Mercia, founded by a body of Angles. Offa, King of the Mercians, is said to have been buried at Bedford; but his sepulchre was carried away by an inundation of the Ouse. In the Danish wars Bedford suffered severely, having indeed been ruined by those fierce invaders; but it was repaired by Edward the Elder, son and successor of Alfred the Great. The same prince afterwards besieged and took Temesford, now Tempsford, which the Danes had fortified. In 1009 and 1010, during the war between Ethelred II. and Sweyn, King of Denmark, the Danes invaded this county. In the latter of these years they burnt

Bedford and Temesford; but in 1011 the county returned under the sway of Ethelred.

An account of the castle of Bedford, and the historical circumstances connected with it, has been given in the article Bedford.

It is supposed that all the other baronial castles in the county of any note had been destroyed in the reign of John; and it is perhaps owing to this that we read of so few occurrences in Bedfordshire during the civil war of the Roses. This county was the scene of few conspicuous events during the civil war between Charles I. and his parliament.

Bedfordshire possessed several monastic establishments. There were six 'greater monasteries,' i. e. monasteries possessing above 200*l.* clear yearly revenue at the time of the Dissolution: viz., Elstow Abbey, near Bedford, for Benedictine nuns, founded in the time of William the Conqueror by his niece Judith; gross yearly income 325*l.* 2*s.* 1*d.*, clear income 284*l.* 12*s.* 11*d.* Dunstable Priory, for Black Canons, was founded by King Henry I. in the latter part of his reign; at the Dissolution the gross revenue was 402*l.* 14*s.* 7*d.*, and the clear revenue 344*l.* 13*s.* 3*d.* per annum. Wardon, or Warden, otherwise De Sartis Abbey (Warden, once a market town, is to the right of the road to Bedford, between Shefford and that town), was founded by Walter Espec, in 1135, for Cistercian monks; at the Dissolution it had 412*l.* 11*s.* 11*d.* gross, or 389*l.* 16*s.* 6*d.* clear yearly revenue. Woburn Abbey and Chicksands Priory, near Shefford, have been already noticed. Newenham Priory, near Bedford, was founded in the time of Henry II. by Simon Beauchamp, who removed hither a priory of Black Canons from St. Paul's, Bedford: the gross yearly revenue of Newenham Priory at the Dissolution was 313*l.* 15*s.* 5*d.*, the clear revenue 293*l.* 5*s.* 11*d.* There were many minor establishments, priories, nunneries, hospitals, &c.

Of these monastic establishments there are no considerable remains, except of Dunstable Priory, Elstow Abbey, Newenham and Chicksand's Priory, the last of which has been already noticed. The parish churches of Dunstable and Elstow were the conventual churches; indeed Dunstable church is only the nave of the original structure. These exhibit the Norman intermingled with the early English style of architecture.

Among the parochial churches of this county are some relics of early architecture. The nave of Pudington church, in the north-west extremity of the county, has the semicircular arch and zigzag moulding characteristic of the Norman, or, as some call it, the Saxon style: the same style is also conspicuous in the south door of St. Peter's at Bedford, and in the doors of the churches at Elstow, Flitwick, and a chapel at Meppershall. The early English is to be traced in the churches of Felmersham, on the Ouse, not far below Harrold; Eaton Bray and Studham, both in the southern extremity of the county; Barton in the Clay, between Luton and Bedford; Leighton Buzzard; and, though in a small degree, Luton. The decorated English style, which prevailed in the fourteenth century and succeeded the early English, is to be traced in Low Sundon and Ampthill churches; in St. Paul's, Bedford; in Silsoe Chapel, and in some churches already mentioned. Dunstable, Leighton Buzzard and Luton churches are perhaps the best deserving of examination of any in the county.

It does not appear that there are any remains of baronial castles in Bedfordshire, except the earth works which mark their sites, and which may be observed at Bedford, Eaton-Socon, and other places.

Education, Schools, &c.—The parliamentary papers of 1820 exhibit a return of the state of education in this county. The return was ordered by the House of Commons to be printed, April 1, 1819. There were then forty-two endowed schools, exclusive of the Harpur free-schools at Bedford, giving instruction to 2066 children, and possessing a revenue of 1825*l.* per annum: of these schools four were on the plan of Bell or Lancaster, and had in them 655 children. Of unendowed day-schools the return was as follows:

		Schools.	Scholars.
National and Lancasterian schools		6	319
Common day-schools		42	1149
Dames' schools		46	849
	Unendowed day-schools	94	2317
Endowed	,,	42	2066
	Total	136	4383

Of the 4383 children taught in the day-schools, endowed and unendowed, 2587 received a gratuitous education, and 1796 paid for their instruction. There were at the same time seventy-seven Sunday-schools giving instruction to 5060 children.

An account of the Harpur charity will be found in the article Bedford.

The free-school at Woburn is not endowed, but has been supported since 1582, by the successive earls and dukes of Bedford. The school is now on the Lancasterian system, and contains 150 boys. The master's stipend (50*l.* per annum) is paid by the Duke of Bedford, who also keeps the school premises in repair. (*Reports of the Commissioners appointed to inquire into Charities.*)

The report of the *National Society for promoting the Education of the Poor, for* 1832, gives an account of the state of education in the county of Bedford, but the account includes only schools connected with the Church of England; and it is further incomplete from the circumstance, that from thirty-nine parishes or parochial chapelries no return had been made. The account states, that there were forty-three Sunday and daily schools, and fifty-two schools held on Sunday only. In schools of the former kind 1287 boys and 1254 girls were instructed; and in those of the latter kind 1771 boys and 1957 girls; making a total of 3058 boys and 3211 girls, or 6269 children. The population of the county in 1831 was 95,383.

Population.—Bedfordshire is the most purely agricultural county in England, having the smallest proportional number of inhabitants engaged in manufactures and trade. Indeed, it can hardly be said that the county contains any persons engaged in manufactures. At the census of 1831 it was found that thirty-eight males above twenty years of age were so employed, but these few persons might with equal propriety have been included among the class engaged in trade or handicraft, their employment being for the most part that of straw-platting. Bedfordshire is one of the very few counties which has maintained, relatively to other counties, the same position as regards the employment of the people at each of the enumerations of 1811, 1821, and 1831. The proportions in which the inhabitants were employed at each of those dates were as follows:

		1811.	1821.	1831.
Agriculture	(families in 100)	63·1	61·9	56·8
Trade, manufactures, &c.	,,	27·9	27·8	25·7
Other classes	,,	9·	10·3	17·5
		100	100	100

The proportions for all England were:—

		1811.	1821.	1831.
Agriculture	,,	34·7	33·	27·7
Trade, manufactures, &c.	,,	45·9	47·6	43·1
Other classes	,,	19·4	19·4	29·2
		100	100	100

The diminution in the proportion of families in Bedfordshire engaged in agriculture in 1831 was not sufficiently great to place the county in this respect after any other.

The population of Bedfordshire at each of the four enumerations made in the present century was as follows:

1801	63,393			
1811	70,213	increase	10·75	per cent.
1821	83,716	,,	19·23	,,
1831	95,483	,,	13·93	,,

showing an increase in the course of thirty years of 32,090 souls, or 50½ per cent.

The ages of the population were ascertained in 1821, at which time there were in Bedfordshire,

	Males.	Females.	Total.
Under 20 years old	20,967	20,955	41,922
Between 20 and 40	10,085	12,461	22,546
Between 40 and 60	6,298	6,725	13,023
Above 60 years	3,031	3,175	6,206
Ages unknown	4	15	19
	40,385	43,331	83,716

The following summary of the population, as it stood at the last enumeration in May, 1831, is taken from Mr. Rickman's abstract of the returns, and exhibits a sufficiently detailed account of the number and occupations of the inhabitants of the county:

HUNDREDS, &c.	HOUSES.				OCCUPATIONS.			PERSONS.			Males twenty years of age.
	Inhabited.	Families.	Building.	Uninhabited.	Families chiefly employed in agriculture.	Families chiefly employed in trade, manufactures, and handicraft.	All other families not comprised in the two preceding classes.	Males.	Females.	Total of persons.	
Barford, Hundred	1,152	1,211	2	18	943	213	55	2,862	3,018	5,880	1,333
Biggleswade . .	1,780	1,976	11	23	1,047	517	412	4,859	4,837	9,696	2,334
Clifton . . .	999	1,073	12	17	672	245	156	2,785	2,773	5,558	1,287
Flitt . . .	2,239	2,480	29	30	1,495	554	431	5,901	6,270	12,171	2,797
Manshead . .	4,004	4,456	37	77	2,170	1,411	875	10,259	10,965	21,224	5,052

County Expenses, Crime, &c.—The sums expended in each of those years for the maintenance of the poor were

In 1801, 36,891*l.*, being an average of 11*s.* 7*d.* for each inhab.
1811, 61,273*l.* „ „ 17*s.* 5*d.* „
1821, 68,826*l.* „ „ 16*s.* 5*d.* „
1831, 81,016*l.* „ „ 16*s.* 11*d.* „

The average proportion for the whole of England during the same years was 9*s.* 5*d.*, 13*s.* 5*d.*, 10*s.* 11*d.*, and 9*s.* 11*d.* respectively.

The total amount of money raised for poor-rate and county-rate in the year ending 25th March, 1833, was 91,761*l.* 8*s.*, and was levied as follows:—

On Land . . .	£81,101	7	0
Dwelling-houses .	9,918	0	0
Mills, &c. . .	315	16	0
Manorial profits, &c. .	396	5	0
	£91,761	8	0

Of which was expended—

For the relief of the poor . .	£80,384	11	0
In suits of law, removal of paupers, &c.	1,273	0	0
For other purposes . . .	9,388	6	0
	£91,045	17	0

The number of inhabited houses in the years when the census was taken was 11,888, 13,286, 15,412, and 17,978.

The annual proportions of baptisms, burials, and marriages to the population, in the five years preceding the four enumerations above-mentioned, were—

	1796-1800.	1806 1810.	1816-1820.	1826-1830.
Baptisms, 1 in	35	32	33	35
Burials, 1 in	51	48	57	54
Marriages, 1 in	114	131	123	129

The proportion of illegitimate children born in 1830 to the number of children born in wedlock was one in thirty: the number of illegitimate children was 41 males and 50 females.

The number of turnpike-trusts in the county in 1829 was 15; the extent of turnpike-roads under their charge 238 miles; the annual income of the same, derived from tolls and parish composition, was 17,938*l.*, and the annual outlay for repairing and management 17,993*l.* The county expenditure for several local purposes in 1833 was as follows:—

Bridges and roads leading to them .	£145	8	5
Gaols . . .	161	9	6
Bridewells, or houses of correction .	436	1	11
Courts of justice	86	11	10
County surveyor . . .	58	15	6
Expenses of criminal trials at quarter-sessions	319	17	1
Ditto ditto at circuits . .	521	17	4
Ditto of coroners . . .	88	1	9
Ditto of shire-halls	225	19	10
Ditto of lunatic asylums . .	649	18	8

The entire sum levied for county-rate during 1833 was 5816*l.*

The total numbers of persons charged with criminal offences in Bedfordshire, in each of the periods of seven years ending with 1820, 1827, and 1834, were 367, 766, and 812 respectively, being an average of 52 annually in the first period, 109 in the second period, and 116 in the seven years ended with 1834.

The number of offences tried at quarter-sessions in 1833 was 71:

Convictions	46
Acquittals	9
Discharged by proclamation	16
	71

The total number of persons charged with crimes at the assizes in 1834 was 164. Of these, 16 were offences against the person; 11 offences against property committed with violence (housebreaking); 86 offences against property without violence; 68 of the offences in this class are described as simple larceny; 7 were malicious offences against property (killing and maiming cattle, and arson); of the remaining 44 charges, 12 were offences against the game laws, and 32 were for trifling breaches of the peace. The total number of convictions was 130, only 5 of which were for capital offences, and the sentences upon these 5 convicts having been commuted for transportation, 4 for life and 1 for fourteen years; no execution took place within the county during the year. Of the 164 persons charged 158 were males, and only 6 females; their ages respectively were as follows:

	Males	Females.
Under 12 years of age . .	1	„
Between 12 and 16 . .	5	„
„ 16 „ 21 . .	42	1
„ 21 „ 30 . .	70	4
„ 30 „ 40 . .	22	„
„ 40 „ 50 . .	6	1
„ 50 „ 60 . .	7	„
Above 60 years of age . .	4	„
Age not ascertained . . .	1	„
	158	6

The proportion of offenders to the population was 1 in 582; the proportion for the whole of England and Wales was 1 in 619. The centesimal proportion of offences committed with violence was 16·47, the proportion for England and Wales being 17·44. Offences against property in this county 52·44, in all England 73·97. Malicious offences 4·27 in Bedfordshire, and 0·72 in all England. Other offences (game laws and breaches of the peace), centesimal proportion in Bedfordshire 26·82, in all England and Wales 5·95. There was not any charge in this county in 1834, for forgery and offences against the currency: the centesimal proportion of this class of crimes for the whole of England and Wales was 1·92.

There are three savings' banks in the county, at Bedford, Ampthill, and Biggleswade: the total number of depositors on 30th November, 1833, was 1858, and the amount deposited 63,333*l.* More than half the accounts were for sums under 20*l.*: the whole may be classed thus:—

948	depositors	under	£20	£7,070 deposited.
502	„	„	50	15,331 „
250	„	„	100	17,268 „
85	„	„	150	10,138 „
56	„	„	200	9,402 „
17		above	200	4,124 „

Total 1858 depositors, entitled to £63,333 savings depos.

Education.—The following abstract of the establishments for education, and the number of scholars attending the same, in the county of Bedford, is taken from returns presented by command of his Majesty to the House of Commons, during the present Session. (1835.) We have kept it distinct from the other part, as the returns are made on a different principle.

		Schls.	Scholars.	
Schools established by Dissenters included in the above.	Infant Schools	1	27	285
	Daily Schools	9	258	
	Sunday Schools	69	6743	

Of the infant schools, one at Silsoe, containing 77 children, is supported by Earl de Grey.

Daily scholars being usually admitted at boarding schools (of which 16 appear in the returns to be established in Bedfordshire), and the boarders being in fact (according to the words of the returns) daily scholars, such boarding-schools are included in the foregoing abstract. Lace and straw-plat schools, which are numerous in this county, are not included in the abstract, although at many of them the children are taught to read.

Of the Sunday-schools 57 are kept at places where no other school exists, and the children instructed in them, 3,110 in number, cannot therefore attend any other school. At other places part of the children taught in Sunday-schools attend other schools also, but the proportion of these is not given in the returns.

The increase of schools since the year 1818 has been as follows:—

Infant and other daily schools	108	containing	2643	scholars.
Sunday-schools	121	„	11180	„
	229		13823	

There are lending libraries of books attached to 17 schools in Bedfordshire.

BEDIS, for prayers, according to Jamieson, is still used in Scotland. He says ‘ In familiar language it is common to speak of ‘counting one's beads’ when one goes to prayer.’ He adds —‘ There is here an allusion to the Popish custom of running over a string of beads, and at the same time repeating Paternosters and Ave-Marias over them, according to a fixed rule, as the particular beads are meant, by their colour, form, or place, to represent to the mind this or that mystery, benefit, or duty.’ (*Etymolog. Dict.* vol. i.)

BEDLAM, a corruption of Bethlehem, the name of a religious house in London, which, subsequently to the dissolution of monasteries, was converted into an hospital for lunatics, but still retained its former appellation.

Shakspeare, in the second part of ‘Henry VI.,’ act v. scene i., speaks of ‘a *bedlam* and ambitious humour.’ Dr. Grey, however, in commenting upon this passage, justly remarks that the word *bedlam* was not used in the reign of Henry VI. Malone says that Shakspeare was led into this anachronism by the author of an earlier historical play upon the same subject: while Ritson, upon a misconception of what Stowe says in his ‘Survey of London’ (4to. 1598, p. 127), declares it to be no anachronism, and leaves the reader to suppose that the Hospital of St. Mary Bethlehem without London, the religious house alluded to, had been a receptacle for distracted people from its earliest foundation.

The Hospital of St. Mary Bethlehem, vulgarly called Bedlam, owed its name and original establishment to the piety of a citizen of London. In the year 1247, in the thirty-ninth of Henry III., Simon Fitz Mary, who had been sheriff, influenced by the prevailing religious feeling of the age, was desirous to found a religious house. Accordingly, he appropriated by a deed of gift, which is still extant, all his lands in the parish of St. Botolph without Bishopsgate, being the spot afterwards known by the name of Old Bethlem, now called Liverpool-street, a few yards north of Bishopsgate Church, to the foundation of a priory. The prior, canons, brethren, and sisters, for whose maintenance he provided, were to be distinguished by a star upon their mantles, and were especially directed to receive and entertain the bishop of St. Mary of Bethlehem, and the canons, brothers, and messengers of that their mother church as often as they might come to England. Such was the original design of this foundation.

In the year 1403, says Tanner (*Notit. Monast.* edit. 1787, Midd. viii. 30), most of the houses belonging to this hospital were alienated, and therein were no brethren or sisters, but only the master, and he did not wear the habit of his order. However, it continued to the Dissolution, when, being seized by Henry VIII., it was granted, in 1547, with all its revenues, to the mayor, commonalty, and citizens of London, from which time only it became an hospital for the cure of lunatics.

In the infant state of this charity no other provision was made for the unfortunate patients, besides confinement and medical relief; it was left for the judicious benevolence of succeeding times to improve the good work, and to supply the subsistence and care which has restored so many distracted objects to their families and to society. There is no account of donations received for this institution before the year 1632. About 1644 it was under consideration to enlarge the old hospital, but the situation had become close and confined. The New Hospital of Bethlehem, as it was then termed, was begun to be built in April, 1675, upon a plot of ground near London Wall, on the south side of the lower quarter of what was then called Little Moorfields; the design of the building was taken from the palace of the Tuileries, and was once admired. It is said to have been finished in the month of July, 1676. It has since, however, given way to a fitter building for its purpose, upon a distant, but more commodious spot, erected in 1814; and the Hospital of St. Mary Bethlem is now placed upon the other side of the Thames, in the parish of Lambeth. (See Shakspeare, Reed's edit. 1803, vol. xiii. p. 378; Tanner's *Notitia Monastica*, ut supr.; Dugdale's *Monasticon Anglicanum*, new edit. vol. vi. P. ii. p. 621; and Bowen's *Hist. Account of the Origin, Progress, &c., of Bethlem Hospital*, 4to. Lond. 1783. [For the treatment of lunatics, see LUNATIC ASYLUM.]

BEDLAM BEGGARS was the antient name for such patients of the Hospital of Bethlem, after it became a lunatic asylum, as, being partially cured, were allowed to go at large. Edgar, in 'King Lear,' act. ii. scene iii., when assuming the character of Poor Tom, says—

> 'The country gives me proof and precedent
> Of *bedlam beggars*, who, with roaring voices,
> Strike in their numb'd and mortified bare arms
> Pins, wooden pricks, nails, sprigs of rosemary,' &c.

Aubrey, in his 'Remains of Gentilisme,' an unpublished work, preserved among the Lansdown MSS. in the British Museum, part iii. fol. 231 b., tells us, 'Before the civil wars, I remember Tom-a-Bedlams went about a-begging. They had been such as had been in Bedlam, and come to some degree of soberness, and when they were licensed to go out they had on their left arm an armilla of tin printed, of about three inches breadth, which was sodered on.'

BEDLIS (also written **BETLIS**, **BIDLIS**, and **BITLIS**), in the Armenian language named Paugesh, one of the most antient cities of Kurdistan, is situated, according to Jaubert (*Voyage en Arménie et en Perse*, p. 475), in lat. 38° 34′ 30″, and long. 40° 10′ E. of Paris (*i. e.* 42° 30′ E. of Greenwich), on the southern side of the Nimrod mountains, and at a distance of about twenty miles, in a south-easterly direction, from the lake of Van. It extends across the greater part of a fine valley, remarkable in the history of the East for a signal defeat which the Osman sultan, Suleiman the Magnificent, here sustained from the Persians in 1533. (See Malcolm's *Hist. of Persia*, vol. i. pp. 507, 508.) Tavernier (*Persian Travels*, book iii. ch. iii.) says that the town is built like a sugar-loaf, 'the ascent being so steep on every side that there is no getting to the top but by wheeling and winding about the mountain.'

The castle belonging to the town is situated on the top of a high mountain on the western side of the valley. The country around Bedlis is highly cultivated, and fertile in grain, cotton, hemp, rice, olives, &c. The neighbourhood abounds in game; the surrounding hills are infested by lions, wolves, and bears. The inhabitants of Bedlis, including those of the neighbouring villages, are supposed by Kinneir (*Geographical Memoir of the Persian Empire*, pp. 330, 331) to amount to 20,000, partly Kurds and Turks, partly Armenian and Syrian Christians. The Armenians have four churches and four monasteries, and enjoy more liberty here than in other Mohammedan states.

The part of Kurdistan in which Bedlis is situated now forms part of the Asiatic dominions of the Osmans. When Tavernier visited this province in 1664, Bedlis was in the possession of a powerful independent bey, who acknowledged neither the supremacy of the grand seignior of Constantinople, nor that of the shah of Persia; and Tavernier observes that it was the interest of those two sovereigns to stand well with him, lest he should intercept the passage from Aleppo to Tauriz, which leads through the valley of Bedlis; the straits of the mountains being so narrow that ten men might defend them against a thousand. The road of the caravans that travel from Erzerum to Bagdad still passes through Bedlis. Colonel Monteith thinks it probable that Xenophon may have ascended the pass of Bedlis (*Journal of the Royal Geographical Society*, vol. iii. p. 51), and accounts for his not mentioning the lake of Van, by the circumstance that the road from Bedlis to Trebizond, which he must have followed, lies on the southern side of the Nimrod Mountains, which encompass the lake. According to Ouseley's Ebn Haukal (p. 165), there are three days' journey from Bedlis to Khullat, and as much to Miafarekein.

BEDMINSTER. [See BRISTOL.]

BEDNORE, a district situated on the summit of the range of mountains called the Western Ghauts, in the north-west quarter of the dominions of the rajah of Mysore, and overlooking to the west the provinces of Canara and Malabar. The Western Ghauts are from 2000 to 3000 feet higher than the chain of hills called the Eastern Ghauts. [See GHAUTS.] The range, on the summit of which Bednore is situated, is elevated from 4000 to 5000 feet above the level of the sea, and presents towards the west a very rapid slope, which intercepts and breaks the clouds brought there by the western monsoon. The climate is in consequence exceedingly moist, and it is calculated that nine months out of the year are rainy, and to such a degree as to oblige the inhabitants to provide themselves beforehand, at least for six months of the time, with a stock of provisions. By means of this excessive moisture vegetation is rendered extremely luxuriant; the timber trees throughout the district attain to great dimensions, and in some parts the underwood and jungle are quite impenetrable. In consequence of the difference of elevation, the seasons are usually one month more backward than in Canara.

The productions of the district of Bednore, which it raises in sufficient abundance for exportation, are betel-nut, cardamoms, pepper, sandal-wood, and a small breed of cattle. The most important of these articles in point of quantity is betel-nut. In return, Bednore imports rice, salt, oil, and cotton goods from the low country. The roads, in consequence of the prevalence of rain, are wretched, and almost all the exports and imports are conveyed by men, without the aid of any kind of carriage or beasts of burthen. A great part of the external trade of the district is carried on through the port of Mangalore.

Bednore district, together with Cuddapah, some Mahratta provinces, the country of the Nairs, and other small states on the Malabar coast, were conquered by Hyder Ally in 1763, shortly after his usurpation of the musnud of Mysore; but on the fall of Tippoo the greater part of these conquests were again severed from Mysore. Bednore is still attached to the rajah's dominions, but that prince is under the protection of the East India Company, with whose government he has concluded a subsidiary treaty.

(Rennell's *Memoir of a Map of Hindustan*; Buchanan's *Journey through Mysore*; *Reports of Committee of House of Commons on the Affairs of India*, 1832.)

BEDNORE, the capital of the district just described, is situated in 13° 50′ N. lat., and 75° 6′ E. long. This town was originally called Biderhully, signifying Bamboo Village; but when the seat of government was removed hither from Ikery, the name was altered to Bideruru, or Bamboo Place. Previously to this event the place consisted of a temple dedicated to *Nilcunta* (one of the titles of Siva) and a few surrounding houses, governed by a Brahmin chief. On becoming the seat of the rajah's government, the chief part of the revenue of the country was expended there, and Bideruru became a town of magnitude. Its situation is favourable for trade, the pass leading from Mangalore through Bednore being one of the best roads in the Western Ghauts. When attacked and taken by Hyder Ally in 1763, it is said to have contained 20,000 good houses, besides meaner dwellings. The ground on which it stands being very uneven, the town was never closely built, and it occupied an area, the circumference of which was eight miles. The place was defended by a circle of woods, hills, and fortified defiles. Towards the centre stood the rajah's palace, built on a high hill, and surrounded by a citadel. Hyder added some new works, but as the palace was commanded by some neighbouring hills, it could never have been capable of offering much resistance. While in the possession of Hyder he made it his chief arsenal, and employed many people in making arms and ammunition: much money was coined there during his reign. This chief also held out much encouragement to merchants, so that the trade of the place increased greatly. He likewise attempted to introduce the cultivation of silk, and caused many mulberry plantations to be made, but with little or no success, owing, probably, to the dampness of the climate.

When the town was taken by Hyder Ally, he found in it a considerable amount of treasure, and is said to have confessed that to this acquisition he was in a great measure indebted for his future success. Colonel Wilks has estimated the spoil which then fell into the conqueror's hands at twelve millions sterling, but this is doubtless a great exaggeration, and seems to partake of the nature of eastern hyperbole. Hyder changed the name of the town to Hyder-nuggur: he built a palace outside the citadel, and resided in it for three years.

In the beginning of 1783 the town was taken by the English, under General Mathews, on which occasion the commandant of the fort, to make a show of offering an obstinate resistance, burnt the palace. The attack made upon Bednore by Tippoo Sultan in the month of April following, appears to have taken the English quite by surprise. It is said that nearly all the British troops were at that time dispersed in every direction in search of spoil, and Tippoo made an easy conquest. The whole town was burnt during an engagement which preceded the capitulation.

The palace was rebuilt by Tippoo, and the town was partly restored; but the materials employed, being only timber and mud, could not be expected to last long in a country where the rains are so excessive. At his death the town contained about 1500 houses, and some additions have been made to it since that time. No manufactures are carried on here, and the chief support of the place is from trade, for which it is well situated.

Bednore is 452 miles from Bombay, 1290 from Calcutta, 413 from Hyderabad, 445 from Madras, 382 from Poonah, and 187 from Seringapatam, all travelling distances.

(Rennell's *Memoir of a Map of Hindustan*; Mill's *History of British India*; Wilks's *History of the South of India*; Buchanan's (Hamilton) *Journey through Mysore, Canara, and Malabar.*)

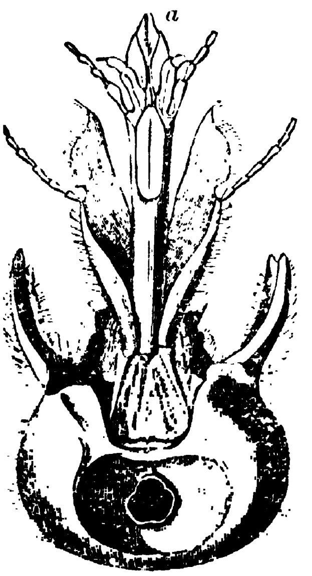
BEDSTRAW. [See GALINUS.]

BEDUINS. [See ARABIA.]

BEE, the name common to all the species of a very numerous tribe of insects of the Order *Hymenoptera.*

In England alone about two hundred and fifty species have been discovered. Kirby, in his beautiful monograph, "Apum Angliæ," divides them into two great groups—*Apis* and *Melitta*, which differ principally in the proboscis. In *Apis* the tongue (fig. 3, *c*), or central part of the proboscis, is generally long, and the proboscis itself has two joints, one near the base, and another about the middle; that at the base directing it outwards, and that in the middle directing it inwards: when folded, the apex of the tongue points backwards. In *Melitta* the tongue (fig. 1, *a*) is short, and the proboscis has but one fold, which is near the base; and when folded, the apex of the tongue points forwards. These two groups are also subdivided by Kirby, and the character of each subdivision is given in detail; but he did not think proper to give names to these smaller groups. It has, however, since been thought necessary to consider the smaller groups as genera; and hence they have all been named, the greater portion of them by Latreille. When the smaller groups were considered genera, the greater ones became families, and are named *Apidæ* and *Andrænidæ* by Dr. Leach.

Fig. 1.



The under side of the Head of one of the Andrænidæ (Melitta, Kirby), showing the proboscis. *a*, the tongue

The species of Andrænidæ, which are very abundant during the spring months, frequent grassy banks; the males are generally seen flying about hedges. The females usually construct their nests underground; for which purpose they generally select a bank in a southern aspect: some species choose sandy situations, while others prefer a heavier soil. The female having fixed upon a convenient spot, excavates a cylindrical hole, from five or six inches to a foot in depth, and only just large enough to allow her to enter; at the bottom it is slightly increased in width, and rendered smooth by being lined with a glutinous substance. The labour of forming these cells is considerable, for the soil is removed grain by grain, and deposited round the entrance of the hole, so that a little hillock is formed. The cell being completed, her next object is to furnish it with pollen; this is collected from flowers, and carried on the tibiæ of the hinder legs, which are thickly furnished with tolerably long hair, among which the pollen is carried until she arrives at the cell. When a sufficient quantity of pollen is collected, and made into a kind of paste by the addition of a portion of honey, it is formed into a little ball, in which an egg is deposited; the mouth of the cell is then carefully closed, to prevent the entrance of other insects. The egg soon hatches, and becomes a larva, which feeds upon the pollen until it is all consumed; the larva then turns to a pupa, and the pupa to the perfect insect. It is remarkable that the *Andrænidæ* seldom make their appearance after the spring months and early part of the summer, although the eggs laid at that time have undergone all their metamorphoses (in many instances) by the autumn. The newly-disclosed insect remains all the intermediate time in a torpid state. We believe that the species only live one year, for in the autumn we have found many of them on the ground dead, and the inner part of their body devoured: this is probably done by a spider which is found in the same situations.

The habits of the species of *Apidæ* are more variable; many excavate their cells in wood; some, like the cuckoo, make use of the nests of other species; others again do not excavate cells, but make use of any hole already formed, or of some other situation, convenient for that purpose. Of this last description, a species of the genus *Anthidium* has afforded a remarkable instance. This bee is nearly the size of the hive-bee, but is broader in proportion, and is easily distinguished from all the hitherto-discovered British species, by having a series of bright yellow spots on each side of the abdomen. A female of this species has been known to build her nest in the lock of a garden gate. The nest consists of a number of cells formed of down collected from the anemone sylvestris, and probably from other woolly-leaved plants, scraped off by the bee with its jaws.

The flight of this insect is exceedingly swift; but when it has discovered a flower on which it intends to settle (generally that of the blind nettle), it stops suddenly, poises itself in the air for a few seconds, and then darts upon the flower, dislodging any bee which may have settled upon it before.

Sometimes it appears more anxious to dislodge other bees, and to prevent their gathering honey, than to collect for itself, for it flies about from flower to flower, and pounces upon all it meets with.

Anthophora retusa is another bee, which, in its flight, very much resembles the one just described. This bee is considerably larger than the hive-bee: the male is brown, sometimes inclining to an ochre colour, and is remarkable for the three long tufts of hair which are attached to the middle leg, two of them to the tip of the tibiæ (that on the posterior part being very long), and another to the tip of the tarsus. The female of this species is so much unlike the male, that it has been thought by many to be a distinct species. It is entirely black, except the outer side of the hinder tibiæ, which is covered with red hairs: it is without the tufts on the intermediate leg. This species constructs its cells in the sides of banks, generally choosing those which are perpendicular.

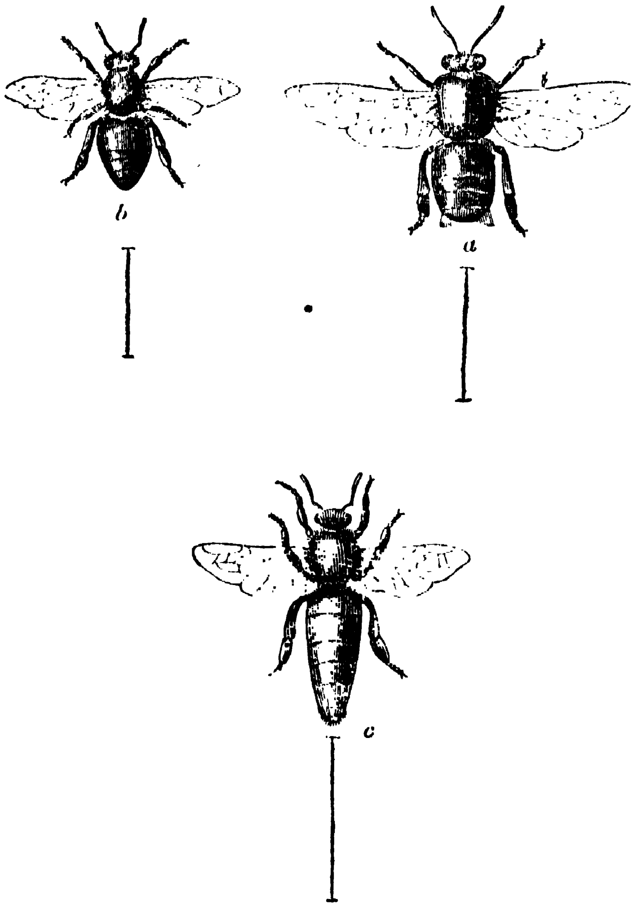
It is to this same family that the hive-bee belongs, to the history and economy of which we shall confine ourselves.

The *Apis mellifica*, hive-bee, or honey-bee, has for many ages justly claimed the attention and study of naturalists. Among the earliest of its observers may be enumerated Aristotle and Virgil; also Aristomachus of Soli in Cilicia, and Philiscus the Thasian. Aristomachus, we are told by Pliny, attended solely to bees for fifty-eight years; and Philiscus, it is said, spent the whole of his time in forests, investigating their habits. (Plin. xi. 9.) Both these observers wrote on the bee. In modern times the labours of Swammerdam, Réaumur, Bonnet, Schirach, Thorley, Hunter, Huber, and others, have added greatly to our knowledge of this interesting species.

The honey-bee always lives in society with many of its own species. In its natural state it generally constructs its nest in hollow trees; but throughout Europe it is now rather a rare occurrence to find it otherwise than domesticated.

Each society or swarm is composed of three descriptions of bees—the male or drone, the neuter or worker, and the female or queen.

Fig. 2.



The three descriptions of Bees of a hive. *a*, the Male or Drone; *b*, the Neuter or Worker; *c*, the Female or Queen.—The lines denote the natural length of each.

The Drone, or Male Bee, in general form, is almost cylindrical, the separation between the thorax and abdomen being much less distinct than in the females or neuters. The head is large, rather narrower than the thorax: the eyes are very large, and meet at the vertex of the head, but divide as they approach the forehead; close to the point of separation there are three stemmata. The antennæ are thirteen-jointed. The thorax is thickly covered above and beneath with short pale brown hairs resembling velvet. The length of the abdomen is scarcely greater than its breadth, and it is terminated obtusely: it has only four segments visible from the upper side, the anal segments being hidden beneath the others. The basal and apical segments are each thickly covered with pale hairs. The colour of the abdomen is black above, having the edge of each segment of a light brown colour; the underside of the body is also pale. The legs are black; the inner side of the hinder legs is covered with pale down. All the claws are divided, the inner part being nearly equal in length to the outer part. The wings are large, and rather longer than the body; the anterior wings are rather acute at the apex.

The drone may be readily distinguished from the queen and workers by its greater breadth, large eyes (which meet at the top of the head), and the abdomen having only four segments visible from the upper side. The wings are much longer in proportion than those of the worker or queen, for in this sex they reach beyond the extremity of the abdomen.

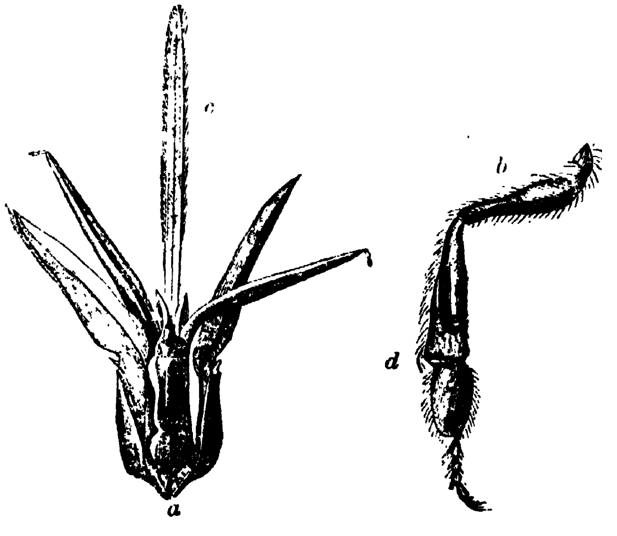
The number of drones in a hive is remarkably irregular, varying from six or seven hundred to two thousand; but the proportion is not regulated by the number of bees contained in the hive, for a small swarm will sometimes possess as many drones as a large one.

The time required to complete the metamorphosis of the drone is as follows. In three days after the deposition of the egg, the larva makes its appearance: about the middle of the seventh day from this time, the larva having then arrived at its full growth, spins its cocoon, a silken substance with which it lines the interior of its cell: this is accomplished in about a day and a half. It then turns to the pupa, and ultimately to the perfect insect, having been about four-and-twenty days from the laying of the egg to the coming forth in the winged state.

The Neuter, or *Worker*, is of a dark-brown colour, approaching to black: the head and thorax resemble those of the female, but the head has black hair on the vertex. The abdomen is conical, and composed of six distinct segments: the basal one is thickly covered with hair, the other segments are sparingly clothed. The legs are black: the plantæ of the hinder legs are transversely striated on the inner side. The wings when closed nearly reach to the apex of the abdomen.

In about four days after the egg of the worker has been deposited, the larva is hatched, and in five or six more (according to the weather) it is full grown; it is then sealed up in its cell by the nurse bees with a covering of farina mixed with wax. As soon as the larva is inclosed it spins its cocoon, which operation requires about thirty-six hours: it then turns to the pupa, and in about eight days more to the perfect insect; having been one-and-twenty days in existence, that is, from the time the egg was laid until the insect has attained its perfect state. The number of workers in a well-stocked hive is about fifteen or twenty thousand. The occupation of these bees is to collect honey, pollen, and propolis; to build the combs, and to attend upon the young.

Fig. 3.



a, the proboscis of the hive-bee; *c*, the tongue; *b*, the hinder leg of the worker-bee; *d*, the part on which the pollen is carried.

Honey is collected by means of the proboscis. To a common observer this instrument appears to be a single tube, through which it is thought the honey is conveyed to the stomach by suction; but if we examine the proboscis through a lens of very moderate power, we find that it is composed of five very distinct parts, a central stalk and four lateral ones, two on each side. The central part is that which is principally used in collecting honey: this part is not perforated, but is a flat cartilaginous substance, and is used as a tongue in lapping up the honey, which is then conveyed to the pharynx, and is afterwards disgorged into the cells of the comb, part being used for the purpose of feeding the young, and the remainder stored up for the winter's consumption.

Pollen is collected from the antheræ of flowers, and is carried on the outer surface of the tibiæ, or middle joint of the hinder leg: this part of the leg is very broad: on one side it is concave, and furnished with a series of strong curved hairs on its margins, forming a natural basket admirably adapted to the purpose for which it is used. This substance mixed with honey forms the food of the larvæ, for which purpose alone it is collected.

In many instances it is only by the bees travelling from flower to flower that the pollen or farina is carried from the male to the female flowers, without which they would not fructify. One species of bee would not be sufficient to fructify all the various sorts of flowers, were the bees of that species ever so numerous, for it requires species of different sizes and different constructions. 'M. Sprengel found, that not only are insects indispensable in fructifying different species of iris, but that some of them, as *I. Xiphium*, require the agency of the larger humble bees, which alone are strong enough to force their way beneath the stile flag; and hence, as these insects are not so common as many others, this iris is often barren, or bears imperfect seeds.'

Propolis is a resinous unctuous substance, of a reddish colour, and is collected from the buds of trees: it is not only used in lining the cells of a new comb, but it is sometimes kneaded with wax and used in rebuilding weak parts. It is also used in stopping all the crevices in the interior of a hive. The workers which arrive laden with this substance are relieved of their burthen by others; these in their turn distribute it among many, who employ it for the purposes above-mentioned.

Nature has provided checks to prevent the too rapid increase of the various species of insects. Among those of the hive-bee, the hornet and wasp, and two or three species of moths, commit great devastation. Wasps frequently take possession of a hive, and after destroying, or causing their weaker neighbours to desert the hive, consume all the honey it contains, and sometimes even construct their own nests in the hive.

Acherontia atropos, or the death's-head hawk-moth, which is almost as large as our common bat, sometimes makes its way into hives, and consumes much of the bees' stores. This insect has the power of emitting a peculiar sound, not unlike that of the queen-bee: this sound is supposed to have the same effect (that of rendering the workers motionless) as that emitted by the queen.

Two other moths commit great devastation in hives: these are small species (*Galleria alvearia*, and *G. melonella*— the honey-moth, and the honeycomb-moth), which, in spite of the guards constantly kept at the entrance of hives, gain admittance, and deposit their eggs in the combs. The larvæ hatched from these eggs form passages through the comb in all directions, spinning a silken tube as they proceed, which it appears is too strong for the bees to destroy, and of course they cannot sting the larvæ. These larvæ generally oblige the bees to desert the hive after a short time.

In attending upon the young the labour of the workers appears to be divided: a certain number always remain brooding over the cells and feeding them, while others are employed in collecting honey. It is these last that are the principal secreters of wax, and are called wax-workers: the former are called nurse-bees.

The *Queen-bee* is of a dark-brown colour: the head is thickly furnished with yellow hairs, except on the forehead, where the hair is nearly black; on the vertex there are three small convex simple eyes, or stemmata. The antennæ are yellow beneath and brown above, and composed of twelve joints, the basal joint is more than one-third of the whole length, the remaining joints are bent forwards, and at an angle with the first. The thorax is covered with pale-brown hairs. The abdomen is the shape of an elongated cone and nearly smooth, exhibiting six distinct segments above: the under side of the body and the base of each segment above are of a paler colour than the remaining parts. The legs are of a brownish yellow: the femora and tibiæ of the anterior, and the base of the femora of the posterior legs are brown. All the claws of the tarsi are divided, the inner division being much shorter than the outer one. The wings are short and small in proportion, scarcely reaching more than half the length of the abdomen.

This sex is furnished with a bent sting; in the neuter the sting is straight; the male has no sting. The queen-bee resembles the worker in the shape of the head and thorax; but the great length of the abdomen and the paler colour of the legs and antennæ are its chief distinguishing characteristics. There is but one queen in a hive, who is treated with the greatest attention by all the other bees. It might be wondered how they can distinguish the queen from any other bee, the interior of the hive being quite dark: in this the antennæ are their sole guide, for if the workers be prevented touching her occasionally with the antennæ they proceed as if she were lost. This has been satisfactorily proved by some ingenious experiments by Huber. If by accident the queen be killed, or if she die, her dead body is still treated with attention, and, for a time, even preferred to any other queen.

The queen being accidentally or intentionally removed from a hive, her absence is soon discovered and great disorder follows: but this is only temporary, for in a few hours preparation is made to replace her loss. The larvæ of neuters from two to three days old are selected for this purpose: the cells containing them are each enlarged by sacrificing three adjoining cells, and in this space the workers build a cylindrical tube which surrounds the young larvæ, which are then supplied with the same food as that given to the ordinary royal larvæ, and which is more pungent than that given to common larvæ. In about three days time a perpendicular tube is constructed and joined to the mouth of the cell just described; into this the larva gradually makes its way, moving in a spiral direction. It then remains two days in a perpendicular position, the head being downwards, after which it turns to the pupa and then to a queen. As several hatch nearly at the same time, the strongest stings the others to death, and becomes ruler of the hive. From this it is evident that the worker-bees are imperfect females, requiring only a slight difference of treatment in the larva state to become queens or fertile females.

If the queen be removed from a hive, and a stranger be immediately introduced, she is surrounded and kept prisoner until she dies of hunger: for the workers never sting a queen. If, however, eighteen hours have elapsed since the loss of the former queen, the stranger is better received, for although she is at first surrounded, she is ultimately set at liberty, and treated with all the usual attention; but if four-and-twenty hours have elapsed before the strange queen be introduced, she is at once admitted to the sovereignty of the hive.

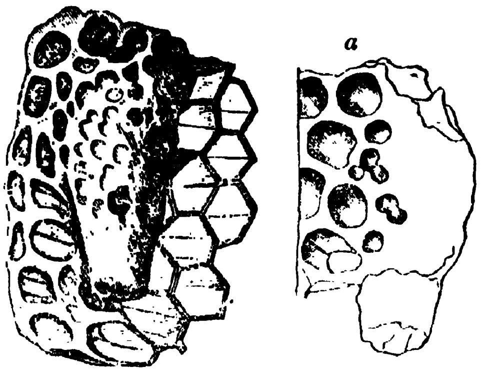
While the queen remains in a hive, the introduction of a strange queen will occasion a disturbance, somewhat similar to that which takes place when two or three young queens escape from their cells at the same time: both the stranger and the reigning queen are surrounded by the workers, and the escape of either being thus prevented, they are soon brought into contact. A battle ensues, which ends in the death of one of them, and the other then becomes ruler of the hive.

The sole occupation of the queen is to lay eggs in the various cells prepared by the workers for that purpose, for she takes no care of the young herself. Until she is about eleven months old, the eggs laid are nearly all such as will turn to workers, but at the completion of that period, which most frequently happens in the spring time, the queen commences the great laying of the eggs of males; at this time the queen will lay from two to three thousand eggs, sometimes from forty to fifty a day being laid during the months of March and April. There is also another laying of the eggs of males in the autumn, but this is not so considerable. In the interval, the eggs of workers are almost exclusively laid.

There seems to be a relation between the laying of the eggs of males and the construction of royal cells, for the workers always commence the construction of the latter, at the time that the female is laying the eggs that are to turn to drones.

The royal cells are very different from those of the male or worker, and are generally suspended from the edges or sides of the comb: their number varies from two or three to twenty, though the latter is a very unusual number. In form they are very much like a pear, having the thickest end joined to the comb, the other end, at which part the mouth or entrance of the cell is situated, hanging downwards.

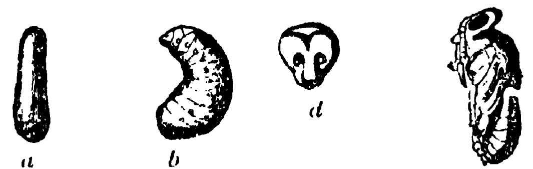
Fig. 4.



The queen's cell; *a*, side view of the same.

In these cells the queen deposits the eggs of future queens, at intervals of at least a day, and always during the period of laying the eggs of males. When the queen is about to lay, she thrusts her head into a cell to ascertain its fitness; she then inserts her abdomen, and in a few seconds withdraws it, leaving an egg at the bottom of the cell fixed in an upright position by a glutinous substance at one of its ends.

Fig. 5.



a, the egg; *b*, the larva; *c*, the pupa of the worker-bee; and *d*, the head of the larva magnified.

The egg is about one-twelfth of an inch long, and of a cylindrical form, with rounded ends. When the larva emerges from the egg, it is immediately supplied with food by the nurse-bees. This larva may be seen lying in a curved position at the bottom of the cell, where it continues to grow until it has completely filled up the space; when it is full grown it lies horizontally with its head towards the entrance. The food given to the larva is a mixture of farina, honey and water, which is converted into a whitish jelly by elaboration in the stomachs of the nurse-bees: the proportions of farina and honey vary according to the age of the young, and we believe that the food is not given directly to the larva, but disgorged into the cell, so that the insect is surrounded with it. But when the larva is nearly full grown, its food is sweeter (probably containing a greater proportion of honey), and is applied by the nurse-bees directly to its mouth, somewhat in the manner of a bird feeding its young.*

The drone and worker-bees are of a greyish colour when they first leave their cells, and several days elapse before they are strong enough to fly; but the queen is kept prisoner in her cell for some time after she has assumed the imago state. The reasons for this imprisonment we shall presently show.

When the larvæ in the queens' cells are about to change into pupæ, the old queen begins to exhibit signs of agitation—running carelessly over the cells, occasionally thrusting her abdomen into some of them, as if about to lay, but withdrawing without having done so, or perhaps laying them on the side of the cell instead of at the bottom. She is no longer surrounded by her usual circle of attendants, and her agitation being communicated to all she passes, at length a general confusion is created; till at last the greater portion of the bees rush out of the hive, with that queen at their head. It is thus that the first swarm quits the hive, and it is invariably conducted by the old queen.

At any other time the queen would have been unable to fly, the great number of eggs contained in her abdomen rendering her too heavy: this however is sufficiently reduced after the great laying just described, to enable her to fly with ease.

An unerring instinct obliges the queen to leave the hive at this time, for two sovereigns never can co-exist in the same community; and had she not left it, the young queens (now just about to quit their cells) would inevitably have been killed by her. Let us now observe what is going on in the hive which has just been deserted by its queen. It would seem as if it were too much reduced by the departure of the swarm; but it must be borne in mind that this event never occurs except in the middle of the day, and during very fine sunny weather, when a large portion of the bees are abroad gathering honey and pollen; and if the hive contain a numerous colony, these, on their return, together with those which have not been disturbed during the general confusion, and a considerable number of young brood continually hatching, form a sufficient stock, and perhaps even enough to send off another swarm.

In two or three days' time from the leaving of the first swarm, perfect order is restored in the hive; and the nurse-bees continue to attend upon the young, carefully watching the queen's cells, and working at the outsides by removing the wax from the surface. It is said that the wax is removed in order to facilitate the exit of the young queen; but although the removal of it may thus be of service, we are not inclined to think it is done for that purpose.

The eggs are laid in the royal cells at intervals of at least a day, and it consequently follows that the completion and closing of these cells must take place at different times we say completion, for at the time the queen lays the eggs the cells are only half formed, and resemble the cup of an acorn. When the cells have been closed about seven days, the young queen cuts away with her jaws the part of the silken covering at the mouth of the cell, and, if permitted, would make her escape; but the bees guarding the cells solder the covering with some particles of wax, and keep her prisoner about two days, in which time she obtains sufficient strength to be able to fly immediately on quitting her prison. It is difficult to imagine by what means the bees guarding the royal cells can judge of the fitness of the enclosed female for liberation. The most probable conjecture is, that they judge by the quality of the sound emitted by the prisoner at this time. This sound consists of a number of monotonous notes, so rapidly repeated as almost to appear one continuous sound. The sound is produced by the vibration of the wings, and probably becomes sharper and more audible as the bee acquires strength.

The young queen upon being liberated immediately approaches the remaining royal cells, and would destroy their contents, by tearing them open and mortally wounding her rivals with her sting; but this is not permitted—for so long as there is a sufficient number of guards, they bite and drive her away. She has the power, however, of arresting this ill-treatment for a while, by emitting a peculiar sound, which has such an effect on the sentinels that they remain motionless; and she sometimes takes advantage of this, to make an attack upon the royal cells. But as the sound ceases when she moves, the charm is dissolved, her guards recover their power, and she is again driven back.

After a time, the young queen, owing to her strong desire to attack the royal cells, and the constant repulses she meets with, becomes extremely agitated, and by running quickly over the cells and groups of workers, communicates her disorder to a great portion of the bees, so that a large number quit the hive and cluster about the outside—and after a short time the young queen leaves the hive with a swarm. Thus it is that the second swarm is thrown off. It seldom happens that a hive sends off more than two or three swarms; after which, unless the hive be an extremely populous one, there are so few bees left, that there is not a sufficient number to keep proper guard over the royal cells. The young queens consequently make their escape, two or three at a time, in which case a contest takes place between them, and the strongest remains queen of the hive, after destroying all the royal larvæ and pupæ that remain.

---

* We have fed the larvæ of wasps (which are very closely allied to the hive-bee in habits) by means of a little piece of paper screwed to a point, and dipped into some sugar and water; they immediately opened their mouths on being touched, and sucked the sugar from the paper. The neuter-wasps touch the larvæ with their antennæ, upon which, if the larvæ require food, they immediately open their mouth and are supplied from the tongue of the wasp.

But if the hive be an unusually populous one, there may be four or five swarms sent off, all accompanied by the same circumstances as those just related. In case a hive is poorly stocked at the time of the great laying of male eggs, no royal cells are built, and consequently no swarms leave. After the swarming, a general massacre of the drones takes place: these defenceless individuals (for the male has no sting) are stung to death by the neuters.

When a swarm quits a hive, it usually clusters on a tree or bush in the neighbourhood, and if it be not hived it will shortly leave this situation, and take possession of an old tree or part of an old building. It is said that bees send out scouts before leaving the hive, to search for a convenient situation for their new abode, and that they may be seen going backwards and forwards to the spot fixed upon, some little time before the swarm departs. The clustering of the swarm probably proceeds from a desire in the bees to be congregated together prior to their last flight. As soon as the bees have taken possession of a new abode, or have been hived, they commence building the comb.

It has been stated that the first swarm is always conducted by an old queen, and the following swarms by the young queens as they are successively hatched. The latter are in a virgin state, but not so the former, nor do these require farther intercourse with the male. About two or three days after quitting her cell, and the fifth day of her existence in the winged state, the young queen quits the hive, and after reconnoitring its exterior, and making herself acquainted with its situation, by flying from it and returning several times, she then soars high in the air, forming spiral circles as she ascends. This ascent is generally preceded by a flight of drones, and it is at this time (whilst on the wing) that the sexual intercourse takes place. The queen is never observed to quit the hive but at this time; and hence it is supposed that this one intercourse is sufficient to fertilize all the eggs she may ever lay. Huber decidedly ascertained that it was sufficient for two years. We think it very improbable that a queen would live much beyond that time. In about six and forty hours after the intercourse with the male has taken place, at which time a part of the comb would be constructed in the new hive, the queen commences laying her eggs; those first deposited being such as will turn to workers, as before described.

The construction of the Comb.—In the *Introduction to British Entomology* by Kirby and Spence, after referring to the various accounts of antient and modern writers on this subject, it is observed, 'still the construction of the comb of the bee-hive is a miracle which overwhelms our faculties.' John Hunter, who was the first to discover the true origin of wax, imagined that the waxen scales (which we shall hereafter mention) bore some proportion to the different parts of the cells, in the formation of which they were used, and thus furnished a guide to their construction. Some naturalists have conjectured that the antennæ, mandibles, and other parts of the body were used to measure the work, and from this they have endeavoured to account for the accuracy of their proceedings. The latter conjecture appears incompatible with instinct; while the well-authenticated mode of proceeding in the construction of the comb throws great doubt on the former.

Upon examination of various combs, the partitions between all the ordinary cells (both at the sides and bottoms) are found to be exactly the same in thickness, and the cells hexagonal with angular bottoms. Exceptions to this general rule are occasionally found, and it is by observing these exceptions with attention—by observing the various modifications of the work under extraordinary circumstances, that some idea of the principles which guide the bee in its operations may be formed. The royal cell is a remarkable exception; its form we have already described. In the original construction of this cell, a profusion of material is always disposed of, particularly at the junction of the cell with the comb. The extra quantity of wax in this part, and on the surface of the cell (which is also unusually thick) is, however, soon reduced by numerous circular excavations, the depth of which varies according to that of the wax, and in the mass nearest the comb they actually become cells, though, in most instances, unfit for use. These cells are invariably cylindrical, with concave bottoms, except they come in contact with others, in which case the wax is always removed from the interstices thus formed, either at the sides or at the bottoms; and the partitions are thus reduced to the same thickness as those between the cells constructed in the ordinary way. Hence we frequently find, in these parts, cells with one side circular and the other angular; the situation of the angles being invariably determined by the position of those cells with which they are in contact.

To work in circles or segments of circles appears most compatible with animal mechanism acted upon by instinct, for we observe that the works of almost all insects (perhaps we may say almost all animals) proceed in circles or segments of circles. The cells of almost all the various species of bees are of this construction, and we find that, under peculiar circumstances, those of the hive-bee are so likewise, as in the case of the queen's cell, and in some of those cells close to it, and sometimes in other parts of the comb, in cases where an accident has been repaired.

If some hive-bees could be made to work in a large solid mass of wax, the first cell formed would most probably be cylindrical, with a hollow circular bottom; this would also be the form of the following cells unless they came in contact with each other; and, in this case, supposing the circumferences of three cylinders were to touch, the bees working in each of these cylinders would cut away the wax at *a*, *a*, *a* (fig. 7). But supposing the wax block were excavated on one of its sides, into the greatest number of equal-sized cylinders that it would admit of, it would then follow that each cylinder would be surrounded by six others, this being the only number of equal-sized circles which may be placed round one of the same magnitude: by the same rule of removing the wax from the interstices, each of these cylinders would become hexagons. Again, supposing this block to be a flat mass of equal thickness in all parts (the ordinary thickness of a comb), this block being cut into cylinders of equal diameter on both sides, and the base of each cylinder being exactly over parts of three opposing ones (as represented below), when the wax is cut away at the interstices, as at the sides, it follows that the bottoms of the cells will be each composed of three equal rhombus-shaped pieces. Hence we have cells exactly like those of the hive-bee, but not constructed in the ordinary way, though upon such principles as analogy points out (a circular form being the basis of the work*), and in such a way as we have observed they do occasionally proceed.

Fig. 7.

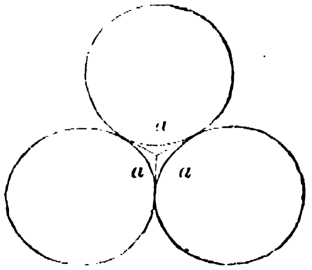


Fig. 8.

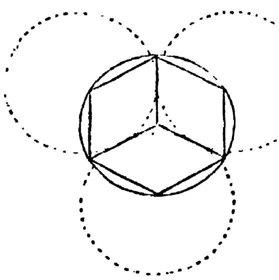


Let us now examine the construction of the comb in its usual way of proceeding:—

The first operation is the formation of wax: this is not, as many have supposed, the farina collected from flowers, but is secreted by the insect at the time of building the combs. For this purpose the wax-workers suspend themselves in festoons from the top of the hive. Those which first reach the top fix themselves by the claws of the fore-legs to the roof, and are followed by others which attach themselves to them, until an inverted cone or festoon of bees is formed, each end of which is attached to the roof of the hive. Before the commencement of the new comb, the interior of a hive presents a series of festoons of this description, intersecting each other in all directions, the bees remaining in perfect repose.

---

* If we allow that the basis of the work of the hive-bee be circular, the royal cell forms no exception to the general rule, so far as the principle of its construction is concerned.

At this time the wax is secreted and makes its appearance in little scales which exude between the segments on the under side of the abdomen, eight scales being visible in each bee. The wax being secreted, one of the bees commences the comb; having detached itself from the festoon, it makes its way to the roof of the hive, and after clearing a space by driving away the other bees, it detaches one of the scales from the abdomen by means of its hinder legs: this is then conveyed by the fore-legs to the mouth, where it is masticated, and impregnated with a frothy liquid by the tongue, in which process it obtains a whiteness and opacity which it did not before possess. The particles of wax are then applied to the roof of the hive. Another scale undergoes the same process, and is attached to the first. The bee thus continues labouring until all its scales are disposed of; it then quits its situation and is followed by another bee, which proceeds with its scales in the work already begun, depositing the wax in a straight line with the former deposition. The same operation is performed by many other bees, until a considerable block is deposited. This block is generally about five or six lines* long, the height two lines, and the thickness half a line; and it is upon this that the formation of the cells commences.

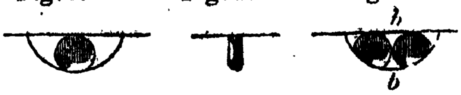
We have seen that the foundation of the block is the work of one bee, so likewise is the commencement of the cells;—the former is the work of what is called the wax-workers, which, we are informed by Huber, do not possess the power of sculpturing the cells:—the cells are made by the sculpturer-bees, who are smaller than the wax-workers. No sooner is the block large enough to admit a sculpturer-bee between the wax-workers, than the excavation commences There seems to be an instinctive desire to perform the work of excavation wherever there is room, even though there may not be sufficient to form a perfect cell; for we never observe a solid piece of wax in any part of a comb. On the contrary, if by any accident there has been space unoccupied by cells, we find that the wax has been excavated at that part as much as was practicable.

The bee, impelled by instinct to deposit wax and to excavate, and also guided by an acute sense of feeling in the antennæ (probably through the elasticity of the wax), as to the degree to which the excavation should proceed, forms the comb; and in so doing it seems to act, not from choice, but from a necessity imposed upon it by two antagonist principles, one causing it to deposit and excavate wax, and the other acting through the antennæ, and limiting the degree of excavation.

It is to this desire for performing the work of excavation that we attribute the small excavations about the royal cells, which are said to be for the purpose of facilitating the exit of the young queen. If the wax were removed for that purpose, we do not see why the operation should not be confined to that part through which she makes her escape. On the other hand, if from the wax of the royal cells being thicker than it is in other parts of the comb, the workers are induced to make excavations, and desist only upon the thickness being reduced to that of the ordinary partitions, it follows that it will at last become uniformly thin, as described by Huber; the reason here given differing from Huber's, but we think more in accordance with the habits and economy of the animal.

In forming the cells, a hollow is first excavated on one side of the wax block; this excavation is rather less than the width of a cell, and is immediately followed by two of a similar description on the opposite side of the block. The particles of wax removed in excavation are kneaded by the jaws of the bee and deposited on the edges of the intended cells; the two latter excavations (*b*, *b*, *fig.* 13) are necessarily on each side of the first (*a*, *fig.* 13), though close to it. In placing the two last-mentioned cells, the bees avoid the opposite part on account of the thinness of the wax, and the size of the wax-block will not admit of their being remote from the first.

Fig. 9. *Fig.* 10. *Fig.* 11.



Front. Side. Back view.

The front, side, and back views of the block on which the first excavations for the cells are made.

Fig. 12.

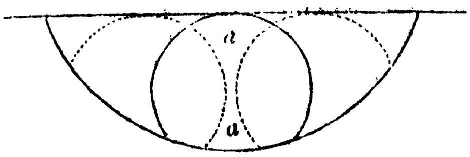


Fig. 13.

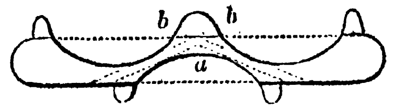

Fig. 12, Front view magnified. Fig. 13, Transverse section through the same.

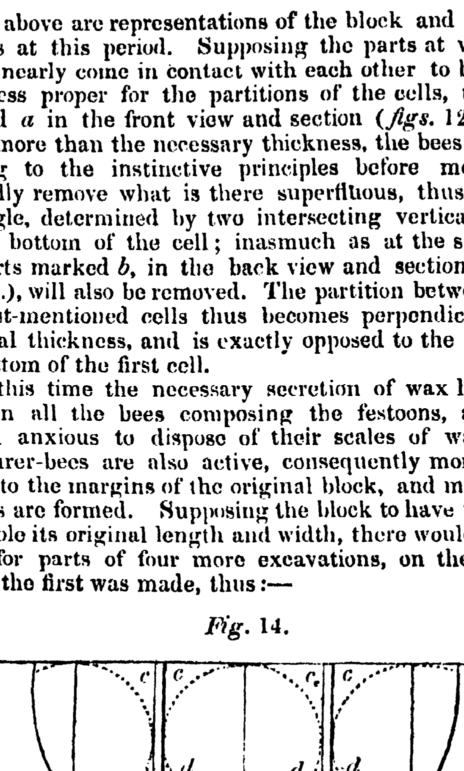
The above are representations of the block and its excavations at this period. Supposing the parts at which the circles nearly come in contact with each other to be of the thickness proper for the partitions of the cells, the parts marked *a* in the front view and section (*figs.* 12 and 13) being more than the necessary thickness, the bees will (according to the instinctive principles before mentioned) naturally remove what is there superfluous, thus forming an angle, determined by two intersecting vertical planes, at the bottom of the cell; inasmuch as at the same time the parts marked *b*, in the back view and section (*figs.* 11 and 13.), will also be removed. The partition between these two last-mentioned cells thus becomes perpendicular and of equal thickness, and is exactly opposed to the angle at the bottom of the first cell.

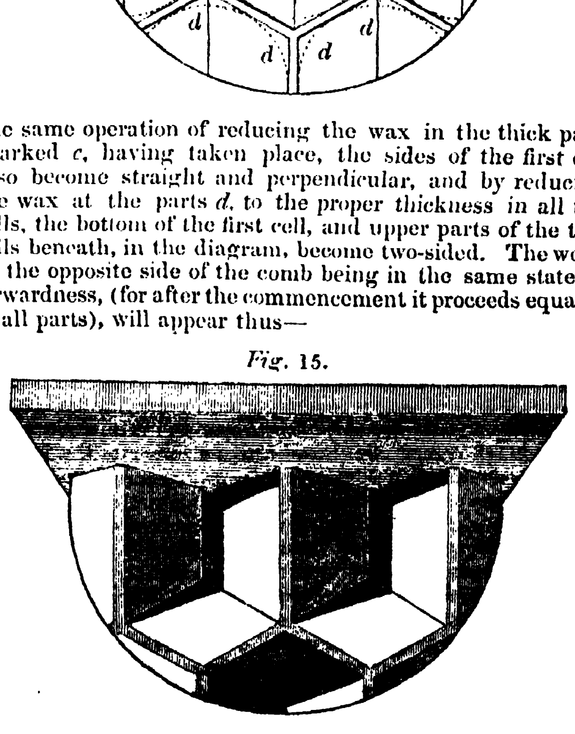
By this time the necessary secretion of wax has taken place in all the bees composing the festoons, and they are all anxious to dispose of their scales of wax. The sculpturer-bees are also active, consequently more wax is added to the margins of the original block, and more excavations are formed. Supposing the block to have increased to double its original length and width, there would then be room for parts of four more excavations, on the side on which the first was made, thus:—

Fig. 14.



the same operation of reducing the wax in the thick parts marked *c*, having taken place, the sides of the first cell also become straight and perpendicular, and by reducing the wax at the parts *d*, to the proper thickness in all the cells, the bottom of the first cell, and upper parts of the two cells beneath, in the diagram, become two-sided. The work on the opposite side of the comb being in the same state of forwardness, (for after the commencement it proceeds equally at all parts), will appear thus—

Fig. 15.



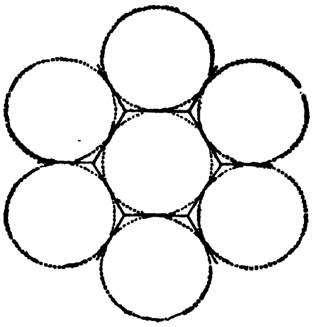
---

* A line is the twelfth of an inch.

In the above figure the angles at the bases of the cells are cut into the partitions of the opposing cells, and hence it is clearly seen that, from the position of those cells, the perpendicular partitions of the cells on this side must be longer than those of the other, and that the cells themselves must have three quadrilateral plates for their bases.

In carrying up the sides of the cell, the form is regulated by the intersection of the surrounding circles, as represented in *fig.* 16. But the circles described in *fig.* 16, parts of which are shown in most of the other figures, represent those which are *enclosed by the hexagons,* whereas we believe the natural circumference of each cell (supposing it to be cylindrical) is that *by which the hexagon is enclosed;* hence it will be necessary to imagine the circles partly intersecting each other.

Fig. 16.



It has now been demonstrated that the cells of the first tiers on each side are pentagonal; that the bases of those on one side are each composed of two plates, while those of the other side are each composed of three plates; and that, according to the laws laid down, they could not have been otherwise: now as this accords with all the accounts given of the proceedings in the construction of the comb, it seems to prove that the laws which we have laid down, as guiding their formation, are correct.

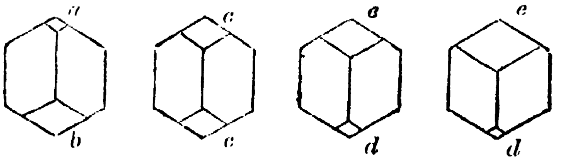
We have now followed the progress of the work until the commencement of the second tiers of cells: it is unnecessary to describe the formation of these and the following tiers. It is shown, that, according to certain laws, the first tiers of each side of the comb become pentagonal, and according to the same laws it is clear that the second and following tiers must become hexagonal; for the two sides forming the lower boundary of each cell of the first tier, also form the upper boundaries (or partitions) of two cells of the second tiers. As the upper part of the first tier is determined by the roof of the hive (represented by the horizontal line in diagram 14), so is the *upper portion* of the cells of the second tier determined by the *lower portion* of those of the first tier: thus, the upper portion of each cell of the second tiers being composed of two planes meeting at an angle, and the work continuing, as in the progress of the first tier, four more planes will be constructed to form the lower portion, and complete the hexagon. It is thus that all the ordinary cells of a comb are hexagonal, and we believe it is clearly shown that they could not be otherwise, according to the mode of proceeding in their construction. Their form depends entirely upon the commencement of the work, which necessarily throws the cells in such a position, that each cell must be surrounded by six others, and consequently have six sides, each side being the common partition of two cells; and, so long as the cells are of equal diameter, they must each be opposed to parts of three other cells on the opposite side of the comb, in such a way, that supposing the external surface of the bottom of each cell were hemispherical (which would be the case were the wax not removed from the interstices), each hemisphere would touch three others; but the wax *being removed* from the interstices and reduced to an equal thickness at all parts;—and the bases of the sides of a cell not being all in the same plane—the bottom of each cell is thus formed into three equal rhomboidal pieces in three different planes, the three angles at their junction being respectively the lowest parts, or the farthest removed from the mouth of the cell.

In working the cells, the wax is always found a little thicker on the edges, thus giving additional strength to them. It has been asserted that this extra thickness is added upon the completion of the cells; but as we have never observed a cell, even though in a state of progress, without it, we think the more probable conjecture is, that the bees, in working the sides of the cells, desist upon arriving near the top, and thus leave that part thick, as it is found to be.

The ordinary cells of a comb are of two sizes; those designed for the male larvæ being rather larger than those of the ordinary size in which the neuter larvæ are reared. The width of the former cells is about $3\frac{1}{3}$ lines, and that of the latter $2\frac{2}{5}$. A comb is always commenced with the small-sized cells. Hence, when the larger cells are constructed, instead of being opposed to three others, they encroach upon a fourth, and their bases are consequently composed of four plates instead of three: at first a minute lozenge-shaped piece is visible at the top of the basal part (*fig.* 17, *a*); this gradually increases in size as the one on the opposite side decreases, *fig.* 17, *b*.

When the full size of the cell is attained, the top and bottom pieces (*fig.* 17, *c*, *c*) are equal; but as soon as a sufficient number of the larger cells is formed, the lower lozenge gradually decreases while the upper one (*fig.* 17, *e*, *e*) increases in size, until there are but three plates again visible (*fig.* 17, *d*, *d*).

Fig. 17.



It is almost always found that the excavations for cells, formed by different insects, in whatever situations they may be, are exactly proportioned to their size. Hence it is extremely difficult to account for the enlargement of the cells of the bees, as just described. We will, however, venture an opinion, in hopes of calling attention to the subject.

In the former part of this account it has been stated, that no sooner is a portion of the comb finished than the queen deposits eggs in the various cells, and that the cells first formed are always those of the smaller size, which are excavated by what are termed the sculpturer-bees, or nurses, which are less than the wax-workers.

We imagine, that when the eggs hatch, the small bees, or nurses, are more particularly engaged in attending upon the young, and that the large-sized workers then commence the excavation of the cells themselves, and thus make cells of a larger diameter than those made by the nurses.

Huber states that the description of bees called wax-workers have not the power of sculpturing the cells: but at the same time he owns that he was unable to follow the proceedings in the construction of a comb for any considerable time after the commencement. During the time of his observations, however, he invariably found that the smaller bees were the sculpturers.

The interior of a hive consists of a number of combs arranged perpendicularly; these are fixed to the roof of the hive, and are parallel to each other, the space between them being about half an inch. When the first comb has advanced in size, so as to consist of two or three rows of cells, two other combs are commenced, one on each side of it; the work proceeding as in the first: these again are followed in their turn by two others. As the comb advances in size it assumes a form nearly circular, and is still joined to the roof of the hive only; the work proceeds by adding wax to the margin of the comb exactly at the junction of the opposing cells, and this is no sooner deposited than it is cut away and worked into cells. These cells are not equally deep throughout the comb, but their depth gradually decreases as they approach the margin: a comb in its progress has the form of a double convex lens.

The form of the comb, as above described, is that of a new one; but in the honey-storing season, the sides of the comb are joined to those of the hive, to give strength to hold the additional weight; the cells are also lengthened, so that the surface of the comb then becomes even. The cells are not quite horizontal, the orifice being generally a little higher than the base, most commonly four or five degrees, but sometimes considerably more. When a comb is first completed, it is of a dull white colour, and of a weak substance; it is however soon strengthened, by adding propolis to the margin of the cells, and lining their interior with threads of the same material.

The cells of a comb are used for the purposes of storing up honey for the winter, and in them the larvæ are reared. Pollen, or bee-bread, is also stored up in some of the cells. Many larvæ may be reared in the same cell, and as each spins a cocoon, or web, on its sides which is never cleared out, it thus becomes at last too contracted to contain larvæ; it is then used for one or both of the other purposes above mentioned. When a hive is well stored with combs having empty cells, the workers disgorge the honey into these receptacles; but in case cells are wanted, they retain the honey, and wax is secreted for the purpose of building more combs.

Honey is never consumed but in cases of the greatest necessity; but as soon as a cell is filled, it is sealed up with a waxen covering.

During the progress of a comb in building, the slightest interruption is likely to alter its form; and as the space between each is always kept exactly the same, it frequently happens that the whole of the combs are affected by any accident happening to one. *Fig.* 18 illustrates an instance of this sort, which we have seen—

Fig. 18.

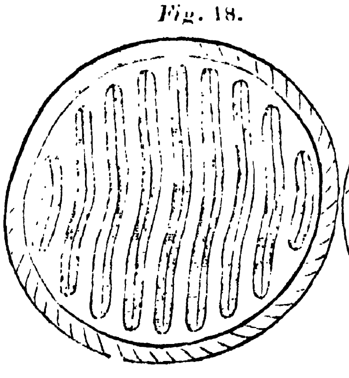


Fig. 19.

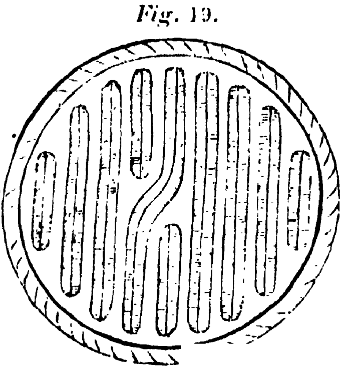


but it also frequently happens that an interruption in one comb is corrected in those that follow. A curious instance of this nature we have also observed. See *fig.* 19.

In both these instances the form of the comb was affected by a stick being placed across the middle of the hive, to enable the owner (as we believe) to remove the hive with less danger of the combs giving way.

The latter case is so ingenious, that at first it appears more like an operation of reason than instinct: it is nevertheless to be accounted for, upon the instinctive principles with which these animals work. The course of the first comb being altered, the two adjoining ones would naturally follow its line: but if those next beyond them on each side were in a state of forwardness, the workers would be obliged to discontinue the two former, as shown in the figure, to avoid coming in contact with the two latter; for it appears to be a law in the construction of new combs, that a certain space should be always left at the margins as well as between them.

In addition to the construction of the comb, the bees, when in danger of attacks from their enemies, barricade themselves. Sometimes the entrance of the hive is nearly blocked up with wax and propolis, and at others a wall of that substance is constructed just behind that part; this wall is perforated with holes only just large enough to admit of the egress and ingress of the bees themselves. The fortifications are occasionally much more ingenious and complicated. Weak hives are sometimes exposed to the attacks of strange bees, and in such cases fortifications would be constructed; but it is more particularly to prevent the ravages of the *Acherontia atropos* that this care is taken. As this moth only makes its appearance in the autumn, these fortifications are removed in the spring, a time when they would be of the greatest inconvenience, as the hive is then extremely populous. Huber states that 'the entrances formed in 1804 were destroyed in the spring of 1805. The sphinx (*Acherontia atropos*) did not appear that year; but it returned in great numbers in the autumn of 1807. By speedily barricading themselves, the bees prevented their threatened ravages; but before the departure of swarms in May, 1808, they demolished the fortifications, whose narrow passage prohibited free egress to the multitude.'

The facts related in the foregoing account are such as we find, for the most part, well authenticated by the various authors who have written on the subject; but there are many more interesting circumstances related in each, which we think not yet quite satisfactorily confirmed.

The principal authors who have written upon the subject are as follows:—

Aristotle.—*History of Animals*, book v.

Pliny.—*Natural History*, book xi.

Swammerdam.—A translation into English, from the Dutch and Latin original edition of his work, has been made by Thomas Floyd, entitled *The Book of Nature, or the History of Insects.*

Réaumur.—In the fifth volume of his *Mémoires pour servir à l'Histoire des Insectes.* 1734-1742.

Schirach.—*Histoire Naturelle de la Reine des Abeilles.* 1771.

Riem.—*Contemplation de la Nature.*

Bonnet.—Tom. v. 4to. edition, and tom. x. 8vo.

John Hunter.—In the *Philosophical Transactions for* 1792.

Thorley.—*Female Monarchy; being an Inquiry into the Nature, Order, and Government of Bees.*

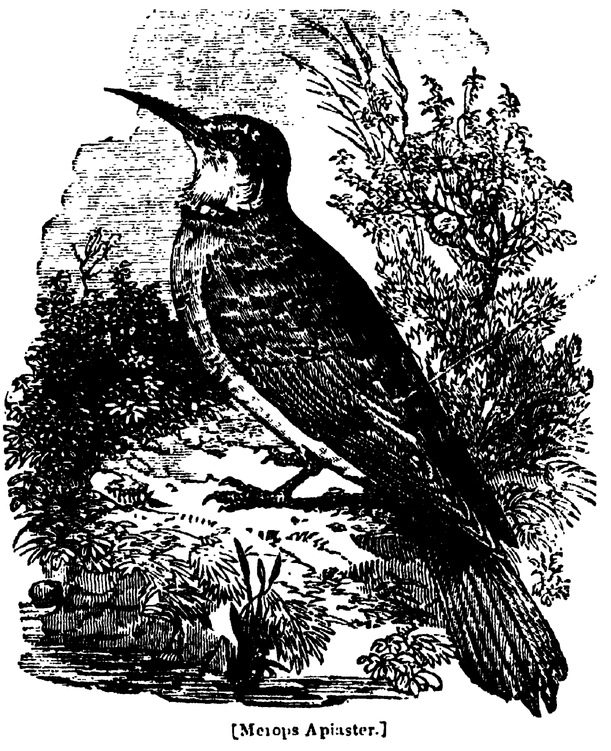
Wildman.—*A Complete Guide for the Management of Bees.* 1819.

Huber.—*Nouvelles Observations sur les Abeilles.* A translation into English of this work was published in the year 1821, entitled *New Observations on the Natural History of Bees.*

Edward Bevan, M.D.—*The Honey-Bee; its Natural History, Physiology, and Management.* 1827.

BEE-EATER (zoology), the vernacular name for a species of the genus *Merops*, Linn., one of the family *Meropidæ*, and of the syndactylous tribe, which have the external toe nearly as long as the middle one, and both joined together up to the penultimate articulation.

The birds of this genus take their prey, consisting of wasps, bees, &c., like the swallows, while on the wing; and, as Cuvier observes, it is remarkable that they are not stung by those insects: the species are numerous, and many are figured by Levaillant. Their nests are formed in the banks of rivers, where they dig deep holes; and their geographical distribution is over the warmer regions of the old continent, Java, &c., and New Holland (Paramatta), none of the genus having been found in America, where their place appears to be supplied by the *Motmots* (*Prionites*, Illiger). Their brilliant plumes of colours, which change according to exposure to light, the prevalent hues being azures and greens, remind the observer of the kingfisher's gorgeous dress. A familiar example of the genus occurs in the bird whose English name is at the head of this article—the *Guêpier vulgaire* of the French, the *Mangia-api* and *Lupo d'Api* of the Italians, the Μέροψ of the Greeks, and *Merops Apiaster* of Linnæus.



[Merops Apiaster.]

In the south of Europe it is frequent in the summer. Sicily, Sardinia, Italy, the South of France, and Germany possess it, and on the southern border of Russia it is numerous. It is found in Turkey and in the Archipelago, and in autumn migrates towards Egypt. It breeds in holes in the banks of the Don and the Wolga, laying from five to seven white eggs in a nest composed of moss, &c. Hasselquist says that it is found in the plains of Galilee, and that it is called Varuar by the Arabs; and Temminck, that the individuals found at the Cape of Good Hope differ in nothing from those killed in Europe. Ray, in his edition of *Willughby*, observes, 'it is not unfrequent in the Campagn of Rome: for that we saw it there to be sold in the market more than once. It is not found in England that we know of. Bellonius writes that it is so common in Candy, that it is seen everywhere in that island. Aristotle tells us that it feeds upon bees, whom all other writers of the history of animals do therein follow. But it feeds not only upon bees, but also upon *Cicadæ*, *beetles*, and other insects. Yea, as Bellonius relates, upon the seeds of the nipplewort, bastard parsley, turnip, &c., not abstaining from wheat and other grain. From its exact agreement in the shape and make of its body, bill, and feet with the king-fisher, we suspect that it likewise preys upon fish.

'Bellonius, in the first book of his observations, writes thus concerning the *Merops*. Flying in the air it catches and preys upon bees, as swallows do upon flies. It flies not singly but in flocks, and especially by the side of those mountains where the true thyme grows. Its voice is heard afar off, almost like the whistling of a man. Its singular elegance invites the Candy boys to hunt for it with *Cicadæ*, as they do also for those greater swallows called *Swifts*, after this manner:—bending a pin like a hook, and tying it by the head to the end of a thread, they thrust it through a *Cicada* (as boys bait a hook with a fly), holding the other end of the thread in their hand. The *Cicada* so fastened flies, nevertheless, in the air, which the *Merops* spying, flies after it with all her force, and catching it, swallows pin and all, wherewith she is caught.'

The passage in Aristotle, mentioning the *Merops* as one of the enemies most destructive to bees, is in the 40th chapter of the 9th book of his *History of Animals*; and there are others in the 1st chapter of his 6th book, and in the 13th chapter of his 9th, wherein he notices the peculiarity of its making its nest in holes in the earth*.

The species may *now* be considered as an occasional visitant to this country. In the third volume of the *Transactions of the Linnæan Society* will be found the following extract from the minute-book, recording the first instance of its appearance:—

'July 2, 1794.—The president communicated an account of *Merops Apiaster*, the bee-eater, having been shot (for the first time in Great Britain) near Mattishall, in the county of Norfolk, by the Rev. Mr. George Smith. The identical specimen was exhibited by permission of Mr. Thomas Talbot, of Wymondham. A flight of about twenty was seen in June, and the same flight probably (much diminished in number) was observed passing over the same spot in October following.' There is a specimen in the British Museum with 'Devonshire' on the label.

BEECH-TREE. [See Fagus.]

BEEDER, a considerable province of Hindustan, forming part of the dominions of the Nizam, and lying between 17° and 20° N. lat. It is bounded on the west by Bejapore and Aurungabad; on the north by the latter province and Berar; on the east by Gundwana and Hyderabad, which last-named province forms also its southern boundary.

The province of Beeder is divided into seven districts, viz., Calberga, Naldroog, Akulcotah, Calliany, Beeder, Nandeer, and Patree.

The surface of the province is hilly, but cannot be called mountainous. It is watered by several small streams, and is intersected by the Beemah, Manjera, Kistna, and Godavery rivers. The Beemah, which is considered a sacred river by the Hindus, is a principal branch of the Kistna, and rises in the mountains on the north of Poonah. Passing within 20 miles east of that city, it flows with many windings in a south-easterly direction, and after a course of nearly 400 miles it falls into the Kistna near Eidgheer in Hyderabad. The Manjera rises about 50 miles south-east from Ahmednuggur, and flows in a south-easterly direction past the city of Beeder, and within a few miles of it to the north-east. When it has arrived within about 30 miles of the city of Hyderabad it makes an abrupt bend to the north, and joins the Godavery in 18° 48′ N. lat. and 77° 55′ E. long., about 400 miles from its source. The Manjera is not navigable in any part of its course.

The soil of Beeder is generally productive, and previous to the Mohammedan conquest the province is said to have been thickly peopled. Its numbers must since then have much fallen off, as it is not now so populous in proportion to its extent as the greater part of the British possessions in India. The Hindus exceed the Mohammedans in the proportion of three to one.

On the invasion of the Deccan, in 1295, the founder of the Bhamenee dynasty, Allah ud Deen, took up his residence at Calberga, the capital of the district of that name, in 17° 19′ N. lat. and 76° 56′ E. long. Although once the capital of a Hindu and afterwards of a Mohammedan sovereign, Calberga has since become a place of no importance. The province was brought under subjection by the Moguls in the reign of Aurungzebe, but was wrested from the successors of that prince, in 1717, by Nizam ul Mulk, the sovereign of Hyderabad, and has since continued in the occupation of the successive Nizams.

(Mills's *History of British India*; Rennell's *Memoir of a Map of Hindustan*; Ferishta's *History of the Deccan*.)

BEEDER, the capital of the province of the same name, is situated in 17° 49′ N. lat. and 77° 45′ E. long. We have not any recently published description of this place. About half a century since it was surrounded by a stone wall, six miles in circumference, with round towers at intervals. The space between this wall and the town is a level and open place, a mode of building a town which is not uncommon in India.

Beeder was founded near the ruins of an old city at the end of the sixteenth century, by Ahmed Shah Bhamenee, who gave to it the name of Ahmedabad, and transferred to it the seat of his government from Calberga. Beeder is situated 426 miles (travelling distance) from Bombay, 980 miles from Calcutta, 857 from Delhi, and 78 from Hyderabad.

(Mills's *History of British India*; Rennell's *Memoir of a Map of Hindustan*.)

BEEF-EATER, a jocular appellation, as it is now used, for the yeomen of the guard; though it seems probable that the name of *buffetiers* was formerly assigned to that portion of the yeomen of the guard only who from time to time waited at table at great solemnities, and were ranged near the buffets. (See *Antiq. Repert.* edit. 1808, vol. ii. p. 398.) The French in the same manner called their valets who attended the side-board *buffets*. Furetiere (*Dictionn. Universelle*, tom. i. in voce) having defined buffet to be a sort of cupboard for keeping vessels, china, &c.; also a sideboard furnished for the service of the table, adds, '*Buffet* se dit aussi des officiers ou valets qui servent au *buffet*.'

BEELZEBUB. [See Baal.]

BEER. [See Brewing.]

BEER-ALSTON, a small market-town in the parish of Beer-Ferris and hundred of Roborough, in the county of Devon, is situate in a most picturesque country between the rivers Tamar and Tavy, six miles S.S.W. from Tavistock, fourteen N. from Plymouth, and 212 W.S.W. from London.

According to Risdon, it was given by William the Conqueror to the French family of Alenson soon after the conquest, from whom it took its name. In the reign of Henry II., 'this honour,' says Risdon, 'as well as Beer-Ferrers, erroneously called Bere-Ferris, was held by Henry Ferrers; and Martin Ferrers, the last of that antient house, was put in special trust to defend the sea-coast against the invasion of the French in Edward III.'s time.' Towards the close of the fourteenth century it belonged to Alexander Champernowne of Dartington, and through his grand-daughter it descended to Robert Willoughby, Lord Brooke. It is now the property of the Earl of Beverley.

Beer-Alston was an antient borough by prescription, although it did not send members to parliament till the reign of Elizabeth. The electors nominally held land of the lord of the manor, at a rent of three-pence. But there really were no landholders except the lord, who created burgage tenures merely for the election. This is one of the flagrant abuses abolished by the Reform Act, Beer-Alston being by that act totally disfranchised. The election of members of parliament, as well as portreeves, town-clerks, &c., took place in the open air, under a large oak-tree. The number of inhabitants in the borough alone is estimated at 360, but the return of the population is included in that of the parish; which in 1821 amounted to 2198; but in 1831 had decreased to 1876. The living of Beer-Ferris, a rectory in the gift of the dean and chapter of Exeter, is in the archdeaconry of Totness, and diocese of Bath and Wells, and was rated in the king's books at 24*l.* 1*s.* 0½*d.* Lord Vallетort is the present patron.

---

* Bekker, in the 1st chapter of the 6th book, gives εἴροψ as the Bœotian name of the bird. (See Bekker's edit. Berlin, 1829.)

The church possesses some curious monuments of the Ferrers and Champernowne families. Beer-Alston was once famous for its silver-mines, which at one time were very productive, but at present they are not considered worth working. Perhaps to this and to the disfranchisement of the borough is to be attributed the unusual decrease of the population in this parish. It is a curious fact, that the annual value of real property, as assessed in 1815, in the parish of Beer-Ferris, is, with the exception of Plymouth and Devonport, the greatest in Devonshire, amounting to 25,550*l.*

BEER-SHEBA, בְּאֵר שֶׁבַע, *the well of the oath*, is called by the Septuagint Βηρσαβεὲ, or φρέαρ ὁρκισμοῦ, and by Josephus (*Ant.* i. 12) Βηρσουβαὶ, and (vi. 3) Βαρσουβαὶ, Βηρσουβεὲ (*Ant.* viii. 13. 7), and Βηρσοβεὲ (*Vita* ed. Havercamp. p. 18, § 37). Beer-sheba is a very antient city in the south of Palestine, the existence of which can be traced from the days of the Patriarchs to the present century.

Few places have been noticed in history during so many centuries as Beer-sheba. Abraham called that place Beer-sheba, because there they sware both of them, when he made a covenant with Abimelech. And Abraham planted a grove in Beer-sheba, and called there on the name of the Lord, the everlasting God. (Gen. xxi. 14. 31.) About B.C. 1804, Abimelech went to Isaac from Gerar, and they sware one to another; and it came to pass the same day, that Isaac's servants came and told him concerning the well which they had digged, and said unto him, we have found water. And he called it Sheba: therefore the name of the city is Beer-sheba unto this day. (Gen. xxvi. 23, 33.) In this antient explanation, שֶׁבַע, *seven*, is considered as equivalent to שְׁבֻעָה, *oath*. Both words are, in Hebrew, intimately related to each other, because the number seven was of frequent occurrence in sacrifices and holy rites.

Beer-sheba was frequently the dwelling place of Abraham, Isaac, and Jacob (Gen. xxii. 19; xxviii. 10; xlvi. 1—5), of the sons of Samuel, *Joel*, and Abiah, who were judges in Beer-sheba. (1 Sam. viii. 2.) Zibiah of Beersheba was the mother of Jehoash, king of Judah. (2 Kings xii. 12; 2 Chron. xxiv. 1.) The prophet Elijah retired to Beer-sheba when he fled before Ahab and Jezebel. (Jos. *Ant.* viii. 13. 7.)

Beer-sheba belonged first to the cities of the tribe of Judah. (Joshua xv. 28; 1 Kings xix. 3.) But it appears from Joshua xix. 2, that, strictly speaking, Beer-sheba had been conceded to the Shimeonites. 'The second lot came forth to Shimeon, even to the tribe of the children of Shimeon, and their inheritance was within the inheritance of the children of Judah: and they had in their inheritance Beersheba, Sheba, Molada,' &c. (1 Chron. iv. 28.)

That Beer-sheba was situated in the south of Judah is expressly mentioned in 2 Sam. xxiv. 2—7. v. 15. Hence the name of Beer-sheba is frequently mentioned, when the whole extent of Palestine is described, in the expression from Dan to Beer-sheba, or *vice versâ*, 'From Beer-sheba even to Dan.' (1 Chron. xxi. 2; 2 Chron. xxx. 5; Judges xx. 1: 1 Sam. iii. 20; 2 Sam. iii. 10; 2 Sam. xvii. 11, xxiv. 15; 1 Kings v. 5; 2 Chron. xxx. 5.) If the kingdom of Judah only is meant, the following phrases are employed, from Geba to Beer-sheba (2 Kings xxiii. 8); from Beer-sheba to the mountain of Ephraim. (2 Chron. xix. 4.)

Under the reign of Uzziah, about the year 787 B.C., Beer-sheba was notorious for idolatry. (Amos v. 5; viii. 14.) The city was re-occupied by the Jews after their return under Nehemiah from the Babylonish exile, about 445 B.C. According to Nehemiah (xi. 27, 30), the children of Judah dwelled again from Beer-sheba unto the valley of Hinnom. About the year 300 A.D. Eusebius Pamphili describes Beer-sheba as a very large village, twenty miles south-west of Hebron, and a garrison post. In the days of St. Hieronymus, about the beginning of the fifth century A.D., we find it again described in the same terms, apparently taken from Eusebius. (Quæst. ad Gen. xvii. 30, and Onomast. h. v.) In the days of the crusades, it is thus mentioned by De Vitriaco, or de Vitry, in *Gesta Dei per Francos*, p. 1070: Beer-sheba is a town at the foot of the mountains, and near the commencement of the plain country, between the mountains and Ascalon, ten miles from Ascalon; he thus appears to assign it a different position from that of Eusebius. In a similar manner Beer-sheba is mentioned by William of Tyre. Breitenbach found, in the place of Beer-sheba, a castle called *Gallin*, other travellers a village called Gibelin; but Seetzen asserts that the town is still extant, under the name of Bir Szabea, under which name it is entered in the maps of Klöden and Grimm. (Comp. Joseph. *Antiquit.* viii. 13, 7; Zachs *Correspondenz*; Relandi *Palestina*, p. 484, 620; Hamelsveld *Bibl. Geog.* iii. 114, seq.; Winers *Biblishes Realwörterbuch*; and Gesenii *Thesaurus*, *sub voce.*)

This Beer-sheba, on the southern frontiers of Palestine, towards Idumæa, should not be confounded with a Beer-sheba (Βηρσαβεὲ, or Βηρσάβη) in Upper Galilæa, mentioned by Josephus (*Jewish War*, ii. 20, 6; iii. 3, 1, pp. 208 and 223); and in Dr. Richardson's *Travels*.

BEESHA, a genus of grasses nearly allied to Bambusa, with which it is actually combined by some naturalists, but from which it differs, according to the concurrent testimony of all authors, in the otherwise incredible circumstance of its seeds being enclosed in a fleshy pericarp.

Two species are known, both of which have the aspect of the spineless bamboos. Of these *Beesha baccifera* is found on the Chittagong mountains of India, where it is called *Pagu tulla*, growing in dry places on the sides of hills, where the upper stratum of soil is sandy. According to Roxburgh's *Flora Indica*, the circumference of the stems near the base is twelve or thirteen inches, and their height from fifty to seventy; 'beautifully erect, and without the least flexure or inequality of surface; bare of branches, except near the extremity: it perishes after yielding its fruit. It yields more or less tabasheer, of a siliceous crystallization; sometimes it is said the cavity between the joints is nearly filled with this, which the people call *Choona* or *lime*.' (*Flora Indica*, ii. 197.)

Beesha Fax is a smaller species, not above eighteen feet high; it is found in Amboyna and other parts of the Malayan Archipelago, where it is applied to many useful purposes. It is the *Arundarbor cratium* of Rumphius's *Herbarium* of Amboyna.

BEET, in Botany. [See BETA.]

BEET, a plant of the genus *Beta*, in the class *Pentandria*, and order *Digynia* of Linnæus, and, in the natural order, *Chenopodeæ* of Jussieu.

There are two distinct species of beet commonly cultivated, each containing several varieties, the one called the *Cicla*, or *Hortensis*, producing succulent leaves only, the other the *Vulgaris*, distinguished by its large fleshy root. The cicla is chiefly cultivated in gardens as a culinary vegetable, and forms one of the principal vegetables used by agricultural labourers and small occupiers of land in many parts of Germany, France, and Switzerland. A variety known by the name of Swiss *chard* produces numerous large succulent leaves, which have a very solid rib running along the middle. The leafy part being stripped off and boiled, is used as a substitute for greens and spinach, and the rib and stalk are dressed like asparagus or scorzenera; they have a pleasant sweet taste, and are more wholesome than the cabbage tribe. In a good soil the produce is very abundant, and if cultivated on a large scale in the field, this species of beet would prove a valuable addition to the plants raised for cattle. By cultivating it in rows, and frequently hoeing and stirring the intervals, it would be an excellent substitute for a fallow on good light loams.

All cattle are very fond of the leaves of this beet, which add much to the milk of cows without giving it that bad taste which is unavoidable when they are fed with turnips or cabbages, and which is chiefly owing to the greater rapidity with which the latter undergo the putrefactive fermentation. If sown in May in drills two feet wide, and thinned out to the distance of a foot from plant to plant in the rows, they will produce an abundance of leaves, which may be gathered in August and September, and will grow again rapidly, provided a bunch of the centre leaves be left on each plant. They do not sensibly exhaust the soil. These leaves, when boiled or steamed with bran, cut chaff, or refuse grain, are an excellent food for pigs, or bullocks put up to fatten.

The second species, the *Vulgaris*, or beet-root, has been long cultivated in gardens; especially that variety called the red beet, which, when boiled and sliced, makes such an excellent addition to winter salad. It is a native of the south of Europe, and hence all the varieties are tender, and destroyed by frost when in their young state. It thrives best in a rich, light, dry soil, and, from the length of its tap-root, requires a considerable depth. The white beet is an excellent root, and is preferred by many to the larger and more common intermediate varieties. It has been lately in great repute in France and Belgium for the manufacture of sugar. It is not commonly cultivated in our gardens, and we only notice it as being, with the red beet, the parent of those varieties which have been introduced into field culture.

The common field-beet for cattle, which has been long known in Germany, was introduced into England at the latter end of the last century; and its introduction is generally attributed to the late Dr. Lettsom, a physician of great reputation, and one of the Society of Friends. The German name is *mangold wurzel*, or *mangold* root, but it is commonly pronounced *mangel wurzel*, which means *scarcity* root; and by a strange translation it is called in French *racine d'abondance*, or root of *plenty*, as well as *racine de disette*, or root of *scarcity*. The name of *field-beet* is much more appropriate.

The improved variety of this beet, which grows to a very large size in good soil, has a red skin, and when cut through appears veined with red, in concentric circles. The principal part of the root rises often a foot and more above the ground, and the leaves, which are large and succulent, spring from the crown of the root. There is a limit, however, beyond which the root does not improve in quality as it increases, and the roots of a moderate size contain more saccharine and nutritive matter in the same bulk than the larger. This is particularly the case with those varieties from which sugar is extracted. The soil best adapted for the beet-root is a deep sandy loam, naturally rich, or made so by repeated manuring. The manure should be well incorporated with the soil, and if any is added for this crop, it should be well rotted and ploughed in deep. The application of liquid manure during the growth of the plant greatly increases the roots; but it is also said to make them more watery, and for the sugar beet it is not recommended. The seed, which should be chosen from the most perfect plants, is sown in May: if sown sooner, there is some danger from the frosty nights which often occur about the beginning of that month; or if the spring is warm and genial, it gets too forward, and instead of increasing in the root, it shoots up a seed-stalk, and the root becomes comparatively useless. If it is sown later than May, it never arrives at a full size before the approach of winter: hence the first or second week in May is the best time in our climate. It is found by experience that those plants of beet which grow from seed sown where they are to remain have larger roots, in general, than those which are transplanted; the seed is therefore usually drilled, or dibbled, in rows from twenty-four to thirty inches distant; the seeds are put in about an inch deep, and when they are dibbled, the holes are about four inches asunder, and two or three seeds are put in a hole. After they come up and are out of danger of frost or insects, they are thinned out, so as to leave the plants a foot asunder. Where the plants have failed, the intervals are filled up by transplanting some of those which are superfluous in other parts: in doing this it is essential that the fibres of the roots be not torn off in pulling up the plant; and if they are taken up carefully with some of the mould adhering to the roots, it will well repay the additional trouble. If the ground is well prepared, there is little fear of the plants not coming up, or of their being destroyed by the fly, as is too often the case with turnips. A sprinkling of liquid manure along the rows, about the time that the plants first appear above ground, will in general secure an abundance of them; and this may be done with much less trouble than would be imagined, by those who have never practised it. It requires only a water-cart, with a large cask and two leathern hose, kept at a proper distance from each other by a stick between them, so that they may pour the liquid manure over two rows at once. If the field be not above a mile from the tank, a man and horse will water two acres in a day, and if the distance is half a mile, four acres; the expense will be amply repaid in the crop.*

On a very large scale this may not be so practicable; but wherever a field of beet is near the home-stall, it should never be omitted; the evident advantage of it will soon remove any objection arising from trouble or expense. When the plants are three inches above ground, they may be thinned out a foot apart in the rows; the intervals between the rows may be stirred with the plough, grubber, or horse-hoe, and the intervals from plant to plant in the row with the hand-hoe. The ground cannot be kept too fine and open, provided the soil be not extremely porous, and the weather very dry; in that case it must not be stirred so much, for fear of the moisture evaporating too much. It is a common practice to throw the earth from the rows against the roots; but the most experienced cultivators do not approve of the method: on the contrary, they recommend drawing the earth from the plants, or at least laying the whole ground level. Where the soil is naturally rich and deep, the drills may be made on the level ground; but if the soil is shallow, or the subsoil of a barren nature, it is best to raise small ridges, as is done for turnips on the Northumberland plan, and bury the dung under them, by which means the roots have more room to strike downwards. As soon as the outer leaves begin to droop, they may be gathered and given to cattle, but a tuft should be left in the centre to carry on the vegetation, or else the roots will not increase. This practice of gathering the leaves is strongly recommended by some, and they assert that the root does not suffer in the least, although the leaves are reproduced: but here we would give this caution, founded on experience and observation. The drooping leaves, if not gathered, will decay and fall off; they have performed their office, and therefore to gather them before they wither is a real economy: but to strip off fresh and growing leaves must injure the plant, and the juices required to replace them are so much taken from the growth of the roots. When fodder is very scarce this may be a sacrifice worth making, but if the object is to reserve the roots for winter food, the leaves should remain on the plant as long as they look fresh and growing, until near the time of taking up the whole crop: the top may then be cut off an inch above the crown of the root, and will be excellent food for the cows and pigs.

The roots are generally taken up and stored for winter, some time before there is any danger of considerable frost; the top having been removed, and the tap root cut off, the mould which may adhere to the fibres is scraped off with the back of the knife. The roots are then either stacked in a barn or root-house, with alternate layers of straw, and the sides and top protected from the frost by straw placed all round, in which way they will keep well and fresh till spring: or they are placed in trenches two feet deep and six feet wide, with a layer of straw at the bottom and against the sides; they are heaped up in these trenches to the height of three feet above the ground, forming a ridge at top, and then covered all over with straw, over which the earth taken out of the trench is spread, and made smooth, sloping like the roof of a house. A small trench is dug all round this heap, with a proper outlet to prevent any water from soaking in; the heaps are made of any length, according to the quantity of roots to be stored, and the two ends are secured with straw, and covered with earth like the sides. When it is required to take out the roots for use, an opening is made at the end, a sufficient quantity is taken out, and the end is secured again with straw and earth as before. When the roots have been put in dry, and some time has been allowed for a slight fermentation, and the steam produced has been allowed to escape before the heap was finally covered in, they will come out quite fresh and juicy till late in spring; but if the proper precautions are neglected, they will often rot or become musty, and then the cattle will not readily eat them. There are few crops so valuable for winter food for cattle as the beet: Swedish turnips, or ruta baga, exceed them in the quantity of nourishment, weight for weight, but on good light soils the produce of the beet per acre is much greater. On old pasture ground trenched up enormous crops of mangel wurzel have been raised. When the

---

* If the water-cart contains 100 gallons, it will water one-third of an acre in rows at three feet distance; the horse will go over one mile and a half in an ordinarily shaped field to water an acre, to which must be added twice the distance from the tank, taken three times. This makes in all 1½ + 6, or 7½ miles for each acre, when the distance is one mile.

Regent's Park was forming, a part which had been trenched was sown very thick with mangel wurzel seed, and such was the produce, that it was sold by auction, in lots, to the cow-keepers in the neighbourhood, at the rate of 80*l.* per acre.

It is said that the cows fed entirely on beet become too fat, and give less milk; but this would be no objection with the cow-keepers who unite the fattening of their cows with the milking, and like to have them ready for the butcher as soon as they are nearly dry. For bullocks they are excellent; for horses Swedish turnips are preferable. The proportional value of hay, potatoes, Swedish turnips, and beet in feeding cattle, according to Einhof, whose statements Thaer has found to agree with his experiments, is as follows:—18 tons of mangel wurzel are equal to 15 tons of ruta baga, or 7½ tons of potatoes, or 3¾ tons of good meadow hay, each quantity containing the same nourishment: but the roots may be grown upon less than an acre, whereas it will take two or three acres of good meadow-land to produce the equivalent quantity of hay; and of all these root crops the least exhausting for the land is the beet. The white beet has been chiefly cultivated for the extraction of sugar from its juice. It is smaller than the mangel wurzel, and more compact, and appears in its texture to be more like the Swedish turnip. We have given it to cattle, and are satisfied with the result; but we have not made sufficiently accurate experiments to decide which sort is the most advantageous. It will probably be found that the nature of the soil will make the scale turn in favour of the one or the other; but for the manufacture of sugar, the smaller beet, of which the roots weigh only one or two pounds, are preferred by Chaptal, who, besides being a celebrated chemist, was also a practical agriculturist, and a manufacturer of sugar from beet-root.

This manufacture sprung up in France in consequence of Bonaparte's scheme for destroying the colonial prosperity of Great Britain by excluding British colonial produce. It having been found that from the juice of the beet-root a crystallizable sugar could be obtained, he encouraged the establishment of the manufacture by every advantage which monopoly and premiums could give it. Colonial sugar was at the enormous price of four and five francs a pound, and the use of it was become so habitual, that no Frenchman could do without it. Several large manufactories of sugar from beet-root were established, some of which only served as pretexts for selling smuggled colonial sugar as the produce of their own works. Count Chaptal, however, established one on his own farm, raising the beet-root, as well as extracting the sugar. We here give a brief account of the process, taken chiefly from his own publications, especially the work entitled *La Chimie appliquée à l'Agriculture*, 2 vols. 8vo. Paris, 1829. The first operation is to clean the roots: some effect this by washing, but Chaptal prefers scraping and paring them with a knife, although by this means one-sixth part of the root is wasted, as the scrapings mixed with earth cannot be safely given to cattle, and even the pigs eat but little of it; but it adds to the manure, and is therefore not altogether lost. Six tons of beet-root are thus reduced to five, which are next to be rasped and reduced to a pulp. This is done by a machine consisting of a cylinder of tinned iron, two feet in diameter, and eighteen inches in the axis, on which it is turned by machinery. On the circumference of this cylinder are fixed, by means of screws, ninety narrow plates of iron, rising three-fourths of an inch from the surface and parallel to the axis, at equal distances all round; the outer or projecting edges of these plates are cut into teeth like a saw; a slanting box is fixed to the frame on which the axis of the cylinder turns, so that the roots may be pressed against these plates. The cylinder is made to revolve rapidly, and the roots are thus scraped, the pulp falling into a vessel, lined with lead, placed below. When two such cylinders are made to revolve 400 times in a minute by a sufficient power, whether water, wind, or horses, two and a half tons of roots are ground down in two hours. It is necessary that this operation should proceed rapidly, or else the pulp acquires a dark colour, and an incipient fermentation takes place, which greatly injures the future results. As the pulp is ground it is put into strong canvass bags, and placed under a powerful press to squeeze out the juice. The residue is stirred, and subjected to a second and third pressure, if necessary, till every particle of juice is extracted. As the liquor is pressed out, it runs into a copper, until it is two-thirds filled. The strength is ascertained by an instrument similar to the saccharometer used by brewers, called the *pèse-liqueur* of Beaumé *, which shows the specific gravity of the liquid. The fire is now lighted, and by the time the copper is full the heat should be raised to 178° of Fahrenheit's thermometer (65° of Réaumur), but no higher.

In the mean time a mixture of lime and water has been prepared by gradually pouring as much water upon 10lb. of quick lime as will make the mixture of the consistency of cream. This is poured into the copper when the heat is steadily at 178°, and is well mixed with the juice by stirring it. The heat is then increased till the mixture boils, when a thick and glutinous scum rises to the surface. As soon as clear bubbles rise through this scum, the fire is suddenly put out by water poured on it or by a proper damper. The scum hardens as it cools, and the sediment being deposited the liquor becomes clear and of a light straw colour. The scum is then carefully taken off with a skimmer having holes in it, and is put into a vessel till such time as the liquor remaining in it can be pressed out. A cock is now opened about five inches above the bottom of the boiler, and all the clear liquor is drawn off. Another cock lower down lets out the remainder until it begins to appear cloudy; what still remains is afterwards boiled again with what is extracted by pressure from the scum. The clear liquor is now subjected to evaporation in another boiler which is wide and shallow. The bottom is but slightly covered with the juice at first, and it boils rapidly. As the water evaporates, fresh juice is let in. When a certain degree of inspissation or thickening has taken place, so as to show five or six degrees of strength on the *pèse-liqueur*, animal charcoal is gradually added till the liquor arrives at 20°. One hundred weight of charcoal is required for the juice of 2½ tons of beet, which is now reduced to about 400 gallons. The evaporation by boiling continues till the saccharometer marks 25° and a regular syrup is obtained. This is now strained through a linen bag, and the liquor is kept flowing by means of steam or hot air, and assisted by pressure. In two or three hours all the clear syrup will have run through.

There are many nice circumstances to be attended to, which can only be learned by experience, and an outline of the process is all that we undertake to give.

The syrup thus prepared is again boiled and skimmed until it is sufficiently concentrated, which is known in the following manner. The skimmer is dipped into the syrup and drawn out; some of the thick syrup which adheres to it is taken between the thumb and fore-finger and held there till the heat is reduced to that of the skin; the finger and thumb are separated, and if the syrup is of a proper strength, a thread will be drawn out, which snaps and has the transparency of horn or rather barley-sugar: this is called the *proof*. The fire is then put out and the syrup is carried to the cooler, which is a vessel capable of containing all the syrup produced by four operations or boilings. Here the sugar is to crystallize: as soon as this commences the whole is well mixed and stirred, and before it becomes too stiff, earthen moulds, of the well-known sugar-loaf shape, and of the size called *great bastards*, are filled with the crystallizing mass, of which a little at a time is poured into each. When they are full, they are carried to the coolest place on the premises. As the crystallization goes on, the crust formed on the top is repeatedly broken, and the whole is stirred till the crystals are collected in the centre; it is then allowed to go on without further disturbance. In three days it is so far advanced, that the pegs which were put into the holes at the point of the moulds may be taken out and the molasses allowed to run out. In a week this is mostly run off. White syrup is now poured on the top of the moulds, which filters through the mass and carries part of the colouring matter with it. The process that follows is exactly that in common use in refining West India sugars.

Although most of the operations are nearly the same as those by which the juice of the sugar-cane is prepared for use, much greater skill and nicety are required in rendering the juice of the beet-root crystallizable on account of its greater rawness, and the smaller quantity of sugar that it contains. But when this sugar is refined, it is impossible for the most experienced judge to distinguish it from the other, either by the taste or appearance; and from this arose the facility with which smuggled colonial sugar was sold in France, under the name of sugar from beet-root. Five tons of clean roots produce about 4½ cwt. of coarse sugar, which give about 160 lbs. of double-refined sugar, and 60 lbs. of inferior lump-sugar. The rest is molasses, from which a good spirit is distilled. The dry residue of the roots, after expressing the juice, consists chiefly of fibre and mucilage, and amounts to about one-fourth of the weight of the clean roots used. It contains all the nutritive part of the root, with the exception of 4½ per cent. of sugar, which has been extracted from the juice, the rest being water. Two pounds of this dry residue, and half a pound of good hay, are considered as sufficient food for a moderate-sized sheep for a day, and will keep it in good condition; and cattle in proportion.

---

* The *pèse-liqueur* of Beaumé here referred to is an hydrometer, of which 0° corresponds to 1·000, the specific gravity of pure water at 55° of Fahrenheit; and 25° to about 1·215.

As the expense of this manufacture greatly exceeds the value of the sugar produced, according to the price of colonial sugar, it is only by the artificial encouragement of a monopoly and premiums that it can ever be carried on to advantage. The process is one of mere curiosity as long as sugar from the sugar-cane can be obtained, and the import duties laid upon it are not so excessive as to amount to a prohibition; and in this case it is almost impossible to prevent its clandestine introduction.

By allowing the juice of the beet-root to undergo the vinous fermentation and by distilling it, a more profitable result will be obtained in a very good spirit. A kind of beer may also be made of it, which is said to be pleasant in warm weather and wholesome.

Another mode of making sugar from beet-root, practised in some parts of Germany, is as follows, and is said to make better sugar than the other process. The roots having been washed are sliced lengthways, strung on packthread and hung up to dry. The object of this is to let the watery juice evaporate, and the sweet juice, being concentrated, is taken up by macerating the dry slices in water. It is managed so that all the juice shall be extracted by a very small quantity of water, which saves much of the trouble of evaporation. Professor Lampadius obtained from 110 lbs. of roots 4 lbs. of well-grained white powder-sugar, and the residuum afforded 7 pints of spirit. Achard says that about a ton of roots produced 100 lbs. of raw sugar, which gave 55 lbs. of refined sugar, and 25 lbs. of treacle. This result is not very different from that of Chaptal.

BEETHOVEN, LUDWIG VON, one of the three great German composers who may be said to have flourished in our time, was born on the 17th of December, 1770, at Bonn. His father and grandfather were both musicians by profession; the former occupied the situation of principal vocal tenor, and the latter that of first base singer, and subsequently *kapellmeister*, in the chapel of the elector of Cologne. In the *Dictionnaire des Musiciens* it is said, that he was the reputed son of Frederick William II. of Prussia, but there seems to have been no ground whatever for a rumour which, in all probability, originated in court scandal. Beethoven's father was so much addicted to intemperance that he was often disqualified from performing his duties; hence he neglected the education of his son, who, however, by the assistance of friends, was enabled to gain some knowledge of Latin, of French, of arithmetic, &c., as taught in the schools of Germany.

From the earliest age Beethoven evinced a disposition for music; or, in other words, he learnt the language of music and his mother-tongue both at the same time: and as modulated sounds seldom fail to make a deep impression on a young fervid mind, when they are almost constantly presented to it, as was the case in the present instance, he soon acquired, and as speedily manifested, a taste for the art of which they are the foundation. His father began to instruct him when he was only in his fifth year, but soon delivered him over to M. Von der Eden, esteemed the best pianist in Bonn, who dying shortly after, the youthful pupil was transferred to M. Neefe, his successor, the Archduke Maximilian of Austria defraying the expense of his tuition. This excellent master initiated his pupil in the works of Sebastian Bach, particularly in those extremely laboured studies entitled 'Le Clavecin bien tempéré;' or the Forty-eight Preludes and Fugues in every key. At the age of thirteen he published at Mannheim and at Spires, in his own name, Variations on a March, Sonatas, and Songs. But at this time his genius displayed itself more decidedly in musical improvisation. His extempore fantasias are mentioned by Gerber in his Lexicon ('Tonkunstler-Lexicon'), as having excited the admiration of the most accomplished musicians of the time.

The elector of Cologne now sent his protégé, in the character of court organist (in which office he had succeeded Neefe), to Vienna, to study under Joseph Haydn; but the great composer, being then on the point of setting out for England in furtherance of his engagement with Mr. Salomon, placed his intended pupil in the hands of the eminent theorist, Albrechtsberger, who first gave him methodical instructions in counterpoint. After having completed his time with that master, he returned to Bonn; but the capital of the Austrian empire had now more charms for him than his native city. His patron, too, died, and war raged in its worst form in the north of Germany; Beethoven, therefore, left for ever the place of his birth, and settled in Vienna, which city and the adjoining country he never afterwards quitted.

About this time (1791?), says the Chevalier von Seyfried, Beethoven most successfully tried his strength in the quartet style, 'a noble style, reformed, or, more properly speaking, created by Haydn, enriched by the universal genius of Mozart with greater depth and gravity, though not at the expense of grace, and carried by Beethoven to a degree of superior power that few will attempt to attain, and perhaps none will ever surpass.' Happily for him he was at that time on terms of intimate friendship with three artists in the service of Prince Rasumowski; and whenever he had finished a work, he communicated to them his intentions in regard to its character and expression. Hence it became a saying in Vienna, 'Those who would well understand the chamber-music of Beethoven must hear it executed by Schuppanzigh, Weiss, and Linke.'

He now was strongly pressed to compose an opera, and M. Sonnleithner undertook to arrange the opera of *Leonore*, from a French piece named *l'Amour conjugal*. Beethoven then went to reside in the very theatre for which he was writing, and laboured at his work with ardour and satisfaction. This opera, better known under the title of *Fidelio*, was not received with much applause; with the exception of three, the performers were not equal to the tasks assigned them. Moreover, the war and progress of the French armies absorbed the attention of nearly every inhabitant of Vienna. The next year the managers of the Karnthnerthor Theatre gave *Fidelio* for their benefit. The work then took the form which it now bears; it was reduced to two acts, and preceded by an imposing overture in E major. The composer also added the short march, the air of the jailer, and the finale of the first act, cutting out a trio in B flat, and a duet for a soprano, with violin and violoncello obligati accompaniments, in C, nine-eight time, neither of which are to be found in the score.

In 1809 Beethoven determined to accept the place of kapellmeister to the king of Westphalia, Jerome Buonaparte, which was offered to him with many advantageous conditions. It was then that three lovers and patrons of the arts, the archduke Rodolph, and the princes Lobkowitz and Kinsky, came forward, and, in terms the most flattering, executed a deed by which an income of 4000 florins (about 400*l.*) was secured to the great composer, till he should obtain some appointment of equal value, the only condition of which was, that it should be expended in the Austrian dominions.

It is to be feared that untoward events frustrated, in a considerable degree, the good intentions of Beethoven's patrons. Prince Lobkowitz was soon involved in such utter ruin that his palace in Vienna was converted into an hotel. Prince Kinsky fell in the French war, and the archduke remained his only protector. He now expressed a strong desire to travel, and especially wished to see England. He had been invited to this metropolis by the Philharmonic Society of London, who proposed to him liberal terms, and he made preparations for the journey; but when the moment for decision arrived, he could not summon up sufficient courage for, what appeared to him to be, so vast an undertaking. He was suffering from an infirmity severe to all afflicted by it, but doubly so to a musician—deafness. This calamity came on gradually, but from the first defied all remedies and every effort of skill, till at length the sense became so wholly extinct that he could only communicate with others by writing. The consequences of so severe a deprivation were, as his friend Seyfried feelingly but candidly remarks, 'a habit of gloomy, anxious distrust, and a violent desire of solitude, the usual precursors of hypochondria. To read, to stroll into the country, were his most agreeable occupations; and a small, very select circle of dear friends formed his only social enjoyment.'

By slow degrees, maladies, arising probably from a long-continued state of mental irritation, attacked a frame which nature had made healthy and robust, and rendered recourse to medical aid absolutely necessary. Three of the chief Vienna physicians attended him, and neglected nothing that could alleviate the sufferings of their patient. But the hope of any cure soon vanished: symptoms of dropsy appeared, and became more and more decisive in character. He underwent the operation of tapping, which mitigated the pain he endured. During the process he very characteristically exclaimed, 'Better water from my body than from my pen.' Six days before his death he said to his friends M. Schindler, an Aulic counsellor, and M. Breuning, '*Plaudite, amici, comœdia finita est.*' From about that time to the moment of his decease he was in a state of constant delirium; and in the evening of the 26th of March, 1827, he breathed his last. M. Schindler, in a letter to Mr. Moscheles, says, 'The funeral ceremonies were such as are due to the remains of a great man. It is calculated that nearly 30,000 people were collected on the glacis and in the street through which the procession was to pass. The scene is not to be described in words; but if you remember the immense concourse of people in the Prater during the Congress of Vienna in 1814, you may form some idea of it. . . . . . Eight *Maîtres-de-Chapelle* were pall-bearers; and in the whole there were thirty-six torch bearers, among whom were the poets Grillpartzer and Castelli, as also all the first artists in Vienna.' At the end of this letter, the writer mentions an extraordinary proof of the avidity with which the German phrenologists seize every opportunity of pursuing their investigations. 'Yesterday,' he says, 'the grave-digger came to announce to us that an offer of a thousand florins, convention-money (about 100*l.* English), had been made to him by letter, if he would deposit the head of Beethoven in a place fixed on.'

'In taking an inventory of M. Beethoven's property,' the before-named gentleman adds, 'there were found, in a half-mouldered chest, seven Austrian bank bills, value about 1000*l.* in British money, and about 100 florins in paper money. The hundred pounds which the Philharmonic Society of London had sent him were found untouched.' This society, hearing that one to whom music owed such deep obligations was suffering from sickness and straitened circumstances, with a most laudable feeling, immediately transmitted that sum for his immediate use, and were prepared to show a further proof of their gratitude, had it been necessary.

Beethoven died unmarried; and he was never known to form any attachment of a tender kind. His portraits are faithful representations. He was of the middle size, stout, and his form altogether indicated strength. Notwithstanding the strange kind of life he led, his only illness was that of which he died.

In reference to his projected travels, it has been observed by an anonymous writer in the *Harmonicon* (vol. i. 156), that it may be doubted whether his presence would have added, either here or elsewhere, to his celebrity. His extreme reserve towards strangers prevented his displaying those excellent qualities which, under a forbidding exterior, he was known to possess; and such were the contrasts in his character, that occasionally his bluntness of remark, and his total want of reserve in offering his opinion of others, made him appear to be quite forgetful of the prescribed rules of society. But, continues the writer in the work mentioned, notwithstanding these foibles, which too often accompany genius, his character for integrity ranked deservedly high: his strong feeling of truth and justice produced a rectitude in his moral conduct which ensured him the esteem of every honourable man. Though his early education was rather neglected, yet he made up for the deficiency by subsequent application; and those who knew him well state, that his knowledge of German literature was very respectable, and that he was a tolerable proficient in Italian, though of French he knew very little: indeed, he had strong prejudices against that nation. Whenever he could be induced to throw off the reserve arising, most likely, from his infirmity, his conversation became 'extremely animated, full of interesting anecdote, and replete with original remarks on men and manners.'

But after his decease it was found that he was conscious of his own weaknesses, and in his will had apologised for them. This curious document, so interesting to the admirers of Beethoven, to the lovers of art, and to the moral philosopher, as developing the feelings of an illustrious composer, and throwing a light on his personal character, is dated Heiligenstadt, Oct. 6, 1802, and addressed to his brother Carl, and his nephew Ludwig Beethoven.

Beethoven's published works reach opera 120, at least; they embrace every class and are in all styles. His vocal music is full of beautiful new melody, and equally distinguished by strong feeling and a just expression of the words. His oratorio, *The Mount of Olives*, his opera, *Fidelio*, and his two masses, bear testimony to this; though, in our opinion, his numerous songs, very little known in England, and his two cantatas, 'Adelaida,' and 'Ah! perfido, spergiuro,' with which all real lovers of music are acquainted, display taste of a more refined kind than any of his other vocal works can boast. Most of his pianoforte music is admirable, and possesses every quality that vast genius could endow it with; while some is crude, wantonly difficult, and betrays a wayward fancy. His quintets and quartets, or what may be termed his chamber music, are elaborately written, and so original,—they speak a language so uncommon,—that, on a first, and even second hearing, many good and impartial critics have confessed themselves unable to form a decisive opinion of their merits. On further acquaintance, beauties of the rarest kind are unfolded, and the appetite for them increases in proportion as they are better known. We are, it must be understood, alluding to the best of the class; the composer was not successful in every production of the sort, though his failures were comparatively few. But the grandeur of Beethoven's conceptions, and his marvellous skill in development, are most manifest in his orchestral works, in his overtures, and more especially in his symphonies. This is the field in which all his faculties are called into action; in which the wonders of his imagination are displayed, and every resource of his art is made contributory. And the power which he here exhibits is the more remarkable, as the ground seemed to be so entirely occupied by Haydn and Mozart, that no room appeared to be left for a third.

Five years after the death of Beethoven, his friend the Chevalier Ignaz von Seyfried published, in German, his posthumous didactic work, under the title of *Beethoven's Studies in Thorough-Bass, Counterpoint, and the Theory of Composition, collected from his autograph MSS., &c.* This work, though deficient in method and desultory, contains matter of much interest and importance to the musician, and, as the record of his own experiences, is not only valuable but curious. Its utility, however, will be felt chiefly by professors, especially composers, who, if they make a right use of it, may profit largely by the practical remarks, illustrated by examples, embodied with the text, in which it abounds. M. Seyfried has added to the work a biographical sketch of the author, and that extraordinary will to which we have above alluded.

BEETLE. This term has frequently been used as the name common to the species of the family *Scarabæidæ*; but it is more commonly and properly used to designate those insects which are covered by a strong horny substance, the abdominal part of the body being protected by two sheaths under which the wings are folded. Hence the term is synonymous with COLEOPTERA.

BE'FORT, BELFORT, or as it is written by Expilly, **BEDFORT,** a town in France, formerly capital of the district of Sundtgau, now capital of an arrondissement in the department of Haut Rhin or Upper Rhine. It is situated amid the Vosges, and on the bank of a little stream, the Savoureuse, which runs into the Doubs. It is in 47° 39 N. lat., and 6° 50′ E. long., 248 miles E.S.E. of Paris.

An old fortress of the feudal ages, which from its strong position had the name of Bel-fort, gave to this town both its origin and its designation. It was at an early period under counts of its own, and afterwards passed under the dominion of the house of Austria. By the treaty of Westphalia in 1648, it was ceded by Austria to France; and its important situation, in a pass from Alsace to Franche Comté, induced Louis XIV. to strengthen it with new military works. The task was committed to the skill and science of Vauban, who was led by the nature of the ground to use a new system of fortification. The ground enclosed by the new fortifications was laid out in regular streets, and occupied by well-built houses, forming a *new town* far superior in appearance and symmetry to the *old town*. The new town occupies the higher ground, the old town occupies the lower. The antient castle, which Vauban repaired, is on a steep rock, and is remarkable for the great height of its walls. Previous to the revolution there was a collegiate church at Béfort.

The town is well situated for trade, being the centre from which several roads branch out; the neighbouring country furnishes wood and iron; and between the town and the Vosges is a vast bed of peat, which might serve for fuel. Iron-wire, wax-candles, leather, and paper are the chief manufactures; and the *Dictionnaire Universel de la France*, Paris, 1804, speaks of a charitable institution for orphan girls in which cotton-yarn was spun, also of manufactories of printed cottons. The population of the town in 1832 was 4537; that of the whole commune amounted to 5753.

The principal objects worthy of notice are the town-house, the church, the military hospital, and the barracks. There are a library, a high school, and a society of agriculture.

The arrondissement of Béfort is very mountainous, being entirely occupied by the branches of the Vosges or the Jura. It comprehends 341 square miles, or 218,240 acres, and is subdivided into nine cantons and 191 communes. The population of the arrondissement in 1832, was 116,156.

(Expilly; Malte-Brun; *Dictionnaire Universel de la France*; Dupin, *Forces productives de la France.*)

BEG, also pronounced **BEY**, is a Turkish word which signifies 'prince, lord, or chief,' and in the Osman empire is rather vaguely used as a title of governors and other high officers of the state. It is also frequently subjoined to proper names, to distinguish persons of high rank generally.

BEGGAR. [See MENDICANT and MENDICITY.]

BEGHARMI, called by Brown **D'AR BAGHERMI**, is a country in Africa, extending southwards, probably to 10° N. lat.: its northern boundary reaches nearly to the Lake Tchad, perhaps to 12° 30′ N. lat. We know only the western boundary with any degree of certainty, and this runs (about 18° E. long.) at a short distance from the eastern bank of the river Shary, which empties itself into the Tchad from the south-east. On the east it seems to extend to the nearly unknown country of Waday, which separates Begharmi from Dar-Fur. Some small kingdoms, which extend along the river Shary, separate on the west Begharmi from Bornou.

This country, like its neighbour Bornou, lies between the unknown region of central Africa and the Great Desert, the Sahara, which latter may be considered as beginning on the northern shores of the Lake Tchad. From the swampy southern shores of the Tchad the country rises imperceptibly for a considerable distance, and then the surface begins to swell into hills, which by degrees attain the height of mountains. The hilly and mountainous portion of it belongs to Begharmi. The greatest part of this country is covered with thick forests, chiefly inhabited by the ferocious animals common in this part of Africa. It is also traversed by a great number of rivers and water-courses, and contains numerous lakes. The river Shary, which probably has its source in the mountains of Begharmi, enters the plain as a considerable stream, being at Kussery about 1200 feet wide.

As this country has never been visited by Europeans, we are unacquainted with its natural wealth. We only know that its horses are of excellent breed, perhaps among the best in the world.

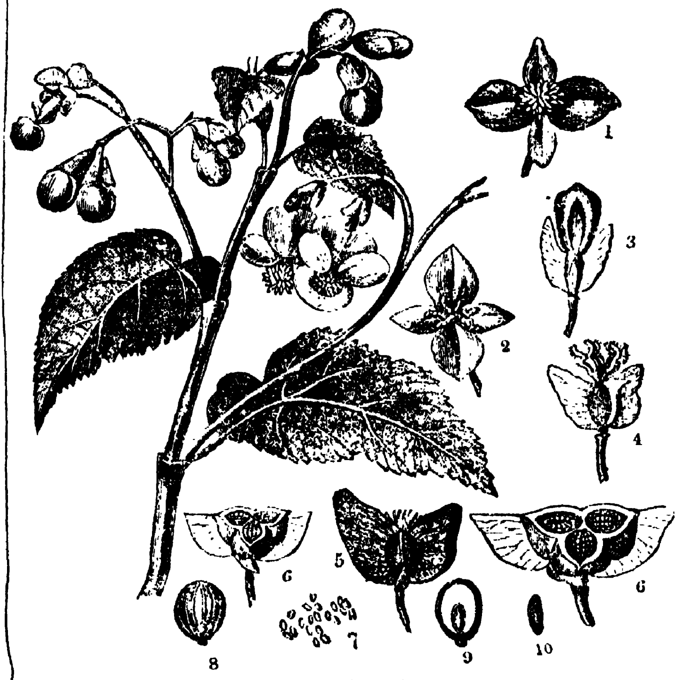
We know little more about its inhabitants, who seem to be numerous and warlike. They frequently undertake predatory incursions into the neighbouring countries, where they often appear in considerable numbers. Besides, they seem to have made considerable progress in some of the arts, at least in those of war. In Denham's 'Journey' there is a picture of a Begharmi horseman, which certainly may be adduced in proof of this assertion. It is not decided whether the inhabitants of Begharmi are negroes, or whether they belong to the Galla tribes which have occupied a considerable part of Abyssinia. It would appear, however, that they have not embraced the Islam, but are still idolaters.

The flat country extending between Begharmi and the Lake Tchad is the abode of a tribe of wandering Arabs, called the Shouaas, who have numerous flocks of cattle and sheep.

The few notices respecting this country we owe to Major Denham, who collected them during his residence at Bornou.

BEGLERBEG, a compound word, which properly signifies 'chief of chiefs,' was till very recently in the Osman empire the title of the governor-generals of the provinces. They stood next in rank to the vizier, and had under their jurisdiction many *sanjaks*, or districts, with their begs, agas, &c. One of their external distinctions was that the sultan of Constantinople always bestowed on them three ensigns, named in Turkish *tugh*, which consisted of staves trimmed with the tail of a horse: inferior officers of the crown were honoured by only one or two of these insignia. About the middle of the seventeenth century, the Turkish empire comprised twenty-two *beglerbeglics*, or provinces governed by beglerbegs, who derived their income from the places under their government, viz., seventeen in Asia: Anatolia, Caramania, Diarbekir, Damascus, Siwas, Erzerum, Van, Childir, Shehrezur, Aleppo, Marash, Cyprus, Tarabolos, Trebizond, Kars, Mosul and Rika; and five in Europe Rumili, Gallipoli (the beglerbeglic of the seas), Budun or Buda, Temeswar, and Bosna. Six other beglerbegs received their salary out of the grand signior's treasury: they were those of Cairo, Bagdad, Yemen, Habesh, Basra, and Lahsa. (See Paul Rycaut, *State of the Ottoman Empire*, London, 1668, fol. pp. 51-57.)

BEGONIA'CEÆ, a natural order of Endogens, consisting of a single genus, composed of species found exclusively in the dampest parts of the tropics in both the New and Old World, particularly in Asia and America. They have perfectly unisexual flowers, with a superior calyx, generally coloured pink, consisting, in the sterile flowers, of from two to four pieces, and in the fertile flowers of from five to eight. The stamens are numerous; the style simple; the stigmas three, often forked, and having a wavy or twisted appearance. These latter originate from a three-cornered, three-celled ovary, containing a multitude of little seeds, which changes to a thin-sided capsule with three extremely unequal wings. The leaves are always more or less unequal-sided, and have highly-developed membranous stipules at their base.



[Begoniaceæ.]

1, a sterile flower; 2, a fertile one; 3, the same in bud; 4, the half-grown ovary and stigmas; 5, fruit; 6, the same cut through horizontally; 7, seeds the natural size; 8, one seed magnified; 9, the same cut through to show the embryo in its natural position in the albumen; 10, an embryo separate.

It is very difficult to say with what other natural order this has most affinity. By Link it has been stationed near *Umbelliferæ*, a most unintelligible association. Jussieu, attracted by its highly developed stipules, and apparently apetalous flowers, together with the acid flavour which is so prevalent in the order, suspected its near alliance with *Polygoneæ*, while Lindley, with a greater degree of probability, now makes it constitute an alliance of his Epigynous Cohort of Exogens with polypetalous flowers, stationing it in the vicinity of the Gourd tribe.

All the species of the only genus, Begonia, of which the order consists, have fleshy leaves, often richly-coloured with crimson, succulent stems, and neat-looking pink flowers growing in few-flowered panicles. They are deservedly favourites with the collectors of tropical plants in consequence of the facility with which they may be kept in a state of almost constant flowering; yet we are not aware that they have ever received in this country the consideration they deserve, although the readiness with which they lend themselves to the cultivator's art renders them peculiarly suited to his attention. Heat and moisture in a high degree, with decayed vegetable matter to grow in, such as old tan, are all that they require: treated thus in the imperial gardens at Schönbrunn, near Vienna, they form one of the most interesting objects in that splendid establishment, occupying almost exclusively a house specially allotted for their cultivation, and not yielding in attraction to the tropical forest, fern-houses, and palm-houses in their vicinity, with which the visiter naturally compares them. About fifty species are at present described, the principal part of which may be procured in a living state in the gardens of Europe.

BEGUINS, in ecclesiastical history, certain tertiaries or half-monks, who followed the *third* rule of St. Francis. They were called in Italy, Bizochi and Bocasoti; in France, Beguins; and in Germany, Beguards or Beghards: and are very frequently mentioned in the ecclesiastical history of the middle age. The accounts, however, which both antient and modern writers generally give of these famous names are so uncertain and so different from each other, that the history of the Beghards and Beguins is involved in greater perplexity than any other part of the ecclesiastical history of that period. Mosheim is minute upon the true origin of these denominations, both of which he considers to have been derived from the German *beggen* or *beggeren* (now written *begehren*), to seek with importunity, by joining which to the syllable *hard*, which is the termination of many German words, we have the word *beggehard*, applicable to a person who asks any thing with great ardour, and from which the English word beggar is manifestly derived. These observations, on the origin and signification of the words in question, serve as a clue to the difficulties in which the history of the Beghards and Beguins has been involved; and, as Mosheim justly observes, will enable the reader to account for the prodigious multitudes of Beghards and Beguins which sprung up in Europe in the thirteenth century; and will show him how it happened that these denominations were given to above thirty sects or orders, which differed widely from each other in their opinions, their discipline, and manner of living. The Bizochi or Beguins, if we except their sordid habit and certain observances or maxims, which they followed in consequence of the injunctions of St. Francis, lived after the manner of other men, and were therefore considered in no other light than as seculars and laymen. (See the *Acta Inquisit. Tholosanæ*, published by Limborch, pp. 307, 329, 382, 389, &c. and Jordan's *Chronicon*, published by Muratori, *Antiquit. Ital. Medii Ævi*, tom. iv., p. 1020.)

We must not, however, says Mosheim, confound these Beguins and Beguines, who derive their origin from an austere branch of the Franciscan order, with the German and Belgic Beguines, who crept out of their obscurity in the thirteenth century, and multiplied prodigiously in a very short time. Their origin was of earlier date than this century, but it was only now that they acquired a name, and made a noise in the world. Their primitive establishment was undoubtedly the effect of virtuous dispositions and upright intentions. A certain number of pious women, both virgins and widows, in order to maintain their integrity, and preserve their principles from the contagion of a corrupt age, formed themselves into societies, each of which had a fixed place of residence, and was under the inspection and government of a female head. Here they divided their time between exercises of devotion and works of industry, reserving to themselves the liberty of entering into the state of matrimony, and quitting the convent whenever they thought proper. And as all those among the female sex, who made extraordinary professions of piety and devotion, were distinguished by the title of *Beguines*, i. e. persons who were uncommonly assiduous in prayer, that title was given to the women of whom we are now speaking. The first society of this kind that we read of, was formed at Nivelle in Brabant, in the year 1226, or as other historians say, in 1207; and was followed by so many institutions of a like nature in France, Germany, Holland, and Flanders, that towards the middle of the thirteenth century, there was scarcely a city of any note that had not its *beguinage*, or vineyard, as it was sometimes called in conformity to the style of the *Song of Songs*. All these female societies were not governed by the same laws: but in the greatest part of them, the hours that were not devoted to prayer, meditation, or other religious exercises, were employed in weaving, embroidering, and other manual labours of various kinds. The poor, sick, and disabled Beguines were supported by the pious liberality of such opulent persons as were friends to the order.

Mosheim, in a note, says, 'in the last,' meaning the seventeenth century, 'there was a great debate carried on in the Netherlands, concerning the origin of the Beghards and Beguines: the latter, in the course of the controversy, producing the most authentic and unexceptionable records and diplomas, from which it appeared that in the eleventh and twelfth centuries there had been several societies of Beguines established in Holland and Flanders.' It is true, he adds, they had no more than three of these authentic acts to offer as a proof of their antiquity; the firs drawn up in the year 1065, the second in the year 1129, the third in 1151; and they were all three drawn up at Vilvorden by the Beguines, who at that time were settled there. (See Aub. Miræi, *Opera Diplomatico-historica*, tom. ii. c. xxvi. p. 948, and tom. iii. p. 628. Edit. nov.; Eryc. Puteanus, *De Beghinarum apud Belgas Instituto et Nomine Suffragio*, printed in A. Rickel's *Vita S. Vaggæ cum Annotationibus*, p. 65-227. 4to. Douay, 1631.) Hence Mosheim thinks it almost probable that a convent of Beguines must have existed at Vilvorden before the thirteenth century, and of course before that of Nivelle.

In the fourteenth century, the societies of the Beguines had become very numerous in Germany; but as they adopted some of the mysterious and extravagant opinions of the 'Mystic brethren and sisters of the free Spirit,' we find in the German records of this century a frequent distinction of them, into those of the right and approved class, and those of the sublime or free spirit, the former of whom adhered to the public religion, while the latter were corrupted by the opinions of the mystics. The Beguines now shared in the persecution which fell upon the mystics. The Clementina, as it is called, or constitution of the council of Vienna, A D. 1311, against the Beguines, or those female societies who lived together in fixed habitations, under a common rule of pious discipline and virtuous industry, gave rise to a persecution of these people which lasted till the reformation by Luther, and ruined the cause both of the Beguines and Beghards in many places. For though the pope, in his last constitution, had permitted pious women to live as nuns in a state of celibacy, with or without taking the vow, and refused a toleration only to such of them as were corrupted with the opinions of the Brethren of the free Spirit; yet the vast number of enemies which the Beguines and Beghards had, partly among the mechanics, especially the weavers, and partly among the priests and monks, took a handle from the Clementina to molest the Beguines in their houses, to seize and destroy their goods, to offer them many other insults, and to involve the Beghards in the like persecution. Pope John XXII. afforded the Beguines some relief under these oppressions, in the year 1324, by a special constitution, in which he gave a favourable explication of the Clementina, and ordered that the goods, chattels, habitations, and societies of the innocent Beguines should be preserved from every kind of violence and insult; which example of clemency and moderation was afterwards followed by other popes. On the other hand, the Beguines, in hopes of disappointing more effectually the malicious attempts of their enemies, embraced in many places the third rule of St. Francis and of the Augustines. Yet all these measures in their favour could not prevent the loss both of their reputation and substance, for from this time they were oppressed in several provinces by the magistrates, the clergy, and the monks, who had cast a greedy eye upon their treasures, and were extremely eager to divide the spoil. (See Mosheim's *Eccles. History*, edit. 8vo. Lond. 1782, vol. iii. pp. 228, 229, 230, 231, 377, 379.) Mosheim intended a separate work upon the Beghards and Beguines, which never appeared; though he states himself, in his history, that it was then almost finished. The most copious writer on the long persecution of the Beguines is Christianus Wurstisen, or

Urtisius, in his *Chronicon Basiliense*, written in German, lib. iv. cap. ix. p. 201. fol. Basil, 1580.

There is a little work of great rarity, entitled *Lettre de M. l'Abbé S*** à Mlle. de G***, Béguine d'Anvers, sur l'Origine et le Progrès de son Institut.* 12mo. Par. 1731, from which we learn that Beguinages, as they were called then, existed at Aix-la-Chapelle, Alost, Anderlech, Anghoin, Antwerp, Arras, Arschot, Audenarde, Bethune, Bruges, Brussels, Cambray, Cologne, Courtray, Diest, Douay, Ghent, Grandmont, Hasselt, Herenthals, Hochstraten, Huy, Isch, Lew, Liége, Lierre, Lille, Lovz, Louvain, Malines, Mons, Namur, Nivelle, Orchies, Ruremonde, Termonde, Tirlemont, St. Trond, Tongres, Tournay, Tournhout, Valenciennes, Venlo, and Vilvorden. It contains also two representations of a Beguine, one in the dress worn in the chapel of her house or convent, and the other in her walking habit. Communities of Beguines still subsist in Holland, Belgium, and Germany. In Brussels there is a portion of the town still called the Beguinage, inhabited by about a thousand Beguines, governed by matrons. There are Beguinages also at Amsterdam, Antwerp, and Mechlin.

BEHEADING. [See DECAPITATION.]

BEHEM, MARTIN, was a celebrated navigator and geographer of the fifteenth century. His name is written by various authors in very different ways: Behem, Beham, Behaim, Bœhm, Bœhem, Behen, Behemira, &c. He was born in the old imperial city of Nuremberg, somewhere about the year 1436. His family, which was respectable, or what was called 'distinguished' in those days, is said to have come originally from Bohemia. His education was carefully attended to, and he is said to have enjoyed the advantage of being instructed by the learned John Müller, better known under the Latin name of Regiomontanus. In early life he followed the profession of a merchant, continuing, however, to cultivate the mathematical, and particularly the nautical, sciences, which may have become more interesting to him from the circumstance of his having to make several commercial voyages. Even at this time he is said to have reflected a great deal on the subject of the antipodes, and, like Columbus, to have been convinced of the existence of vast tracts of land in the western hemisphere; but already many scientific men entertained vague notions of the kind.

Being on business at Antwerp in the year 1479, Behem became acquainted with some Flemings who were closely connected with the enterprising court of Lisbon, and who had formed colonies in the newly-discovered islands of the Azores. At their pressing invitation, Martin went to Portugal, where, as a skilful cosmographer and maker of maps, he was well received, that country being at the time wholly given up to maritime discoveries. The many controversies and contradictions concerning Behem's life begin at this point, but here, at least, they are easily settled. Cellarius and several other writers say that Behem was the discoverer of the whole group of the Azores, whereas there is ample evidence to show that some of them were seen by Vanderberg, a navigator of Bruges, in 1431, when Martin could be little more than a year old; that Gonsavo Velho Cabral visited and named the island of Santa Maria in 1432; and that all the islands were known in 1460, or nineteen years before Behem went to Lisbon, and connected himself as a geographer and explorer with the Portuguese government. These facts are recorded in Portuguese history. Other authors, again, merely make Behem the discoverer of the island of Fayal; and Mr. Otto, who has taken great pains to advance the fame of his countryman, attaches great importance to the following note, which he says was written in German, on parchment, and preserved in the archives of Nuremberg:—'Martin Beham, Esq., son of Mr. Martin Beham of Scopperin, lived in the reign of John II., king of Portugal, on an island which he discovered himself, and which he called Fayal, situated among the Azores in the Western Ocean.' But there is good ground for believing that the only two of the islands unknown even so early as 1449 (when King Alphonso of Portugal granted a license to his own uncle, Don Henry, to colonise the Azores), were the comparatively small and distant islands of Corvo and Flores; and its magnitude and position must of necessity have made Fayal, with the group to which it belongs, known soon after the discovery (in 1432) of St. Mary's and St. Michael's.

We now come to a fact in which his biographers generally agree, though they differ a few months as to date. In 1484, Behem was placed as a scientific man on board the fleet of the celebrated navigator Diogo Cam, who was commissioned to prosecute Portuguese discovery along the west African coasts, which were then only known as far as Cape St. Catherine in lat. 2° 30′ S. With that distinguished admiral the cosmographer went to Fayal and Pico; and this we believe to be the first time he ever visited the Azores. Leaving that group of islands, they bound in with the African continent, and, doubling Cape Verde, examined all the coast from the river Gambia to the river Zaire, or Congo, the mouth of which lies in lat. 6° S. Continuing their course, they made Cape St. Augustine, and finally reached Cape Cross, or De Padrono, in lat. 22° S., which was the limit of their voyage, and no less than *19° 30′ farther south than any* preceding discoverer had ventured. After an absence of nineteen months, Behem returned to Lisbon, where, in reward for his services, the king (John II.) conferred the honour of knighthood upon him in a public and unusually splendid manner.

In 1486 we hear of Behem at Fayal, where, and at which time, he married the daughter of Job Huerter, by whom he had a son. It appears to us, that, from his settlement in this island, and from the care he took to colonize and cultivate it, the mistake arose, in after years, of his having been the discoverer of Fayal. Martin Behem did not (as far as we can learn) accompany any other expedition for discovery either to Africa or elsewhere; but he busied himself in making charts, and occasionally went from the Azores to Lisbon and to Madeira, at either of which places he may have formed an acquaintance with Christopher Columbus. An important, but we think an unreasonable, conclusion has been drawn chiefly from the assumed meeting of these two great men.

In 1492, the year in which Columbus started on the expedition that ended in the discovery of the New World, Martin Behem paid a visit to his native city of Nuremberg, where, in the course of a year's residence, and at the earnest request of his countrymen, he made a terrestrial globe, some traits and guesses in which have, perhaps more than anything else, contributed to an obstinately maintained theory. When he returned from Germany to Portugal he was employed for a short time in some diplomatic negociations; but in 1494, retiring from all public business, Martin repaired to his estates in Fayal, where he lived tranquilly in the bosom of his family, continuing, however, to keep his attention awake to his old and darling subject, and to the progress of discovery, which after Columbus's first voyage was carried on more rapidly than ever. In 1506 he was once more at Lisbon, and on the 29th day of July in the same year, full of years and honours, he died in that city, leaving no works of any kind behind him, except the maps and charts he had made, and his globe. A recent tourist in Germany (Mrs. Jameson) mentions an interesting fact: the old house of Martin Behem in the city of Nuremberg is to the present day occupied by a globe and mapseller.

It is admitted on all sides that Martin Behem ought to be regarded as one of the most learned geographers, and as the very best chart-maker of his age. But these, his real and great merits, have not satisfied certain writers, who, moved by the prejudices of country, or a love of contradiction and paradox, insist that Behem, and not Columbus, was the discoverer of America. Cellarius and Riccioli both say that he visited the American continent and the Strait of Magalhaens, but Stuvenius appears to have been the first to give great importance to this doctrine: asserting in his treatise, *De vero novi Orbis Inventore*, that Behem had accurately traced on his globe preserved at Nuremberg the islands of America, and even the Strait of Magalhaens. Professor Tozen combated this assertion as far back as 1761, and for a quarter of a century the theory was laid aside as untenable. Dr. Robertson, in his *History of America*, took some pains to rescue the fame of Columbus, but the task was then considered almost unnecessary. In 1786, however, Mr. Otto, a diplomatic servant of the French government, but a German by birth, again renewed the nearly forgotten dispute, and in a long letter to Dr. Franklin stated his reasons for believing that Martin Behem had visited America before Columbus, and that all Columbus had done after him had been in pursuance of Behem's instructions and advice.

Mr. Otto does not seem to be aware that such an opinion was ever started before. His letter was published in the second volume of 'Transactions of the American Philosophical Society, held at Philadelphia for promoting Useful Knowledge.' After its appearance a variety of writers and compilers of cyclopædias and biographical dictionaries, without looking into the matter, took up Mr. Otto's story as something new and striking, not knowing that it was old and had been disproved. The way in which it opens is enough to throw discredit on the whole, for Mr. Otto repeats and believes the error that Behem was the discoverer of all the Azores. When he says that this impossibility is established by records preserved in the archives of Nuremberg, we can have no faith in the same kind of proofs as to the American discovery. It must be mentioned, moreover, that none of these records or documents 'preserved in the archives of Nuremberg,' with the exception of a letter said to be written by Behem, bear any date; and thus they may all have been written after the discoveries of Columbus and Magalhaens were well known, at least to the learned world.

According to one of these undated records, Behem, after residing twenty years at Fayal, applied, in 1484 (eight years before Columbus's expedition), to John II. of Portugal for the means of making a voyage of discovery in the south-west, and having procured some ships found out that part of America which is now called Brazil, whence, sailing southward, he went to the Strait of Magalhaens, and to the country of some savage tribes, whom he called Patagonians, because the extremities of their bodies were covered with a skin more like bears' paws than feet and hands.

Another of these Nuremberg documents, as quoted by Mr. Otto, says that Behem, traversing the Atlantic Ocean for several years, examined the American islands, and discovered the strait which bears the name of Magalhaens, before either Christopher Columbus or Magalhaens sailed in those seas, and even mathematically delineated on a chart for the king of Portugal the situation of every part of that famous strait.

With regard to the first of these assertions, which is the more definite of the two, it is perfectly well known that the only expedition for discovery fitted out by the Portuguese in 1484 was that of Diogo Cam, who certainly never went near America, and who, as we have already shown, was accompanied by Martin Behem. Indeed Mr. Otto, who quotes contradictory statements to support each other, and prove one and the same thing, himself allows that Behem was with Diogo Cam in his African voyage in 1484, *i. e.* in the very year that he is said to have applied for a fleet to go westward and to have discovered Brazil, &c., and in which year, as we have already stated, no other expedition than Diogo Cam's left Portugal.

Mr. Otto quotes as contemporary authorities one or two writers who did not live until many years after Behem's death and the discoveries both of Magalhaens and Columbus, and refers to several later authors who could be of no authority whatsoever. The chronicler Hartman Schedl was contemporary with Behem; but, as far as he is cited by Mr. Otto, who thinks the passage conclusive, he does not prove or even imply that Behem was the discoverer of America. The passage simply states that Martin Behem went in King John's ships *with Diogo Cam*, that they coasted along the southern ocean, crossed the equator, got into the other hemisphere, where, facing to the eastward, their shadows projected towards the south and right-hand; that thus the enterprise may be said to have opened to us another world hitherto unknown, and that having finished this cruise in twenty-six months they returned to Portugal with the loss of many of their men. Now, as it has been seen, Diogo Cam, though keeping close to the African coast, did indeed cross the equator and even reach the 22° of southern latitude, and the great extent of his discoveries on the coast of Africa, occupying 19° 30′, might in those times be very well called a new or unknown world, without any reference to America.

Mr. Otto says that Columbus, being at Madeira, met Martin Behem, who informed him of his discoveries in the western world and showed him which way to shape his course. But this assertion falls to the ground when we find that the course actually taken by Columbus was very different from the alleged one of Behem, and far to the north of the pretended discovered land marked on Behem's famous globe. This globe, though a remarkable performance, was of necessity, in those times, both defective and erroneous even in relation to the old world. It was made up from the authorities of Ptolemy, Pliny, and Strabo, and still more from the excellent travels of Marco Polo and the fabulous travels of Sir John Mandeville. From this very globe it should appear that his geographical information in the east did not extend beyond Japan, nor in the west beyond the Cape Verde Islands; and that all that he dotted down on his globe beyond those islands was from mere conjecture. Of two islands which he set down between the Cape Verde group and America neither exists in the place assigned to it. One was called St. Brandon, the other Antilia, and from the similarity of the latter name it has been supposed to be one of the Antilles or American islands discovered by Columbus. But Columbus only gave the name of a fabulous island to a real one; for, long before his time, the denomination of Antilia or Antilla had been assigned to a supposed country somewhere westward of the Azores. Andrea Bianco, a Venetian geographer, who lived at the beginning of the fifteenth century, indulged precisely in the same speculation. Among a collection of his charts bearing the date of 1436 (*i. e.* fifty-six years before Martin Behem made his globe) there is one in which he lays down a very large island at a great distance to the west of the Azores, and which he calls Antilia, and marks the beginning of another island which he calls La Man di Satanasso, or the Devil's Hand.

Mr. Otto admits that neither Martin Behem nor the Portuguese who employed him, and who were exceedingly jealous of the discoveries made under the Spanish flag, ever even hinted, at the time that, Columbus was indebted to another for his discovery of America. Had there been the shadow of a doubt on the subject the court of Lisbon would have made itself heard throughout Europe, and would not have left the controversy to a few literary men living long after the event. Mr. Washington Irving, in his *Life of Columbus*, has come to the now incontrovertible conclusion that Martin Behem had no sort of claim to the honours due to the great Genoese.

BEHE'MOTH, בְּהֵמוֹת, is the *pluralis majestatis*, or majestic plural, or plural of excellence, of *Behemah*, i. e. *beast, cattle*, and occurs in Job xl. 15-24, as the name of a large herbivorous animal, the description of which, according to Bochart, Scheuchzer, Herder, Gesenius, and other interpreters, corresponds with the appearance and qualities of the hippopotamus. Gesenius thinks that the name behemoth was a Hebrew corruption of the Egyptian word *Pehemoedh*, πεχεμοεδ—bos marinus seu aquaticus—the water ox, or hippopotamus, which is described by various travellers.

Behemoth is thus described in Job xl. 15-24: 'Behold now behemoth which I created as well as thyself; he eateth grass as an ox. Behold now his strength in his loins, and his power in the muscles of his belly. He bends his extremity (*i. e.* trunk, proboscis) like a cedar; the sinews of his terrors (*i. e.* his terrible sinews) are interwoven (*i. e.* twisted, or interlaced). His hollow bones are like tubes of brass; his solid bones are like bars of iron. He is the chief of the works of the Almighty. His Maker gave him his sword (*i. e.* the weapon of his tusks). For mountains bear his fodder, and all the beasts of the field play there. He lieth under the lotus-bushes; in the covert of reeds and mire. The lotus-bushes cover him with their shadow; the willows of the brook encompass him. Behold, the river overfloweth, yet he fleeth not. He is undismayed, although Jordan rush against his mouth. With his eyes he takes it (his aim), his nose pierces through snares.' This is frequently illustrated by a reference to the elephant, who tries with the extremity of his trunk whether the enclosures are secure. It was perhaps in allusion to the irresistibility of Behemoth that Thomas Hobbes of Malmsbury gave the title *Behemoth* to his history of the causes of the civil wars of England, from the year 1640 to 1660.

This description appears to answer more to the elephant than to the hippopotamus; and the opinion of the oldest commentators, who understood it of the elephant, is confirmed by the fact that the Arabs are in the habit of adding the epithet *mehemoth* to their name of the elephant, *fihl*, if he is very large (Strahlenberg, English translation, p. 403, cited in Cuvier's *Ossemens Fossiles*, vol. i.) It is singular that the Siberians call the elephants which have been preserved in their country, *mammout*, or *momot*, or *momoth*, or *mammoth*, or *mammouth*.

The word *behemoth* occurs also as the mere plural of behemah, *cattle*, in Ps. l. 10: 'For every beast of the forest is mine; and the cattle (behemoth) upon a thousand hills.' (Compare Psalm lxxiii. 22.) Jarchi and other rabbies understand these passages as the majestic plural for one great ox, which consumes each day the verdure of a thousand mountains; but, according to them, it is providentially ordered that whatever he eats in the day grows again during the night. They conclude from the passage, 'male and female created he them,' that there were two behemoth; but, that they might not destroy the whole world by multiplying, the female was killed, and the flesh, which is salted, is reserved for the first dish at the feast of the blessed in Paradise. (For the literary references see Buxtorfii *Synagoge Judaica*, fourth ed. Basileæ, 1680, pp. 734-736.) [See HIPPOPOTAMUS.]

BEHMEN, JACOB. [See BÖHME.]

BEHN, APHARA, sometimes spelt **APHRA,** and **AFRA,** a dramatist and miscellaneous writer, was of a good family in the city of Canterbury: she was born in the reign of Charles I., but in what year has not been ascertained. Her father, whose name was Johnson, was related to the Lords Willoughby, and by means of his connexion obtained the post of lieutenant-general of Surinam, and its dependencies; for which place he accordingly sailed with his daughter, then very young, but died on the passage. Aphara, however, continued the voyage; and appears to have resided at Surinam for some length of time, though under what circumstances is not known. She there became acquainted with the famous slave Oroonoko, whom she represents to have been a prince among his own countrymen, and a man of an heroic cast of character, and who afterwards became the subject of a novel from her pen, and of a tragedy, better known, by her friend Southern. After her return to England she married Mr. Behn, a merchant of Dutch extraction; and appears to have been personally introduced to Charles II., who was so much pleased with her account of Surinam, and probably with the freedom and vivacity of her manners, that he thought her (say the biographers) a proper person to be intrusted with the management of some important affairs during the Dutch war, which occasioned her going into Flanders, and residing at Antwerp: as some other biographers say, in the character of a spy; or as others have put it, 'she engaged in gallantries for the good of her country.' It is supposed that by this time her husband was dead. The engaging patriotism of Mrs. Behn succeeded in discovering the intention of the Dutch to sail up the Thames and Medway, and to put the English to the shame of having their ships burnt, as they actually did; but the court of Charles, with its usual levity, giving no credit to the report of its fair envoy, she is said to have renounced all further politics, out of mortification, and to have devoted the rest of her stay in Holland to amusement. She set out shortly afterwards on her return to England, narrowly escaped death (for the vessel foundered in sight of land, and the passengers were saved in boats,) and became for the rest of her life an authoress by profession, and a woman of gallantry. She wrote seventeen plays, besides poems, tales, love-letters, and translations both in prose and verse. The once celebrated letters between a nobleman and his sister-in-law (Lady Henrietta Berkeley and the infamous Lord Grey) are hers. She contributed the paraphrase of Œnone's Letters to Paris, in the English collection of Ovid's Epistles; and translated Fontenelle's Plurality of Worlds, and the sixth book of Cowley's Latin poem on Plants. Both her opinions and her talents naturally brought her acquainted with the leading wits of the day, the wildest and the staidest, Rochester, Etherege, Charles Cotton, Dryden, Southern, &c.; and at one time, we know not how long, she describes herself as having been forced to write for her bread; but, from an expression in Langbaine, we guess that during the latter part of her life she was in more easy circumstances. She died between forty and fifty years of age, and was buried in the cloisters of Westminster Abbey, with the following absurd inscription:

'Mrs. Aphara Behn died April 16th, 1689.

'Here lies a proof that wit can never be
Defence enough against mortality.
Great poetess! O, thy stupendous lays'
The world admires, and the Muses praise.

Revived by Thomas Waine, in respect to so bright a genius.'

This Mr. Waine, it seems, was said, 'by the envious of her own sex,' to have been the author of most of the pieces that went under her name; but her biographers justly adduce the above verses as a sufficing proof to the contrary.

Aphara Behn is described as having been a graceful comely woman, with brown hair, and a piercing eye; something passionate, but generous; and who would sooner forgive an injury than do one. She would write in company, and at the same time take her part in the conversation. We have read somewhere, that the 'Lycidas,' for whom she represents herself as entertaining a hopeless passion, was Creech.

The character of Mrs. Behn's writings is that of a lively mediocrity, availing itself of all the license of the age. She had a feeling for truth, great animal spirits, great facility in versification, an unceasing flow of sprightly but not uncommon ideas, and courage enough to put down whatever came into her head. The result was, some pleasing little novels, chiefly taken from the French; some songs and poetical translations, very clever; and a set of dramas, successful in their day, and astounding for their licentiousness. Pope's couplet is well known:

The stage how loosely does Astræa tread,
Who fairly puts her characters to bed.

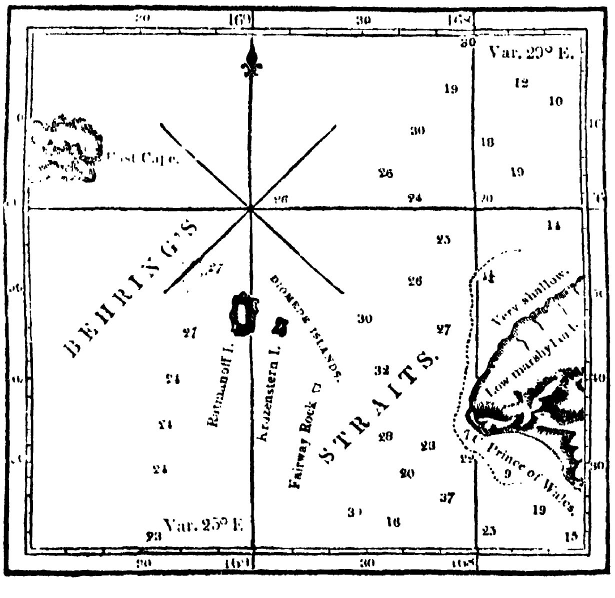
Astrœa was the poetical name by which she was known among her contemporaries. A modern reader who dips into her plays is astonished to find of what a heap of meretriciousness they are made up; but luckily he cannot read far. The very liveliness, not being of a high order, becomes tiresome. There is an endless imbroglio of rakes, demireps, and common-place situations, out of which he is glad to escape. Mrs. Behn seems scarcely to have had any idea of love, except as an animal passion; but as this was the feeling of the age, and she was probably brought up in it, besides being early thrown out into the world, and ultimately surrounded with men of wit, who helped to spoil her, a reflecting reader will perhaps give her the credit of having been injured by the very candour and docility of her nature; and consider it probable, that, had she lived in better times, she would have been a real ornament to her sex. (*Dramatic Works of the late incomparable Mrs. Aphra Behn; Biographia Britannica, &c.*)

BEHRING, VITUS, was by birth a Dane, and in his youth made many voyages to the East and West Indies; but being tempted by the great encouragement held out to able mariners by Peter the Great, he early entered the navy of Russia, and served in the Cronstadt fleet, in the wars with the Swedes. He obtained the rank of lieutenant in 1707, and of captain-lieutenant in 1710; the date of his becoming captain is uncertain, but in 1732 he was promoted to the rank of captain-commander previous to setting out on his last expedition.

The Empress Catherine being anxious to promote discovery in the north-east quarter of Asia, and to settle the then doubtful question as to the junction of Asia and America, Behring was appointed to command an expedition for that purpose. He left St. Petersburg in February, 1725, and after exploring several rivers, travelled over-land by the way of Yakutsk, on the Lena, to Okhotsk, then crossed over to Bolcheretsk, and arrived at Nischnei Kamtchatka Ostrog. Here he built a small boat, and sailed on the 20th of July, 1728, coasting Kamtchatka till he reached in August (67° 18′ N. lat. by his observations) a cape which, from the land beyond it trending so much to the westward, he supposed to be the north-easternmost point of Asia. In this conjecture, however, as has since been proved, Behring was mistaken; the point reached by him must have been Serdze Kamen: but with this conviction on his own mind, and the approach of winter, he determined to retrace his steps, and he returned in safety to Nischnei Kamtchatka. The following year he made another attempt, but a continuance of bad weather obliged him to shape his course in an opposite direction, and he reached Okhotsk, having doubled the southern promontory of Kamtchatka, which peninsula was up to that time generally believed to join Japan. From Okhotsk he went to St. Petersburg, and having obtained his promotion, in 1733 took the command of an expedition for the purposes of discovery, which was fitted out on a very large scale. After several exploratory excursions, he stationed himself at Yakutsk, directing various detachments of his officers down the rivers on different points of the Frozen Ocean. In 1740 he reached Okhotsk, where vessels had previously been built for him, in which he sailed for Awatska Bay, where he founded the present settlement of Petropaulovski, and passed the winter. His discoveries to the northward being deemed sufficiently satisfactory, he was now directed to proceed to the eastward towards the American continent. He left Awatska in June, 1741, steering to the south-east, but having reached the parallel of 46° without seeing land, he altered his course to the north-east, and on the 18th of July (having been forty-four days at sea) he descried very high mountains covered with snow in lat. 58½° N., having made, according to his reckoning, 50° of E. long. from Awatska. He now followed the coast to the northward, which was found to take a very westerly direction, but his crew suffering from sickness, and the ship being in a very disabled state from bad weather, he resolved to return to Kamtchatka, which, however, he was not doomed to reach. Having passed several islands, his ship was wrecked on that which now bears his name, on the 3d of November, 1741: Behring died on the 8th of the following month. He may be said to have been half buried alive, for the sand rolled down continually over him in the ditch where he lay, but he would not suffer it to be removed, as it afforded him warmth.

In the following summer the survivors of his crew reached Kamtchatka in a small vessel which they built from the wreck, and thus some account of this ill-fated voyage was preserved. With regard to the places that he touched at on the American shore, they must be very undefined; but the fact of the westerly trending of the coast, and the high mountains, seem to place his first landfall about Admiralty Bay, on that part of the coast now called New Norfolk. The islands mentioned by him must have been some of the Aleutian Archipelago. (Müller's *Account of Russian Discoveries.*)

BEHRING'S STRAITS, which connect the Pacific with the Polar Ocean, are formed by the approach of the continents of America and Asia; the two nearest points of these continents are Cape Prince of Wales to the east, and East Cape to the west, which are distant only 50 miles from each other in a N.W. and S.E. direction. They are both bold and high promontories, but the hills on the American side are more ragged and peaked. About a mile to the northward of Cape Prince of Wales, a low swampy shore begins, which continues all the way to Kotzebue Sound. The greatest depth of water in the straits is about 32 fathoms: the bottom is soft mud in the middle, and sandy towards each shore. About midway across are three islands, called the Diomedes, the largest of which (Ratmanoff) is about four miles long; the next (Kruzenstern) nearly two miles, and the last a mere rock. Neither these islands nor the adjacent shores are permanently inhabited, though frequently visited by the Esquimaux in their excursions.



These Straits derive their name from the celebrated Russian navigator, Vitus Behring, who in 1728 left Kamtchatka and made a coasting voyage to the northward, though it is by no means certain that he ever passed East Cape. To our own countryman Cook we are indebted for more accurate information about these straits, which have recently undergone a stricter examination by Capt. Beechey. It is uncertain whether these straits are blocked up during the winter, though it does not appear probable that they are, as the ice in these seas is not of the heavy nature that it is in Baffin's Bay, and therefore only takes the ground in very shallow water. The prevailing current appears to set through the straits to the northward, but it has not that decided character which it has farther to the northward, where, along the American coast, it runs strong to the N.E.

BEHRING'S ISLAND is situated in the North Pacific, 100 miles S.E. of Cape Kamtchatka. It was first discovered by Behring, on his return to Kamtchatka from the voyage of discovery on the coast of America in 1741. Soon after, some Kamtchadales went over to the island to hunt the sea-otter, foxes, and other animals, for their skins. It was uninhabited at the time of its discovery, and was barren in the extreme, without a shrub on its surface, the only fire-wood being what was cast on the beach. It has since become an important trading station, and vessels from Okhotsk and Kamtchatka, trading to the numerous islands in these seas, generally winter here, and cure a quantity of the flesh of sea-animals for their voyage.

The island is high to the N.W., steep and cliffy, but slopes gradually down to the southern shores, which are low; the island is nearly surrounded by a rocky coast. Fresh water is found on it. The north point of the island is in 55° 22′ N. lat., 165° 51′ E. long.

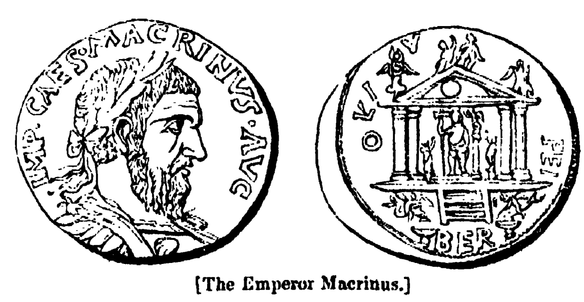
BEHUT, the antient Hydaspes. [See PENJAB.]

BEIRA. [See BEYRA.]

BEIRUT, or BAIROUT (Βηρυτὸς, Berytus, Steph. Byzant.: see Dionys. Periegetes, l. 411, for the quantity of the penultima), is a town of Syria, on the shores of the Mediterranean, situated on the south side of an open bay. It was a Phœnician city of great antiquity. The name is supposed by some to have been derived from the Phœnician deity Baal-Berith, who had a temple here; but Stephanus Byzantinus says it was so called from its abundant supply of water: Beer (Βήρ), he adds, signifies in the Phœnician language a *well*. [See BEER-SHEBA.] Diodotus Tryphon entirely destroyed it about 140 B.C., but after the conquest of Syria by the Romans, it was rebuilt near the site of the antient city. Augustus, who made it a colony called it after his daughter, with the epithet 'happy,' Colonia Felix Julia, and medals were afterwards struck in honour of the Roman emperors, bearing the legend Colonia Felix Berytus. (Plin. v. 20.) Agrippa, the grandson of Herod the Great, decorated the town with a theatre, amphitheatre, baths, &c., and instituted games. Herod the Great held here an assembly, in which he condemned his two sons, Alexander and Aristobulus, on the charge of conspiring against his life. After the capture of Jerusalem, Titus celebrated the birth-day of his father Vespasian at this city. Berytus was famous for the study of the law, for which there was a celebrated school in the city, the foundation of which is ascribed to Alexander Severus; it certainly flourished, at least before Diocletian. Justinian called it the 'nurse of the law,' and

[Coins of Berytus from the British Museum, actual size.]

[The Emperor M. Aurel. Antoninus.]



[The Emperor Macrinus.]

would not allow any other city than Rome, Constantinople, and Berytus, to have professors who should expound the Roman law. (See the second epistle prefixed to the *Digesta.*) The splendour of this school, which preserved in the East the language and jurisprudence of the Romans, may be computed to have lasted from the third to the middle of the sixth century. (Gibbon, ii. 294.) In 551 A.D. Berytus was nearly destroyed by an earthquake.

When the Saracens' overran Syria, Berytus fell into their hands. It was taken from them in 1111, by Baldwin, king of Jerusalem, but retaken by Saladin in 1187. During the Holy Wars it often changed masters, and is the scene of the fabled victory of St. George over the dragon. Till the year 1791 the French had a factory at Beirut, but they were expelled by Djezzar, pasha of Acre, who seized the place from the emir of the Druses, to whom it then belonged, and placed a Turkish garrison in it.

Since this time both the town and the adjacent country have been greatly neglected, though it still continues the entrepôt of the commerce of the Druses and Maronites, whence they export their cottons and silks, and receive in return rice, tobacco, and money, which they exchange for the corn of the Bekaa and Havuran. As the town was greatly inconvenienced for water, Djezzar cut a canal from the River Beirut, which falls into the bay near the city, and built fountains, in excavating which much of the antient remains was discovered. He also built the present walls, after the bombardment of the place by the Russians, but they are very weak.

Beirut now contains few traces of its former splendour: a bath, pieces of granite columns, several of which were still standing when Pococke visited the place, and a few other fragments, are all that now remain. But a great number of granite columns may be seen along the shore beneath the water, and part of the present mole is composed of them. From the debris without the present walls, it appears that the antient town occupied a larger space than the modern, which is but a small place. The walls are strengthened by several towers, and there are five gates to the city. It receives a copious supply of water from a small river called Nahr Beirut, which rises in Mount Libanus, and flows into the sea a short distance from the town; the water is conveyed by the canal before-mentioned, and received into reservoirs and fountains. The streets are narrow and dirty, like those of all Turkish towns: the houses are mostly built of stone. The town is commanded by some low hills to the S.E. Its population is estimated at 6000 souls, of whom the Turks form one-third. There is a large and well-built mosque in the city, formerly a Christian church, dedicated to St. John, and there was a Capuchin convent. The suburbs of the town are as large as the city itself.

In point of locality, Beirut is as pleasantly situated as any town in Syria: it stands at the verge of a beautiful plain, varied with small hills, and extending to the foot of Mount Libanus. The surrounding country is covered with kiosks, and enriched with groves of vines, olives, palms, and orange, lemon, and mulberry trees; behind which rises the lofty chain of Libanus. No corn is produced around the town; a small red wine is made on Mount Libanus, which is cheap and good; but raw silk is the staple, which, with cotton, olives, and figs, is exported to Cairo, Damascus, and Aleppo. Game is abundant, the beef from Libanus is excellent, and supplies of all sorts may be procured good and cheap.

The bay is large, and the anchorage good, though open to the northward; formerly there was a port, but now there is only a small mole sufficient to shelter boats. The entrance to the river is too shallow to admit a boat of any size. There is a rise and fall of about two feet, but no regular tide. Beirut is in the pashalik of Acre. It lies in 33° 49½′ N. lat., 35° 27′ E. long., 40 miles S.S.W. of Tripoli, and 13 miles N.N.E. of Saide.

(Pococke's *Travels in the East*; Volney's *Travels in Syria*; Browne's *Travels*; Mangles and Irby; Purdy's *Mediterranean Pilot, &c.*)

BEIT is an Arabic word, which properly signifies a tent or hut, but is likewise employed to denote any edifice or abode of men. It is often found as a component part of proper names in the geography of those countries that have become subject to the Arabs: *Beit-al-Harâm, i.e.* 'the sacred edifice,' or 'the edifice of the sanctuary,' a designation frequently given to the temple of Mecca; *Beit-al-Mukaddas*, 'the sanctified abode,' *i.e.* Jerusalem; *Beit-al-Fakih, i.e.* 'the abode of the jurist,' a town in Yemen, &c. The Hebrew word, corresponding to the Arabic *Beit*, is *Beth*, which we find employed in a manner perfectly analogous in the Old Testament: in the name *Bethlehem* (in Arabic *Beit-Lahm*, or *Beit-al-Lahm*), *i.e.* 'the house of bread;' *Beth-Togarmah*, 'the house of Togarmah,' *i.e.* Armenia. The same word, *Beth*, is in Syriac still more extensively used as a component part of geographical names. In Arabian poetry, *Beit* signifies a distich.

BEITH, a small town in the district of Cunningham in Ayrshire, Scotland, eleven miles from Paisley, on the road from Glasgow by Paisley to Irvine, Ayr, and Port-Patrick. The parish of Beith, a part of which runs into Renfrewshire, is about five miles in length from east to west, and four in breadth. On the north there is a small ridge of hills, from which the land slopes to the south. Its lowest elevation, Kilburnie Loch, is 95 feet above the level of the sea, and its highest, Cuffhill, 652.

The parish contains in all 11,060 acres, of which 10,560 are in Ayrshire and 500 in Renfrewshire. Its total valued rent is 6276*l.* 0*s.* 8*d.*, of which the part in Ayrshire makes 6111*l.* 7*s.* 4*d.*, and that in Renfrewshire 164*l.* 13*s.* 4*d.* The town has gradually advanced, from a few houses in the beginning of the last century, to its present state, when it has a good town-house, built by subscription, which serves as a news-room and justice of the peace court, a thread-mill, two lint, and three corn-mills, two branch banks, a parish church with a modern spire, a subscription library, and two meeting-houses, belonging to the Relief and Antiburger dissenters. The parish of Beith is famed for its dairy produce. The manufactures of the town have several times changed. At the beginning of the last century its chief trade was in linen cloth; at one time, between 1777 and 1789, one firm alone employed 270 looms in the manufacture of silk gauze; at present thread and cotton are the principal manufactures. The population of the parish in 1755 was 2064, and in 1831, 5113. The parish church contains 1257 sittings; the United Secession, 498; the Relief, 849. The parish schoolmaster has the minimum salary. The stipend of the clergyman is 16 chalder of victual, half meal, half barley, and a glebe of 40 acres. The clergyman's stipend was at that time 79 bolls of meal, and 17*l.* 12*s.* 6*d.*, and the glebe contained 33 acres, 3 roods. The poor's money is made up of collections at the doors of the parish church and some of the dissenting meeting-houses; of part of the dues of marriage proclamations, of the proceeds of an aisle in the parish church set apart for the poor, and of a farm bought with the poor's money in 1695; and the deficiency of the poor's fund is made up by a voluntary assessment on the valued rent of the parish and the rental of the town. There are several fairs held here annually.

In the parish, there are several quarries of freestone of rather an inferior quality. Coal, though not much wrought, has been found; and the abundance of limestone, of a very superior quality, has a ready sale, not only in the parish, but in those of Lochwinnoch, Kilbarchan, &c. Rich veins of ironstone have also been discovered.

(See Sinclair's *Account of Scotland*, vol. viii., compared with Chambers's *Gazetteer*, and Carlisle's *Topographical Dictionary of Scotland.*)

BE'JA, a comarca or district of Portugal, in the province of Alentejo, bounded on the north by the districts of Evora and Villaviciosa, on the south by that of Campo de Ourique, on the east by Spanish, and on the west by Portuguese Estremadura. The ramifications of the Serra de Viana cross it in all directions, and the rivers Odiarca and Freijo irrigate its plains, which are the most fertile in Alentejo. The former of these rivers rises near the capital, flows first to the north, afterwards to the east, and then to the south-east, and joins the second, which, rising in the mountains near Cuba, flows southwards: the united stream joins the Guadiana, not far from Os Pedroas. This comarca is so productive in grain, that, after supplying its inhabitants, many thousand fanegas or bushels are yearly sent to Porto del Rey to be embarked in the Sado, down which they are conveyed to Setubal and Lisbon. The vine, olive, and fruit-trees are also in great abundance. The pasturage is rich, and game is plentiful in the mountains. The extent of the district is about 30 miles from north to south, and 60 from east to west, and its population amounts to 55,310 souls.

Beja, the capital, is built upon a rock of granite on the south-western extremity of the district, and commands a plain so fertile, that it is said to produce more than a million of bushels of wheat yearly, besides a great quantity of oil, wine, and fruit. The town is almost circular, and surrounded by walls of Moorish and Portuguese construction. It has an old castle, in the opinion of Murphy one of the best in the kingdom; a good square, in which is the town-house; and regular streets, with good houses, inhabited by the rich citizens. The principal buildings are the convent of San Francisco, and the Casa de Misericordia, or charity house. The merit of these buildings, however, cannot be very great, as Murphy does not so much as mention them. Beja is the seat of a bishop, and of the civil authorities of the district. It contains four parishes, and 10,422 inhabitants. It is about 90 miles south-east of Lisbon, in 38° 5′ N. lat., and 7° 40′ W. long.

The city of Beja is of very great antiquity. It was a Roman colony under the name of Pax Julia. The original city stood at a short distance east of the present Beja. It was in the possession of the Moors from 717 to 1165, when Alonso, the first king of Portugal, wrested it from their hands. The chief part of the present city was built by Alonso III., and the castle was constructed under his son Dom Deniz. Many valuable relics of Pax Julia have been dug out at different times, which are preserved in the museum of antiquities at Evora. (Miñano; Murphy's *Travels in Portugal.*)

BEJA, or BOJA, an African people who inhabit a tract of country north of Abyssinia, and between the Mareb and the Red Sea to the south of the port of Suakim. Mr. Salt says the country of the Boja is two days' journey north of Hamazen, which is the most northern district of Abyssinia, and that they are partially under the influence of the Nayib of Massowa and of a Christian chief, the natives being half Musselmans and half Christians. Farther north-west, towards the Mareb, is a people called Tokué, who, in all probability, are the same as the Tokaeou, mentioned in the Axum inscription as being at that time subject to the king of Axum. That inscription refers to an expedition sent by Aeizanas, king of the Axumites, Homerites, &c., who reigned about the middle of the fourth century, against the revolted Bougaeitæ, the modern Boja. [See Axum.]

Mr. Salt places to the east of the Beja, and near the coast of the Red Sea, north of Arkeeko, another people, whom he calls Bekla. Ibn 'l Wardi, an Arabian geographer who wrote about the thirteenth century, and is quoted by Salt in the Appendix, says, 'the Bujja, or Boja, are the merchants of Habesh to the north, their country being between Habesh and Nuba;' and he describes them as black, naked, and worshippers of idols, but he adds that 'many Arabs of the tribe of Raben Ibn Nuzzar have connected themselves with these people, and intermarried with them.' This seems to show that the Beja, or Boja, were originally an African race, and became intermixed with Arab blood, and gradually and partially adopted the profession of Islamism. Bruce says the Beja speak a dialect of the Geez. Ibn 'l Wardi speaks of a mine of gold, probably the Jebel Dyab, and gold sands in the country of the Boja, in the valley of Allaki (the modern Salaka), the collecting of the gold constituting the chief support of the natives. In describing the land of Aidhab (now called Gidid, or Ras Gidid), which was then a much-frequented harbour on the Red Sea, to the north of Suakim, he says, 'a governor from the Bujja presides over it, and another from the sultan of Egypt, who divide the revenues between them. The duty of the governor from Egypt is to provide supplies, and the governor of the Bujja has to guard it from the Habshi,' the people of Habbesh or Abyssinia. It is evident that at the time of Ibn 'l Wardi the Beja were a powerful and widely-extended people, or confederation of tribes, and we have also an account of their sending a large army, together with the Nubians, to the assistance of the Christians of Oxyrhynchus in Upper Egypt, against the Saracen invaders. (See Appendix to Burckhardt's *Nubia.*) The Beja and Nuba are said to have had elephants in their army. With the Beja were a race of men of gigantic stature, called El Kowad, who came from beyond Suakim. They wore tiger-skins, and had their upper lips pierced with copper rings. Makrizi, also quoted by Burckhardt, gives a long account of the Beja. Burckhardt himself, in his journey from Berber to Suakim in 1814, passed through the country of Taka, 'which,' he says, 'forms part of the country of Bedja, whose inhabitants are called Bedjawa, and which extends from Goz Radjib on the Atbara as far southwards as the mountains of Abyssinia, while to the north the chain of mountains called Langay marks its boundaries towards the Bisharye or Bishareen. It includes various deserts and several hilly districts and valleys, some of which are very fertile. The range of country thus described extends from about 15° to 18° N. lat., and from the right bank of the Atbara to the shores of the Red Sea. It is in this region that the Mareb must terminate its course, either by being lost in the sands or by joining the Atbara.

Some writers (see Malte Brun's *Geography*) have placed the Beja much farther north, among the Ababde, and near the port of Habbesh, at the bottom of the large bay between Ras el Ans and Ras el Gidid, but the proper locality of the Beja seems now too well ascertained by the authorities above given to admit of doubt.

BEJAH, the antient Hydraotes. [See Penjab.]

BEJAPORE, a considerable province of the Deccan in Hindustan, lying between 15° and 18° N. lat. and 73° and 76° E. long. The province is bounded on the north by Aurungabad, on the east by that province and Beeder, on the south by Canara, and on the west by the Indian Ocean. Its length is about 320 miles, and its average breadth 200 miles.

Towards the west, running parallel with the coast, and at a distance varying from 25 to 60 miles from the sea, is a range of lofty mountains, forming a continuation of the Ghauts. In these mountains are several fortresses which, aided by their natural position, are of great strength. They are usually built on isolated eminences, the sides of which are either naturally scarped or cut perpendicular for 70 or 80 feet below their upper margin, with only one narrow path leading up to the fortress. The passes through these mountains to the low land of the Concan on the sea-shore are always difficult, and at times are rendered almost impracticable by the swelling of mountain-streams during the frequent and abundant rains in those high regions.

The province of Bejapore is divided into sixteen districts, viz.: the Concan (the low ground between the mountains and the sea), Colapoor, Mortizabad, Assodnagur, Bejapore, Sackur, Raichoor, Mudgul, Gujundeghur, Annagoondy, Bancapore, Gunduck, Nurgul, Azimnagur, Ryebaugh, and Darwar. The principal towns of the province are: Bejapore (the capital), Satara, Goa, Bijanagur, Warree, Colapoor, Darwar, Shahnoor, Hoobly, and Meritch.

The principal rivers in the province are the Kistna, the Toombuddra, the Beema, and the Gutpurba.

On the ruin of the Bhamenee empire in this quarter the Adil Shahy dynasty was established in Bejapore in the year 1489, and the sovereignty of the province was transmitted through eight princes, all of whom bore the name or title of Adil Shah. The founder of this dynasty was Aboul-Adil Shah, and the last of these sovereigns was Secunder Adil Shah, who was made prisoner by Aurungzebe in 1689, exactly 200 years after the founding of the sovereignty.

The Emperor Aurungzebe never obtained quiet possession of Bejapore, and after his death it speedily passed under the sway of the Mahrattas, with whom it remained until 1818, when, on the expulsion of the Peshwa Bajee Rao, this great province was brought under British government. On this occasion a treaty was made with the rajah of Sattara, then a minor, assigning to him a small principality under British protection out of his former dominions, the peshwa, who was actually the sovereign of the province, having been, nominally, the minister of the rajah. Under the stipulations of this treaty the tract of country which now forms the Sattara dominions was to remain for some time under the management of British officers, to be gradually transferred to the rajah's management, who was still bound to conform generally to the advice of the British resident, and to the British system in the collection of his customs' duties. The British government charged itself at the same time with the defence of his territory, and accordingly the rajah's military establishment is entirely regulated by the will of the East India Company, with which he is bound always to act in subordinate co-operation. One of the fundamental conditions of the agreement on the part of the rajah is the renunciation of all intercourse with foreign powers, a departure from which line of conduct would subject him to the loss of the protection and other advantages which are secured to him by the treaty. The whole of the stipulated territory was placed under the rajah's management in April, 1821, when he became twenty-one years of age: it yields him an annual revenue to the amount of about 20 lacs of rupees (200,000*l*.) The tract thus guaranteed to the rajah of Sattara is bounded on the west by the western Ghaut mountains, on the south by the Kistna and Warna rivers, on the north by the rivers Neera and Beema, and on the east by the territory of the Nizam. [See SATTARA.]

The remainder of the province, which is attached to the presidency of Bombay, is distinguished in the revenue records of the East India Company as the district of Darwar.

(Rennell's *Memoir of a Map of Hindustan*; Mill's *History of British India*; *Appendix to Report of Committee of the House of Commons on the Affairs of India*, political section, 1832.)

BEJAPORE, or **VIZIAPORE** (*Vijayapura*, signifying in Sanscrit the victorious or triumphant city), was the antient capital of the province of Bejapore. It stands in 16° 48′ N. lat., and 75° 46′ E. long., and is now the capital of the district of Bejapore.

The fortifications, which formed the outworks of Bejapore, are said to have been of such extent, that 15,000 cavalry might have encamped between them and the wall of the city. The citadel, or inner fort, contained the king's palace, the houses of the chief people, and large magazines. The great extent of Bejapore is still evident from the quantity of ruins in all directions, but the assertion of the natives, that in the time of its prosperity it contained 984,000 houses, is doubtless a great exaggeration. Many of the dwellings occupied a very considerable space, and had extensive gardens attached to them. That the population of the city, however, was once considerable, is evident from the great number of cupolas, spires, and minarets, still distinguishable among the ruins. The wall of the outer fort measures eight miles in circuit, and has seven gates, the Mecca, Shahpore, Bhamanee, Padshapore, Allahpore, and Futteh gates; the other gate, which is shut up, is not at present known by any particular name. When the province came under the dominion of the English in 1818, there were guns still mounted on the walls.

There is still a considerable number of buildings in the inner fort, or city, which contains a regular street three miles long, and fifty feet wide; it is paved, and has many mosques and private dwellings built with stone. The most remarkable buildings within the town are mausoleums and religious structures. Among the latter is a low Hindu temple, supported by numerous pillars, each of which is formed of a single stone: the building throughout exhibits the earliest and rudest style of Brahminical architecture. This temple is almost the only Hindu structure standing in this neighbourhood.

Within the fort are some cultivated inclosures, and in every part of its area, among the ruins of larger buildings, are mud hovels, as well as buildings of a better class. The only quarter of the city which contains any considerable number of inhabitants, is near the western gate, in the neighbourhood of the *jumma musjeed*, or great mosque. In this quarter, but without the western gate of the fort, is a well frequented bazaar, built of stone. Few of the larger buildings appear to have had any timber used in their construction, and the whole are solid and massive erections.

Passing from the western gate, a succession of ruins, the principal of which are Mohammedan tombs, occur to the distance of five miles, where the village of Toorvee forms at present the boundary of the antient city. A little to the east of this village stands the meanly-built Mohammedan mosque of Chunda Saheb, which to the present day is much resorted to by devotees. At a short distance beyond the western wall of the fort are the ruins of the mausoleum and mosque of Ibrahim Adil Shah, who died in 1626. These buildings were erected on a base 400 feet long and 150 feet wide: the centre of the mosque is covered by an immense dome supported on arches. The mausoleum is fifty-seven feet square, and consists of a very plain chamber, surrounded by a verandah twelve feet broad and twenty-two feet high. The exterior of both these buildings is of an opposite character to the interior, being elaborately ornamented. The fret-work of the ceiling of the verandah is covered with various passages taken from the Koran, sculptured in bas-relief.

The walls of the fort were formerly provided with twelve guns of immense size; only two of these remained when the English obtained possession of it. One of them was made of iron; the other, which was of brass, was cast in 1549, and carried shot weighing 2646 lbs. It was at one time intended to send this gun to England, but the state of the roads rendered its removal to the coast impracticable.

Previous to the expulsion of the Peshwa, the ruins of Bejapore were the haunt of numerous thieves, who have been wholly extirpated since the English authority was established in the province. The city, and the district in which it is situated, are inhabited chiefly by Canarese, who retain their original language and customs, and in 1818 assisted the English in expelling their Mahratta rulers.

BE′KES, a considerable county in the central part of Eastern Hungary, lying within one of the great subdivisions of that kingdom, called the 'Province beyond the Theiss,' between 46° 30′ and 47° 7′ N. lat., and 20° 16′ and 21° 36′ E. long. This county, popularly called the 'Egypt of Hungary,' contains about 1370 square miles, and is from 40 to 45 miles in its greatest length, and nearly the same in breadth. It is bounded on the east by the county of Bihar, on the north-west by those of Great-Cumani and Heves, on the south-west by that of Tsongrad, and on the south-east by those of Arad and Tsanad. The surface presents an almost uniform level, with an inclination so slight, that the rivers, which flow through it in a westerly direction to the Theiss, in consequence of their sluggish current and the lightness of the soil, convert the land near their banks into morasses. From this circumstance Békes possesses an unhealthy climate, and a highly fertile soil. It is productive in corn, and has excellent meadows and pastures, but is deficient in timber. The principal stream which traverses it is the Körös, called the White Körös when it enters the south-eastern districts of the county near Gyula, its capital. It then flows north-westward to the town of Békes, where it is joined by the Black Körös; it afterwards receives the Bükösd, and is subsequently increased by the Rapid Körös; thence it runs for some distance under the name of the Three Körös, but in its sinuous passage along the north-western frontier of the county it exchanges this designation, between Tur and Szarvas, for that of the Berettyo, and it is in these north-western parts particularly that marsh and swamp abound. The extent of land which has been turned to the purposes of husbandry or grazing is about 360,000 acres, or four-tenths of the entire surface: of these about 200,000 are arable, and 132,000 are used as meadows and pastures, the remainder being applied to horticulture, &c. The extent of wood-land does not exceed 27,000. Békes grows very large quantities of wheat of excellent quality, but the cultivation of other descriptions of grain is generally neglected. Much hay is also made, particularly in the districts within the minor circle of Békes, and reed-grass is also cut and stacked as winter-fodder for the cattle. The culture of vegetables is extensive. A considerable trade is carried on in water-melons; and the vine is partially cultivated, but its produce, not even excepting the Tsaba wine, which is the best, is of an inferior kind. Instead of slate or tile, rushes are employed for roofing houses and fencing gardens; and the want of wood for fuel compels the inhabitants in general to have recourse to straw, rushes, and cow-dung; for they are either too ignorant or too indifferent to avail themselves of the plentiful supply of peat which the country contains. The rearing of cattle and sheep is carried on upon a large scale. Much cheese and wool are brought to market, but the former is of indifferent quality; horses are bred in many parts. The county has no wild animals but wolves and hares. Of the water-fowl in the marshy districts the most noted are the nocturnal and the gray heron, the first of which produces the fine and delicate plumes with which the better class of Hungarians ornament their caps. The rivers produce abundance of fish; and the marshlands, crabs and tortoises. Bees are universally reared, and some individuals possess upwards of two hundred hives Békes is altogether destitute of mineral products.

The inhabitants, who are about 126,000 in number, consist mostly of Magyars, intermixed with a few Slawacks, Germans, Wallachians, and Jews. In no very remote age the country was scarcely better than a dreary waste: but in modern days, though even at present it is capable of sustaining double the number of individuals, the population has been greatly on the increase, for, according to official returns, it had risen from 71,557, in the year 1787, to 92,463, in 1805. The increase since the last date has averaged nearly 1200 annually; the greatest in any single year having been in 1816-17, when it was 5734. The people are a thrifty industrious race, but interest themselves in few pursuits except those connected with agriculture and cattle breeding. Two-thirds of them are of the Protestant faith; the remainder being chiefly Roman Catholics.

We possess no other data respecting the public burdens, except that the yearly quota which Békes contributes to the Hungarian treasury is about 4300*l.* (43,140 florins), independently of about 4500*l.* (45,642 florins) towards the expense of recruiting the army.

Békes is divided into two principal circles; that of Gyula including the eastern districts, and that of Csaba the western. It contains five market-towns and sixteen villages, among which Csaba, which was founded in 1715, is the largest village in Hungary if not in Europe, for it contains upwards of 2000 houses and 20,200 inhabitants; Orosháza contains 8100; and Tot Komlós nearly 5500 inhabitants: besides these there are sixty-one prædia, or privileged settlements. Gyula, though not the most populous town, is the capital, inasmuch as it is the spot where the provincial assemblies are held. The town of Békes is situated in the eastern part of this county, at the confluence of the White and Black Körös. The Catholic, Lutheran, and Greek denominations of Christians have each a church in the town. The number of houses is about 2000, and of inhabitants about 15,000. It has a considerable market for cattle, and the surrounding country produces much excellent wheat, and large quantities of wine, flax, honey, and vegetables. Close to it are the remains of a strongly fortified castle. It lies in 46° 46′ N. lat. and 20° 49′ E. long.

BEL. [See Belus.]

BELBE'YS, a small town in the Bahari or Lower Egypt, and the head place of a district or prefectship. It is situated on the right bank of the most eastern or Pelusiac branch of the Nile and on the borders of the desert, thirty miles N.N.E. of Cairo, and on the road from that city to Syria by Salhieh or Ras el Wadi, and about eight miles south of the antient Bubastis. Traces of the canal which joined the Nile to the Red Sea are seen in the neighbourhood of Belbeys. (French Description of Egypt; Jomard, quoted by Balbi in the *Abregé de Geographie.*)

BELED, or BALAD, is an Arabic word, which signifies a town, a province, or country, and is met with as a component part of many proper names in Oriental geography, *e. g.* in Biledulgorid, which properly is *Balad-al-Jarîd, i.e.* the 'Country of Palm-trees.' [See Atlas.]

BELEEFF, or BJELEFF, the capital of a circle of this name in the province of Tula in Russia in Europe, lying on the left bank of the Oka, about 80 miles S.W. of Tula, and about 680 miles (1029 versts) S.E. of St. Petersburgh. It is a large town, surrounded by a wall and ditch, and of remote date, for it is mentioned in native chronicles as the seat of the Viatitches as far back as the year 1147, when it belonged to the Tshernigoff domains. It contains about 1060 houses, mostly of wood, and a population of about 7000 souls: it has a public school, attached to a monastery, four nunneries, fifteen churches, two charitable asylums, a cutlery manufactory where the celebrated Bjeleff knives are made, fifty-one iron and two copper manufactories, several tanneries and breweries, and wax, tallow, and soap manufactories. It carries on a brisk trade with other parts of Russia, for which the Oka affords great facilities, and it has an annual fair, which is much frequented. It gives its name to an eparchate of the Greek church. It is in 54° 25′ N. lat., and 36° 5′ E. long.

BELE'M, properly BETHLEHEM, one of the suburbs of Lisbon, on the south-west part of the city, with which it is united. King Emanuel built a church here in 1499, in honour of the birth of Christ, and a monastery of Hieronymites. The church is a fine specimen of the mixed Norman-Gothic and Arabic styles; but the monastery is such a confused mixture of all styles, that there are no two columns alike. In the monastery is a royal vault, ornamented with white marble. Opposite the church a square tower rises out of the Tagus, and serves to defend both the suburb and the entrance of the river. At that tower, called Torre de Belem, all the vessels which enter the port of Lisbon are first visited by the custom-house officers. Near it is a commodious quay with numerous wharfs, made in the reign of Joseph I. The royal palace of Ajuda is also near Belem. Close by the palace are a botanical garden, a cabinet of natural curiosities, a chemical laboratory, and the Quinta da Rainha, a royal villa, with fine gardens, extensive parks, a menagerie, and an aviary of rare birds. Any respectable person, by giving a trifling sum to the keeper, may easily obtain admittance. Belem is a considerable place, and is inhabited by many of the nobility and rich citizens. This part of Lisbon suffered least from the great earthquake in 1755. In the opinion of Mr. Link, this was owing to the circumstance of the place being built on a rock of basalt, which he supposes to have been forced up by a similar convulsion at some very remote epoch. (Murphy; Link's *Travels in Portugal.*)

BELEMNITE, THUNDERSTONE, or ARROWHEAD (Zoology), from the Greek *βέλεμνον*, a dart or arrow, *pfeilstein* and *donnerstein* of the Germans, *pierre de foudre* of the French. Before the geological history of this extinct marine animal was well made out, few natural productions ministered more largely to the superstitious feelings of man. The antients, it was said, had a legend that they came from the lynx, and called them *Lapides Lyncis*, and *Lyncuria*. They were also, from being found on Mount Ida, and from their supposed resemblance to those organs, called *Idæi dactyli*, or *petrified fingers**. This idea was too much in unison with the gloomy imagination of the northern nations to be lost: we accordingly find the term *Devil's fingers* bestowed on them, and not unfrequently that of *spectre-candles.*

Afterwards came the age of Thunderstones, when this fossil was alleged to be the produce of electricity, and was called by the learned *Lapis fulminans.*

Subsequently, and at the period when organic remains were almost universally regarded as *lusus naturæ,* formed by the plastic power of the earth, the Belemnite was considered, even by those who had adopted more correct opinions upon the subject of many fossil shells, to be strictly mineral,—to be a stalactite or a crystal†; and by some who found it in the sandy parts of Prussia, where amber also occurs, it was supposed to be that substance petrified.

At length, it began to be granted that the Belemnite was of organic animal origin, and the conical cavity at its broader end caused it to be looked upon as the tooth of some unknown creature; while some pronounced it to be a spine, like those of an *echinus*, and others gave way to various conjectures not worth recording. Then arrived the dawn of Von Tressau, Klein, Breynius, Da Costa, Brander, and Plott, who allowed the fossil to be of testaceous origin, but knew nothing of its relative position. At last, the increasing light of science placed the belemnite in a comparatively clear point of view.

A substance with which fable had been so busy was not likely to have been overlooked in the old materia medica: we accordingly find that it was administered in a powdered state as a remedy for the night-mare, and for the stone. Dr. Woodward states, that in Gloucestershire, the powder was blown into the eyes of horses affected with watery humours; and, in Prussia, it is said to be used when pulverized in dressing wounds.

The true place of the Belemnite is among the *Cephalopods.* Cuvier, Lamarck, and indeed all modern writers of any note agree in this‡, and they also concur in allowing that it was an internal shell. It forms the first genus of the first family (*Orthocerata*) of Lamarck's first division of the *Cephalopods*, namely, the *Polythalamous* or *many-chambered division.*

Miller, in his interesting paper in the Transactions of the Geological Society, gives the following as the generic character:

---

* These are the opinions of Woodward, Formey, and others, and they are repeated by Miller; but it is by no means clear that the antients were speaking of Belemnites on those occasions. That the Belemnite was called *Pierre de Lynx*, and that it was the article used in the old Materia Medica, as a remedy for the night-mare, stone, &c. &c., need not be doubted. But the question is, whether authors have not been rather hasty in concluding that the *Lapides Lyncis*, &c., of the antients (see *Ovid. Metam.* lib. xv. v. 413) were the fossils alluded to in this article.

Pliny's accounts (*Nat. Hist.* lib. viii. c. 38, and lib. xxxvii, c. 2 et 3) relative to these *Lyncuria*, *λυγκούρια* of the Greeks, are by no means uniform, and seem rather to refer to different kinds of true gems; and though, in the tenth chapter of his thirty-seventh book, he says that Idæi Dactyli are found in Crete, that they are of an iron colour, and resemble the human thumb ("finger" would have been more applicable to a Belemnite), it must be remembered that he has placed them in his catalogue of Gems; he has, it is true, inserted the *Cornu Hammonis* in the same list. It should not be forgotten that the Corybantes were called Idæi Dactyli.

If we turn to Theophrastus, who describes the *λυγκούριον* at some length (chapters 50, 51, 52, 56), we shall find nothing to sanction the opinion that it was a Belemnite, though it is clearly the Lapis Lyncis of authors. It is described, on the contrary, as a gem of very solid texture (*στερεωτάτη*), on which seals were engraved.

† So late as 1808 an analysis of it was given by Mr. T. Acton in Nicholson's *Journal*, under the name of a crystal called a "Thunder-pick." In the following year Farey corrected the mistake (in the same journal), and stated it to be "the *exuviæ* of an animal now unknown, called a Belemnite."

‡ We must except M. Raspail, who, in 1829, published his opinion, that these fossils were the cutaneous appendages of a marine animal, probably approaching the *Echinodermata*, and that the *Alveolus*, or chambered part, was a being distinct from the Belemnite (probably its parasite), which he calls an *Alveolite.*

'A cephalopodous? molluscous animal, provided with a fibrous spathose conical shell, divided by transverse concave septa into separate cells, or chambers connected by a siphuncle; and inserted into a laminar, solid, fibrous, spathose, subconical or fusiform body extending beyond it, and forming a protecting guard or sheath.'

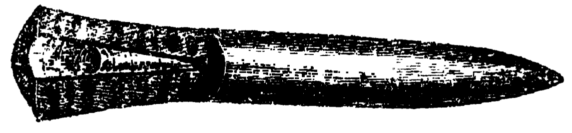
It will be observed that, in this definition, the word cephalopodous is followed by a note of interrogation; but there is so much evidence that the shell in question could have belonged only to an animal whose organization was similar to that of the existing cephalopods, that there is no longer room for doubt; indeed Miller gives a design of the supposed position of the shell within the living cephalopod, taking one of the cuttle fishes as his example.

De Blainville, in his Memoir published at Paris in 1827, has separated the genus into many divisions according to the shape of the shells, and has recorded a great many species.

Professor Agassiz is of opinion that the fossil ink-bags found in the lias at Lyme Regis belonged to Belemnites, and has come to this conclusion from a specimen which presents the ink-bag *in situ*.

The chief writers on these fossils, in addition to those above-mentioned, are Sage, Deluc, Beudant, D'Orbigny, and Voltz.

Belemnites are most abundant, and occur principally in the chalk formations, in the oolite and lias. *Belemnites canaliculatus* will give a general idea of the form and structure of the shell. The upper part is represented as cut off and laid open, to show the shell in its sheath, and the chambers.



[Belemnites canaliculatus.]

BELE'NYES, a large market-town in the southern part of the Hungarian county of Bihar, in the province 'east of the Theiss;' it is situated on the Black Körös, near the borders of Transsylvania, and belongs to the episcopal chapter of Grosvardein. It has a castle, a united Greek and Catholic, and a reformed-Lutheran church, with a population of about 5000 souls, all Magyârs or Wallachians. The neighbourhood produces good timber and fruit; and the quarries of Mount Belény, which lie opposite to the town, yield beautiful marble. It is in 46° 40′ N. lat., and 22° 20′ E. long.

BELESTA, or BELLESTA, a small place in France, to which the dictionaries, with obvious impropriety, give the name of town (*bourg*, or *ville*). It is in the commune of Peyrefite, the arrondissement of Castelnaudari, and the department of Aude. The whole population of the commune, as given in the *Dictionnaire Universel de la France*, 1804, our latest authority, was only 216; and the only claim to notice which the place has arises from a singular natural phenomenon, the intermitting spring of Font Estorbe. This spring rises in a natural grotto or cavern, and is ordinarily so copious as to form of itself the principal part of the river Lers, a feeder of the Garonne, which, passing two or three miles to the east of Toulouse, falls into the Garonne near Grenade. The stream which flows from the grotto is about eighteen or twenty feet wide, and a foot and several inches deep, and runs with a very rapid current;—yet in the summer and autumn (and indeed at other times of the year, if there has been a drought of any continuance) it becomes intermittent. According to the *Encyclopédie Methodique* (*Géographie Moderne*) the intermission takes place at equal intervals, twice in the twenty-four hours; and Expilly says it may be regarded as a sort of natural Clepsydra, or water-clock. When the time for its flowing comes, a great noise is heard on the side of the cavern from which the waters spring, and they gush out so copiously, that their effect in swelling the river Lers may be perceived five or six miles down the stream. (*Encyclopédie Methodique; Géographie Physique;* Expilly, *Dictionnaire des Gaules et de la France.*)

BELFAST, the chief town of the north of Ireland, is situated on the Antrim side of the Lagan, where that river runs into the southern extremity of the bay of Carrickfergus, 54° 34½′ N. lat., 5° 46′ W. long.; distant direct from London about 324 miles N.W., and about 85 English miles, direct distance, N. by E. of Dublin. Belfast gives its name to the barony of Upper Belfast, in which it is situated, as well as to Lower Belfast, another barony of the county of Antrim, and also to its own parish of Belfast, or Shankil. Shankil parish contains 18,411 acres; and the town land of Ballymacarret, on the opposite side of the river, in the county of Down, the populous suburb of which has been included in the borough by the Reform Bill, has an area of nearly 576 acres. Although built on a flat, which has in a great measure been reclaimed from the marshy banks and shallow bed of the river, Belfast is a healthy town. Its position, on the confines of two great counties, with a secure harbour and extended water-communication with the interior, is peculiarly favourable. The scenery around possesses great beauty and variety. Mountains of considerable height and bold outline skirting the western side of the rich valley of the Lagan, stretch northward from the town (which one of their highest elevations may be said to overhang) in a continuous chain, which renders the Antrim side of the bay exceedingly picturesque; while the fertility and cultivation of the opposite county and the intermediate shore can hardly be exceeded. Two bridges are built over the river, one at the east end of the town, an old bridge 2500 feet long, and consisting of twenty-one arches; and another, built in 1814, about half a mile up the river, on the south of the town, which connects the counties of Antrim and Down.

The origin of the town itself is modern; but, as an important pass, Belfast was known either by its original name *Bealfearsaid* (Fordmouth), or by its Norman translated appellation of 'Le Ford,' both in ancient Irish history and during the earlier occupation of Ulster by the English. Prior to the reign of Edward III., the northern pale (or compass of English jurisdiction in the north) embraced the present counties of Down and Antrim, and had even extended partially into Derry; and although the destruction of the early Irish Parliamentary papers at Trim has deprived us of all particular record of its administration, enough still remains in the Close and Patent Rolls of the kingdom to show that a great part, if not the whole, of these counties, up to nearly the middle of the fourteenth century, enjoyed the protection of the English law under regularly appointed and resident authorities. But although the power of the government was able to keep the native chieftains of the interior in comparative subjection, it was principally along the coast that the line of civilization and complete security extended; and accordingly it appears that the passes by which communication was chiefly kept up invariably lay near the sea. Of these, the ford at Belfast was the most important, and the castle was in all probability built for its protection, as we find it in the possession of William de Burgho, Earl of Ulster, at the time of his murder there in 1333. This event, more than any other connected with the place, had the greatest effect on the early condition of Ulster; for the rebellious English, by whom the murder was committed, inviting the native Irish to their aid from beyond the Bann, whither they had been driven before the vigorous administration of the early conquerors, let in such a torrent of barbarism, as in a short time swept all that frontier of the pale clear of whatever civilization its previous reduction had forced upon it. The castle of the ford now fell into the hands of the old O'Neils of Dalaradia, who, from a celebrated leader of their nation when in exile, were known as the Clan-Hugh-Buy, a title which still distinguishes two districts of Down, and which, prior to the settlement of the country under James I., extended over a great part of both Down and Antrim. During the lawless times that followed, when the pale had shrunk to Drogheda, and Carrickfergus was almost the only spot beyond the Newry mountains where the English had footing at all, Belfast castle, though frequently taken and dismantled, still remained in the independent though precarious possession of the O'Neils, until a chief of Claneboy, in 1552, after having been severely handled by two successive lords' deputies, consented at length to hold the castle by a legal tenure from the Crown. The rebellion of Shane O'Neil shortly after deprived his successor of even this possession, and Belfast, with the rest of the estates of the rebel chieftains, was confiscated. Sir Thomas Smith was the grantee of this district of the forfeited lands; but his first attempt to take possession being signally defeated, and his son, who commanded the expedition, slain, the adventurers under his grant dispersed, and the conditions of his tenure remaining unfulfilled, the estates escheated to the crown. Walter, first Earl of Essex, was the next to attempt the plantation of this intractable district, but he was still more unsuccessful than his predecessor. After the expenditure of much blood and treasure, he abandoned the undertaking in the course of the first year, and shortly afterwards died. Essex had, however, already seen the advantages of making Belfast a chief place in Ulster; and his recommendations to build there and erect a dock-yard were repeated by Sir John Perrot, when he visited that country, still lying waste, ten years afterwards. For more than a quarter of a century this state of things continued, until at length, in 1604, Sir Arthur Chichester, then lord deputy, procured from James I. the final grant, from which the prosperity of Antrim and rise of Belfast, as a town, may be said to date. This active and politic governor immediately set about planting his estate with emigrants from his paternal possessions in Devonshire. In addition to this, the general settlement of Ulster, which took place about four years afterwards, brought in a multitude of Scotch and English colonists. All this gave such security and countenance to their undertaking, that, in 1611, those who were settled in Malone had raised a town about Sir Arthur's castle of Belfast, which had been rebuilt; and this town was already so considerable, that it obtained a charter, erecting it into a borough, with sovereign burgesses and commonalty, and the privilege of sending two members to the Irish parliament.

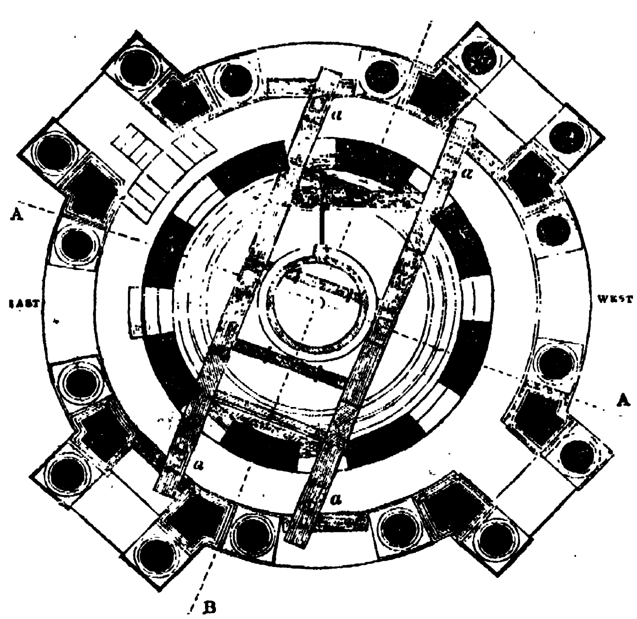
It has been generally supposed that the prosperity of Belfast ought to date from the year 1637, when the Earl of Strafford, after purchasing certain monopolies enjoyed by the adjacent port of Carrickfergus, threw open the competition to its better-situated rival, which thus prospered at its neighbour's expense: but it would seem that, long before this event, Belfast was a prosperous and rapidly-improving town, the central mart for the colonists of both Down and Antrim, and, from its vicinity to the woods, the seat of many trades and manufactures, which could not have been carried on in a place so ill supplied with fuel as Carrickfergus had long been. It was the prosperity of Belfast that forced the purchase of these monopolies by the Earl of Strafford, and for that unexampled prosperity Belfast is mainly indebted to the enterprise and liberality of the house of Chichester. Never perhaps has there been an instance of success so sudden and so complete as that which attended the undertaking of Sir Arthur Chichester in 1604. In seven years the most desert spot in Ulster was a corporate town, which, before it was half a century in existence, had gained a superiority over the oldest foundations north of Dublin. And now, but for the unhappy differences on the score of religion, which soon began to distract the minds of these thriving colonists, all would have been well. The Scottish clergy, men deeply imbued with the severe spirit which then characterized their national church, had been not only tolerated but encouraged under the liberal ecclesiastical administration of Usher. They enjoyed the tithes and the immunities of the then establishment, were ordained and inducted by its bishops, and were under its general jurisdiction. Their dislike of prelacy, which had slumbered while these advantages were yet uncertain, broke out as they acquired confidence in their confirmed possession; and even before the tyrannical measures of Lord Strafford, which are generally alleged as the prime cause of their discontent, had finally justified their opposition, disputes, complaints, and recriminations were frequent between this body of the northern clergy and their spiritual superiors. The subsequent interference of Wentworth and Laud, and the attempt to force the already indignant Presbyterians into a further conformity to the prelatic church, completed the breach; petitions and remonstrances went forward on all hands, and the resisting party had at length the gratification of mainly aiding in the overthrow of their great persecutor, when, in the midst of their triumph, the rebellion of 1641 threw the whole country once more into tumult and dismay. The Presbytery of Belfast, after seeing their town successively occupied by the troops of the Royalists, the Parliamentarians, and the Irish, forgot their ecclesiastical grievances in the dread of civil extinction, and throughout the succeeding wars were invariably well affected towards the royal and episcopal cause. The first expression of their attachment to these principles was made at a time which renders the avowal peculiarly honourable. On the execution of Charles I., in 1649, the Presbytery of Belfast put forth their 'Representation of the present evils and imminent danger to religion, laws, and liberties, arising from the late and present practices of the sectarian party in England,' &c., in which they freely express their indignation and disgust at the conduct of their old associates in anti-prelatic zeal. This brought down the vengeance of Milton, whose reply is written with great acrimony; but 'these blockish Presbyters of Clandeboy,' these 'unhallowed priestlings' of the 'unchristian synagogue' at Belfast, as the indignant republican calls them, evinced the sincerity of their professions, by enduring, with exemplary fortitude, throughout all the troubles that succeeded, the consequences of their fidelity to the crown. Such, however, was the respect in which the mercantile body of Belfast was held by all parties, that, during these wars, the town suffered little more than the negative injury of being, for a time, retarded in its prosperity. It was occupied or taken, time after time, by the troops of all the parties, which, for the next fifty years, made the rest of Ireland one scene of desolation, and was respected and left comparatively unplundered by them all. At length, in 1690, the arrival of William III. restored Belfast to the enjoyment of tranquillity. To reward their loyalty, the Presbyterian ministers of Ulster received from the king a grant of 1200*l.* per annum. Trade and manufactures now went on with increased vigour, and, in the beginning of the next century, we find the commercial progress of the town so considerable, as to place it in the first rank, on a scale of credit appended to the names of the different commercial towns of Europe, in the Exchange at Amsterdam. In 1708 the castle was destroyed by fire, and three of the Ladies Chichester burned to death. An anonymous tourist, writing of the town at this time, speaks in terms of high admiration of its commerce and manufactures, especially of its superior potteries. Printing had now been introduced, and Belfast, in 1704, had the honour of sending forth one of the earliest editions of the Bible printed in Ireland. The first newspaper printed in Ulster, the Belfast News-letter, which still has a large circulation, was commenced here in 1737. A local militia was also called into being by the Scottish rebellion of 1715; and the inhabitants of Belfast, having once accustomed themselves to look to their own resources for defence, have ever since been ready to take up arms when necessary, whether against foreign invasion or intestine revolt. In 1758 the first census of the town was taken: it then contained 1779 houses, inhabited by 7993 Protestants, and 556 Roman Catholics, in all 8549; of whom 1800 were able to bear arms. The number of looms in this year was 399. The introduction of the cotton-spinning trade, in 1777, opened a new field for industry. In twenty-three years, from its commencement, at which time there was not one cotton-loom in Ulster, it numbered no less than 13,500 operatives; while in a circuit of ten miles, including the flourishing town of Lisburn, the number connected with it in every way amounted to 27,000 individuals. Prior to this, however, the linen manufacture had become, as it still is, the staple trade of the district; and we may form an idea of the wealth and enterprise of those engaged in it from the fact, that in 1782 the merchants of Belfast, experiencing the want of a proper hall for the transaction of their business, at once subscribed a sum of 17,550*l.* for that purpose, the subscription list exhibiting very few contributions under from 100*l.* to 300*l.* The spinning of linen yarn by machinery, a trade which now rivals either of the other great branches of manufacture, was introduced into Ulster about 1806 or 1808; but so prosperous has it latterly become, that at present it employs perhaps more capital and labour than the cotton trade itself. There are ten factories of this description in the town and vicinity, driving upwards of 65,000 spindles, and several others are in course of erection. Damask and diaper of a superior quality are also manufactured in this district; indeed, Belfast linen fabrics, of all descriptions, have long maintained the highest character. In 1792 ship-building was first commenced here: previous to this time, the craft required were purchased and generally repaired in the Scotch or English ports; and when we find that, in 1785, the shipping of Belfast so supplied amounted only to 55 vessels, or 10,040 tons, the backwardness of early enterprise in this direction appears very remarkable. The first dock-yard employed only 10 workmen: the shipwrights, block-makers, sail-makers, rope-makers, and smiths now engaged in the constant building, rigging, and repairing of vessels, exceed 200. In 1811 the numbers employed were under 120; but there had already been built more than 40 vessels, the greater number above 200 tons. The largest vessel built in the port registers about 500 tons. Iron and brass founding have long been carried on with considerable activity; iron founding was actively prosecuted prior to 1641. Castings on the largest scale are now executed in the best manner; and much of the cotton and linen spinning machinery is driven by steam-engines constructed in the Lagan foundries. Belfast presents more of a manufacturing aspect than any other town in Ireland: there is, however, a lightness and elegance about the place that takes away much of the dark effect of its numerous chimneys and their black volumes of smoke; so that no town, perhaps, in the British islands more agreeably unites the appearances of industry and cheerfulness.

The private buildings are (with one or two exceptions) invariably of brick, and extremely regular; the general aspect of the chief streets is pleasing, and the neighbourhood of Donegal-square exhibits as good houses and as handsome street-views as almost any provincial town can boast of. The public buildings are more numerous than striking, and the want of steeples cannot fail to strike the traveller who is accustomed to the view of more antient towns. The parish church of St. Anne's, built in 1778, has a tower and coppered cupola of good proportions, although the upper part of the tower is framed of painted wood: it is capable of accommodating 1100 persons, and was erected at the expense of the late Marquis of Donegal. The chapel of ease, built in 1811 12, on the site of the old parish church in High-street, is a plain building with a beautiful portico. The portico was presented by the bishop of Down and Connor, who procured it at the taking down of Ballyscullen-house, the Irish Fonthill, built by Lord Bristol, the celebrated bishop of Derry in the last century; the building will contain 1200 persons. Another church, which has lately been erected in the south-western suburbs of the town, is a substantial edifice. The presbyterian places of worship are eleven in number, three of which, lately erected, possess architectural pretensions; but wanting spires, and being rather clumsily furnished with porticos, they contribute much less than could be desired to the ornament of the town. Of the eleven, four, including the three alluded to, are attended by the congregations professing the faith of the synod of Ulster. The number of persons who can be accommodated in them is between 5000 and 6000. Two others, which are attended by congregations professing Unitarian doctrines, are capable of containing from 2000 to 2500 persons. The orthodox Seceders have also two small chapels. The Covenanters, or reformed Presbyterians, have a good though not large meeting-house in the suburbs; the remainder are in the hands of independent congregations. The Roman Catholic places of worship within the town are two, but in the neighbourhood there are several others. Previous to the year 1763, the Roman Catholics of Belfast, although upwards of 550 in number, performed their worship in the open air. In that year their first chapel was erected, but soon becoming inadequate to their increasing numbers, another was required, and a large and handsome edifice has been erected in Donegal-street, with spacious schools and handsome residences for the clergy attached to it. These buildings are still insufficient to accommodate the rapidly-growing Roman Catholic population, which is now more than one-third of that of the whole town. The Methodists have four chapels, and the Society of Friends a meeting-house. The chief public edifice is the Commercial Buildings, an extensive pile, terminating one end of Donegal-street, to which it presents a handsome architectural front of stone. It was erected at a cost of about 20,000*l.*, and is the property of a company incorporated by act of parliament. Here is a remarkably good and well-regulated news-room, frequented by all the mercantile body of Belfast. Partially fronting this stands the old Exchange at the divergence of Donegal-street and North-street—a heavy and neglected but respectable square building of brick on a cut-stone basement. The exchange used to be held in the lower story, and the upper contains a very excellent assembly-room, much superior both in size and proportion to that in the building opposite: the house is the property of the Marquis of Donegal. The theatre, a shabby brick structure externally, but of very elegant though small proportions within, is much neglected. In its charitable institutions Belfast stands pre-eminent: the poor-house at the north end of Donegal-street fronting the Commercial buildings is a fine structure, with extensive wings and a handsome spire, built at an original cost of from 7000*l.* to 10,000*l.*, and supported at an expense of upwards of 2000*l.* per annum by the voluntary yearly subscriptions of the inhabitants and the produce of their former invested donations. In 1830 it contained 432 inmates, all of whom were fed, clothed, and the children educated, by the institution: it was incorporated under the title of the Belfast Incorporated Charitable Society, in anno 1774. The fever hospital opened in 1817 is capable of accommodating upwards of 200 patients: its expenditure in 1828 amounted to 1239*l.* 6*s.* 10*d.*, of which about one-half was granted at the county assizes, and the remainder was the produce of voluntary subscriptions and donations. A lying-in hospital, a female penitentiary, and a house of industry for the prevention of mendicity, are entirely supported by voluntary subscriptions. Carrickfergus being the assize town for the county, there is no jail at Belfast, but a large house of correction and a handsome police-office have been lately built. The barracks on the high ground in the north-western part of the town have been lately enlarged; they are capable of accommodating one regiment of foot, and a troop of horse or company of artillery. Belfast is well lighted: the gas-works which supply the town are the property of a company; they have been erected upwards of ten years. The supply of water, which is neither very copious nor good, is brought by open drains from the country a mile to the south, and is conducted by pipes from an open reservoir to the cisterns of the houses. As coal is the fuel of Belfast, a great amount of shipping is constantly employed between this port and Newcastle, Whitehaven, and other ports of England. The coal quay is highest up the river, then come those where the general merchantmen are moored, and beyond these, towards the bay, lie the ship-yards and ballast corporation graving-docks; lower down a new floating-dock is nearly completed, the property of an enterprizing individual, and still further improvements are contemplated between this and the pool of Garmoyle, a deep and secure station about three miles down the bay. A plan of these works, by Messrs. Walker and Bourges of London, has been adopted by the town authorities, and sanctioned by act of parliament, but as yet no step has been taken to carry it into execution. By the improvements however effected by the ballast corporation, ships drawing thirteen and fourteen feet of water can already lie at the quays, and the dry docks are sufficiently capacious to hold vessels of equal size during their repairs; a patent slip is also completed in one of the private dock-yards. The manufactures and commerce of Belfast have been so intimately connected with its rise as a town, that in its civil history we have already spoken of their introduction and progress. The export trade, which must in all Irish ports be commensurate in great measure with the prosperity of their several districts, has long been very considerable here. It consists chiefly of bacon, butter, pork, beef, corn, and raw hides; and, in manufactured articles, of linens, calicoes, muslins, cotton-yarn, linen-yarn, soap, tanned leather, candles, and starch. The chief imports are the raw material of the staple manufactures, and foreign luxuries; cotton, wool, flax-seed, flax, barilla, potash, groceries, wine, &c. The gross amount of customs including excise amounted in 1783 to 32,900*l.*; the customs exclusive of excise, for the year ending 5th January, 1834, were 228,945*l.* 6*s.* 10*d.* In 1682 the shipping of the port was 3307 tons: in 1827 the registered tonnage of the port was 21,557 tons. The value of the exports in 1810 was 2,904,520*l.* 19*s.*, being upwards of half a million more than in the year previous; the linens alone making more than two millions of this amount; the cotton-yarn exported in that year valued but 4942*l.* 6*s.*, and the cotton fabrics of all kinds did not exceed 35,000*l.* The items on a similar return for the last few years would be materially different, but the increase of the export trade we can only exhibit by a comparison of the tonnage as cleared outward. In 1831 there cleared outwards, coastwise, 155,416 tons, and for foreign ports 35,335. In 1834 the export tonnage was coastwise 174,894 tons, and for foreign ports 31,665. Inwards, there entered in 1831, of British tonnage 27,970, and of foreign 4276 tons; in the year 1833, of British tonnage 26,947, and of foreign 2537 tons; and in 1834, of British tonnage 30,733 tons, and of foreign 2395 tons. From a comparison of these items with similar returns for the port of Cork, it appears that Belfast, with fewer vessels, has in the foreign trade a greater amount of tonnage; but that, taking the amount of British and foreign shipping, their tonnage inwards for the last three years is very nearly equal. The post-office also indicates the activity of the commercial body of Belfast; the annual amount of postage being since 1832 nearly 10,000*l*. There are four banks in Belfast—two of them branches of the great metropolitan establishments, and two in the hands of private companies. There is also a savings bank, in which on the 30th November, 1830, there was lodged a sum of 40,679*l*. by 2423 depositors. The amount of stamps sold here averages 25,000*l*. per annum; the number of stamps for newspapers for the year 1823 was 335,000, and since then a considerable increase has taken place: there are now four newspapers and two small periodicals published in the town.

The increase of the population of Belfast has been extremely rapid within the last half century. In 1782 the town contained 6132 males and 6972 females, in all 13,105 inhabitants. In 1807 they were nearly doubled, being in all 22,095; in 1821 they were 37,277; and in 1831 their numbers in the town and suburbs stood thus—males 24,559; females 28,754, total 53,313; of whom there are 14,597 persons belonging to the Established Church; 18,715 Presbyterians; 18,268 Roman Catholics; 1111 Protestant dissenters, and 622 unclassed. This enumeration is exclusive of Ballymacarret, a portion of the borough which contains between four and five thousand inhabitants. The population of the borough itself by the last returns is 39,146, and its constituency 1700 voters.

Belfast has long had the reputation of possessing a well-educated community. In 1824 there were in the town and parish sixty-three schools of all kinds, educating 2152 males and 1666 females, exclusive of the Royal Academical Institution, which in 1825 had 462 males in its various classes. This great collegiate school was erected by public subscription, and incorporated by act of parliament in the year 1810. The original subscriptions amounted to 25,000*l*., including 5000*l*. received from India by the liberality and exertions of the Marquis of Hastings. The object of the undertaking was to procure a cheap home education for those who formerly frequented the colleges of Scotland; and since the synod of Ulster receives the general certificate of this institution as a qualification for ordination in their ministry, it may now be looked on as the great seminary of the Presbyterian church in Ireland. Its affairs are directed by a president, four vice-presidents, twenty managers, and eight visitors, chosen by the proprietary; and it enjoys an annual grant from parliament of 1500*l*. The chairs in the collegiate department are eight, embracing professorships of divinity, moral and natural philosophy, logic, mathematics, Greek, Latin, Hebrew, and, within the last year, a lectureship on Irish. The schools afford ample means of instruction on all subjects generally taught, and the faculty and managers have succeeded in forming a very respectable library and museum. There is no regularly endowed school here. The Lancasterian and the Brown-street institutions may be called free-schools: both have enjoyed the patronage of the Kildare-street association, but the Lancasterian school is now under the national board; nearly 2000 poor children are educated in these two establishments alone. Of the private schools, the Donegal-street academy is the most respectable; it has upwards of 150 scholars. A number of literary and scientific individuals in 1788 formed themselves into a body and took the name of the Society for Promoting Knowledge: they publish their transactions, and have a good library of upwards of 6000 volumes, together with a philosophical apparatus. A literary society more private, but comprising men of considerable eminence, was established in 1801. In 1821 another literary and scientific body was formed, called the Natural History Society; they have lately built a handsome house for their meetings, where they have a thriving library and a museum, which bids fair to be the next in Ireland to that of the Royal Dublin Society. In 1825 a mechanics' institute was erected, and a scientific school for artisans opened, where lectures are delivered on mechanics and chemistry. A botanical garden has been formed within the last four years, which is highly ornamental to the vicinity of the town, and already rich in a good assortment of plants. A patriotic institution, called the Irish Harp Society, for the cultivation of national music, has been long supported by voluntary subscription. The town expenses are levied by twelve commissioners and a committee of police, by virtue of an act passed in 1810. The paving, lighting, and cleansing of the streets, and general police of the town, are under their management. The amount of the police-tax for the first year of their superintendence was 3087*l*. 18*s*.; in 1834 it amounted to 8,058*l*. 2*s*. 2*d*. The sovereign has the control of the markets, the regulation of the cranes and weights, and is ex-officio a magistrate of the county of Antrim. A police magistrate, town-clerk, and seneschal of the manor are the other chief officers of the corporation. Since the year 1775, upwards of 100,000*l*. have been expended on a canal connecting this port with Lisburn and Loch Neagh, which is now the property of the Lagan Navigation Company. A plan for a railroad from the lime-quarries on the Cave-hill to the new docks is now being carried into effect: it is the property of private individuals, as well as a new bridge across the Lagan, about a quarter of a mile above the old long bridge which was built in 1682, and is now in a ruinous and unsafe condition. A lunatic asylum, capable of accommodating 106 patients, has been built by government in the vicinity of the town, at an expense of above 50,000*l*.: it is intended for the two counties of Down and Antrim. (See Spenser's *View*; Cox's *History of Ireland*; Dubourdieu's *Statistical Survey of the County of Antrim*; *Historical Collections relative to the Town of Belfast*, Belfast, 1817; Reid's *History of the Presbyterian Church in Ireland*; Hardy's *Northern Irish Tourist*; Inglis's *Ireland in* 1834; *Government Official Tables*; *Appendix to 2nd Report of Commissioners of Education in Ireland, and 4th Report, ditto*; *Ordnance Survey Map of Antrim*; *Calendar of Inquisitions for Ulster, &c. Communication from Ireland.*)

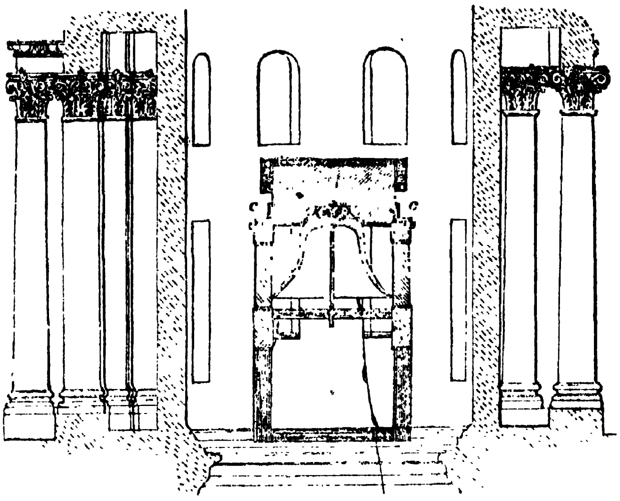
BELFRY, that part of a church-tower or steeple in which the bells are hung. The term is applied not only to that part of the tower, but also to the framing on which the bells are suspended. Belfry is probably derived from Belfredus, a low Latin term of the middle ages, a compound of *bell*, a Teutonic word, and *freid* (*friede*), peace. (Ducange, *Gloss.*) The old French word is *belfroit*. (Johnson's *Dict.* by Todd.) Ducange gives also the forms Beaufroy and Bellefroy. Belfry is synonymous with *Campanile* [see CAMPANILE], which, with the terms *clocaria* and *tristegum*, was used by the writers of the middle ages to express the same thing. According to some, the name Belfredus, which was applied to a wooden tower used in attacking fortified places, was afterwards given to any elevated tower in which a bell was hung. This statement, if correct, might lead us to infer that the Latin word *bellum* (war) was the first part of the compound Belfredus, and the second part possibly derived from the Latin, *fero*, to bear or carry away. The forms Berfredus and Verfredus also occur as the names of old military engines, and seem to lead to a different etymology.



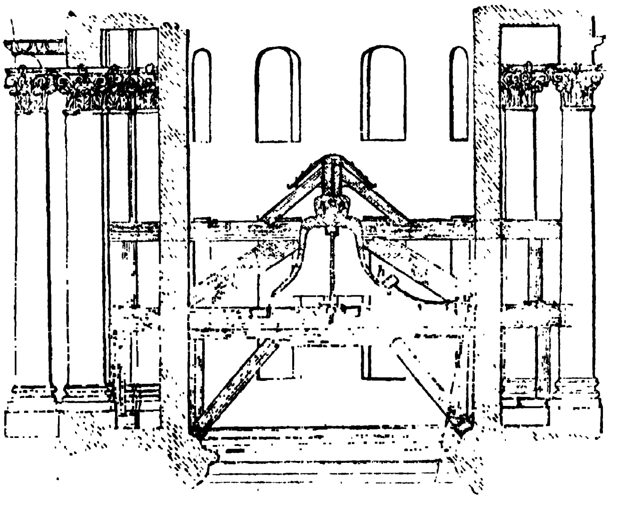
Plan of the belfry of St. Paul's.

A and B, lines of sections; *a*, *a*, beams.

In this plan and sections of the belfry of St. Paul's church are seen the construction of the timbers, showing their bearings independent of the masonry; that is, not fixed into the masonry. This construction may be taken as a good example of the method of hanging heavy bells in a belfry. In the two towers of St. Paul's Church four bells are hung; in the lower three and in the other one. The great bell shown in the section is hung over two others in the south tower; these latter are fixed, and not intended to be rung: the upper bell is hung on gudgeons or axles, and prepared for ringing, but from the confined space in which it is hung it cannot be rung, and only moves on its axle when struck by the hammer of the clock. In the construction of belfries the bearing of the timbers should always be on wooden plates.



Section of the belfry of St. Paul's on the line A, A. *c, c*, gudgeons, on which the bell swings.



Section of the belfry of St. Paul's on the line B, B. *h*, hammer.

0 1 2 3 4 5 10 20

Scale of Feet.

The term belfry was probably applied in the first instance to the wooden construction, which was made strong, in order to bear the weight of the bell or bells.

In constructing a belfry, the frame-work is placed either on stone corbels, or is made to bear on a 'recess formed in the wall.' (*Encyc. Method. Arch.*) This latter method is considered the best, because the vibration caused by the motion of the bells acts with less force on the masonry than it would if it were fixed in the masonry. It is also observed, that the higher the bells are placed in the tower, the more does the vibration, caused by ringing them, affect the masonry.

Village churches have belfries in their towers or steeples. In some instances, where there is a single bell, it is not placed in a tower, but suspended to a slight frame-work fixed between an arch constructed on the exterior top of the gable end of a church or chapel. [See BELL.]

BELGÆ, the general name given by Cæsar to the different tribes inhabiting the north of Gaul, between the sea on the west, the rivers Matrona (Marne) and Sequana (Seine) on the south, and the Rhenus (Rhine) on the east. But it is not well determined how far this name may be extended to the east; perhaps the Treviri, on the banks of the Moselle, were included. Cæsar remarks that the Matrona and Sequana separate the Belgæ from the Galli, who were to the south of them. He says also, in general and vague terms, that the Belgæ extend to the Lower Rhine, and lie towards the north and the rising sun. He also (*De Bell. Gall.* v. 24) uses the term Belgium to express the country of the Belgæ. The Belgæ, were according to Cæsar's testimony, of German origin, though perhaps somewhat mingled with the Celtic inhabitants of Gaul, and distinguished by their warlike character, which Cæsar attributes partly to their origin and partly to their being strangers to luxury and refinement. The Bellovaci [see BEAUVAIS] were the most warlike and numerous Belgic tribe in the time of Cæsar. (*De Bell. Gall.* ii. 4.) The Remi, whose capital was Durocortorum (Rheims), were the nearest Belgic tribe to the Galli on that side. The rest of the tribes are mentioned by Cæsar (ii. 4): among them we find one name, the Atrebates, the same as that of a tribe in Britain. The Belgæ may be described generally as occupying, in the time of Cæsar, the French departments of Nord, Pas de Calais, Somme, Seine Inférieure, Oise, and Aisne; with a part of modern Belgium.

When Cæsar invaded South Britain, he found that part of the island occupied by Belgæ, that is, by tribes of German origin, who had passed over from the opposite shores of Gaul, and obliged the original inhabitants to retreat into the interior of the country. (*De Bell. Gall.* v. 12.) But as he had no intercourse with the original inhabitants, it is impossible to say how far the Belgæ had penetrated inland; and later historians have given us no account of this circumstance. We learn only that the whole southern coast from Suffolk to Devonshire was occupied by Belgic tribes. The Cantii were settled in Kent, the Trinobantes to the north of the Thames, the Regni in Sussex and the Atrebatii in Berkshire. To the west of them the Belgæ, properly so called, occupied Hampshire and Wiltshire, and extended through Somersetshire to the Bristol Channel; their capital was Venta Belgarum, Winchester. Farther to the west, the Durotriges were found in Dorsetshire, and their neighbours, the Damnonii, in Devonshire.

The Belgæ in Britain, conformably to the character of their brethren in Gaul, made a stout resistance to Cæsar. But about a century afterwards they were compelled to submit to the yoke, which the Romans had already in the time of Cæsar imposed on their kinsmen in Gaul. The name Belgica occurs as the name of a division of Gaul as late as Diocletian's time. Under the emperors it was governed by an officer with the title of Procurator, or Legatus.

BELGIUM. The origin of this kingdom as a separate state dates from the year 1830. In the month of August of that year, the revolution began at Brussels which severed the Belgian provinces from the crown of Holland. On the 4th of October following, the provisional government at Brussels proclaimed the independence of Belgium; and on the 26th of December it was announced to the congress assembled in that city, that the allied powers of Europe had recognised the permanent separation of the Belgian provinces from the kingdom of the Netherlands. [See NETHERLANDS.]

In February, 1831, the congress elected the Duke of Nemours to the throne of the new kingdom; but his father, Louis Philippe, king of the French, having refused the crown on the part of his son, a new election became necessary, and the choice of the national representatives then fell upon Prince Leopold of Saxe Cobourg, widower of the Princess Charlotte of England. This prince having accepted the crown, took the oaths prescribed, and ascended the throne in the presence of the congress on the 22nd of July, 1831.

The courts of Great Britain, Austria, France, Prussia, and Russia, which had already acknowledged the independence of Belgium, concluded a treaty with King Leopold, which was signed in London on the 15th of November, 1831, in which treaty the boundaries of the new kingdom were defined, and the peaceable possession of his territories was guaranteed to King Leopold.

According to the terms of this treaty, the Belgian territory is composed of the provinces of South Brabant, Liége, Namur, Hainault, West Flanders, East Flanders, Antwerp, Limbourg, with the exception of some districts particularly described, and a part of the Grand Duchy of Luxembourg.

The exceptions in the province of Limbourg just mentioned are :—' 1st. On the right bank of the Meuse; the old

Dutch *enclaves* upon the said bank, united to those districts of the said province upon the same bank which did not belong to the States General in 1790; in suchwise that the whole of that part of the present province of Limbourg, situated upon the right bank of the Meuse, and comprised between that river on the west, the frontier of the Prussian territory on the east, the present frontier of the province of Liége on the south, and Dutch Guelderland on the north, shall henceforth belong to his majesty the king of the Netherlands, either to be held by him in his character of Grand Duke of Luxembourg, or in order to be united to Holland.

'2. On the left bank of the Meuse:—commencing from the southernmost point of the Dutch province of North Brabant, there shall be drawn a line, which shall terminate on the Meuse below *Wessem*, between that place and *Stevensweardt*, at the point where the present *Arrondissement* of *Ruremond* and *Maestricht* meet, on the left bank of the Meuse; in such manner that *Bergerot*, *Stamproy*, *Neer Itteren*, *Itervoord* and *Thorne*, with their districts, as well as all the other places situated to the north of this line, shall form part of the Dutch territory.

'The old Dutch *enclaves* in the province of Limbourg, upon the left bank of the Meuse, shall belong to Belgium, with the exception of the town of Maestricht, which together with a radius of territory, extending 1200 toises from the outer glacis of the fortress on the said bank of this river, shall continue to be possessed in full sovereignty by his majesty, the king of the Netherlands.'

The exceptions thus described in Limbourg were assigned to the king of the Netherlands in return for cessions to be made by him to Belgium, of a part of the Grand Duchy of Luxembourg, which are thus described in the treaty —

'Commencing from the frontier of France between *Rodange*, which shall remain to the Grand Duchy of Luxembourg, and *Athus*, which shall belong to Belgium, there shall be drawn a line, which leaving to Belgium the road from *Arlon* to *Longwy*, the town of *Arlon* with its district, and the road from *Arlon* to *Bastogne*, shall pass between *Mesancy*, which shall be on the Belgian territory and *Clemancy*, which shall remain to the Grand Duchy of Luxembourg, terminating at *Steinfort*, which place shall also remain to the Grand Duchy. From *Steinfort* this line shall be continued in the direction of *Eischen*, *Hecbus*, *Guïrsch*, *Grende*, *Nothomb*, *Parette*, and *Perlé*, as far as *Martelange*: *Hecbus*, *Guïrsch*, *Grende*, *Nothomb*, and *Parette*, being to belong to Belgium, and *Eischen*, *Oberpalen*, *Perlé*, and *Martelange*, to the Grand Duchy. From *Martelange* the said line shall follow the course of the *Sure*, the water-way (*thalweg*) of which river shall serve as the limit between the two states, as far as opposite to *Tintange*, from whence it shall be continued, as directly as possible, towards the present frontier of the *Arrondissement* of *Dickirch*, and shall pass between *Surret*, *Harlange*, and *Tarchamps*, which places shall be left to the Grand Duchy of Luxembourg; and *Honville*, *Livarchamp*, and *Loutremange*, which places shall form part of the Belgian territory. Then having, in the vicinity of *Doncols* and *Soulez*, which shall remain to the Grand Duchy, reached the present boundary of the *Arrondissement* of *Dickirch*, the line in question shall follow the said boundary to the frontier of the Prussian territory. All the territories, towns, fortresses, and places situated to the west of this line shall belong to Belgium; and all the territories, towns, fortresses, and places situated to the east of this line shall continue to belong to the Grand Duchy of Luxembourg.'

Boundaries.—The kingdom, as thus described, is bounded on the north by the Dutch part of the province of Limbourg, and by North Brabant, and Zeeland; on the north-west by the North Sea; on the south-west and south by the Departments of the Pas de Calais, Nord, Ardennes, and Moselle, in France; and on the east by the Dutch portion of the Grand Duchy of Luxembourg, and the Grand Duchy of the Lower Rhine.

Area and Population.—This territory lies between 49° 31′ and 51° 27′ N. lat., and between 2° 37′ and 6° E. long. Its greatest length from south-east to north-west is 173 English miles, and its greatest breadth, measured in the direction S.S.W. from the most northern part of the province of Antwerp, to the most southern point of the province of Hainault, 112 miles. Its form approaches to that of a triangle, the base of which is the French frontier, and its area is computed at 3,252,058 hectares, equal to 8,044,323 English acres, or 12569 English square miles. It is thus very nearly one-eighth of the area of Great Britain. The population, according to the census of 1830, amounted to 4,064,235 distributed through the different provinces as follows:—

	Inhabitants of		
	Towns.	Rural Districts.	Total.
South Brabant . .	160,784	395,362	556,146
Liége	95,375	274,562	369,937
Namur	34,219	178,506	212,725
Hainault	128,841	476,116	604,957
West Flanders . . .	164,945	436,759	601,704
East Flanders . . .	179,423	554,515	733,938
Antwerp	127,281	227,693	354,974
Limbourg	67,671	270,032	337,703
Luxembourg . . .	39,579	252,572	292,151
Total . .	998,118	3,066,117	4,064,235

The above numbers exhibit a population of 323 for every square mile. The coast of Belgium, which is low and flat, is not above forty miles in length.

Mountains, &c.—The general character of Belgium is that of a low and level country. The high land of Belgium is connected with the Vosges, the remote branches of which stretch into the provinces of Luxembourg and Liége. From the neighbourhood of the sources of the Saone and the Moselle another branch runs north and divides the waters of the Moselle from those of the Maese. Extending into the southern part of Luxembourg, it gradually declines as it approaches the banks of the Semoy and the Sure. The high ground, which is interrupted by these rivers, rises again to a greater elevation on their northern borders, encloses the valley of the Ourthe, and terminates between the Ourthe and the Roer, in the mountains of Hohe-veen, a wild tract situated to the north of Malmedy. The greatest height of the mountains in the tract described is 2265 feet above the sea, an elevation greater than that of the Ardennes by 317 feet.

Some high ground, which likewise forms part of the Ardennes, runs in a north direction between Cambray and Mezieres, and extends into the provinces of Namur and Hainault, and South Brabant, enclosing the valley of the Sambre, and separating the waters of the Maese from those of the Scheldt. The northern termination of this high ground is about Vilvoorde, between Brussels and Malines. [See Ardennes, Hainault, Lie'ge, Luxembourg, and Namur.]

The coal-fields of Belgium are in the provinces of Limbourg, Liége, Namur, and Hainault. The Limbourg coal-field is in the environs of Kerkraede, about twelve miles east of Maestricht, whence it extends into the Prussian territory. The greatest length of this field from north to south is about three miles and a half, and its greatest breadth from east to west not quite two miles; the surface contains about five and a half square miles, one-half of which is in the Prussian territory. In Liége there are two coal-fields. The largest of these is in the immediate vicinity of the town of Liége, and on both sides of the Maese or Meuse river. The field extends six and a quarter miles N.N.E. from Liége to Oupeye, and seven and a half miles in the contrary direction to Yvot. Jemeppe, three and three-quarter miles N.W. from Liége, is the termination of the bed in that direction, and Jupille, two and a half miles east from Liége, is its limit in the opposite direction. Its extreme length may therefore be stated as thirteen and three quarter miles, and its extreme breadth six and a quarter miles. This field is worked in many places: the principal pits are at Jemeppe, St. Nicholas, Glain, Ans, St. Marguerite St. Walburg, Herstal, and Oupeye: these places are on the left bank of the Maese. On the right bank there are pits at Wandre, Yvot, Seraing, Ougrée, La Chartreuse, Jupille and Cheratte.

The second coal-field of Liége is that of Battice and Clermont: its length eleven and a quarter miles E.S.E. from Housse to Clermont, and its greatest breadth six and a quarter miles E.N.E. from Fleron to Battice. The places here mentioned are those at which the principal workings are carried on.

Hainault contains three extensive coal-fields. One is situated to the west of Mons, and extends nearly twelve and a half miles from Quievrain on the west to Eugies on the south of Mons, and eight and three-quarter miles from Baisieux on the W.S.W. to Jemmapes on the west of Mons. The second coal-field on the east of Mons extends ten and five-eighth miles from Saint Denis on the west to Chapelle les Herlaimont on the east; and fifteen miles from Ville-sur-Haine on the N.W. to Thuin on the S.E: thirty-four pits are wrought in this field, and 142 in that west of Mons.

The third coal-field in this province is the most extensive, and it stretches into the adjoining province of Namur. The town of Charleroi stands in the centre of this coal district, which extends in Hainault from Fontaine-l'Evêque on the west to the boundary line on the east, a distance of thirteen and one-eighth miles; and from Fleurus on the north to Jamioulx on the south, about ten miles. The part of this field which is in Namur is in the form of a triangle, the base of which extends from Falisotte on the south to Velaine on the north, a distance of nearly three and three-quarter miles. The vertex of this triangle is between Mozet and Maizaret, so that it is nearly fifteen miles. The whole coal district of Hainault traverses the middle part of the province from E.N.E. to W.S.W. in a belt about five miles in breadth.

The soil, which in each of the provinces consists almost entirely of clay and sand, has for the most part been rendered fertile by a due admixture of both these elements. Agricultural industry is carried to a great extent in the kingdom, and the cultivators have availed themselves of every advantage within their reach for increasing their productions. The extent of cultivation in each province will be seen in the following table, taken from the *Annuaire de l'Observatoire de Bruxelles pour l'an* 1835, compiled by Mons. Quetelet, from official documents:

PROVINCES.	Cultivated Land. Hectares.	Uncultivated Land. Hectares.	Land occupied with buildings. Hectares.	Roads and Canals. Hectares.	Total in Hectares.	Total in English Acres of Cultivated Land.
Limbourg . .	310,514	139,410	1,480	15,283	466,687	767,070
Liege	237,579	40,850	915	9,648	288,992	586,671
Namur . . .	278,397	58,959	926	9,401	347,683	687,610
Luxembourg . .	463,423	167,760	1,462	17 571	650 216	1,144,655
Hainault . . .	356,258	3,455	2,962	9,794	372,469	879,957
Brabant (South) .	316,833	1,356	1,768	8,419	328,426	782,701
East Flanders .	264 988	1,310	4,422	11,641	282,361	654,520
West Flanders .	296,915	8,690	2,015	8,965	316 585	733,380
Antwerp . . .	197,303	72,651	1,719	12,157	283,830	487,339
Totals . .	2,722,260	494,441	17,669	102,879	3,337,249	6,723,933

It appears from this statement, that about nine-elevenths of the whole surface of the country are under cultivation. Even of the uncultivated land, which amounts to no more than 15 per cent. of the whole area, a considerable part is occupied by forests, and is therefore productive. A part of the uncultivated surface is also occupied by towns, roads, and canals. In England only six-tenths of the land has been brought under cultivation.

Rivers, Canals, &c.—The principal rivers of Belgium are the Maese, or Meuse, and the Scheldt. The first, which has its source in the department of Haute Marne in France, enters Belgium about a mile from Givet, in the province of Namur. It flows first to the north as far as Hastière-par-dela, about seventeen and a half miles south of Namur; it then turns to the north-east, and afterwards resuming its north course, flows to Namur, where its direction is again changed to E.N.E. The Maese quits the province of Namur at Huy, and continues the same course to Liége, when it again takes a more northerly direction to Maestricht in Limbourg, which province it enters at Navagne, and quits the Belgian territory between Wessem and Stevenswaardt.

In its course, as here described, the Maese is increased by the waters of the Sambre, which joins its left bank at Namur, and those of the Houyon on the left, and the Méhaigne on the right at Huy. It is joined by the Ourthe on the right, and the Légie on the left at Liége, and by the Berwinne on the right at Navagne; by the Geer or Jaar on the left, and the Geule on the left at Maestricht, and just before it quits the Belgian territory it is joined by the Geleen near Stevenswaardt. The Maese is navigable through the whole of its course in Belgium; below Liége the passage is rendered difficult by shifting sand-banks. It is crossed by a stone bridge of six arches at Dinant, and by another of nine arches at Namur. At Liége a stone bridge unites the two parts of the town which stand on opposite sides of the river.

The Scheldt has likewise its source in France, about one and a quarter mile south-east of Casteiet, in the department of L'Aisne. It enters Belgium immediately after its confluence with the Scarpe, about twelve miles south of Tournay in Hainault. Its course is N.N.W. to Tournay, which town it divides into two parts; it then turns more to the north, and at the end of seven and a half miles, at Hérinnes, forms the boundary-line between Hainault and East Flanders; it leaves the former province at Escamaffles, and becomes the common boundary of West and East Flanders to the north-eastern extremity of the commune of Berchem, when its course is altered to N.N.E., and it passes through East Flanders to Ghent. At this town the course of the river turns east, in which direction it continues to Dendermond, where the Scheldt again becomes the boundary of two provinces, and divides East Flanders from Antwerp. Its course again changes at Dendermond to N.N.E., and at Antwerp it turns to N.W., in which direction it flows until it quits the Belgian territory between Zeeland and North Brabant, and joins the æstuary of the West Scheldt at the point of its junction with the East Scheldt opposite the south-eastern end of the island of Zuid-Beveland.

In its course through Belgium the Scheldt receives the waters of the Lys on the left at Ghent, and those of the Durme on the left at Thielrode, two leagues N.E. of Dendermond; it is afterwards joined on the right by the Dender at Dendermond, and by the Rupel nearly opposite Rupelmond, seven and a half miles S.S.W. of Antwerp.

The Scheldt is navigable throughout its whole course in Belgium, and indeed as far as Cambray in France, 195 miles from the sea. The navigation is rendered somewhat difficult for large vessels at the mouths of the river by sand-banks. At Antwerp the mean depth of the river at low-water is 32 feet, and its width 480 yards: the rise of the tide at this city is 16 feet. The water is brackish as high up as Fort Lillo. Opposite Antwerp it is quite fresh, but too muddy to drink. In spring-tides the water flows at the rate of three miles an hour, but only at half that rate during neap tides: the tide flows as high as Ghent, 100 miles from the mouth of the river. From the nature of the country, there being no hills to break the force of the winds, they have a very sensible effect in increasing or diminishing the tides, causing a difference in this respect of three or four feet in the height of the water in different conditions of the weather.

In addition to the two principal rivers and those of their affluents which have been described, Belgium is watered by other streams, some of which require notice, but as descriptions of them will necessarily be given in connexion with the provinces in which they occur, it does not appear necessary to do more than mention them here.

The Ourthe rises in the Ardennes from two sources, which are more than twelve and a half miles apart. The two branches join at Houffalize in Luxembourg, and become navigable at Laroche, in Liége—having previously been augmented by two smaller streams, the Aine and the Logne. It joins the Maese at the town of Liége, as already mentioned. The Vesdre has its source in the Grand Duchy of the Lower Rhine, and enters Liége near the town of Limbourg. Flowing to the west it falls into the Ourthe at Chenée, near to the town of Liége. The Amblève also rises in the Prussian territory, enters Belgium near Stavelot, in the province of Liége, and joins the Ourthe near to Comblain-au-Pont in the same province. The Mehaign rises in Namur, and discharges itself into the Maese on its right bank at Statte, near to Huy in Liége. The Geer or Jaar rises in the district of Waremme in Liége, and falls into the Maese at Maestricht.

The Sambre has its source in France, in the Forest of La Haye Cartigny, in the department de l'Aisne. It enters Hainault at Erquelinnes, runs in a direction E.N.E. to Namur, which province it enters a little below D'Aiseau, not far from Moignelée, and falls into the Maese, as already described, at Namur.

Belgium is not so well provided as Holland with canals. The canal of Bois-le-duc commences at Maestricht, passes through the communes of Neerharen, Reckheim, Borsheim, Mechelen, Eysden, Neeroeteren, Oppiter, Brée, Beek, Bockholt, Weert, and Nederwert, at which last-named place it quits the province of Limbourg, and enters the Dutch territory of North Brabant. The length of the canal from Maestricht to Nederwert is about forty-two English miles; it has two stationary bridges, fourteen drawbridges, seven sluices, and sixteen reservoirs. Its supply of water is drawn from the Maese. The canal from Bruges to Ghent communicates at Bruges with the canals of Damme and of Ostend. The Bruges and Ghent canal was constructed in the beginning of the seventeenth century, and is adapted for the passage of vessels of 80 to 100 tons burthen; its principal feeder is the River Lys, with which it is connected by means of a sluice at Ghent. Ghent has communication with the sea by means of a canal, whose course is N.N.E. from Ghent through Sas-de-Gand, where it is joined to the canal of Neuzen, which communicates with the æstuary of the East Scheldt. This canal was projected for the purpose of draining the province of East Flanders, and was undertaken by the general government; but in consideration of its depth and width being increased so as to render it navigable, the regency of Ghent consented to bear a part of the expense, and their town by this means was rendered a sea-port. Vessels drawing eighteen feet water easily pass through this canal; after the discharge of their cargo, it is usual for them to descend the Scheldt to Antwerp. This improvement was not completed until 1828. A similar project is said to have been once contemplated by Napoleon.

The Louvain canal begins at that town, where it is fed by the river Dyle, follows a north-west direction, and enters the province of Antwerp a short distance from Malines, passing under the walls of that town, and again joins the river Dyle at its confluence with the Senne, at a place called Senne-gal near Rumpst. The Louvain canal is sixty feet wide, and eleven feet deep. The boats employed upon it are sixty feet long, twelve feet wide, and draw from two to three feet water. When the wind is fair they sail up or down, otherwise they are drawn by horses. This canal was constructed in 1750, at the expense of the city of Louvain. Its cost was about 160,000*l.*, and to reimburse the city for its outlay the government granted to it a duty on beer and on butter, as well as a toll upon vessels, the produce of which was sufficient to pay for the canal in forty-eight years. In fifteen years from its completion, the land in the vicinity of the canal was doubled in value, by the means which it afforded for procuring manure and for conveying agricultural produce to market.

The Brussels canal which is supplied by the water of the river Senne at Brussels, proceeds to the north by Vilvoorde, passes from South Brabant to the province of Antwerp, a little below Thisselt, crosses the commune of Willebrock, and ends in the river Rupel opposite Boom. This canal, begun in 1550, was not opened for navigation until 1591. The object of its construction was to facilitate the communication between Brussels and Antwerp; its cost was 130,000*l*, a large sum for those days, and it is still considered one of the finest works in Belgium.

The canal from Mons to Condé is supplied by the river Haine, which gives its name to the province of Hainault. It proceeds in a strait line to the west, enters France near Valenciennes, and falls into the Scheldt at Condé, after a course of about twenty-four miles, rather more than four miles of which are in the French territory. It has seven sluices, five in Hainault and two in France. It is crossed at different places by fourteen drawbridges, three of them in France. The mean depth of water in this canal is six feet, and its mean breadth at the water-line fifty-five feet. This canal was undertaken by the French government in 1807, and was finished in 1814. Some judgment may be formed of its utility from the number of boats which have passed upon it in each year, from 1816 to 1828, the last year of which any account is given: their numbers were

	Boats.		Boats.		Boats.
1816 . .	3287	1821 . .	3998	1826 . .	5430
1817 . .	3460	1822 . .	3942	1827 . .	5440
1818 . .	3673	1823 . .	4052	1828 . .	6009
1819 . .	3739	1824 . .	4881		
1820 . .	3940	1825 . .	5370		

The principal use of this canal is to convey coals from Hainault to France. In 1828, 3603 boats, loaded with 374,158 tons of coals, passed along it.*

A rail-road between Brussels and Malines, through Vilvoorde, was finished and opened for use with much ceremony on the 5th of May, 1835. The carriages on this railroad are propelled by means of locomotive steam-engines, the whole of which have been imported from England, where they were constructed under the direction of Mr. Stephenson, the engineer of the Manchester and Liverpool railway. It is intended that branches of the Brussels railway shall proceed from Malines to Dendermond and Antwerp: the lines for these roads are already surveyed and marked out.

Natural productions.—It has been seen how very considerable a portion of the kingdom of Belgium has been brought under cultivation. This has been effected by a long course of industry on the part of the inhabitants. Naturally, the soil is unproductive, consisting in some parts of sand, and in other parts of clay. Separately, these would yield no return to the husbandman, but by a due admixture of both, and the addition of manure, the soil has been made highly productive. The most general objects of cultivation are wheat, rye, barley, oats, meslin, buck-wheat, hemp, flax, madder, hops, chicory, colza (*Brassica oleracea arvensis*), and the artificial grasses clover, trefoil, lucerne, and sainfoin. The ruta baga, or Swedish turnip, turnips, carrots, parsnips, and potatoes, are raised to a considerable amount by field culture. Tobacco is grown in some situations, and every where fruits of the kinds grown in England are objects of careful cultivation.

In addition to the materials commonly used in England for manure, the Belgian farmers employ considerable quantities of turf-ashes, which are prepared in Holland, and conveyed by inland navigation to the different provinces of Belgium. They also collect with the utmost care the drainings of dung-heaps, and other fertilizing liquids, in which rape-cake is dissolved, in the proportion of six pounds of rape-cake to five gallons of liquor. Turf-ashes are found to be an excellent dressing for clover land, in the proportion of eighteen or twenty bushels to the English acre. By means of their crops of clover and other artificial grasses, a large number of cattle is bred and fatted, and these again are serviceable in providing manure for the land.

The following table of the number of horned cattle, horses, and sheep, which were found in each province in the year 1825, is taken from a collection of statistical documents published by the Netherlands government in 1829. As this enumeration was made previous to the separation of Belgium from the northern provinces, the returns comprehend the whole of Limbourg and Luxembourg. We have not been able to find any similar statement compiled since the revolution of 1830.

	Horned Cattle.	Horses.	Sheep.
South Brabant . . .	93,007	50,543	32,725
Liége	70,800	21,403	96,344
East Flanders . . .	118,024	27,549	34,707
West Flanders . .	127,713	23,752	38,604
Hainault	98,999	51,812	95,916
Namur	55,571	21,922	113,657
Antwerp	85,532	30,500	28,408
Limbourg	101,637	24,769	126,913
Luxembourg . . .	131,651	37,195	206,860
Totals . .	882,934	289,445	774,134

Returns have been made from some of the provinces to the year 1829; but they do not exhibit any great difference from the numbers of 1825 given above, which may therefore be taken as representing pretty nearly the numbers actually existing at this time (1835). The graziers in Belgium do not appear to have paid much attention to the improvement of the breed of their cattle or sheep. The breeders of horses have taken some trouble in this respect, and a considerable number of draft-horses are every year sold for exportation. Pigs are also bred, and the sale of those animals to the northern provinces formed an important branch of trade before the separation of Belgium from Holland.

It is customary to plant trees on the borders of fields, and round the villages. There are few woods, except in Liége and Luxembourg; these two provinces, with Namur, include a portion of the antient forest of Ardennes. Among the timber-trees are the oak, chestnut, horse-chestnut, beech, elm, horn-beam, ash, walnut, fir, and different descriptions of poplars.

Metals and minerals.—The mineral productions of Belgium are iron, calamine, coals, and building stone. The men employed in extracting coal, are now between 14,000 and 15,000, and the different mines are furnished with 115 steam-engines for pumping out water, and for raising the coal to the surface.

Population.—The number of inhabitants in each pro vince at the last census has already been given from official authority. From the same source we derive the following particulars of the *movement* of the population in the year 1833:—

PROVINCES.	Number of Births.						Number of Marriages.	Number of Divorces.	Number of Deaths.					
	In Towns.			In Villages, &c.					In Towns.			In Villages, &c.		
	Males.	Females.	Total.	Males.	Females.	Total.			Males.	Females.	Total.	Males.	Females.	Total.
South Brabant	3,151	2,959	6,110	7,180	7,005	14,185	3,932	2	3,316	3,296	6,612	5,316	5,355	10,671

The number of births, marriages, and deaths, proportionally with the population, and the average number of children to each marriage in the different provinces, are as follows:—

PROVINCES.	No. of Inhabitants for			Average number of children to each marriage.
	One Birth.	One Marriage.	One Death.	
Limbourg	32	139	44	4·37
Liége	31	155	47	4·72
Namur	33	154	56	4·57
Luxembourg	28	128	43	4·67
Hainault	30	140	48	4·51
South Brabant	29	137	41	4·68
East Flanders	30	173	43	5·19
West Flanders	30	169	39	4·90
Antwerp	32	149	46	4·48
Mean of all the Provinces	30	144	43	4·72

Religion.—The great bulk of the inhabitants of the kingdom profess the Roman Catholic religion. The following table embraces every province excepting Limbourg, the returns for which are wanting:—

Provinces.	Catholics.	Protestants.	Jews.
Liége	369,044	810	22
Namur	211,963	612	61
Luxembourg	300,155	106	92
Hainault	603,197	1,683	36
South Brabant	551,987	3,146	580
East Flanders	732,129	1,647	128
West Flanders	600,060	1,598	4
Antwerp	351,818	2,898	151

The people of all religious persuasions enjoy the most perfect freedom in every thing connected with the expression of their opinions and the modes of worship which they may adopt. The incomes of the ministers of each denomination of religionists are derived from the public treasury: the expense of the whole in the year 1834 was as under.

Catholics	3,352,900 francs,	equal to	£134,116
Protestants	65,000 „	„	2,600
Jews	10,000 „	„	400
	3,427,900 fr.		£137,116

The Catholics are under the spiritual charge of the Archbishop of Malines and of five bishops, viz., of Bruges, Ghent, Liége, Namur, and Tournay. The salary of the archbishop is 100,420 francs, equal to 4016*l.* per annum. The salaries of the bishops vary from 56,300 francs, the lowest, to 77,300 francs, the highest, or from 2252*l.* to 3092*l.* per annum. Out of these revenues they have to pay a very large proportion for the support of vicars-general and canons, as well as a fixed sum of 800 francs each for seminaries of education, leaving net incomes of 21,000 francs or 840*l.* per annum to the archbishop, and of 14,700 francs or 588*l.* per annum to each of the bishops, the difference in their gross incomes being rendered necessary by the different amount of expenses to which each is liable.

The officiating clergy in connexion with the Catholic Church are distributed through the provinces as follows:—

Provinces.	Curés, 1st class.	Curés, 2nd class.	Inferior clergy.
Antwerp	10	11	362
South Brabant	12	17	625
West Flanders	19	17	431
East Flanders	21	15	498
Hainault	6	26	506
Liége	6	18	436
Limbourg	5	17	606
Luxembourg	1	29	652
Namur	1	15	306
Total	81	165	4422

The salaries paid out of the public treasury are—

To curés of the 1st class 975 florins, equal to £82 per ann.
To curés of the 2nd class 670 „ „ 55 „

To the inferior clergy the allowances vary from 100 florins to 375 florins (from 8 guineas to 30 guineas) per annum.

The allowances made to the Protestant clergymen vary from 200 to 2000 florins for each (from 16*l.* 16*s.* to 168*l.*); the greater number receive about 1000 florins (84*l.*) per ann.

The sum of 10,000 francs contributed for the support of the Jewish faith is thus distributed:—

To the high priest	2,400 francs, or	£96	per ann.
Two officiating priests	2,500 „	100	„
Secretary	400 „	16	„
Expenses of synagogues, cemetery, &c.	4,700 „	188	„
	10,000 fr.	£400	

Very recently the chambers have granted the sum of 12,000 francs, to encourage religious establishments in the principal towns of the kingdom, for the celebration of worship according to the rites of the Church of England.

Education.—Belgium contains three universities, at Ghent, Liége, and Louvain, in which are classes for medicine, law, moral philosophy, and physical and mathematical sciences. The number of students in 1832 were:—

	Medicine.	Law.	Other sciences.	Total.
University of Ghent	141	151	—	292
„ Liége	97	147	108	352
„ Louvain	129	125	141	395
Together	367	423	249	1039

Bruges, Brussels, Namur, and Tournay each contain a public school (Athénée), in which the usual branches of literary education are taught. These schools, in 1832, gave instruction to 876 scholars, viz.:—

Bruges	131
Brussels	181
Namur	240
Tournay	324
	876

Descriptions of these schools will be found under the names of the different localities in which they are situated.

In addition to the establishments already mentioned, a great number of elementary schools (Ecoles Primaires) are opened in the different provinces. The number of these schools, and of the scholars attending them, in 1832, are here given.

PROVINCES.	Number of Schools.	Number of Scholars.			Population of Provinces.
		Males	Females.	Total.	
Antwerp .	341	15,105	11,801	26,906	354,974
South Brabant	592	21,104	17,586	38,690	556,146
West Flanders	547	19,949	16,997	36,946	601,704
East Flanders	875	30,710	24,284	54,994	733,938
Hainault . .	888	35,671	29,048	64,719	604,957
Liége . . .	492	17,912	11,977	29,889	369,937
Limbourg .	404	16,973	12,419	29,392	337,703
Luxembourg .	831	24,049	19,201	43,250	292,151
Namur . .	416	17,061	13,575	30,636	212,725
Total . .	5,386	198,534	156,888	355,422	4,064,235

The sums contributed in 1834 out of the public treasury for the purposes of education amounted to 743,200 francs or 29,728*l*. About one-half of this sum (384,900 francs) was applied to the support of the three universities, and 242,000 francs were assigned to the elementary schools; the remainder was divided among the 'Athénées.'

Manufactures.—The manufacturing industry of Belgium has very much declined in modern times as compared with the extent to which this was carried on in the fourteenth century. Much earlier than this, under the Romans, several Flemish cities were celebrated for producing woollen-cloths. Extensive manufactures of woollens and linens were carried on in the time of Charlemagne, chiefly in Liége. The making of thread-lace originated in Flanders, and, up to a recent period, Brussels and Mechlin have carried on a large trade in that article: in the former city more than 12,000 persons were once employed for its production. Early in the fourteenth century Louvain contained 4000 looms for woollens; and Brussels and Antwerp had together as large a number. At a date not quite so remote Ghent employed between 30,000 and 40,000 looms for the weaving of woollen and linen goods. It is mentioned that the weavers of that city once mustered 16,000 men in arms under the banners of their respective trades. The city of Antwerp, at the time of its capture in 1585 by the Duke of Parma, governor of the Spanish Netherlands, contained a large population employed in manufacturing woollen and silk goods; but at that time, through the tyranny of its conquerors, the artisans were driven away, and many of them took refuge in England, where their example and instruction were of great use for the improvement of the English silk manufacture. The woollen manufacture is now prosecuted, but to a much smaller extent than formerly, at Verviers, Charleroy, Tournay, Mons, and some other towns. Cotton-spinning and weaving are carried on in Brussels and some towns in Limbourg. Liége and Maestricht contain large tanneries. At Antwerp, Ostend, and Ghent, there are some sugar-refineries, cutlery is made at Namur, and fire-arms in considerable quantities at Liege: breweries are likewise numerous and extensive in most of the principal towns throughout the kingdom. Earthenware is made of good quality in several places, and the manufacture of nails has been carried on for a very long period in the provinces of Liége and Hainault. These provinces used formerly to supply a large quantity of nails to foreign markets, but this branch of their trade has greatly fallen off since the great reduction in the price of iron and in the charges of manufacture in England, which have not been accompanied by corresponding reductions in Belgium.

Trade.—The external trade of Belgium has suffered greatly from the revolution by which it has been separated from the northern provinces of the Netherlands. Holland retains all the colonies which belonged to the kingdom of the United Netherlands, and monopolizes the trade with them. Antwerp, the principal mercantile part of the new kingdom, which in 1829 received 995 ships, of 145,881 tons burthen, received in 1831 only 382 ships of 49,368 tons burthen. The proportions of these ships which were employed in the trade with England were, in 1829, 212 vessels of 35,306 tons burthen, and in 1831, 169 ships of 21,670 tons burthen: the trade with America has fallen off much more considerably, having been 113 ships of 30,316 tons burthen in 1829, and only 20 ships of 5057 tons in 1831.

Many ship-owners who, up to the time of the revolution, were established in Belgium, then transferred themselves to Holland, and put their ships under the Dutch flag, in order that they might not be excluded from participating in the colonial trade in which they had previously been employed.

The articles which Belgium supplies to England are oak-bark, flax, madder, clover-seed, spelter, and sheeps' wool. in return for which we send various kinds of East India and West India produce, tobacco, and cotton wool, besides British and Irish produce, and manufactures to the value of nearly one million annually, consisting principally of brass and copper manufactures, cotton manufactures and yarn, hardware, earthenware, salt, sheeps' wool, woollen and worsted yarn, and woollen manufactures. A great part of the cotton-yarn and cloths, and the tobacco, which are exported hence to Belgium, are not intended for consumption there, but are smuggled across the French frontier by means of dogs trained for the purpose, by being pampered in France and half starved and otherwise ill-used in Belgium.

Government.—Belgium is called a limited constitutional monarchy. The succession is limited to the direct male line, to the perpetual exclusion of females and their descendants. In default of a male heir, the king, with the consent of the legislative chambers, may nominate his successor, and in further default of such nomination the throne is declared vacant.

The legislative power is vested in the king and two chambers—the Senate and House of Representatives. The members of these chambers are elected by citizens paying not less than twenty florins (about thirty-five shillings) annually of direct taxes. The members are elected for certain divisions or places, but by one of the articles of the constitution it is expressly declared that the deputies and senators shall consider themselves as representing the whole nation, and not simply the provinces or divisions from which they are sent. The number of deputies is fixed with reference to the amount of population, so that the proportion of one deputy for 40,000 inhabitants must in no case be exceeded. Each representative must be a Belgian by birth or naturalization, in the full enjoyment of all civil and political rights, of at least twenty-five years of age, and having his permanent residence within the kingdom. The members of the representative chamber are elected for four years, renewable one half every two years. The king has the power to dissolve the chambers, either simultaneously or separately. The decree or act of dissolution must contain a provision convoking the electors within forty days, and the new chambers in two months.

The Senate is composed of exactly one-half the number of members in the Chamber of Representatives, and the senators are elected by the same citizens who elect to that chamber. The senators are elected for eight years; they are renewed one-half every four years; but in case of dissolution, of course the election must comprise the whole number of which the Senate is composed. The qualifications requisite for a senator are, that he must be a Belgian by birth or naturalization, in full possession of all political and civil rights, domiciled within the kingdom, at least forty years of age, and paying at least 1000 florins of direct taxes (84*l*. sterling). In those provinces where the list of citizens who possess this last-mentioned qualification does not reach the proportion of one in 6000 of the population, that list is enlarged by the admission into it of the names of those citizens who pay the greatest amount of direct taxes, so that the list shall always contain at least one person who is eligible to the Senate for every 6000 inhabitants of the province.

The members of the House of Representatives are paid for their services at the rate of 200 florins monthly (16*l*. 16*s*.) during the continuance of the session. The senators do not receive any pay. The presumptive heir to the throne is of right a senator at the age of eighteen, but he has not any voice in the proceedings until twenty-five years of age. All proceedings of the Senate during the time when the Chamber of Representatives is not sitting are without force.

Each branch of the legislature may originate laws, with this exception, that every law relating to the receipt or expenditure of money for public purposes must be first voted by the Chamber of Representatives. The ordinary sittings of both chambers are held in public; but each chamber, on the demand of the president or of ten members, may form itself into a secret committee, and when so formed it rests with the majority of the chamber to decide whether or not the sittings shall continue to be secret. If a member of either of the legislative houses accepts an office of emolument under the crown, he immediately vacates his seat until re-elected. The president and vice-presidents of each chamber are nominated by its members at the beginning of each session.

The chambers assemble as of right every year on the second Tuesday in November, unless they shall have been previously called together by the king. The session must last at least forty days; its prorogation is pronounced by the king.

The number of citizens registered as electors in the lists, as they stood in each province in April, 1833, and the number of representatives and senators chosen in each province, are as under:—

PROVINCES.	Number of Electors.			Number of Inhabitants to each Elector.	Number of Members.	
	In Towns.	In Country.	Total.		Representatives.	Senate.
Antwerp . . .	1,572	2,872	4,444	78	9	4
South Brabant . .	2,785	3,104	5,889	93	14	7
West Flanders . .	2,217	4,391	6,608	92	15	8
East Flanders . . .	2,605	7,001	9,606	74	18	9
Hainault . . .	2,047	4,280	6,327	98	15	7
Liége	1,191	2,535	3,726	101	9	5
Limbourg . . .	960	2,399	3,359	96	9	4
Luxembourg . . .	580	4,354	4,934	62	8	4
Namur	878	2,082	2,960	73	5	3
Total . . .	14,835	33,018	47,853	85	102	51

The person of the king is declared sacred. His ministers are responsible for the acts of the government. No act of the king can have any legal effect until countersigned by one of his ministers, who by that means becomes responsible.

The king appoints and dismisses his ministers at pleasure. He nominates to civil and military offices. He promulgates the rules and orders necessary to insure the execution of laws, but has no power to dispense with nor to suspend the execution of the laws. The king commands the land and sea forces, declares war, and makes treaties of peace, of alliance and of commerce, communicating the same to the legislative chambers as speedily as the public safety and interest permit. Commercial treaties have no legal effect until they have been assented to by the chambers. No cession, exchange, or addition to the national territory can be made except by means of a law passed in conjunction with the chambers.

The king is declared of age at eighteen years. Before he can exercise the functions of royalty, he must take the following oath, in presence of both legislative chambers:—'I swear to observe the constitution and the laws of the Belgian people, to maintain the independence of the nation and the integrity of its territory.'

If at the death of the king his successor should be a minor, the two chambers meet together in order to appoint a regent. The regency cannot be intrusted to more than one person, who, before he can enter upon his office, must take the oath just recited.

In case the throne should become vacant, the chambers deliberating together shall appoint a provisional regent; both chambers are then dissolved, and must meet again at latest in two months, when the new chambers, sitting in deliberation together, are to supply the vacancy.

No man can be appointed a minister of state who is not a Belgian by birth or naturalization. No member of the royal family can be a minister. The ministers have the right of attending and speaking in either of the chambers, but can only vote in one, provided they have been elected members thereof. The chambers may require the presence of ministers. In no case can the king screen a minister from responsibility.

The king has the right of coining money, and of conferring titles of nobility, but without granting thereby any peculiar privileges, such being repudiated by a fundamental article of the constitution, which declares all Belgians to be equal in the eye of the law, without any distinction of orders.

Judges receive their appointments directly from the king, and hold them for life, so that they cannot be superseded but by their own consent, or by a judgment pronounced in open court, and for reasons publicly declared on that occasion. The trial by jury is established for all criminal and political charges, and for offences of the press.

No taxes can be levied by the state unless previously established by a law passed by the chambers, and all such taxes must be voted annually, the laws by which they are established expiring at the end of a year. The contingent of the army is voted under the same limitation.

Personal liberty, and liberty of conscience, are guaranteed to every citizen by the constitution in the fullest sense; all are amenable to the laws, and all are placed equally under their protection.

Military Forces.—The Civic or National Guard of the kingdom is raised for the purposes of defending the constitutional rights of the monarchy and the people, of maintaining order, upholding the laws and preserving the territory of Belgium from invasion. This guard is unequally divided into three corps (*bans*). The entire number of the three is 590,907 men, raised in the different provinces in the following proportions:—

Brabant . .	27 legions	. 82,166	men.
Antwerp . .	20 ,,	. 48,533	,,
East Flanders	38 ,,	. 108,206	,,
West Flanders	40 ,,	. 82,663	,,
Hainault . .	35 ,,	. 89,834	,,
Namur . .	16 ,,	. 31,542	,,
Liége . .	25 ,,	. 53,771	,,
Limbourg .	24 ,,	. 49,793	,,
Luxembourg .	32 ,,	. 44,399	,,
Total	257 legions	590,907	men.

The first corps, or *ban*, includes only 89,089 men. The government is authorised to give a more active and efficient character (*mobiliser*) to the whole, or any part of this corps; hitherto only a portion has been called into active service.

The more regular or standing army consists of the following number of men:—

12 regiments of infantry of the line, each 1900 .	22,800
3 ,, foot chasseurs ,, 1368 .	4,104
2 ,, horse chasseurs ,, 1462 .	2,924
2 ,, lancers . ,, 1462 .	2,924
1 regiment of cuirassiers	1,500
1 ,, 'guides'	867
1 ,, gensd'armes . . .	1,156
Artillery, battering train, sappers and miners, &c.	5,557
Total	41,832

The number of horses belonging to this army is 14,064

Finances.—The total revenue of Belgium for the year 1834, as stated in the 'Budget Général' laid before the Chambers by the government, amounted to 84,130,624 francs (3,365,225*l.*). This revenue was derived from the following principal sources, viz.:—

	Francs.
Direct taxes.—viz., land-tax, licenses for carrying on trades (patents), and personal contributions	31,410,624
Customs duties.—On importations, exportations, transit, and tonnage duties .	7,600,000
Excise.—Salt, wine, spirits, beer, sugar, &c.	17,580,000
Sundries.—Stamps, duty on registrations, and on successions	17,375,000
Posts.—Carriage of letters, specie, &c. .	2,340,000
National domains.—Rents, produce of canal dues, &c.	2,400,000
Sundries.—Tolls on roads, passports, seizures, &c.	5,425,000
	84,130,624

The expenses of the year were just about equal to the receipts, and may be classed as follows:—

	Francs.
Interest on the public debt . . .	10,864,394
Civil list, expenses of the chambers, salaries and expenses of officers engaged in administering justice, prisons, and police, and public charitable institutions . .	8,734,505
Diplomatic services and expenses . .	691,200
Marine	1,001,201
Army	40,000,000
Provincial government, public instruction, religious worship, expenses of civic guard, public works, advancement of scientific objects, &c.	10,482,244
Salaries of various public functionaries, expenses of national domains, of ports, customs, excise, &c.	11,315,897
Overpayments returned, and the like .	1,033,000
Francs	84,122,441
or	£3,364,897

The expenditure for the year 1833 exceeded the sum here stated by 14,000,000 of francs, or 560,000*l.*, the difference having been caused by a reduction of the army; but as the peculiar position of the kingdom with regard to Holland obliges the government still to keep on foot a very considerable force, and to maintain a numerous staff ready organized, the Belgian government is not in so favourable a position for reducing its debt, and for relieving its subjects from the pressure of taxation as it would be, if a better understanding could be effected with the Dutch government, which is equally burthened with expenses occasioned by armaments, and has its resources equally crippled by the want of a free intercourse between the two kingdoms.

BELGOROD, or **BJELGOROD**, once the capital of a province, but now the chief town of a circle in the province of Kursk, in the south-eastern part of Russia in Europe, is nearly four miles and a half in circuit, and is situated close to the sources of the Severnoi-Donetz, which falls into the Don. It is traversed by the small river Ziolka or Wessolka, and lies about ninety miles south of Kursk. This town was originally built in the reign of Fedor Ivanovitsh, in the year 1597, when its site was a chalk hill, close to where it now stands, whence it was called the 'white town:' but it was afterwards removed about a mile lower down to its present situation, in a valley between two hills. It is divided into the Old and New towns, and has three suburbs: the old town is surrounded by a rampart and ditch, but the new by palisades only. It is the seat of an archbishopric, has two monastic establishments, ten churches of stone and three of wood, and three charitable asylums. There are several manufactories in the town, particularly for refining and pressing wax, and for spinning and weaving; and it carries on a considerable trade in hemp, bristles, honey, wax, leather, soap, &c. Three fairs, to which a swarm of dealers from the south of Russia resort, are held here in the course of the year. The environs are extremely productive, chiefly in fruit, for which the district is much celebrated: whole fields of water-melons are of common occurrence, and the climate from its mildness is very favourable to vegetable growth. Belgorod contains about 1600 houses and 8700 inhabitants, and lies in 50° 53′ N. lat., and 36° 2′ E. long.

BELGRADE, by the Servians called Alba-Græca and Greek-Weissenburgh, by the Turks Bilgrad and Darol Dshishad, or the House of the Holy War, and by the Hungarians Nándor Fejervar, is a city in the northern part of Turkish Servia, about two miles south-east of Semlin, at the junction of the Save with the Danube, and on the right bank of both these rivers. 'These two majestic streams, blending their waters at this point,' says Frickel (*Pedestrian Journey*, 1827-1829), 'expand into what might be mistaken for the ocean itself, and the spot where the Save pours itself into the queen of European rivers is clearly perceptible from the diversity of the tints.'

Belgrade is the Sigindunum of Ptolemy, the Singidunum of the *Itinerarium* of Antoninus, and the Singedum of Procopius (Περὶ κτισμάτων, lib. iv.). The city was founded by the Romans, afterwards totally destroyed by the Barbarians, and rebuilt by the Emperor Justinian, who fortified it strongly. He also built a new fort, called Octavum, at a little distance from the city. The city was opposite to Tauranum (now Semlin) in Pannonia. A vestige of its former name is still retained by a holm in the Save called Singin, not far from the present site of the town.

The Belgrade of modern times was founded by Dushan, king of Servia, in the year 1372, and is divided into four quarters, the most conspicuous of which is the Citadel, which forms the centre of the town, and is constructed on a steep acclivity, about a hundred feet high, jutting out into the Danube; it presents a picturesque object from the opposite city of Semlin. The space between the banks of the river and the ramparts is traversed by a wall of earth in a decayed state, which is mounted with iron cannon in as unserviceable a condition as the carriages on which they rest. The access through this wall is between two stone columns, the evident remains of a substantial wall. A paved way leads thence to the citadel, the entrance to which is through a gate in a massive lofty wall, which runs along the edge of the rocky acclivity, and constitutes the chief part of its fortifications. The first objects that meet the eye on entering the fortress are the arsenal and magazines, erected by the Austrians during their possession of Belgrade in the beginning of the last century. These once splendid edifices are fast mouldering away; but not more rapidly, perhaps, than the ramparts, bastions, and massive towers which lie around them. The ascent from these buildings leads to a lofty quadrangle, consisting of two stories, and built partly of wood and partly of stucco. The roofs jut out considerably beyond the walls, and serve as a protection to the galleries which range beneath them; these are ascended by broad flights of wooden steps. This edifice, though it is the residence of a pasha of three tails, is a very sink of every species of filth, and has been the theatre of the most brutal atrocities which the Turk could devise against his Christian captive. This was the spot, for instance, where Rhigas the Greek was sawed into pieces, limb by limb, and where six-and-thirty Servians, in the year 1815, were empaled, in violation of the pledge that their lives should be spared; in many cases these wretched victims endured this excruciating torture for seven whole days. The garrison is of the most miserable description, for it is the pasha's interest to maintain as few troops as possible, and at as low a cost as he finds practicable. The main-wall is furnished with gabions, between which iron cannon are mounted: this wall as well as the principal ditch are in tolerable condition, but in other respects the citadel is in a very indifferent state. In all, there are three ditches to it, the one within the other, besides mines and bomb-proof casemates. The principal mosque in the town, which is a handsome building, with the great tower Benoviso rising from its interior, stands within the citadel.

The flames, bombardments, and other havoc of war have left little standing of the former town of Belgrade. The modern erections constitute the three remaining quarters, which are divided into the Water Town, the Rascian Town, and the Palanka. Crossing a glacis of four hundred paces, and passing through three gates along a very gentle descent, we reach the main street, running to the north-west, with several lateral lanes of houses. These form part of what is called the Citadel, and are united by a small footway with the Water Town, which occupies a confined space on the edge of the banks of the Save, close to its confluence with the Danube, and is the best built quarter of the town. It contains the palace of the Greek bishop, fourteen mosques, the fish and other markets, an arsenal, spacious barracks, and the custom-house. The northern and eastern sides of it are protected by a ruinous wall of earth, eight feet in height, the two outlets through which are defended by wooden towers. It is much more strongly fortified towards the south, in which direction it is encircled by a wall of earth, intermixed occasionally with masonry and brickwork; this wall is ornamented by a very solid gate, opening upon the road that leads to Constantinople. The line of defence on this side is also provided with watch-towers. More immediately to the south-west of the Citadel, as well as west of it, runs a long range of suburbs, lying scattered like a village, beyond which is the Rascian, or Servian Town, likewise denominated the Town of the Save; it is defended by walls and palisades, is the principal residence of the merchants and dealers, and stands close to the Palanka, a further line of suburbs, which surround the citadel on the south and east. These two quarters contain nearly a hundred mosques and churches, two handsome besesteins or bazaars, twelve baths, and other public edifices, among which we may mention the palace of the prince of Servia and a spacious school. The Servians, also, have several well-built dwellings, and a neat coffee-house in this part of the town.

But in speaking of Belgrade and its streets we must warn the reader, that they are not composed of lines of modern houses, but, in general, of rows of wooden stalls, in which the owner arranges his merchandise with no small degree of taste, and parades his customers, surrounded by his workmen intent upon their several tasks. The barber and coffee-vendor alone carry on their trade in closed shops, and enjoy the luxury of glazed windows. To any traveller fresh from western Europe, the motley population of this town is a novel and highly-interesting scene; the tailor and the gunsmith the baker and the victualler, by their white turbans, sallow sombre faces, and haughty mien, will be instantly recognized as Turks; the red cap, sharp eye, and insinuating manners of the merchant and dealer betray their Greek extraction; and the merry countenance of the shopkeeper smirks beneath the round close bonnet of the native Servian. Independently of the Turkish garrison, which seldom exceeds five or six thousand men, the inhabitants of Belgrade do not at present amount to more than twenty thousand; but even in its present state they carry on so considerable a trade, both internal and external, that the customs produce 15,000*l.* per annum and upwards. The extensive manufactures for which it was formerly celebrated are now reduced to a few establishments, in which woollens, carpets, leather, ironware, and arms, are made. In other hands than those of its Turkish masters it would rapidly rise into importance: at present, attractive as its outward appearance may be at a distance, no spot can be more disgusting on close examination, for there is not a street or public place in which every rule of cleanliness does not seem to be almost studiously violated. The surrounding country is diversified with gentle hills, and richly wooded; and the public thoroughfares are embellished with many traces of Turkish piety—the inclosed well and fountain, and the caravanserai.

Belgrade has been the theatre of many important events. It first fell under the Hungarian sceptre in 1086, when King Solomon wrested it from the Greek empire. Three years after the fall of Constantinople, in 1456, it was besieged by the Turks, but rescued from their hands by the gallant Hunyady, voyvode of Transylvania, who drove them back with great loss. The second attempt, made by them in 1522, was met by a resolute but fruitless resistance: the Turkish sultan, Solyman, succeeded in planting the crescent upon its walls, and it was possessed by his successors until the year 1688, when the elector of Bavaria, at the head of the Austrian forces, laid siege to it, and expelled the Turks from the place. Two years afterwards, Belgrade again fell into their hands, under Amurath II.; and in 1693 the Imperialists re-appeared upon the spot, but were baffled in their endeavour to regain it. In 1717 the celebrated Prince Eugene, leading the Austrians in his second campaign against Turkey, met his enemy under the walls of Belgrade on the 16th of August, destroyed nearly the whole of his army, entered Belgrade, and reduced the greater portion of Servia under the imperial sway. The extensive scale upon which the Austrians now enlarged and completed the fortifications of the place cost them at least 400,000*l.* (4,000,000 of guldens); and their possession of it was confirmed to them by the sultan in the treaty of Passarovitz on the 21st of July following. In 1739, about which time Belgrade attained the height of its commercial splendour, the war which Austria unadvisedly undertook against Turkey, in conjunction with Russia, by whom she was suddenly and faithlessly abandoned, terminated in the signal defeat of her forces at Krotska on the Danube, the abandonment of her conquests in Servia, and the restitution of Belgrade to the sultan by the treaty which he dictated to her generals in a moment of panic. In conformity with this treaty, all the new fortifications were razed at the emperor's expense. The disastrous opening of the Austrian campaign against the Turks in 1788, was counterbalanced in the succeeding year by Marshal Loudon's brilliant successes against them, and the re-capture of Belgrade; but the weakness of Austria forced her to restore it, with her other Servian acquisitions, at the peace of Szistova in 1791. It has remained ever since in the occupation of Turkey, except for a short time during the Servian insurrection, which broke out under the conduct of Czerny George (the Black George) in 1804. The intrepid patriot laid siege to the town, and expelled the Ottomans from it in 1806; he retained possession of Belgrade until the year 1813, when he was at length obliged to abandon it to them, but not before the inhabitants had set fire to and destroyed the suburbs, and blown up the fortifications. The destruction thus brought upon the town has since been partially repaired, and its defences have been restored to some extent; but the happier consequence of the spirit with which the Servians then asserted their independence, has been that they have gained it; and that, under the conditions of the treaty of 1815, by which Turkey recognizes their free institutions, Belgrade is the only spot in the country where the sultan is allowed to maintain a garrison.

Belgrade is in 44° 50′ N. lat., and 20° 39′ E. long. Above the town are three long, narrow islands in the Danube, divided from the land by a natural canal, which forms a safe harbour; and opposite the Rascian Town, near the mouth of the Save, lies another islet, called the Gipsies' Island.

BELIAL, usually Bélial, more correctly Belíal, Βελίαλ, בְּלִיַּעַל (pronounce B'liyángal), is one of the few compound words in the Hebrew language. It is formed of בְּלִי *nothingness, not*, and יַעַל *utility, advantage.* Hence Belial means a worthless fellow. A man of Belial, or a son of Belial, a daughter of Belial, mean in the Bible a wicked person. Belial, if emphatically used, or κατ' ἐξοχην in preference, means the worst of spirits. Thus in the passage, 'What concord hath Christ with Belial?' 2 Cor. vi. 15. Compare Milton's *Paradise Regained*, book ii. v. 147-152:—

> 'So spake the old serpent doubting, and from all
> With clamor was assur'd their utmost aid
> At his command; when from amidst them rose
> *Belial*, the dissolutest spirit that fell,
> The sensuallest, and, after Asmodai,
> The fleshliest incubus, and thus . . . . .

Others have endeavoured to derive the word from עלל *to act*, so that Belial should be *a not acting one*, an *idle fellow*: others from עלה *to rise*, so that Belial should be one who should finally be cut down, *not to rise again.* The Talmudists in Sanhedrin, fol. 111, derive the word from עול or על *yoke.* According to them, Belial is *without a yoke, without restraint and discipline.* Compare Pfeiffer's *Opera. Ultraject.*, 1704, tom. i. p. 503.

BELIDOR, BERNARD FOREST DE, was born in Catalonia, in 1697 or 1698. He was the son of a French officer, and his father and mother dying very shortly after his birth, he was adopted by another officer, who brought him to France. The brother of his protector was an officer of engineers, and under his care, Belidor, who had studied the elements of mathematics with attention, saw the sieges of Bouchain and Quesnoy before he was sixteen years old. He was shortly afterwards an assistant of Cassini and Lahire, in their continuation of the measure of the degree; and was afterwards appointed professor at the school of artillery of La Fere, founded by the Regent Duke of Orleans. He was afterwards raised to the rank of captain, much to the dissatisfaction of his new comrades, who could not bear to see a professor in uniform: but, says our account, a reprimand and a few days' imprisonment reconciled them to the innovation.

Before 1742 M. Belidor lost his place of professor, on account of his discovering that some of the powder in the charge then used was useless, not being set on fire before the ball had left the gun. The originality of the discovery was contested; and it is also said, that his dismissal was owing to his having communicated it to Cardinal Fleury, instead of the head of his department. In 1742 Belidor was aide-de-camp to General de Segur in Bavaria and Bohemia, and was made prisoner at Lintz. He was soon exchanged, and was made a lieutenant-colonel. He served under the Prince de Conti, in the campaigns of 1744 and 1746, the first in Italy, the second in Flanders. In the first he distinguished himself by blowing up in six hours, and in the face of the enemy, a château which it was important to destroy, and which by ordinary methods it would have taken several days to dismantle. In the second, he reduced the town of Charleroi, by entrusting as a secret to a clergyman in its neighbourhood his intention to serve that place in the same way. This communication soon got wind, and, with some covered carts which were seen on their way to some coal-pits in the neighbourhood, so frightened the inhabitants, that they forced the governor to surrender. For this service he was made colonel; he was also member of the academy in 1756, inspector of arsenals in 1758, and brigadier and inspector-general of mines in 1759. He died at Paris in 1761.

The works of M. Belidor are even now in credit among military engineers, and he advanced every branch of their science, particularly mining. The common notion on this subject was, that the effect of a mine took place mostly in the direction of least resistance, and that the effect of a very powerful charge would be to blow upwards the cylinder of earth immediately above it. The experiments of M. Belidor showed that the effect is nearly equal in all directions in which there can be any effect at all, that is, that lateral as well as superincumbent earth is blown away, leaving a sort of hemispherical void. Thus he showed how to effect a lateral entrance into the counter-mine of a besieged place.

The works of Belidor are as follows: 1725, *Nouveau Cours de Mathématique*, which went through a large number of editions: 1729, *La Science des Ingénieurs:* 1731, *Bombardier Français*, containing some of the earliest tables of the relation between the elevation and the range: 1737 and 1739, the two first volumes of the *Architecture Hydraulique*, a work which has not yet been superseded by any other of equal extent and merit; the two latter volumes appeared in 1750 and 1753: 1755, *Dictionnaire portatif de l'Ingénieur:* 1764, posthumous work, *Œuvres diverses, &c.*, relating to fortification and mining. (This is the only work we ever met with which has a wrong date in its own title-page, it being there 1754, in which year M. Belidor was living.) The work on fortification, which has been sometimes attributed to M. Belidor, in 4 vols. 4to., was never published, as far as we can find, but was left incomplete among his papers. There are also memoirs of M. Belidor, in the *History of the Academy of Sciences*, from 1737 to 1756.

BELIGRAD (a word signifying, in the Bulgaro-Slavonic dialect, the White Town), an important town of Albania, now generally known under the name of Berát. Mr. Hughes conjectures, though with great diffidence, that it is on the site of the antient Antipatria, a city taken by Apustius, lieutenant of the Consul P. Sulpicius, in the war between the Romans and Philip King of Macedonia; and he urges, in support of his conjecture, the description of Antipatria given by Livy, who says that it was in a narrow pass, and that it inspired confidence into its inhabitants by its size and the strength of its walls and site. (Livy, lib. xxxi. 27.) In the Byzantine writers, Beligrád appears under the name of Balágrada, or Balagrita, and is still sometimes called Arnaout Belgrade (or the Albanian Belgrade), to distinguish it from the town of Belgrade on the Danube. In the latter part of the thirteenth century it was in the hands of the Greek emperors, the dominion of the Albanians not having yet extended to this part of the country. In the fourteenth century it was conquered by the Albanians; and it was probably from them that it was taken by Amurath, or Murad II., Emperor of the Turks, who reigned in the early part of the fifteenth century. George Kastrióti (better known by the Turkish name of Iskénder Beg, or Scanderbeg) attempted to retake it. He encamped against it with a force of 8000 horse and 7000 foot, among whom was a strong body of Italians, sent by Alfonso King of Naples, 'men skilful in the assaulting of walles and holdes.' Kastrióti was defeated, and lost nearly all his Neapolitan auxiliaries. Beligrád has been ever since in the hands of the Turks. [See BERAT.] (Hughes's *Travels in Greece and Albania*; Leake's *Researches in Greece.*)

BELISA'RIUS (Βελισάριος), a general of the lower empire, under Justinian I. The precise year and place of his birth are uncertain, but it is most probable that he was born near the city of Sardica (a place on the Isker), in the beginning of the sixth century. Of his parentage nothing is known.

He makes his first appearance in history as one of the body guard of Justinian, at that time heir to the throne. The *Byzantine* empire was then, about A.D. 525, at war with Persia, and Belisarius exercised his first command in an expedition into Persarmenia. On his return he was nominated to the government of Dara, an important fortified town in the northern part of Mesopotamia, near the frontier of Armenia, where he took into his service, as secretary, the historian Procopius, whose writings are our principal authority for the events of his life. In 527 Justinian came to the throne, and by his orders Belisarius proceeded to build a fortress at Mindon, near Dara. The Persians commanded him to desist, and on his refusal marched against him, defeated his troops, and razed the works. We may conclude, however, that no blame attached to him, as shortly after we find him appointed general of the East, with the conduct of the Persian war. In the year 530 he defeated the enemy in the decisive battle of Dara; and in the following year he repulsed, by a series of skilful manœuvres, a considerable army, which had invaded Syria on the side of the desert, and advanced so far as to threaten Antioch. Being, however, compelled by his troops to give battle, contrary to his own inclination, at Callinicum, a town at the junction of the rivers Bilecha and Euphrates, he sustained a defeat, but succeeded in preventing the Persians from deriving any advantage from their victory.

Shortly afterwards peace was concluded, and Belisarius returned to Constantinople. During his residence there he married Antonina, and succeeded in suppressing the sedition called νίκα (nika), which had nearly subverted the throne of Justinian. In June, 533, he sailed as commander of an expedition for the recovery of those provinces of Africa which had anciently belonged to the empire, but were now possessed by the Vandals. He landed (Procop, περὶ κτισμάτων) in September at Caput Vada, now Capoudia, about 150 miles south of Carthage, and advanced without opposition to Decimum, about eight miles (seventy stadia) from Carthage. Having defeated the enemy at Decimum, he immediately entered the capital, while Gelimer, the Vandal king, fled towards the deserts of Numidia, where he occupied himself in assembling an army at Bulla, four days' journey from Carthage. He also endeavoured to organise a conspiracy among the Carthaginians and the Huns in the Byzantine service, which was discovered and suppressed by Belisarius. The Vandals having advanced to Tricameron, within twenty miles of Carthage, were defeated in a decisive battle, and Gelimer fled to the inaccessible mountain of Pappua, near Hippo Regius, where he was blockaded, and some time afterwards obliged to surrender. On his return to Carthage Belisarius sent detachments which reduced Sardinia and Corsica, and the Balearic Isles; he likewise recovered the fortress of Lilybæum, in Sicily, which the Vandals had received as the dowry of a Gothic Princess, and which, on their downfall, had been resumed by the Goths. He proceeded for some time in the settlement of the province, but finding that suspicions of his fidelity had been excited in the mind of Justinian, he determined to disarm them by a speedy return. He committed the government to the eunuch Solomon, and set sail for Constantinople. On his arrival he was honoured with a triumph, an honour which, since the reign of Tiberius, had been reserved for the emperors alone; a medal was struck, with the inscription 'Belisarius, the glory of the Romans,' and in the ensuing year, 535, he was invested with the dignity of sole consul.

In that year he sailed with a very insufficient force for the conquest of Italy from the Goths: he landed at Catania in Sicily, and having rapidly reduced that island, fixed his head-quarters at Syracuse. While at Syracuse he received news of a rebellion in Africa. He immediately set out thither with only one ship and 100 guards, and had nearly succeeded in restoring subordination, when he was recalled to Sicily by a mutiny in the army there. Some negotiations which had been in progress between the Goths and Justinian having been broken off, Belisarius crossed over to Italy; his advance was only delayed by the resistance of Naples, which he took after a siege of twenty days, and at the end of the year 536 he entered Rome, which was evacuated by the Gothic garrison on his approach. Early in 537 he was besieged there by Vitiges, the Gothic king, who had recently been raised to the throne on the deposition and murder of Theodatus, and now advanced from Ravenna with an army of 150,000 men. In the course of the siege Belisarius deposed the Pope Sylverius, whom he had detected in a treasonable correspondence with the enemy: by some writers he is accused of having himself forged the letters, in compliance with the orders of the Empress Theodora, who wished to remove Sylverius from the pontificate, but the charge appears to be unsupported by proof. Before the end of the siege he incurred much obloquy by his precipitate execution of Constantine, an officer of rank and reputation, who in an altercation with him respecting the restoration of some plunder, forgot himself so far as to draw his sword on his general; he was immediately put to death by the command of Belisarius, who is supposed to have acted rather in furtherance of the private revenge of Antonina, who accompanied him in his expeditions, than from any seasonable zeal for the vindication of discipline.

Early in 538 the siege, which had been carried on for more than a year with great vigour, was raised, and Vitiges retired to Ravenna. Belisarius then proceeded in the reduction of the provinces of Italy, though much impeded by the factious opposition of his officers and by an invasion of the Franks; but in the beginning of the year 539, Narses, the leader of the faction, was recalled, and the Franks retreated after a short inroad. At length Ravenna was invested, but, when its surrender could no longer have been delayed, an embassy which had been sent by Vitiges to Constantinople returned with a treaty of partition, which left to him the title of king, and the provinces north of the Po. This treaty Belisarius refused, on his own responsibility, to execute, and the Goths, driven to despair, offered him their support if he would assume the title of Emperor of the West. By affecting compliance he gained possession of Ravenna, and the surrender of that city was followed by the submission of almost the whole of Italy. In the beginning of 540 he was recalled to Constantinople, whither he immediately repaired

In the spring of 541 he was sent to conduct the war which had broken out with Persia, and after an indecisive campaign returned to Constantinople. In 542 he was again appointed to the supreme command in the Persian war, and at the close of the campaign again recalled, and on his arrival degraded from all his employments. During the campaign a rumour had prevailed of the death of Justinian, and Belisarius had used language unfavourable to the succession of Theodora. His treasures were attached, and he remained in momentary expectation of an order for his execution. A heavy fine was levied on his effects, but his life was spared, the pardon being accompanied by the injunction to be reconciled to his wife Antonina, against whom he was incensed for her infidelity.

In 544 Belisarius was again named to command in Italy, where, through the incapacity of his successors, the slight remains of resistance which he had left behind were become formidable. Having set out from Constantinople with a few veteran troops, he succeeded in his progress through Thrace in collecting an inconsiderable force, with which he proceeded to meet the fleet at Salona in Illyricum, whence he despatched some ships to the relief of Otranto, which was besieged by the Goths. This squadron having raised the siege, rejoined him at Salona, and the whole armament proceeded by sea to Pola, also in Illyricum, where he spent some time in reviewing and exercising his troops. From this place he sailed along the coast of the Adriatic to Ravenna. For some time he was prevented by the insufficiency of his force from effecting anything considerable, and at last, leaving merely the necessary garrison in Ravenna, he sailed with the rest of his troops to Dyrrachium in Epirus, where he awaited the succours which he expected. Having with much delay obtained a scanty reinforcement, he proceeded by sea to the relief of Rome, which had, since the beginning of 546, been blockaded by Totilas, the Gothic king, and was now reduced to the extremity of famine. After a vigorous attack on the Gothic lines by Belisarius, which only failed through the disobedience of one of his officers, Rome was taken by treachery in the end of the same year; but Totilas was diverted from his design of razing the city with the ground by the remonstrances of Belisarius. In the beginning of 547 Totilas advanced against Ravenna, and immediately on his departure Rome was re occupied by Belisarius, and successfully defended by him against Totila, who retraced his steps and endeavoured to retake it. But, though successful in the neighbourhood of Rome, he was unable, from the smallness of his means, to put an end to the war; and from the same cause he afterwards suffered so many reverses, that in the year 548 he requested that either the force at his disposal might be augmented, or he might be recalled; and the latter alternative was granted.

Belisarius, having escaped assassination by the discovery of a conspiracy, the chiefs of which dreaded his inflexible fidelity, lived for some time at Constantinople in the enjoyment of wealth and dignity. In 559 the Bulgarians invaded the empire, and he received the command of the army destined to oppose them. After checking their progress, he was removed from the command by the jealousy of Justinian, and was never after employed in the field.

In 563 a conspiracy against the emperor was discovered, in which he was accused of participating. Of his subsequent fate there are two accounts. The more probable is that given by Gibbon, that his life was spared, but his fortune sequestrated, and that he was confined to his own palace. His innocence was soon acknowledged, and his property and freedom restored, but he did not long survive his liberation; he died in the early part of the year 565. A tradition relates that he was deprived of his eyes, and reduced to beg his bread, exclaiming to the passers-by, 'Give a penny to Belisarius the General!' but this is not countenanced by any authority older than the eleventh century, and can be traced no further back than to an anonymous writer in Banduri's *Imperium Orientale* (quoted by Lord Mahon, p. 467), and to Tzetzes, who wrote in the twelfth century. Though the last writer on the subject (Lord Mahon) labours hard to establish the truth of the tradition, his arguments do not appear sufficiently strong to induce us to receive it. The story of the blindness of Belisarius was adopted by painters, as we might naturally expect; and various modern writers also, such as Marmontel in his romance of Belisarius, have contributed to give it a popular character: but for these circumstances, a fact for which there is no reasonable evidence would hardly require even this brief notice.

Belisarius had one daughter, Joannina, by his wife Antonina.

He is described as being of a majestic presence, brave generous, and affable, and a strict lover of justice. His unshaken fidelity is sufficiently manifest from the whole course of his life. His talents for war appear to have been of the highest order, and we have few examples of such great effects produced with such small means. His character is stained by base subserviency to his wife, who appears to have been mainly concerned in the most objectionable passages of his career, and his ignorance or endurance of her infidelity rendered him ridiculous. The latter part of his life appears to have been liable to the charge of rapacity, but, when we consider his superiority to the age in which he lived, we shall be inclined, if not to pardon his defects, at least to excuse them in consideration of the corruption of the times.

(See Procopius; Jornandes, *De Reb. Get.*; Lord Mahon's *Life of Belisarius*; the sketch in Schlosser's *Universal-historische Uebersicht*, th. 3, abth. 4; and Gibbon, chaps. xli. xlii. and xliii.)

BELIZE. [See Balize.]

BELKNAP, JEREMY, was born in 1744. He took his degree at Harvard College, near Boston in North America, and was afterwards ordained minister of Dover church, in New Hampshire, in 1767. He remained here till 1787, when he entered upon the charge of a church in Boston, at which he officiated until his death in 1798. He is the author of a 'History of New Hampshire,' and commenced an American biography, only two volumes of which were published. He wrote also a number of religious, political, and literary tracts, and was one of the founders of the Massachusetts Historical Society. The biographical writers of the United States represent him as distinguished by industry, research, and extent of knowledge, rather than by the possession of remarkable intellectual qualities.

BELKNAP, SIR ROBERT, was bred to the study of the law, and became chief justice of the Court of Common Pleas, in the 48th of Edward III. (1374.) He continued to hold this office until the 11th of Richard II. (1388), when his removal from it took place under the following circumstances, which are given at length in Fuller's *Worthies of England*, p. 567. 'The king had a mind to make away certain lords: viz. his uncle, the Duke of Gloucester, the Earls of Arundel, Warwick, Derby, Nottingham, &c., who in the former parliament had been appointed governors of the kingdom. For this purpose he called all the judges before him at Nottingham, where the king's many questions in fine resolved themselves into this,—"Whether he might by his regal power revoke what was acted in parliament?" To this all the judges, Sir William Skipwith alone excepted, answered affirmatively, and subscribed it. This, Belknap underwrote unwillingly, as foreseeing the danger, and putting to his seal, said these words:—"There wants nothing but a hurdle, a horse, and a halter to carry me where I may suffer the death I deserve; for if I had not done this, I should have died for it; and because I have done it I deserve death for betraying the lords."' By thus acting against his conscience he lost the opportunity of transmitting an honourable fame to posterity; but his submission saved him only for a short time. In the succeeding parliament all the judges were arrested in Westminster Hall, on a charge of high treason. The lord chief justice of the Court of King's Bench was executed, and the other judges, with Belknap, barely escaped with their lives through the intercession of the queen; but their property was confiscated to the king's use. Fuller does not mention the birthplace of Sir Robert Belknap, but places him amongst the remarkable personages which the county of Leicester has produced, on the ground that a family of that name existed in the county when he collected the materials for his work, about the year 1660.

BELL, a vessel, or hollow body of cast-metal, formed to make a noise by some instrument striking against it. Bells of a small size are undoubtedly very antient. As pots and other vessels, more immediately necessary in the service of life, were doubtless made before bells, it seems probable that these vessels being observed to have a sound when struck, gave occasion to making bells in that form.

Small gold bells, intermixed with pomegranates, are mentioned as ornaments worn upon the hem of the high-priest's robe in *Exod.* chap. xxviii. v. 3, 4; and Calmet (*Dict.* 4to. Lond. 1797, vol. i. in voce) says that both were worn in the same manner by the kings of Persia. Among the Greeks we find hand-bells used in camps and garrisons. At certain hours in the night, patroles (called περίπολοι) went round the camp and visited the sentinels; and to try if any were asleep, they had a little bell (termed κωδών, *codon*), at the sound of which the soldiers were to answer: whence to go this circuit was called κωδωνίζειν, and κωδωνοφορεῖν. (See Potter's *Greek Antiq.* edit. Edinb. 1827, vol. ii. p. 74; compare also Aristoph. *Birds*, 842, 1160, edit. Brunck. 8vo. Argent. 1783; and Suidas, κώδων.) This custom furnished Brasidas with an advantage against Potidæa in the Peloponnesian war. Having observed that the bell had passed a certain part of the walls, he seized the opportunity before its return to set up his ladders, and nearly succeeded in entering the city. (Thucyd. iv. 135.) Plutarch mentions the use of the bell in the Grecian fish-market. (*Symposiac.* lib. iv. Oper. edit. Reiske, tom. viii. p. 653; and also Strabo in his account of Jassus, lib. xiv. edit. Falconer, fol. Oxf. 1807, p. 942.) The Romans had three chief appellations for the little bell, *petasus*, *codo*, and *tintinnabulum*; the second of these was evidently borrowed from the Greek word already mentioned: the last was probably intended to be imitative of the sound of the bell. The hour of bathing among the Romans was announced by a bell (Pitisci *Lexicon*, p. 966, col. ii), which was hence called by Martial *æs thermarum:* it was also in domestic use (*ibid.*); was adopted both as an ornament and an emblem upon triumphal cars (Zonaras, lib. xi. 32): and was fastened to the necks of cattle, that they might be traced when they strayed (Phædr. *Fab.* xi. 8, 4), particularly to the necks of sheep.

The large bells now used in churches are said to have been invented by Paulinus, bishop of Nola in Campania, about the year 400, whence the Nola and Campana of the lower Latinity. They were probably introduced into England very soon after their invention. They are first mentioned by Bede about the close of the seventh century. (*Hist. Eccl.* lib. iv. c. 28.) Ingulphus records that Turketul, abbot of Croyland, who died about the year 870, gave a bell of very large size to that abbey, which he named Guthlac. His successor Egelric cast a ring of six others, to which he gave the names of Bartholomew, Bettelin, Turketul, Tatwine, Pega, and Bega. He adds, 'nec erat tunc tanta consonantia campanarum in tota Anglia.' (Ingulphi *Hist. Script. post Bedam*, edit. Saville, fol., London, 1596, fol. 505 b.) Baronius informs us that Pope John XIII., A.D. 968, consecrated a very large new cast bell in the Lateran Church, and gave it the name of John. (*Annal.* a Spondano, p. 871.) The ritual for the baptizing of bells may be found in the Roman Pontificale.

Sir Henry Spelman, in his *Glossary*, v. *Campana*, has preserved two monkish lines on the subject of the antient offices of bells:—

> 'Laudo Deum verum, Plebem voco, congrego Clerum,
> Defunctos ploro, Pestem fugo, Festa decoro.'

Brand quotes the following monkish rhymes on bells, in which the first of these lines is repeated, from a tract entitled *A Helpe to Discourse*, 12mo. Lond. 1633, p. 63:—

> 'En ego Campana, nunquam denuntio vana,
> Laudo Deum verum, Plebem voco, congrego Clerum,
> Defunctos plango, vivos voco, fulmina frango,
> Vox mea, vox vitæ, voco vos, ad sacra venite.
> Sanctos collaudo, tonitrua fugo, funera claudo,
> Funera plango, fulgura frango, Sabbatha pango
> Excito lentos, dissipo ventos, paco cruentos.'

The city of Nankin in China, was antiently famous for the largeness of its bells, as we learn from Father Le Comte: but they were afterwards far exceeded in size by those of the churches in Moscow. A bell in the tower of St. Ivan's church, in Moscow, weighed 127,836 English pounds. A bell given by the czar Boris Godunof to the cathedral of Moscow weighed 288,000 pounds, and another given by the Empress Anne, probably the largest in the known world, weighed 432,000 pounds. According to Coxe (*Travels in Russia*, vol. i. p. 322), the height of this last bell was nineteen feet, the circumference at the bottom sixty-three feet eleven inches, and its greatest thickness twenty-three inches. The great bell of St. Paul's weighs between 11,000 and 12,000 lbs., and is nine feet in diameter.

The *Couvre-feu*, or *Curfew Bell*, the name of which is almost proverbial with us, is commonly supposed to have been introduced by William the Conqueror, and to have been imposed upon the English as a badge of servitude. Henry, however, in his *History of Britain*, 4to. vol. iii. p. 567, says that this opinion does not seem well founded. For there is sufficient evidence that the same custom prevailed in France, Spain, Italy, Scotland, and probably in all the countries of Europe at the same period; and was intended as a precaution against fires, which were then very frequent and very fatal, when so many houses were built of wood. The practice of ringing the curfew bell, that all people should put out their fires and lights at eight o'clock, is said to have been observed to its full extent, only during the reigns of the first two Williams. (See Brand's *Popular Antiq.* 4to. edit. vol. ii. p. 136.)

The *Passing Bell* was so named, as being tolled when any one was passing from life. Hence it was sometimes called the *Soul Bell*; and was rung that those who heard it might pray for the person dying, and who was not yet dead. Durand, who flourished about the end of the twelfth century, tells us in his *Rationale*, 'when any one is dying, bells must be tolled, that the people may put up their prayers: twice for a woman, and thrice for a man; if for a clergyman, as many times as he had orders; and at the conclusion a peal on all the bells, to distinguish the quality of the person for whom the people are to put up their prayers.' This practice is of high antiquity in England. Bede, in his *Ecclesiastical History*, lib. iv. cap. 23, speaking of the death of the abbess of St. Hilda, says, that one of the sisters of a distant monastery, as she was sleeping, thought she heard the well-known sound of that bell which called them to prayers, when any of them was departing this life. She no sooner heard it, than she raised all the sisters, and called them into the church, where she exhorted them to pray fervently, and sing a Requiem for the soul of their Mother. We have a remarkable mention of it also in the narrative of the last moments of the Lady Katherine (sister of Lady Jane) Grey, who died a prisoner in the Tower of London in 1567. Sir Owen Hopton, constable of the Tower, 'perceiving her to draw towards her end, said to Mr. Bockeham, Were it not best to send to the church that the bell may be rung, and she herself hearing him, said, "Good Sir Owen, be it so:"' and almost immediately died. (Ellis's *Orig. Letters, illustr. of Eng. Hist.* 2d ser. vol. ii. p. 290.) The tolling of the passing-bell certainly continued in use as late as the time of Charles II.: and Nelson (who died in 1715), in his Meditations for the Holy Time of Lent, (*Feasts and Fasts of the Church of England*, 8vo. Lond. 1732, p. 144.) speaking of the death of a good Christian, says, 'if his senses hold out so long, he can hear even his passing-bell without disturbance.' To the time of Charles II., the tolling of this bell formed one of the enquiries in all Articles of Visitation: there seems to be nothing intended by tolling it at present, but to inform the neighbourhood of a death.

A *Sanctus*, or *Saint's-bell*, many of which are still to be seen in our country churches, was so called, because it was rung when the priest came to those words of the mass, *Sancte, Sancte, Sancte Deus Sabaoth*, that all persons who were absent might fall on their knees, in reverence of the holy office which was then going on in the church. It was usually placed where it might be heard farthest, in a lantern at the springing of the steeple, or in a turret at an angle of the tower: and sometimes, for the convenience of being more readily and exactly rung, within a pediment or arcade, between the church and the chancel; the rope in this situation falling down into the choir not far from the altar. (See Warton's *Hist. of Kiddington in Oxfordsh.* 4to. Lond. 1815. p. 14, *note*.)

Ringing, says Sir John Hawkins (*Hist. of Music*, vol. iv. p. 211, *note*), is a practice which is said to be peculiar to England, which for that reason, and the dexterity of its inhabitants in composing and ringing musical peals, wherein the sounds interchange in regular order, is called the Ringing Island. Dr. Burney, in his *History of Music*, vol. iii. p. 413, mentions *Tintinnalogia, or the Art of Ringing*, published in 1668; a work, he assures us, not beneath the notice of musicians who wish to explore all the regions of natural melody; as in this little book they will see every possible change in the arrangement of diatonic sounds, from two to twelve; which being reduced to musical notes, would point out innumerable passages, that, in spite of all which has hitherto been written, would be new in melody and musical composition. In the art of ringing, however, melody has never been studied; mechanical order and succession have been all in all. The treatise on this subject at present in highest repute is *Campanologia Improved*, or *the Art of Ringing made easy*, 3d edit. 12mo. Lond. 1733, where the reader will find all the terms explained of single, plain bob, grandsire bob, single bob minor, grandsire treble, bob-major, caters, ten-in or bob royal, cinques, and twelve-in or bob maximus, with all their regular permutations.

The reader who is desirous of knowing more concerning bells may consult Hieronymus Magius *De Tintinnabulis*, 8vo. Hanov. 1608, and 12mo. Amst. 1664, in which book are many curious particulars relating to them. See also Arnoldus *De Campanarum Usu*, 12mo. Altdorf, 1665.

BELL, HENRY, an individual whose name is connected with the history of steam-navigation in this country. Dr. Cleland, in his work on *Glasgow*, speaks of him as 'an ingenious untutored engineer, and citizen of Glasgow,' and states that it may be said, without the hazard of impropriety, that Mr. Bell 'invented' the steam-propelling system, 'for he knew nothing of the principles which had been so successfully followed out by Mr. Fulton.' Fulton, however, launched his first steam-boat on the Hudson, Oct. 3, 1807, and it was not till more than four years after this date that Bell successfully applied steam to the purposes of navigation. In 1811 he caused a boat to be constructed on a peculiar plan, which was named the 'Comet,' in consequence of the appearance of a large comet that year. He constructed the steam-engine himself, and in January, 1812, the first trial of the Comet took place on the Clyde. Dr. Cleland adds:—'After various experiments, the Comet was at length propelled on the Clyde by an engine of three-horse power, which was subsequently increased to six. Mr. Bell continued to encounter and overcome the various and indescribable difficulties incident to invention, till his ultimate success encouraged others to embark in similar undertakings.' In the course of these experiments he unfortunately did not succeed in realising the advantages which were due to his enterprise; and had it not been for the liberality of the town of Glasgow, who settled upon him a small annuity, he would probably have spent his latter days in a state of poverty.

BELL, JOHN, generally called from his Scottish estate Bell of Antermony, was born in the West of Scotland in the year 1691. He was brought up to the medical profession, and passed as a physician in the twenty-third year of his age. Shortly afterwards he began those travels to which alone he is indebted for his celebrity.

He says himself, in the preface to his valuable book, 'In my youth I had a strong desire of seeing foreign parts: to satisfy which inclination, after having obtained from some persons of worth recommendatory letters to Dr. Areskine, chief physician and privy councillor to the Czar Peter I., I embarked at London in the month of July, 1714, on board the Prosperity of Ramsgate, Captain Emerson, for St. Petersburgh.' Russia then stood in need of and welcomed foreigners of talent and acquirements. Bell was exceedingly well received, and immediately on his arrival became personally known to Peter the Great, for whom he ever afterwards entertained sentiments of veneration and singular affection. He had very soon an opportunity of gratifying his passion for travelling, as at the time of his arrival Peter was preparing an embassy to Persia, and his friend Dr. Areskine having introduced him to Artemy Petrovich Valensky, the ambassador, he was engaged to accompany the expedition in quality of surgeon and physician. On the 15th of July, 1715, he left St. Petersburgh. 'That city,' he says, 'which has since grown so considerable was then in its infancy, having been founded only ten or eleven years before.' The embassy was obliged by the severity of the weather to halt and pass the winter at Cazan, which place, indeed, it did not leave until the 4th of June, 1716. It then proceeded by Astrakhan, the Caspian Sea, and Tauris to Ispahan, where the Persian monarch then held his court, and where Bell says he arrived on the 13th of March, 1717. He did not return to St. Petersburgh until the 30th of December, 1718, having been absent in all three years and six months. His account of this long journey is exceedingly interesting, and he tells us at the end of it, that in spite of the Swedish war in which the czar was engaged, the Russian capital had been so improved and beautified during his absence that he scarcely knew it again. He was grieved to find that his excellent friend Dr. Areskine was dead, but his love of travelling being as strong as ever, he was soon made happy by learning that Peter the Great was preparing a grand embassy to China. Valensky, whose affections he had engaged during the Persian expedition, recommended him to Leoff Vasilovich Ismayloff, the ambassador appointed to Pekin, who gladly availed himself of Bell's valuable services. Ismayloff, with Bell and a numerous retinue, departed from St. Petersbugh on the 14th of July, 1719, and travelled by Moscow, Siberia, and the great Tartar deserts, to the celebrated wall of China. They did not reach Pekin until sixteen months after their departure from the Russian capital, having undergone immense fatigue during the journey. They left the Chinese capital on the 2nd of March, 1721, and arrived at Moscow on the 5th of January, 1722. The account of this journey, and of what he saw and learned during his residence at the court of China, is the most valuable part of his book, and one of the best and most interesting relations ever written by any traveller. He fully confirms many of the almost incredible things told of the Chinese by the old Venetian traveller Marco Polo, with whose work Bell does not appear to have been acquainted.

He had scarcely recovered from the fatigues of his Chinese expedition, when, in May, 1722, he started on a long and dangerous journey with the Russian emperor to Derbent. a celebrated pass between the foot of the Caucasus and the Caspian Sea. This was the most original and singular expedition in which Peter the Great was ever engaged. Having concluded peace with Sweden he resolved to assist the Shah of Persia, whose territories had been invaded by the fierce and warlike Afghans: and accordingly Peter marched with an army, taking the empress with him. The Russians suffered severely during their return march, and even the emperor and his wife had some narrow escapes from the savage mountain-tribes that infested the rear and flanks of the retiring army. In the course of his account of this journey Bell introduces a short but good description of Tzercassia, or Daghestan (Circassia), and at the end of it he draws a fine character of Peter the Great, whose habits, both public and private, he had excellent opportunities of studying during the Derbent expedition. It appears that shortly after this journey Bell visited Scotland: and we do not hear of him again until 1737, when he resumed his travelling vocation. Three years before that date, a war, in which the emperor of Germany eventually became engaged, had broken out between Russia and Turkey. In the autumn of 1737 a congress was appointed to be held at Nemiroff, a frontier town of Poland, in order to prepare a peace through the mediation of the ministers of Great Britain, France, and Holland: but, on meeting, the plenipotentiaries of the powers at war could not agree, and the conferences were stopped. The court of Russia then determined on sending a confidential agent to Constantinople, and as during hostilities no Russian or German subject was allowed by the Turks to set foot on their territory, Bell, whose activity and talents were highly appreciated, undertook the mission at the earnest desire of Count Osterman, the grand chancellor of Russia, and of Mr. Rondeau, at that time British minister at St. Petersburg. Accordingly, on the 6th of December, 1737, Bell once more quitted the banks of the Neva, and travelling in the midst of winter, and through countries exposed to all the horrors of a barbarous warfare, arrived at Constantinople, attended by only one servant, who understood the Turkish language. On the 17th of May, 1738, he returned to St. Petersburg. (All his dates are according to the old style.)

We know very little more of this estimable man than what he tells himself in his book of travels, wherein he is far from being communicative as to his personal history. It appears, however, that he afterwards settled for some years as a merchant at Constantinople; that he married about the year 1746, and in the following year returned to Scotland, where he lived in ease and affluence on his estates of Antermony. He was a warm-hearted, benevolent, and sociable man, and he obtained from his friends and neighbours the appellation of 'Honest John Bell.' He died at a very advanced age on the 1st of July, 1780.

Although he had so much to tell he was by no means anxious to distinguish himself as an author. For many years the only record of his travels was a simple diary, to which he occasionally referred to refresh his memory, for he was fond of talking about his journeys and adventures with his intimate associates. In his preface, which is dated Antermony, the 1st of October, 1762, he says, that, 'About four years ago, spending some days at the house of a right honourable and most honoured friend,' and talking about his travels, he was pressed to throw his notes together in the form of a regular narrative, and that then, with diffident feelings, he began the work. A writer in the 'Quarterly Review' asserts that this most honoured friend to whom we stand indebted for a most excellent book, was Earl Granville, then president of the council, and this may probably be the fact. We, however, doubt the rest of the reviewer's story, which goes on to say that the volumes were written, or copiously revised, by a professed literary man. Honest John Bell speaks of them as his own faulty compositions, and excuses the 'plainness of the style,' which is their chief charm, and which could hardly have proceeded (so much individuality is there in it) from anybody but from a man relating his own adventures. The work, in two vols. 4to., was printed and published at Glasgow by subscription, in 1763. It has been several times reprinted in various forms, and a French translation of it has been widely circulated on the Continent. It includes the translation of a journal kept by M. De Lange, a gentleman who accompanied Ismayloff to Pekin, and who remained in that city to finish the negociations with the Chinese, for several months after the departure of the ambassador. This journal details the manner of transacting business with the ministers of state in China, and exposes their conceit and chicanery.

BELL, JOHN, an eminent surgeon and anatomist, the first who successfully applied, in Scotland, the science of anatomy to practical surgery, was born in Edinburgh on the 12th of May, 1763, and died of dropsy at Rome on the 15th of April, 1820. The grandfather of John Bell, of the same name, was minister of Gladsmuir in East Lothian, the parish which was afterwards held by the historian of Charles V. He died at the early age of thirty-two, with a high character for learning and virtue. The father of the subject of this article, the Rev. William Bell, a learned scholar and eloquent minister, was, in the course of his education for the presbyterian church, led, by a perusal of the English divines, to become a member of the episcopal church of Scotland, then in the lowest state of depression on account of its attachment to the exiled family of the Stuarts. By this act he entailed on himself a life of labour without any prospect of worldly advantages. The mother of Mr. John Bell was of a family which, in a long descent, had furnished clergymen to the episcopal church of Scotland during its splendour and in its decay. She was a woman of masculine understanding, tempered with great mildness and gentleness of manners, and improved by an excellent education under the care of Bishop White, her maternal grandfather. There were eight children of the marriage, two of whom died in infancy. Robert, John, George Joseph (the present Professor of Law in Edinburgh), and Charles, became eminent in their several professions. About a month before the birth of John, the father, then fifty-nine years old, had submitted to the operation for stone; and his admiration of that science to which he owed his safety led him to devote to the services of mankind, in the medical profession, the talent of the son born while his heart was warm with gratitude for the relief which he had obtained. He died on the 26th of September, 1779.

John Bell was educated at the high school of Edinburgh, and at the usual age was entered as a pupil in surgery with the late Mr. Alexander Wood of that place. He was very early remarkable for enthusiasm in his profession, and always engaged with great ardour in whatever he undertook. It is a proof of his early proficiency that he had hardly arrived at manhood before his assistance was eagerly sought by his teachers both in the departments of midwifery and chemistry. During the time that Bell was pursuing his studies, the medical school of the University of Edinburgh stood very high, ranking among its professors, Black, Cullen, and the second Monro. It was while attending the lectures of the last mentioned professor that Bell saw the way to his professional advancement. Monro was a zealous anatomist, and anatomy was well taught as the ground-work of medical science, but its application to surgery was quite neglected. This deficiency Bell was determined to supply, and in the year 1790, whilst yet a very young man, he built a theatre in Surgeon's Square, Edinburgh, where he delivered lectures on surgery and anatomy, carried on dissections, and laid the foundation of a museum.

As there was then scarcely any private teaching or means of cultivating anatomy by private dissections, the establishment of a school naturally excited great hostility against Mr. Bell, every attempt at private teaching being considered as an encroachment on the privileges of the professors and the rights of the university. In his lectures he was wont to speak of some of Monro's anatomical opinions with less respect than the character of that great man deserved, and he made no scruple to expose many mistaken doctrines and erroneous practices recommended in the system of surgery of Mr. Benjamin Bell. The tone and spirit of these criticisms raised up a host of enemies among the friends of these two gentlemen.

In 1799 a pamphlet was published, entitled 'Review of the writings of John Bell, Esq., by Jonathan Dawplucker.' It was an affected panegyric of Mr. Bell's works, and was dedicated to him; but the real design was to criticise his first volume of 'Anatomy,' to represent him as a plagiarist, 'to pluck from him all his borrowed feathers,' and to vindicate Dr. Monro and Mr. Benjamin Bell from his criticisms. The author was supposed to be some near friend of Benjamin Bell's. Mr. John Bell published a second number, under the same name of J. Dawplucker, addressed to Mr. Benjamin Bell. It contained ironical remarks on this surgeon's system of surgery, and had such an effect on the popularity of his work that it soon ceased to be the text-book for students. At this time Mr. (now Sir) Charles Bell was associated with his brother in teaching, the latter taking the surgical, the former the anatomical department.

The College of Surgeons in Edinburgh presented at this time a very anomalous condition. It was a college of surgery and a corporation, forming an integral part of the town-council of Edinburgh. The first character had fallen comparatively into neglect and oblivion, while the privileges belonging to the body in its relation to the burgh, exposed its members to the temptation of mixing in the politics of the town. This state of the college Mr. Bell was very anxious to alter; he wished to convert the college into a literary and scientific body, and to separate it from the politics of the city. It was a part of his plan that the college should resume the right, vested in them by their charter, of appointing a professorship of surgery, and take upon them their proper duty of watching over the interests of anatomy and surgery; that the examination should be placed on a more respectable footing; that the candidates should compose a thesis on some subject of surgery or anatomy, suggestions which have since been adopted, but the proposal of which at that time excited against Mr. Bell great opposition. The change which was at this time proposed in the surgical attendance at the infirmary, and which, on being ultimately carried into effect, proved fatal to Mr. Bell's prospects as a teacher, was supposed to have had its origin in this feeling. The members of the College of Surgeons were in rotation the surgeons of the establishment, and each surgeon, during his attendance, chose his own assistant for his operations, and those whose talents or inclinations did not lead them to take their share in the duties of the hospital, devolved those duties on others, and thus the surgeons particularly qualified for this situation soon distinguished themselves. Mr. Bell, from his expertness as an operator, was among the number.

Dr. Gregory drew up a pleading or memorial to the managers of the infirmary against this system, and proposed that two or three ordinary surgeons, the best qualified that could be got, should be permanently appointed, with assistant and consulting surgeons. Mr. Bell, seeing that the proceedings were intended to affect his interests and his plans of teaching, made an appeal personally to the board of the infirmary. He laid six folio books of cases on the table, filled with surgical drawings and surgical cases; he represented the long time he had served the poor in that house, and the great attention he had paid to the interests of his profession, and how assiduously he had laboured; he explained to them the manner in which he had taught his classes, that he had accompanied the students from the lecture-room to the infirmary; he explained to them how inseparably connected his system of teaching was with the best interests of the patients, as well as with the improvement of surgery. All this was in vain: in the end he found himself and his brother with many other surgeons deprived of the use of the institution. Mr. Bell brought the question before the courts of law, whether the managers had power to exclude him from the infirmary, and it was adjudged against him.

In 1798 he went to Yarmouth to visit those who had been wounded at Camperdown, and he there applied himself with the zeal and activity of the most devoted student to the proofs exhibited in the wounded of those great principles of surgery which it had been the business of his life to explain. In 1803 he made an offer to government for the embodying of a corps of young men, to be instructed in military surgery, and in the duties of the camp and hospital, in order to aid in the service of the country, then supposed to be on the eve of an invasion. The offer was first accepted, but subsequently declined.

After the loss of the infirmary, Mr. John Bell never resumed his lectures: he settled his mind to private study and professional occupation. He resumed his classical pursuits, and perused and enjoyed the authors of antiquity with his characteristic ardour. In 1805 he married a very amiable and accomplished lady, the daughter of Dr. Congalton, a physician long retired from practice, and he enjoyed in the society of Mrs. Bell and a large circle of friends twelve happy years in Edinburgh. Mr. Bell was always of a delicate constitution, and towards the end of this period his health declined so much that he was induced to visit the Continent, in the hope of regaining his strength by travelling and relaxation. In the course of his travels through Italy he made notes of his observations, which, since his decease, have been published by his widow. He finally sunk at Rome, under the effects of his complaint.

In 1793 Mr. Bell published the first volume of his *Anatomy*, consisting of a description of the bones, muscles, and joints. In a short time afterwards the second volume was published, containing the anatomy of the heart and arteries. The work was afterwards completed by his brother Charles. His next work was on surgery, entitled *Discourses on the Nature and Cure of Wounds*, in two small volumes, 8vo. The *Principles of Surgery*, in three vols., 4to., was his next and most formidable undertaking; and his last production is the *Letters on Professional Character and Education*, addressed to Dr. Gregory.

The character of this celebrated man may be summed up in a few words. He was a man of varied talents, and possessed great energy and industry, great facility in communicating his ideas, and great acuteness and discrimination in availing himself of all that knowledge which is essential to perfecting surgical science: but he had little patience with the very slow retreat of antient prejudices, and little acquaintance with the world, of which he was so much in advance. He was an entertaining and instructive writer, and a popular and eloquent teacher. As a controversialist he was acute and powerful, and as a writer pungent, even beyond his intention and desire. His work on Italy has shown that his talent for general literature, had it been exclusively cultivated, would have made him at least as eminent as his professional attainments have rendered him.

BELL-FLOWER. [See Campanula.]

BELL-METAL. [See Copper, Alloys of.]

BELL-METAL ORE, a name by which the sulphuret of tin found in Cornwall (see Tin Pyrites) is frequently known, owing to the aspect of bronze or of bell-metal which it possesses, in consequence of containing copper pyrites.

BELL (or INCHCAPE) ROCK, on the east coast of Scotland, lies at the opening of the bay formed by the Red Head in Forfarshire and Fifeness, and nearly opposite the entrance of the Tay. From Fifeness the Bell Rock is distant 11⅓ geographical miles, bearing N.E. by E. ½E. by compass. It is dry for about half a mile at low water spring tides: its average breadth is about 200 yards.

By an act of parliament a lighthouse was erected on this rock, in which a light was first exhibited on the 1st of February, 1811. The light, which is from oil, with reflectors, is 108 feet above the medium level of the sea: the tides rise ten feet, and therefore the light is 113 feet above low water. A bright and red light are exhibited, each of which attains its greatest strength every four minutes. There are two bells, which in thick foggy weather are tolled by machinery night and day, at intervals of half a minute. Prior to the erection of the light-house many wrecks took place annually on this rock, which was the more dangerous from having deep water all round it. (Stevenson's *Account of the Bell Rock Light-house*, 4to. 1824; Dessiou's *North Sea Pilot*.)

BELLAC, a town in France, the capital of an arrondissement in the department of Haute Vienne. It is on the bank of the little river Vinçon, a feeder of the Gartempe, whose waters flow into the Creuse, by the Creuse into the Vienne, and ultimately into the Loire. Bellac is probably about twenty-five miles N.N.W. of Limoges, the capital of the department. It is in 46° 7′ N. lat., and 1° 4′ E. long.

The town is built on the slope of a hill, at the foot of which the Vinçon flows. It does not appear to be a place of much trade. It possesses, however, several tan-yards, some paper-mills, and a foundry. Some woollens and linens are also made. The wines of the neighbourhood are of fair quality. The population in 1832 was 3025 for the town, or 3607 for the whole commune.

The castle of Bellac was a place of strength in the tenth century, and successfully withstood the attack of the combined forces of Robert King of France, son of Hugues Capet, and of the Duke of Aquitaine. The town sustained a siege in the civil wars of the sixteenth century. It was held for the king (Henry IV.), and was attacked by the forces of the League under La Guierche.

This siege is remarkable from the circumstance of the assailants having attempted to throw a bridge, after the manner of the antients, from a tower to the walls; but the bridge was destroyed by the guns of the town.

In the neighbourhood of Bellac, near the village of Borderie, is a fine druidical monument. The arrondissement of Bellac contains 780 square miles, or 499,200 acres, and is subdivided into nine cantons and seventy-nine communes. The population in 1832 was 80,061.

BELLADO'NNA, a violently poisonous wild plant. [See Atropa.]

BELLADO'NNA (literally *Fair Lady*) **LILY**, a species of Amaryllis, so called on account of its beauty and delicate blushing flowers. It is found wild at the Cape of Good Hope, has become naturalized in the ditches of Madeira, and is not uncommon in the gardens of England, where it lives for many years without shelter, if planted on a sunny border well protected from wet in winter. Its stems are about eighteen inches high, of a rich purplish green, with a dense violet bloom spread over them; the flowers grow in a cluster at the top of the stem, are of a funnel shape, with six divisions curving backwards at the points, and not less than three inches long; their colour is a rich but not deep rose, which varies in intensity in different varieties. They appear in August and September, without their leaves, and give an extremely rich and very exotic appearance to the borders in which they appear. The bulbs may be procured in any quantity from Madeira.

BELLAMY, MRS. GEORGE ANN, an actress of some celebrity. Her mother, whose name was Seale, after having been the mistress of Lord Tyrawley, married Captain Bellamy, and a few months after her marriage gave birth, on St. George's Day, 1733, to the subject of this article: this unexpected occurrence occasioned Captain Bellamy immediately to separate from her. The daughter was educated in a convent at Boulogne, till she was eleven years of age, when she returned to England. Rich, the manager of Covent Garden Theatre, overhearing her reciting the part of Othello to his children, was struck by her voice, and brought her out at the age of fourteen in the part of Monimia in the tragedy of 'The Orphan.' As an actress she drew the attention of the town for some seasons, particularly when she played Juliet with Mr. Garrick at Drury Lane, against Mrs. Cibber with Barry at Covent Garden. Her life, a memoir of which she wrote and published in six vols. 12mo., was a series of misfortunes and errors. She died February 15th, 1788, at Edinburgh, in great distress, aged fifty-five.

BELLAMY, JAMES, was born at Flushing of poor parents. As a boy he showed a great inclination for a military life, but being the only son of his mother, she put him to the trade of a baker, which he was still following, when in the year 1772, the second secular festival in commemoration of the foundation of the republic was celebrated throughout Holland. Till then he had never given any proofs of his genius, but this event suddenly made him a poet. His first verses were effusions of patriotic feelings and love for his native country. Some wealthy citizens of Flushing were so much pleased with these first productions of the young poet, that, to encourage his talent, they resolved to send him, at their own expense, to a university. Accordingly, after the necessary preparation for academical lectures, he went to Utrecht, with the intention of studying divinity. These studies, however, he soon left for the more congenial pursuits of poetry and general literature. A society of students, among whom Kleyn and Rau afterwards distinguished themselves, the first as a jurisconsult, the second as an orientalist, was then formed at this university, which had for its object the cultivation and improvement of the Dutch language and poetry after the German model: at the head of this society stood our poet. It was at Utrecht also, in the year 1785, when his country was involved in war, that our poet published his *Vaderlandsche Gezangen* (patriotic poems), which bear high testimony to his fiery imagination, superior taste, and facility in poetical composition. Previous to the year 1785 he had already published several pieces of merit, sufficient to induce the Society of Arts at the Hague to insert them in their collections. He also wrote a series of amatory poems, entitled *Gezangen myner Jeugd* (songs of my youth). Although Bellamy died before his genius had reached its maturity, he still must be ranked among the first poets of his nation, and the restorers of modern Dutch poetry. A presentiment, which he had of his approaching death, seems to account for a morbid sentimentality which his latter works betray. He died in 1786, at the age of twenty-eight. A short account of his life, together with two of his speeches, has been published by G. Kniper.

BELLARMIN, ROBERT, CARDINAL, 'who had,' says Bayle, 'the best pen for controversy of any man of his age,' was born at Monte Pulciano in Tuscany, in the year 1542. He entered the order of Jesuits in 1560; was ordained priest at Ghent by the celebrated Jansenius in 1569; and elected Professor of Theology at the University of Louvain in the year after. Having filled this chair for seven years with increasing celebrity, he returned to Rome in 1576, where he gave lectures on controversial theology. The Jesuits were at the time the great defenders of the church of Rome against the doctrines of Luther and the Protestants; and to their learning, ability, zeal, and worldly wisdom that church was mainly indebted for its vigorous stand against the assaults of the divines of the Reformation. In 1590 Bellarmin accompanied the pope's legate into France, for the purpose of affording the papal cause the aid of a master of the controversial points of divinity. In 1599 he was made a cardinal, but so little covetous was he of the honour that it is stated he was compelled to accept it only through threats of being anathematized for contumacy. Three years afterwards he was created archbishop of Capua, which see he quitted in 1605 for Rome, where he resided till his death in 1621, an active member of the court of the Vatican.

The controversial works of Bellarmin are very numerous, filling three large folio volumes. Of their merits, and of the merits, intellectual and moral, of their author, we have the following favourable opinion from the learned and candid Mosheim:-

'The disputants which the order of Jesuits sent forth in great numbers against the adversaries of the Church of Rome, surpassed all the rest in subtlety, impudence, and invective. But the chief leader and champion of the polemic tribe was Robert Bellarmine, a Jesuit, and one of the College of Cardinals, who treated, in several bulky volumes, of all the controversies that subsisted between the Protestants and the Church of Rome, and whose merits as a writer consisted principally in clearness of style, and a certain copiousness of argument which showed a rich and fertile imagination. This eminent defender of the Church of Rome arose about the conclusion of this century (sixteenth), and on his first appearance all the force and attacks of the most illustrious Protestant doctors were turned against him alone. His candour and plain dealing, however, exposed him to the censures of several divines of his own communion; for he collected with diligence the reasons and objections of his adversaries, and proposed them for the most part, in their full force, with integrity and exactness. Had he been less remarkable on account of his fidelity and industry; had he taken care to select the weakest arguments of his antagonists, and to render them still weaker by proposing them in an imperfect and unfaithful light, his fame would have been much greater among the friends of Rome than it actually is.' (Mosheim, *Ecclesiast. Hist.*, vol. iii. p. 155, Maclane's *Translation.*)

A much less favourable opinion was expressed by Scaliger in a criticism which has called down the just animadversions of Bayle (note L. art. 'Bellarmin'), who cannot well be suspected of any bias in favour of the Jesuit. Scaliger has ventured to assert that Bellarmin did not believe a word of what he wrote, and that he was at heart an atheist; but, besides the strong testimony of his life and death-bed to the contrary, such judgments are, as Bayle well remarks, a usurpation of the rights of Him who alone is the judge of hearts, and before whom there is no dissembling.

Besides the controversial works to which we have alluded, the Cologne edition, 1617, of Bellarmin's works contains three folio volumes of other works in addition to a volume of sermons and letters.

BELLA'TRIX, the name of the smaller of the two bright upper stars in Orion. The three stars of the belt rather incline towards it; it is of the second magnitude, and is marked γ by Bayer, and 24 by Flamsteed. The name (warrior) is indicative of the supposed astrological properties of the star; the old Arabic name is Al Mirzam al Nâjid, *the valiant lion.* [See ORION.]

BELLE DE NUIT, a name given by the French to various kinds of bind-weeds. In tropical countries those plants occur in great abundance, expanding their large, fragrant, and delicate flowers of white, or blue, or lilac, in such magnificence, that they may well be called the '*glory of the night.*' The species to which the name is more particularly applied, is what botanists call Ipomœa, or Calonyction Bona Nox, whose white flowers have a diameter of five or six inches, and open at sunset in the woods of the East and West Indies, drooping at daylight.

BELLE-ILE-EN-MER, an island on the west coast of France, a little to the north-west of the mouth of the Loire, in the department of Morbihan. It was known to the Romans by the name of Vindilis; and appears in a deed of the middle ages under the name of Guedel, a name which has some affinity with Vindilis. (D'Anville, *Notice de l'Ancienne Gaule.*) It was also, according to some writers, known to the antients under the Greek name of Calonesus, of which its modern designation of Belle-Ile (fair or beautiful island) is a translation. (Piganiol de la Force, *Nouvelle Description de la France.*)

It is said to have belonged in early times to the Count of Cornouailles, a small district in Bretagne, and to have been seized by Geoffroi, Count of Rennes, who bestowed the island upon the abbey of Redon. It was withdrawn from the possession of the abbey by Alain, son of Geoffroi, and restored by him to the Count of Cornouailles, who gave it to the abbey of Quimperlé. Possession was contested by the heads of the two ecclesiastical establishments, into whose disposal it had thus successively come; by repeated decisions it was confirmed to the monks of Quimperlé, but under them it remained almost a desert.

In 1572 the monks represented to the King of France, Charles IX., the inutility of their possession; they pointed out that in time of war it was occupied by the enemy, and in time of peace by pirates; and finally they prayed that he would take the island to himself, giving them in exchange some lands more suited to them, or allow them to effect an exchange with some private individual. By the king's authority, this last mode of exchange was effected, and Belle-Ile came into the possession of the Count de Retz or Raiz, then governor of Bretagne, and favourite of the king. It was erected into a marquisate, in favour of this count or his son, in 1573. The Count de Raiz, when he obtained the island, colonized it with settlers, who were in a state of abject vassalage to him; yet, notwithstanding this, the island so improved as to become a desirable acquisition for the government to make; and both Henry IV. and Cardinal Richelieu attempted to bring about its union with the domains of the crown, but in vain. The island, with the title of Marquis de Belle-Ile, afterwards came into possession of the family of Fouquet. In the reign of Louis XIV. the crown made some considerable encroachments on the rights of the lords of the island; and, in the year 1718, under the regency of the Duke of Orleans, while Louis XV. was a minor, the whole island came to the crown, in exchange for some lordships which were ceded to the marquis. (Expilly, *Dictionnaire des Gaules et de la France.*)

The island is of an oblong form: its greatest length runs N.W. and S.E., and is about eleven or twelve miles. The greatest breadth is about six miles. The longer dimension is in a direction parallel to the line of the coast of Bretagne, from which Belle-Ile is distant about sixteen or eighteen miles; but the peninsula of Quiberon, which stretches out into the passage between the island and the mainland, approaches to within six or eight miles of Belle-Ile. Close to the N.W. point of the island are some small islands or rocks, called the Conigues; the S.E. point is called Pointe Locmaria; and between this and the Conigues, on the S.W. side of the island towards the ocean, are the headlands Pointe du Vieux Château or Poulains, Pointe du Grand Guet, Pointe du Talus, and Pointe du Canon or Echelle.

Palais, the capital of the island, is on the N.E. side, nearly midway between the Conigues and Pointe Locmaria, facing the Breton coast. It is in 47° 21′ N. lat., and in 3° 9′ W. long. Between the island and the main are the small islands of Houat and Hoëdik, and several other islets or rocks. (*Maps of France*, by the Society for the Diffusion of Useful Knowledge, and by A. H. Brué, Paris, 1818.)

The general elevation of the soil is 160 to 170 feet above the level of the sea: it is the highest land along this part of the coast. The island is surrounded by rocks, frequented by sea birds; and the side towards Bretagne is in almost every place inaccessible, and in high winds the sea breaks with great violence upon the rocks which gird this coast. There are two roadsteads, the Grande Rade and the Rade de Sauzon, through which vessels pass coming from America or the West Indies. The mass of the island and of the surrounding rocks is calcareous. The summit of the island is a level plain, without trees, in which horizontal strata are observed. From the valleys which intersect this plain, springs of very pure water flow, and form by their junction small streams, which run into the sea.

The climate is mild and temperate. Ice and snow are rarely seen. The cattle need no shelter in winter, and the harvest never fails. The fig-tree, the laurel, and the myrtle flourish without any particular care. The soil is fertile, producing oats and wheat; but the farmers allow their land to lie fallow every other year. They use, for manure, sea-weed, fern, and broom, which have been allowed to putrify. (Expilly, *Dictionnaire des Gaules, &c.; Encyclopédie Méthodique, Géographie Physique.*) There is a good deal of common land, on which many sheep are reared. About 800 draught horses are exported yearly. (Malte-Brun.)

The island is said to contain 123 villages or hamlets, three small towns (bourgs), viz., Sauzon in the north-west part, Locmaria in the south-east part, and Bangor in the centre, and one town of more importance (ville), viz., Palais, the capital of the island. When Expilly wrote (1762), the island was divided into four parishes or quarters, named after the four towns. The population of the island is estimated in the last edition of Malte-Brun (Paris, 1832) at 8000.

The sardine or pilchard fishery is carried on to a great extent by the inhabitants of Belle-Ile. It commences in the month of June, and lasts till October. The fish are cured and exported to the coast of Spain, or to the French coast south of the island. The oil which is obtained during the process of curing the fish is either used in the island for careening the boats, or by the poor for their lamps, or else is sent to Nantes or Bordeaux, where it is used in the preparation of leather. (Expilly.)

The town of Palais is fortified, and is commanded by a citadel. A canal, which is filled by the tide, divides the city into two parts. There were, before the Revolution, two churches, the parish church, and that of St. Stephen. There are some salt-works. The harbour, which has a mole or jetty, is only for small vessels. It is adjacent to the Grande Rade, and is inferior to the harbour of Sauzon, which is three or four miles to the north-west of it, but which does not admit large ships. A third port, Le Goulfard, on the south-west or sea-ward side of the island, will admit larger vessels than either of the other, but it is not well sheltered from the south wind, and has a difficult entrance. (Expilly.) The population of Palais in 1832 was 1800 for the town, or 3584 for the whole commune.

The natives of Belle-Ile are a large, well made, bold race of people; as are also those of the little islands of Houat and Hoëdic, which have been already mentioned as lying between Belle-Ile and the Main. The inhabitants of these islands are engaged in fishing, or in raising a little wheat. (*Encyclopédie Méthodique;* Expilly.)

In the year 1761, during the war between England and France, Belle-Ile was attacked by an English armament: the naval force under Commodore Keppel, and the land forces (8000 in number) under General Hodgson. In their first attempt to land near Pointe Locmaria, the invaders were repulsed with considerable loss, but a second attempt was more successful. The whole English army was disembarked, drove the enemy into the town of Palais, and after meeting with a vigorous resistance, compelled the garrison to retire into the citadel. At last a capitulation was agreed to on honourable terms, and the island remained in the hands of the English till the peace of 1763, when it was restored. (Smollett's *Hist. of England; Annual Register.*)

BELLEISLE, a small island lying about fifteen miles north of the most northerly point of the island of Newfoundland, and about the same distance east from the coast of Labrador. It is placed near the middle of the north-eastern entrance to the Straits of Belleisle, in 51° 57′ N. lat., and 55° 40′ W. long. The island is about seven leagues in circumference. It has a small convenient harbour, called Lark Harbour, on the north-west side, capable of receiving only small vessels; and at the east point is another small harbour or cove which will admit only fishing shallops. (Anspach's *History of Newfoundland;* Malham's *Naval Gazetteer.*)

BELLEISLE, STRAITS OF, a channel which divides the north-west coast of Newfoundland from the coast of Labrador, on the continent of North America, and forms the northern entrance from the Atlantic to the Gulf of St. Lawrence. The length of the strait, from its commencement at Belleisle island to its termination at Grand Point south-east of Bradore Harbour on the Labrador coast, is twenty-seven leagues, and its general width about four leagues.

This passage is considered unsafe, and is in consequence but seldom frequented in the usual course of navigation by vessels entering the River St. Lawrence. The Labrador side of the strait is much indented with bays, among which are Temple Bay, Wreck Cove, Green Bay, Red Bay, and Black Bay. The coast of Newfoundland along the straits is uniformly without indentations. (Anspach's *History of Newfoundland:* Malham's *Naval Gazetteer.*)

BELLEGARDE, a fort in France, in the department of Pyrénées Orientales, or Eastern Pyrenees. It is 554 miles nearly due south from Paris, by the road through Nevers, Moulines, Clermont, Mende, Montpellier, Narbonne, and Perpignan, from the last of which (the capital of the department) it is distant about twenty-two miles. It is in 42° 29′ N. lat., and 2° 52′ E. long.

Bellegarde crowns the summit of a mountain, which lies close upon the frontier towards Spain, and is above the pass (le Col de Pertuis) through which runs the road from Perpignan to Figueras in Catalonia. Originally there was only a tower to defend the pass: this tower was, in 1674, taken by the Spaniards, who added to it some works; but it was retaken in July, 1675, by Maréchal Schomberg, commander of the French army in this quarter, the same who was afterwards killed in Ireland at the battle of the Boyne. After the peace of Nimeguen in 1679, Louis XIV. ordered a regular fortress, with five bastions, to be constructed. At one angle of the fortress are some outworks, cut in the solid rock, and inaccessible on one side from the precipice, on the crest of which they have been formed.

The town is very inconsiderable: in fact there is scarcely anything deserving the name. A few houses of entertainment for travellers, and some gardens which belong to the resident officers of the garrison, lie at the foot of the mountain. The only object of curiosity in Bellegarde is the well, which deserves notice for its great depth, and the hardness of the rock which has been cut through in order to obtain water.

In the war between France and Spain which followed the French revolution, Bellegarde became an object of contention. It was taken by the Spaniards in 1793, but was retaken by the French under General Dugommier, in September, 1794, after a siege of four months, and after a Spanish army, which attempted to raise the siege, had been defeated. The Spaniards sustained another defeat in an attack upon the besieging army the day after the place had surrendered. Dugommier, who was killed in battle shortly afterwards, was buried in one of the bastions.

The population of Bellegarde, as given in the *Dictionnaire Universel de la France* (Paris, 1804), our latest authority, was only 130. (*Dictionnaire Universel de la France;* Reichard's *Descriptive Road Book of France;* Martinière; Expilly.)

BELLENDEN, SIR JOHN, eldest son of Thomas Bellenden, Ballenden, Ballantyne or Bannatyne (for, by all these names is this family known), of Auchinvole, a lord of session, director of the chancery, and justice clerk of Scotland. He was some time secretary to Archibald Douglas, earl of Angus, lord chancellor and prime minister of Scotland, in the beginning of the sixteenth century. When Angus was, in September, 1528, indicted for high treason, of the many that had previously waited on him Bellenden alone continued his friend, and, though not a lawyer, drew up the defences for him. In 1424 an act had been passed by the Scottish legislature, providing, that 'gif there be ony poor creature that for lack of cunning or dispenses cannot or may not follow his cause, the King, for the love of God, sal ordain the judge to purvey and get a leil and wise advocate to follow sik poor creature's cause:' but here, the once potent Earl of Angus had for his first plea, that though 'callit upon oure life, landes, and gudes, and ar na man of law ourself, we can get na procuratour nor advocat to speik for us.' All his pleas and defences were overruled, and he was found guilty by the parliament, and attainted; but in March 1542-3, the attainder was reversed, Crawfurd says, on the grounds taken in the defences, and Angus restored to his estates and honours.

Bellenden immediately after had the honour of knighthood conferred upon him; and on his father's death, he was in June, 1547, appointed to the vacant places of a lord of session, director of the chancery, and justice-clerk. On the breaking out of the Reformation, he was named by the Queen Regent one of the commissioners between her and the lords of the congregation; but he soon joined the reformers, and in August, 1560, he and Wishart of Pittarrow are mentioned in Randolph's despatch to Cecil, as the two whom they had resolved to join in a mission to France (Robertson's *Scotland*, vol. i. p. 186), and on Mary's arrival in Scotland, he was, 6th September, 1651, appointed one of the privy council. In December following he was one of those named to modify stipends to the reformed clergy—the mean allowance for whom roused the indignation of Knox. On the 23rd September, 1563, he and Sir John Maxwell, the warden of the West Marches, met the English commissioners at Dumfries, where they entered into a convention for redressing the mutual trespasses on the borders. (Nicolson's *Border Laws*, p. 84, et seq.)

Sir John appears to have been thrice married. His first wife was Barbara, daughter of Sir Hugh Kennedy of Girvanmains, a friend of the Douglas family; and on the 1st May, 1559, he had a charter to himself and his said spouse of the lands of Waukmill with the Fullers-mill, and some other lands in the regality of Broughton, belonging to the abbey of Holyrood near Edinburgh. His younger brother, Patrick, who was made sheriff of Orkney, also married a daughter of the house of Kennedy, and on the 18th February, 1565, had a charter from Adam, bishop of Orkney, of the lands of Stenhouse in that diocese, to himself and Catherine his wife, and their children, whom failing, the said Sir John. On the 31st May, 1565, Sir John got a grant of the office of usher of exchequer—an office which seems to have remained in his family till 1796, when on the insolvency of the fifth Lord Ballenden it was attached, and sold by the creditors. The same year Sir John had a grant of the office of justiciar and bailie of the baronies of Canongate and Broughton, and other lands belonging to Holyrood-house; and the next year the commendator made him justiciar and bailie of Calder, belonging to the same abbey.

Among the numerous reports to which the murder of Rizzio gave rise, one was, that the Bellendens were implicated in the crime; and in the despatch from Randolph and the Earl of Bedford to the privy council of England, 27th March, 1566, it is said 'There were in this companie two that came in with the king, the one Andrewe Car of Fawdonside, whom the Queen sayth would have stroken her with a dagger, and one Patrick Balentyne, brother to the justice-clerk, who also, her grace sayth, offered a dag against her belly with the cock down:' but it is added, 'We have been earnestly in hand with the Lord Ruthen to know the varitie, and he assureth us to the contrarie.' (Robertson's *Scotland*, vol. iii. p. 227.) It would seem, however, that Sir John Bellenden fled from Edinburgh, on the 18th March, 1566, on the arrival of Mary and Darnley with an army; but he was soon restored to favour. He carried Mary's commands to Mr. John Craig, the famous fellow-minister of John Knox, to proclaim the banns between her and Bothwell, and had long reasoning with the church on the subject. The marriage was solemnized on the 15th May, 1567, by the above-mentioned Adam, bishop of Orkney—an act for which he had to ask pardon of the church, before they would allow him to remain in the ministry. The bishop of Orkney afterwards joined the association against Mary and Bothwell; and in July following he anointed and crowned the infant James. Sir John Ballenden joined the association likewise. He was also one of the Regent's privy council. In 1573 he was employed in framing the pacification of Perth, whereby all the queen's party, except Kirkcaldy of Grange, Lethington, and those with them in Edinburgh castle, were brought to the king's obedience. The same year he was, it seems, employed in a still more difficult affair, namely, to persuade the General Assembly on the behalf of Morton, that the civil magistrate ought to be head of the church as well as of the state. The discussion was continued for twelve days, and then adjourned. (Home's *History of the House of Douglas.*)

Sir John died some time before April, 1577, leaving by his first wife two sons, on the eldest of whom, Lewis, he by his latter will, dated in 1567, laid an injunction to serve the regent and the house of Angus, under the king's majesty's obedience, 'as I and my forbearis haf done, in tymes bypast, befoir all the warld.' Sir Lewis succeeded his father in his possessions, and in his place of justice-clerk. Thomas Bellenden of Newtyle got the vacant place of lord of session: 'quhilk place (says the king's letter) may not now be usit by our said familiar clerk, viz. Sir Lewis, by reason of his less age.' To what term of life this last expression applies is somewhat doubtful, chiefly because the opinion of Lord Hailes has intervened. His lordship conceives it to be twenty-five, though that age does not appear to have been required for the bench till the act 1592, c. 134. In the king's letter above referred to, the lords of session were enjoined to allow Sir Lewis to remain in court during its deliberations, 'that he may hear the reasoning of all causes with advysement of the processes and interloquitors thereof:' for it must be remembered that at that time the court of session always deliberated in secret. The practice indeed continued till the Revolution, when an act was passed, requiring the judges to advise and vote 'with open doors;' and it is not a little singular that, notwithstanding the importance of publicity and of the constant presence in court of a body of vigilant and intelligent lawyers to the due administration of the law, the practitioners before the court of session do generally continue to perambulate the 'Outer House' to this day.

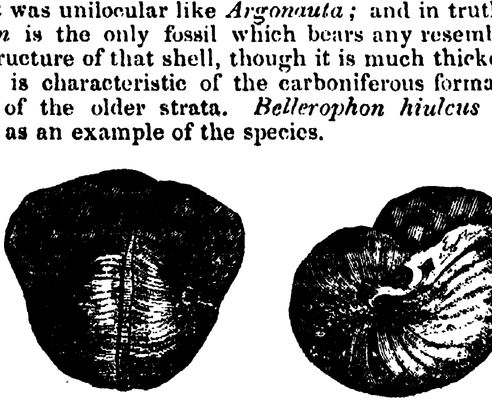
Sir Lewis's immediate younger brother, Adam, was bred to the church, and became bishop of Aberdeen. He had another brother, Thomas, said to be of a third marriage, who was for a short time one of the lords of session. The grandson of Sir Lewis was in June, 1661, created Lord Ballenden of Broughton; and on the death of the third Duke of Roxburghe, the latter honour devolved on his kinsman, the seventh Lord Ballenden, on whose death, the following year, the barony of Bellenden expired.

BELLENDEN, WILLIAM, an eminent writer, concerning whose birth and education we possess no certain information except that he was of Scotch family, became known as a writer in the commencement of the sixteenth century. It is stated that he filled the office of Professor of Humanity in the University of Paris in 1602, and that he was enabled to reside at that university through the favour of James VI. (James I. of England). It is certain that he resided a long time in Paris, and that the various writings which have transmitted his name down to us were published during his residence there. In 1608 he published his 'Ciceronis Princeps,' &c., 'a singular work,' says Dr. Bennett, Bishop of Cloyne, 'in which he extracted from Cicero's writings detached remarks, and compressed them into one regular body, containing the rules of monarchical government, with the line of conduct to be adopted, and the virtues proper to be encouraged by the prince himself.' This treatise, which is called 'De Statu Principis,' he dedicated to Prince Henry, the eldest son of his royal patron. In 1612 he published a work of a similar character, which he called 'Ciceronis Consul, Senator, Senatusque Romanus,' that is 'De Statu Reipublicæ,' in which the nature of the consular office, and the constitution of the Roman senate are perspicuously treated. Finding these works deservedly successful, he conceived, and partly executed, the plan of a third work, 'De Statu prisci Orbis,' which was to contain a history of the progress of religion, government, and philosophy, from the times before the Flood, to their various degrees of improvement under the Hebrews, Greeks, and Romans. He had proceeded so far as to print a few copies of this work in 1615, 'when it seems,' says Dr. Bennett, 'to have been suggested that his three treatises, 'De Statu Principis,' 'De Statu Reipublicæ,' 'De Statu Prisci Orbis,' being on subjects so nearly resembling each other, there might be a propriety in uniting them into one work, by republishing the two former, and entitling the whole 'Bellendenus de Statu.' With this view he recalled the few copies of his last work that were abroad, and, after a short delay, published the three treatises under their new title in 1616. A copy of the original edition of the 'De Statu prisci Orbis,' dated 1615, is in the British Museum. The great work being now completed, Bellenden looked forward (we still follow Dr. Bennett) with a pretty well-grounded expectation of that applause which his labour and ingenuity deserved. Unfortunately, however, the vessel in which the whole impression was embarked was overtaken by a storm before she could reach the English coast, and foundered with all her cargo. A few copies only, which Bellenden had kept for his own use, or made presents of, were saved; and accordingly the work, from its scarcity, was hardly known to even the most curious of book collectors. Dr. Bennett states that no mention is made of the work in either the 'Observationes Literariæ,' published at Magdeburg in 1705, or in the 'Amœnitates Literariæ,' published at Frankfort in 1728, though both are devoted to a history of scarce and learned books.

Bellenden, though naturally much concerned, was not, it seems, discouraged at his loss; but immediately set about arranging his materials in a new form. His studies had made him familiar with the works of the great Latin writers, particularly Cicero; and he designed a work with the title 'De Tribus Luminibus Romanorum,' in which he proposed to explain the character, literary merits, and philosophical opinions of Cicero, Seneca, and Pliny the elder according to some, the younger according to other critics. The first of these he finished, and was proceeding with the others when he died. The republication of the three original works above named of 'Bellendenus de Statu' in 1787, with a preface remarkable for its Latinity, and still more, perhaps, as being the vehicle of much fierce political invective against the character and administration of Mr. Pitt, and of unmeasured eulogy of the author's 'Tria Lumina Anglorum'—Mr. Burke, Lord North, and Mr. Fox—from the pen of Dr. Parr, has made Bellenden's name more familiar to the English reader than it otherwise might have been. In his preface, Parr affirms that Middleton, in his 'Life of Cicero,' borrowed largely from Bellenden, without making any mention of his name.

(See the works of Dr. Samuel Parr, edited by J. Johnstone, M.D., vols. i. and iii.; and *The Biographia Britannica.*)

BELLE'ROPHON (Zoology), a fossil shell, the animal of which is unknown, but which probably was allied to that of *Argonauta* and *Carinaria*. Denys de Montfort established the genus, but he placed it among the polythalamous or chambered shells. De France cut in half the very specimen which belonged to De Montfort, and thus proved that it was unilocular like *Argonauta*; and in truth, *Bellerophon* is the only fossil which bears any resemblance to the structure of that shell, though it is much thicker. The genus is characteristic of the carboniferous formation and some of the older strata. *Bellerophon hiulcus* may be taken as an example of the species.



[Bellerophon hiulcus.]

BELLES LETTRES, a vague term used by the French, which has been adopted by other nations, to signify various branches of knowledge, which are the produce of the imagination and taste, rather than of serious study and reflection. We do not find that the limits of this description of knowledge have been clearly defined. Rhetoric, poetry, history, philology, are generally understood to come within the definition of belles lettres; but the mathematical and natural sciences, jurisprudence, metaphysics, ethics, and theology, the fine arts, and the mechanical arts, are considered distinct from them. Antiquarian and classical researches are not always included among the belles lettres: the French Academy *des Inscriptions et Belles Lettres*, seems by its very title to make a distinction between the two, as the first part of the title, 'Inscriptions,' refers to the investigation of antient or oriental inscriptions, medals, &c. Belles lettres may be said to answer to the *literæ humaniores* of the Latin language, and to the English expression 'polite literature.'

BELLESME, BELLÊME, or BELESME, a town in France, in the department of Orne, formerly included in the district of Perche. It is near the source of the little river Meme (a tributary of the Huine, which flows into the Sarthe), 93 miles W.S.W. of Paris, 48° 22′ N. lat., 0° 31′ E. long. It disputes with Mortagne the title to be considered as the capital of Perche. It was under counts of its own at an early period, but the last of these was deprived of his domains by Henry I., King of England and Duke of Normandy, who gave Bellesme to the Counts of Mortagne, whose successors assumed the title of Counts of Perche. In 1228 Bellesme was besieged by the army of Louis IX. (St. Louis) of France, and taken in fifteen days, although it was then accounted one of the strongest places in Europe.

The town is tolerably well built, and stands on an eminence which commands the surrounding country. To the north of the town is the small forest of Bellesme, in which are some mineral springs, and also some iron mines. The wood of this forest is much used for cask staves, and furnishes the town with one of its most considerable articles of trade. Common linens and cottons are manufactured. The population in 1832 was 3264 for the town, or 3413 for the whole commune.

In the neighbouring forest of Bellesme, in the earlier part or the middle of the eighteenth century (as we gather from the phrase used by Expilly in 1762, 'il y a quelques années'), two antient inscriptions were dug up, apparently the inscriptions of an antient temple of Venus. The first contained simply the word 'APHRODISIUM;' the second consisted of the words 'DIIS INFERIS VENERI MARTI ET MERCURIO SACRUM.' (Expilly, *Dictionnaire des Gaules, &c.*)

BELLEVUE LES BAINS. [See BOURBON LANCY.]

BELLEY, a town in France, formerly capital of the district of Bugey, or Bugei, a subdivision of Bourgogne, or Burgundy [see BUGEY], and now the capital of an arrondissement in the department of Aix. It lies amidst the ridges of Jura, and not far from the banks of the Rhône, which in this neighbourhood is the boundary of the French and Sardinian territories. It is in 45° 45′ N. lat., and 5° 42′ E. long.

According to Martinière, no mention of this town is known to have been made of earlier date than the time of the Merovingian kings of France; but Malte-Brun* speaks of its having been destroyed by Alaric, A.D. 390, and rebuilt A.D. 412. A bishop of Belley (Latin, *Belica*) was at the second council of Paris in the middle of the sixth century; and tradition speaks of a bishop, Audax, at the commencement of the fifth century. The see is said to have been transferred here from Nyon in Switzerland. The town continued under the dominion of its bishops; and Frederick Barbarossa, emperor of Germany, granted to the then bishop all the rights of regality, including that of coining money. These ecclesiastics obtained also a seat in the Diet, which they retained as long as Bugey was an incorporated part of the German empire. Belley, with the district of Bugey, came subsequently into the hands of the dukes of Savoy, but in the year 1601 they were ceded to France by the Duke Charles Emanuel. The town is said to have been burned wholly or in part in 1385, and rebuilt by Amadeus VIII., duke of Savoy.

Before the Revolution, Belley possessed a cathedral and a parish church, an abbey for Cistertian nuns, convents for Cordeliers and Capuchins, and nunneries of Ursulines and Visitandines, besides a seminary for priests, a college, and an hospital. The cathedral is well built. The principal manufacture carried on is of calico and muslin, which is sent to Lyons and Avignon. (*Dictionnaire Universel de la France*, Paris, 1804.) Population, in 1832, 3550 for the town, and 4286 for the whole commune.

The arrondissement of Belley is bounded on the west by the Ain, and on the east and south by the Rhône. It contains 540 square miles, or 345,600 acres, and is subdivided into 9 cantons, and 118 communes. The population in 1832 was 79,744. The country round Belley is fertile, and the situation of the town agreeable. The river Foran, or Furand, a small feeder of the Rhône, flows a short distance west of the town.

---

* M. Malte-Brun even goes so far as to say that Belley existed when Brennus made his expedition against Rome, and that it was destroyed by those who fled before the approach of the fierce Gaul, B.C. 390.

The bishopric formerly extended into Savoy. At present it includes the department of Ain. Population in 1832, 346,030. The bishop is a suffragan of the archbishop of Besançon.

BELLI'NI, JACOPO, was born in Venice. He was one of the earliest practitioners in oil painting, and his works have considerable merit, considering the age in which they were executed. He adorned the public edifices of Venice with a great number of pictures, the principal of which were a series of subjects from the New Testament in the church of St. John the Evangelist. He was distinguished in portrait-painting, and among many other eminent persons who sate to him were Lusignano, King of Cyprus, and the Doge Cornaro. This artist died in 1470.

BELLINI, GENTILE, was the eldest son of the preceding, and born at Venice in 1421. He studied under his father, and acted for some time as his assistant, but subsequently gained such reputation by his original works that he was employed, in conjunction with his brother, Giovanni, to decorate the great council-chamber of the Venetian senate-house. His other principal works are the Histories of the Holy Cross at San Giovanni, and the Preaching of St. Mark, at the college of that saint: this latter work vies in colouring and effect with the pictures of Paris Bordone, which hang near it, a proof that Bellini had made immense improvement on his original style; in other respects, the picture is marked by the barbarity of early art; the figures, which are numerous, are introduced without discrimination. the maimed, halt, and deformed, being among them, all painted with rigid regard to nature, but exhibiting ridiculous anachronisms, their costume being that of Turks or Venetians. His Presentation of the Infant Jesus at the Temple, in the Palazzo Barberigo, is a highly-esteemed performance. Some of Bellini's pictures were taken by commercial speculators to Constantinople, where, having been seen by the sultan, Mohammed II., that monarch sent an invitation to the artist to make a visit to his court. This proposal was accepted by Bellini; he was courteously received by the sultan, who sat to him for his portrait, and commissioned him to paint various historical works. Among the rest was the subject of the Decollation of St. John: this picture being completed was greatly admired by Mohammed, who pointed out, nevertheless, some inaccuracy in the marking of the dissevered neck; and in order to prove the justice of his criticism, he ordered the head of a slave to be struck off in the presence of the astonished artist. From this moment Bellini never enjoyed an hour's tranquillity until he had obtained leave to return to Venice. Mohammed dismissed him with many marks of favour, placing a gold chain round his neck, and giving him letters to the Venetian senate expressive of his satisfaction. During his residence in Constantinople he struck a medallion of the sultan. He was engaged in various public works after his return to Venice, for which he was requited by the republic with an honourable pension for life, and the order of St. Mark. He died in 1501, aged eighty.

BELLINI, GIOVANNI, the son of Jacopo, and the brother of Gentile Bellini, was born at Venice in 1422. He was the best artist of his family, and contributed, perhaps, more than any painter of his time to emancipate art from the dry Gothic manner of his predecessors. His first public works were those in the Venetian senate-house, in the decoration of which he was associated with his brother, Gentile. It is asserted by some authorities that the invitation of Mohammed II. was sent to Giovanni, but that the senate induced Gentile to go in his stead, being unwilling to lose the services of their most distinguished artist. Giovanni ornamented the public edifices and churches of Venice and other cities of Italy with a prodigious number of paintings, and continued his labours to a very advanced age. Among his most distinguished works are altar-pieces in the Sacristy of the Conventuali and at San Zaccaria at Venice; and in the monastery of the Capuchins in that city is a picture of the Infant Jesus slumbering in the lap of the Madonna and attended by angels, a work conspicuous for its grace, beauty, and expression. To these may be added a Virgin in the cathedral of Bergamo, a Baptism of our Lord at Santa Corona, at Vicenza, and Christ and the Woman of Samaria at the Well, in the Schiarra Palace at Rome. In all these works the elements of a finer style are more visible than had been practised either by Perugino, Ghirlandaio, or any of his immediate contemporaries. Bellini introduced a more ample style of drapery, he generalized his colour, and gave breadth to his masses; and although he fell short of the excellence which was soon after attained by Giorgione and Titian, he claims the honour of having given the first hints of that admirable style which was perfected by those great masters. Some of his small pictures are in England; but it is only by his large works in Italy that an adequate idea of his powers can be formed. He died at the age of ninety, in 1512. (Vasari; Lanzi; Rodolfi; De Piles.)

BELLI'NI, LAURENTIO, descended from a respectable family, was born at Florence in 1643. After receiving in his native place the elements of a classical education, he proceeded to Pisa, to enjoy the advantages which the Grand Duke Ferdinand II. granted to those who were disposed to study the sciences. At this time the doctrines adopted in order to explain the functions of the human body were derived from the sect of mathematical physicians, who ascribed them to mechanical principles. The leader of this sect was Borelli, then professor of mechanics and anatomy at Pisa. Under him, and also under Alexander Marchetti, professor of mathematics, Bellini studied, and imbibed their opinions. He made such rapid progress, that, when only twenty years of age, he was appointed professor of philosophy at Pisa. Shortly afterwards he was made professor of anatomy, and was frequently honoured with the attendance of the grand duke at his lectures. He continued to teach anatomy and to practise medicine at Pisa, with great success, for thirty years, when he was invited to Florence, and made chief physician to the Grand Duke Cosmo III. At the recommendation of Lancisi, physician to Pope Clement XI., he was nominated senior consulting physician to that pontiff. His reputation was also extended to foreign countries both by his writings and pupils, one of the most distinguished of whom was Dr. Archibald Pitcairn, successively professor at Leyden and Edinburgh, who introduced and maintained the doctrines of his master in these celebrated schools, where they held sway for a considerable time. Bellini died on the 8th of January, 1704.

Borelli and his pupil Bellini having likened the body to a collection of tubes, forming an hydraulic machine, calculated the force of the circulation of the blood and other fluids through them, making allowance for the diminished velocity of their course arising from the friction along the sides of the vessels, the angles at which the branches of the arteries were given off from the main trunk, the curves which were formed by the vessels, and the diminished calibre of these as they proceeded to their terminations. The moving or propelling force was not, in their opinion, solely mechanical, but arose from a fermentation in the blood, by which certain animal or vital spirits were disengaged, which forced the blood along the channels of the blood-vessels. So far, therefore, a unanimity of views existed between the chemical and mathematical sect of physicians. To give an example of Bellini's opinions, we may select his explanation of the alternate contractions and dilations of the auricles and ventricles of the heart: according to him, when the blood fills the ventricles, it compresses the nerves of the auricles, and so prevents the influence of the vital spirits, and causes the auricles to be distended.

His theory of respiration was of a similar kind. In his estimation, the sole object of respiration was to push the blood into the capillary or extreme vessels with a suitable degree of force. His views respecting secretion and inflammation are more important, as they had much influence upon practice, both during his own life and for nearly a century afterwards. The doublings and windings of the capillaries in the glands was the chief cause, in his view of the subject, of the different secretions, and an accumulation or prolonged stay of the blood in these vessels was the cause of inflammations and fevers. These opinions formed the basis of the doctrines of *obstruction* and *lentor*, which being adopted by Boerhaave in his eclectic system of medicine, were extended by him and his pupils to most of the medical schools of Europe. Their importance has greatly declined since the writings of Haller and John Hunter.

The writings of Bellini are now little read. The best is the treatise *Gustûs Organum novissime deprehensum*, Bononiæ, 1665, in which he pointed out the papillæ of the tongue to be the essential organ of taste. The next most important is entitled *De Urinis, Pulsibus, Missione san-*

guinis, *febribus*, &c., Bononiæ, 1683. His works have been collected and published in two volumes, 4to., *Opera Omnia*, Venetiis, 1708, and reprinted 1732.

Bellini possessed a taste for music and poetry, and was the author of a poem called *Bucchereide*, which was published after his death at Florence in 1729.

(See Sprengel, *L'Histoire de la Medicine*; Haller, *Bibliotheca Medicinæ Practicæ*, vol. iii. p. 124; *Fabroni Vitæ Italorum*, vol. iv.)

BELLINZO'NA, one of the three towns of the Canton Ticino in Italian Switzerland: Lugano and Locarno are the other two, which are by turns the seat of the cantonal government. It is situated in a pleasant valley on both banks of the Ticino, eight miles above its entrance into the Lago Maggiore, and on the road from Switzerland to Milan by the St. Gothard. The valley is very narrow at Bellinzona, and the town, with its three castles, completely shuts up the pass. Another road branches off three miles north of Bellinzona, eastwards, and along the Val Misocco into the canton of the Grisons, and over Mount Bernardin to Coire and the banks of the lake of Constance. This road puts eastern Switzerland and central Germany in direct communication with the Sardinian states which border the western bank of the Lago Maggiore, and thus the Austrian territories are avoided; goods from the port of Genoa are sent into Bavaria and Würtemberg, while German manufactures are sent down to Turin or Genoa. This useful road has been constructed since the last peace at the joint expense of the Grisons, the Canton Ticino, and the king of Sardinia. The following inscription is placed on Mount Bernardin: 'Jam via patet hostibus et amicis; cavete Rhæti! Simplicitas morum et unio servabunt avitam libertatem.' The traveller who descends either the St. Gothard or the Bernardin finds at Bellinzona the climate and the productions of Italy: the vine, the laurel, the mulberry and fig trees thrive there, and even the orange and lemon are trained against the walls. The neighbouring mountains are covered with large chestnut trees. Chestnuts and the *polenta*, or pudding made of the flour of Indian corn, constitute here, as in other parts of Northern Italy, the common food of the peasantry. The people of Canton Ticino are Catholics. [See TICINO.] The population of Bellinzona is about 1300. (Carta, *Manuale di Geografia*, Milan, 1826.) Bellinzona is seventy-five miles S.S.E. of the Hospice of the St. Gothard, fourteen miles north of Lugano, and thirty miles from Como, the first town of the Austrian territories on the road to Milan. (Kasthofer, *Voyage dans les petits Cantons et dans les Alpes Rhétiennes*; Walsh, *Voyage en Suisse, en Lombardie, et en Piémont*; Ebel's *Manual*.)

BELLMANN, CHARLES MICHEL, a Swedish poet, who is justly entitled to the fame of originality above all his Swedish contemporaries, was born at Stockholm in 1741, and died in 1796. He studied at the University of Upsala, and after he had left it was enabled to devote himself entirely to his favourite pursuits of poetry and literature by the liberality of Gustavus III., who appointed him to a nominal office, with a competent income, and the title of secretary of the court. The king had already favourably noticed Bellmann's earliest productions, which were a metrical translation from the German of Schweidnitz's 'Evangelical Dying Thoughts' ('Evangelische Todesgedanken'), published when he was only sixteen; and a poem entitled 'Zion's Högtid' (the 'Festival of Zion'); to which some years afterwards were added: 'Bachi Tempel' (the 'Temple of Bacchus'), the most important of his poems; Friedmann's 'Epistler og Songer;' and a Swedish translation from the German of Gellert's 'Fables.' His posthumous works, 'Skaldestykken' ('Poems'), and Friedmann's 'Handskrifter' (Friedmann's 'Manuscripts'), were published; the first at Stockholm, 2 volumes, 1812, and the second at Upsala, 1813. Bellmann's poetical pictures generally represent scenes of the lowest life in Sweden; but they are so chaste, so true, so full of imagination, and their colours are so lively, that the reader forgets the scenes of vulgarity to which he is introduced, and finds himself suddenly transported from low tap-rooms to cheerful habitations of joy and song. To enter, however, fully into the spirit of Bellmann's lyrical productions, it is necessary, not only to read them, but also to hear them sung to the tunes which were composed expressly for them. Bellmann had a heart open to friendship, he was a cheerful companion, and bore a good moral character. (See Ersch and Gruber's *Encyclopædia*.)

BELLO'NA, the goddess of war among the Romans, corresponding in some measure with Enyo of the Greeks; but much confusion has arisen in the study of antient mythology from the habit of looking upon the names of the Greek and Roman deities as convertible with one another. Where there are some points of resemblance, there are often still more of dissimilarity, especially as regards those deities which were the objects of religious honour among the Romans before the introduction of Greek and Asiatic forms of worship. The Saturn of the Romans, for example, is far from identical with the Kronos of the Greeks; Minerva, again, differs much from Pallas, and Diana from Artemis. The greater part of the deities strictly belonging to the Romans have names which have grown out of the language itself. This cannot be said of the Greek deities. Thus, *Bellona* is properly a feminine adjective, which with the noun *dea* signifies the goddess of war (from *bello*, war); so Pomona, the goddess of fruit (*pomo*); Portunus, or Portumnus, the god of harbours (*portu*); Vertumnus, of change (*versu*, antiently *vertu*); Silvanus, of woods (*silva*): Luna, or Lucina, the goddess of light (*luc*, and perhaps *luci*); Fortuna, the goddess of chance (*fort*, or more probably from an obsolete noun *fortu*); Dianus, afterwards Janus, the god of light, until the Greek Apollo usurped this character; Diana, or Jana (a name actually used), the goddess of light or moon (*die*, day). On the same principle, no doubt, are formed the names of Vulcanus (compare *fulgeo*, φλέγω, shine, blaze), Neptunus (compare νίπτω, wash, and *nympha*, a goddess of water), Saturnus (compare *satur*, full), Picumnus, Pilumnus, Faunus; and we might perhaps look upon Auctumnus (from *auctu*, increase) as a deity.

Another principle which pervades the Roman mythology is the division of each object of fear or desire between deities of either sex. (Niebuhr, *Roman Hist.*) We have already seen Dianus and Diana. Besides these, there occur Saturnus, the god of plenty; Ops, the goddess of plenty; Vulcanus and Vesta, the god and goddess of fire; Tellumo and Tellus, of earth; Neptunus and Nympha (Nimfa would be a more correct Latin form), of water; Jupiter, or rather Jove, and Juno, of air. In the same way they had Mavors (or Gradivus), together with Bellona, to preside over war.

The temple of Bellona was founded, according to Pliny (xxxv. 3), in the year 259 of Rome, by App. Claudius, the colleague of P. Servilius Priscus. Livy, however (x. 19), refers the foundation to App. Claudius Cæcus, the colleague of L. Volumnius, in the year of Rome 456; and the latter is confirmed by an inscription in Gruter (389. 4). Both accounts will be substantially true, if the latter only rebuilt the temple. When any Roman family had once connected its name with a public work, those who afterwards bore the name had a pride in keeping up the connexion. The temple was situated in the ninth region, between the Carmental Gate and the Flaminian Circus, and consequently without the walls of Servius. It was on this account the place usually selected by the Roman senate and consuls for the reception of embassies from hostile powers, and also of their own generals, especially when these came to claim a triumph; for the *imperium*, or supreme military authority, was at once annulled by an entrance into the city, and with it all claim to a triumph. Near the temple was a column, over which a spear was hurled as a declaration of war against any foreign state. (Ovid, *Fasti*, vi. 201.) This rite was introduced to supply the place of another. According to the original ceremony, a herald, or *fecial*, proceeded to the frontiers, and hurled a spear of defiance into the hostile territory; but as the limits of the empire were extended, this became impracticable.

The goddess was usually represented as wearing a helmet, and bearing a shield in one hand, in the other a firebrand, a spear, or a lash. Sometimes she was blowing a trumpet, or uttering a war-cry and rushing to the combat. Her image is seen on the coins of the Bruttii, or Brettii. (Montfaucon, *Ant. Ex.* i. 126.)

The wildest extravagance marked her worship. Her priests (Bellonarii), like those of Cybele and Bacchus, affected insanity (Juvenal, iv. 123), whirling their heads round with fearful rapidity, and shrieking out words of pretended prophecy. On the 24th of March, which was appropriately called the day of blood, they exhibited their zeal by making incisions in their arms, and sprinkling all around with their blood. The more prudent among her followers, however, contrived to produce the appearance of wounds without any self-torture, a laxity which the Emperor Commodus corrected by a special precept that the devotees of the goddess should make *bonâ fide* incisions; but, besides the priests officially attached to the worship of the goddess, there were volunteers who, impostors or enthusiasts, frequented her temple and exhibited the same symptoms of phrenzy. Such scenes indeed were to be seen in the temples of other deities, but more particularly in that of Bellona. The wretched creatures were called *fanatici* (from *fano*, a temple), which, though a term of reproach or compassion among the educated, was a title of honour in their own estimation, and proudly engraved on public monuments. See an inscription given by Gruter, 313, 1, 'To Q. Caecilius Apollinaris, fanatic of the temple of Bellona,' and another in 312, 7.

The worship of Bellona was not unlike that of the goddess Ma, in the sacred cities of Cappadocia and Pontus called by the common name of Comana; and hence the Roman writers often use the title of Bellona when speaking of the Cappadocian goddess. Strabo in the same way calls her Enyo.

The earliest orthography of the name of the Roman goddess was Duellona, agreeing with *duellum*, the older form of *bellum*. [See article B, for the interchange of *du* before a vowel with *b*.]

BELLOWS. This term is applied not only to the common instrument in use, but to any machine which serves to force a current of air against a fire. The principle of all these different adaptations of parts is the same, and is very similar to that of a forcing pump. By one motion a vacuum would be made, if it were not for a valve which opens towards the incipient vacuum, and admits the air: by a contrary motion the air just admitted is expelled, not by the valve which is now closed, but by any other orifice.

When a furnace is to be supplied with a perpetual blast of air, it may have two separate bellows, worked by the same machinery, in such a way that one is discharging air while the other is receiving a new supply. The inconvenience of this construction is, that the blast, though perpetual, is not of uniform strength. The blast-furnaces of Merthyr, in Wales, are worked by one huge air-pump, which condenses the air in spherical reservoirs, out of which the blast-pipes lead to the furnaces. In cases where a uniform and gentle blast is required, as in the organ, the air is condensed into a reservoir called the wind-chest, which supplies the pipes. [See ORGAN.] A patent has lately been obtained for a construction by which a perpetual and uniform blast is produced, and instruments for domestic use are manufactured. It consists in a vaned wheel, which is enclosed in a vessel communicating with a tube, the vessel and tube being, in their longitudinal section, in form like that of a retort. A supply of air is obtained by holes in the side of the vessel, so that, on turning the vane by an exterior apparatus, the air is driven through the tube, and the blast thus created is permanently supplied by the lateral holes. These instruments are very cheap, and more effective than the bellows in common use.

The oldest representation of bellows is in the Egyptian paintings copied in the work of Rosellini, now (1835) in course of publication. (See M. C. Pl. L.) There are two pair of bellows, one on each side of the fire, with which they are connected by long tubes of wood or cane, terminating in pointed metal snouts. A string is attached to each bellows, and the blower takes one string in his right hand and the other in his left. He presses with one foot on the bellows that is filled with air, at the same time raising his other foot from that which is just exhausted, and also pulling upwards with the string that is attached to it.

BELLU'NO, a town in the Lombardo-Venetian kingdom, and the chief place of the province of the same name, which forms the most northern part of Austrian Italy, being divided from Carinthia by the Noric Alps. In the time of the Venetian republic, the district called 'il Bellunese' was circumscribed within narrower limits than the present province of Belluno, which includes the territories of Feltre and Cadore. The province of Belluno is bounded by the Tyrol on the west, Friuli on the east, Carinthia on the north, and the province of Treviso on the south. It is watered in its length from N. to S. by the river Piave. The population of the province amounts to 122,000. (Serristori, *Saggio Statistico dell' Italia.*) The country is mountainous, and affords good pastures. Cattle, and the produce of the dairy, timber, which is cut from the mountain forests and floated down the Piave to Venice; and copper from the mines of Agordo, constitute the chief wealth of the country. The vine and other fruit-trees thrive on the lower hills about the valley of the Piave. The country abounds with game. An account of the copper-mines of Agordo, and the works connected with them, has been published by Corniani degli Algarotti (*Dello Stabilimento delle Miniere e relative Fabbriche del Distretto d' Agordo*, 8vo. Venezia, 1823). The towns of the province are Belluno, Feltre, and Cadore. The town of Belluno is built on a hill, near the right or western bank of the Piave, in 46° 10′ N. lat., and 12° 20′ E. long., and 55 miles N.N.E. of Padua. It is a bishop's see, and is the residence of the delegate or governor of the province. Its population is about 8000. The cathedral was built after Palladio's design. The palace of the government is a handsome structure; and the town is adorned with several marble fountains. It has a gymnasium, and an 'Instituto d'Educazione,' or higher school for the education of females, besides elementary schools for the children of both sexes. Perrin Victor, one of Napoleon's generals, Marshal of France, and Duke of Belluno, took his title from this place.

BELON, PIERRE, one of the fathers of natural history on the revival of letters, was born at a hamlet in a parish of the French province of Maine, somewhere about the year 1518. Deservedly great as is the fame which he acquired, nothing seems to be known concerning his family, which is generally considered not to have been of note. Medicine and botany were his studies at a very early period of his life; and the bishops of Mans and of Clermont, and afterwards the cardinals of Tournon and of Lorraine, were his patrons. To their fostering care he owed his education, the means of travelling, and the opportunities of publishing the observations which he so well knew how to make.

He visited Germany, Bohemia, Italy, Greece, Egypt, Palestine, and Asia Minor, and appeared in Paris, after three years of absence, in 1550, with a fine and extensive collection, which he arranged: he then proceeded to publish his works.

In 1557 he traversed Italy, Savoy, Dauphiné, and Auvergne. In 1564, when he was about forty-five years old, he was cut off in the midst of his useful career by the arm of an assassin, as he was returning to Paris. The Bois de Boulogne was the scene of this murder.

It would be out of place in a work of this description to give a catalogue of his various and excellent publications. The sciences of botany, zoology, geography, and antiquity, were all enriched by his labours.

Henry II. and Charles IX. of France reflected honour on themselves by the esteem which they showed for this celebrated man, who was far in advance of the age in which he lived. [See BIRDS.]

BELOOCHISTAN, or the country of the Belooches, extends along the coast of the Indian Ocean from the river Indus nearly to the straits of Ormuz, beginning on the east with Cape Monze or Ras Mooaree, and terminating with Cape Jask on the west. In the interior it extends farther east and west, so that its extreme boundaries are 57° 50′ and 69° 10′ E. long., and 24° 50′ and 30° 40′ N. lat. Its average length may be 600 and breadth 300 miles, which will give an area of 180,000 square miles, or about the surface of the British island and one-half more.

This country was formerly considered as constituting part of Persia and afterwards as belonging to Afghanistan; but it has lately been ascertained that its dependence on Caubul is merely nominal, and it is now considered as a separate country.

The countries bordering it on the east, and lying on both sides of the lower course of the Indus, are under the dominion of a Beloochee family, and on that account often included in Beloochistan; but we shall treat of these districts in the article SINDE.

The central parts of Iran (Persia) are occupied by extensive deserts, which extend from S.E. to N.W. upwards of 600 miles, and in breadth in some places from 400 to 500. These deserts are inclosed on all sides by a wide border of mountain-tracts. Beloochistan forms the most southern part of this border, and separates the deserts from the Indian Ocean. A considerable part of the deserts is included in its boundary, and is called the desert of Beloochistan.

The desert forms its northern boundary, except at its north-eastern corner, where an elevated mountain-region joins the numerous ranges inhabited by the Cawkers, a savage nation subject to Afghanistan. This mountain-region, extending southward and terminating in a single range on the shores of the Indian Ocean, divides Beloochistan from Sinde; but a considerable tract, lying on the declivity and at the foot of the mountains, is under the dominion of the Khan of Kelat, and forms the province of Kutch Gundava. The western boundary of Beloochistan is likewise formed by mountain-ranges, which begin on the coast with Cape Jask and Cape Bombarack or Ras Kerazee, at the latter of which the straits of Ormuz commence, and stretch northward to the desert, where they terminate with the Surhud Mountains, which divide the Persian provinces of Mogistan and Kerman from Beloochistan.

The Hala Mountains, which begin at Ras Mooaree and rise abruptly to a conspicuous height, run for about a hundred miles N.E., and form in this space one single chain with a few short lateral ones, which extend in breadth from thirty to forty miles, and separate the plains on the Indus from those of the province of Lus. Near 26° N. lat. the principal chain begins to run due north, and continues thus to the most northern extremity of the country. At the same place (26° N.) a high lateral chain branches off to the N.W., in which direction it continues for upwards of 200 miles, declining afterwards gradually to the N. and N.E. till it terminates nearly at the most northern point of Beloochistan with the Ajrum range. At a short distance from the Ajrum range the Tukkatoo Mountains begin, and running east, soon join the Hala range, which is here called the Umbar Mountains.

The extensive tract enclosed by these ranges is an upland country and comprehends the provinces of Jhalawan and Sarawan, with the intervening district of Kelat, and the two districts of Mustoong and Shawl, which form the most northern angle of Beloochistan. This upland country extends nearly 200 miles in breadth in 28° N. lat., but it grows somewhat narrower to the north and south of this parallel; but even at the most northern extremity it may be a hundred miles across.

Where this upland country is widest, that is, in the parallel of Kelat and about fifty miles to the north and south of it, the whole surface is covered with a succession of high mountains and narrow valleys, with only small levels between them. The highest part of this mountain-tract is about Kelat, where the elevation of the whole country may be not much less than 8000 feet above the level of the sea. To the south, as well as to the north of it, are some plains of considerable extent, which, like a succession of terraces, seem to decrease in elevation as they recede from the central mass. Such plains on the south are those of Soherab (from thirty to forty miles in length and from ten to twenty in breadth), Khozdar, and Wudd, and on the north the Desht be Doulut (the desert without riches) and the plain of Quetta. These plains are generally divided from one another by ridges twenty miles and upwards in breadth. That part of the province of Sarawan which is to the west of the mountains and borders on the desert has a large portion of level ground stretching out in extensive plains.

The climate in the higher parts of this upland country resembles that of the northern countries of Europe, and has four seasons. Snow falls from October to the end of February; and from the close of the month of November to the beginning of February the whole country, even the valleys, are covered with it; at the same time the frost is very intense and commonly attended with north-eastern winds. The winter is followed by a good deal of rain in February or March, and then comes the dry season, which lasts to September. September and October are showery, and so is the whole cold season, except during frosty weather, when the air is keen and bracing. The heat is never unpleasant, unless it may be a few days at the close of the summer, and in the country bordering on the great desert.

The mountains consist of hard black or grey rocks, and the earth in the plains and valleys is mixed with such a profusion of pebbles and stones, that there is often not the slightest appearance of mould; yet in some places the crops of wheat, barley, and jawaree (*holcus sorghum*), are plentiful, and other places afford excellent pasture for sheep and cattle. Wheat is sown in August and September and reaped the June following. Rice is only planted in the low valleys, where there is a supply of water to keep it flooded, which is only practicable in the southern districts. In the northern districts there is not a single stream which is above the rank of a rivulet, unless when swollen by heavy rains or the melting of snow.

Kelat or Kelaut-e-Nausseer is the residence of a khan, whose dominion extends over a country larger than England. This town is enclosed with a wall of mud, and stands partly on the declivity of a hill, on which the palace of the khan is built. It contains 3750 houses and about 20,000 inhabitants.

Among the smaller towns are Sarawan, with 500 houses, and Kharan, which is somewhat larger, in the province of Sarawan, and Zuhuree in Jhalawan, with from 2000 to 3000 houses. In the district of Shawl is Quetta or Kwotta, with 400 houses, a place of some trade.

At the northern extremity of the upland country which we have here described, the plains of Iran approach nearer to those on the Indus than at any other place, and as a smaller number of mountain-ridges here opposes the progress of the traveller, this district has been chosen for the common line of communication between the high plains of Iran and those on the Lower Indus. Two passes are already known, each of which begins at the town of Quetta in Shawl. One traverses the Hala Mountains in a southern direction and leads to the town of Dadur in Kutch Gundava. This pass, running through the Vale of Bolan, has received the name of the Pass of Bolan. The other road passes from Quetta south-west to Mustoong, thence south to Kelat, and from Kelat in a south-eastern direction to Gundava, the capital of the province of Kutch Gundava. The latter pass is practicable for loaded camels.

The province of Kutch Gundava forms a striking contrast with the upland country. It extends on the eastern side of the Hala Mountains, and belongs, properly speaking, to the plains on the Indus; but it does not extend to the bank of that river, being separated from it by a desert tract. Its length from north to south is about 120 miles, but the habitable and fertile part of it is little more than sixty miles broad. The southern boundary is formed by a jungle of low trees, which between Saatee and Poonoo runs east and west, and extends southward to the Indus, whose banks it fringes.

The whole of this province consists of a plain of arid white soil, the crusted surface of which, in dry weather, is cracked like the dried bed of a marsh. It would be unfit for cultivation but for the rivers, which in the rainy season inundate a large portion of the plain, and whose water is brought by canals and embankments to the places which lie farther off, and reserved to fertilize the country in the dry season. The two most considerable rivers are the Naree and the Kauhee, both of which issue from the mountains where the Tukkatoo range crosses the Umbar chain and unite nearly in the centre of the plain. Its course hence is southerly to Cunda, where the river goes off to the west, nearer the mountains, and loses itself in the sand and impenetrable jungle. According to some, the Naree reaches the sea. (Conolly.) This river has an immense quantity of water when heavy rains prevail or the snow on the mountains melts, but it is often almost dry for months at a time.

This plain partakes of the climate of the intertropical countries, the year being divided between the dry and the rainy season. The latter lasts during the south-west monsoon (from July to September), and the dry season occupies the remainder of the year. The winters are very mild, but the heat of the summer is oppressive. In the latter season the Badé Sumoom or pestilential wind blows frequently, and many people lose their lives by it. Kutch Gundava is a grain country, and many sorts are cultivated to a great extent, more especially jawaree, bajree (*holcus spicatus*), and wheat, besides cotton, indigo, and til (*sesamum*). The villages in this fine plain are very numerous, and are increasing every year. Gundava, the capital, is not so large as Kelat, but is better built, and probably contains about 20,000 inhabitants. The other considerable places are Dander, Bhag, and Lheree, of which Dadur contains 400 houses and Bhag or Baugh 2000.

The province Lus, which extends along the shore of the Indian Ocean, between the sea and the upland region, is a plain perfectly flat, and in general barren, except on the banks of the rivers, where it produces abundant crops of grain, sugar-canes, &c. The remainder is partly covered with sand and partly bare and stony, or diversified with thick jungle. Along the sea-coast a salt marsh extends twelve or fifteen miles inland, which is diversified with tamarisk and other jungle, and in many places perfectly white with salt. To the north of Bela the country is undulating, and, towards the mountains, hilly.

This plain is separated from Sinde by the Hala Mountains, and by another chain from Mukran. This latter branches off from the upland region to the north of 26° N. lat., and runs in a south-western and southern direction to Ras Kutcherie, where it terminates on the shores of the bay of Sonmeany. On this chain a Hindoo pagoda, called Hinglatz, stands, from which it receives the name of Hinglatz Mountains. Two passes lead over this range, one at the temple, called the Hinglatz Pass, and the other farther to the north near Bela, called Bela Pass. Two passes likewise traverse the Hala Mountains, one not far from the coast leads to Kurachee, and the other farther to the north to Hyderabad. There is one pass to the upland, which is called Kohun Wat, or 'the mountain road.'

The whole coast of this province lies on the bay of Sonmeany, which is formed on the east by Ras Mooaree and Chilney Island, the Bibacta of Nearchus, and on the west by Cape Arubah, or Oremarsah in Mukran. It is a large sheet of water, said to be free from rocks or shoals, and contains a good port, named by Nearchus Port Alexander. This bay receives the river Poorally, the Arabis of Nearchus, which rises north-east of Bela, runs along the base of the Jhalawan Mountains, and afterwards turns to the south, in which direction it traverses the plain and reaches the sea about two miles S.W. of the village of Sonmeany. At Lyaree, twenty miles N.N.E. of Sonmeany, it becomes navigable for small boats. At Bela it is only from fifteen to twenty yards wide, and a foot or two deep in the dry season, but during the rains it is a quarter of a mile across and unfordable. The bar at the mouth of the river has only two fathoms of water on it at low water, but near the village of Sonmeany the river is from six to seven fathoms deep. Bela, on the northern bank of the Poorally, has 2000 houses, and in its vicinity the sugar-cane is much cultivated. Lyaree has between 1600 and 1800 houses.

The countries which we have described are under the immediate or mediate sway of the khan of Kelat, and pay him obedience. In the remainder of Beloochistan his authority is only nominal.

The province of Meckran, or Mukran, called Gedrosia by the antient geographers, extends from the western boundary of Lus and Jhalawan, to the borders of Persia, and from the shores of the sea to the desert of Beloochistan. It is divided from this desert by a range of mountains, called the Wushutee, or Much Mountains, which run E. and W., and on the east are connected with the mountains of Jhalawan, on the west decline to the N.W. and join the mountain-region of Kohistan. Another range of mountains runs nearly parallel with the Wushutee Mountains, at a distance of from twenty to fifty miles from the sea, being on the east connected with the Hinglatz range, and on the west with the mountain-region called Bushkurd. None of these ranges seems to attain any great height. The southern range divides Mukran into two parts, the upland and coast, but both are very little known.

The upland of Mukran seems to consist of a succession of plains, divided from one another by ridges of hills or mountains, which, commonly running N. and S., connect the two mountain-ranges which form its boundary. The soil of these plains generally consists of bare rock, and large tracts, according to Arrian, are covered by sand. (*Anab. Alex.* vi. 24, &c.) It is observed, that whenever these plains exceed ten or twelve miles in width, they are found to be little better than complete deserts, except at the immediate base of the hills which bound them, where they are cultivated. Most of these plains, however, do not seem to be at a great elevation above the level of the sea, because nearly in all of them the date-palm grows, and produces such excellent fruit, that Mukran is noted for it. The best are those of the valley of Punjgoor, situated nearly in the centre of the province.

The sea-coast consists of flat bare plains, very little elevated above high water-mark, which contain many salt-marshes, and extend to the base of the nearest mountains. They frequently show no trace of vegetation: Nearchus says (*Indike*, chap. 26) that the sheep which were supplied by the natives to the ships of Alexander had a fishy taste from being fed on fish, there being no grass in the country. The wretched mode of life of the inhabitants of this coast, to whom the Greeks gave the general name of Ichthyophagi, or Fish-eaters, is described by Nearchus (chap. 29).

The climate of Mukran and of Lus approaches to that of the intertropical countries: both provinces have four seasons, two wet, one hot and one cold. The first wet season begins in February or March, and lasts only two or three weeks; the wind blows from N.W. The second wet season comes on with the south-west monsoon, and continues through June, July, and August. These wet seasons are particularly favourable to the growth of grass, and change many tracts into pasture ground. The hot season begins after the rain in spring, and continues till October, those months excepted in which the south-west monsoon blows. The heat is sometimes so excessive, as to prevent even the natives from venturing abroad during the days called the Khoorma Puz, or 'date ripening,' which takes place in August. The cold season lasts from December to February, but even then the air is warmer than at any time in the upper parts of Jhalawan and Sarawan. During the hot season the winds blow continually from the sea inland, and though they are seldom known to be fatal to animal life, they destroy vegetation.

No part of Beloochistan suffers more from scarcity of water than Mukran, except the desert. Owing to the comparatively small elevation of the mountains, the hard nature of the rocks of which they consist, their bareness of vegetation, and the stony and sandy surface of the plains, the abundant rain which descends is not absorbed, and no permanent streams are formed. During the rain the water-courses are changed in a few hours into rapid torrents, frequently several miles wide, but a few days afterwards they dwindle down to insignificant brooks, and in the dry season they entirely cease to flow, and water is found only in a few places in their beds. These beds are usually overgrown with thick and impervious jungle, which supply food for camels and goats, and harbour many different descriptions of wild beasts.

The river Suduck forms a small harbour at its mouth, a mile from which is the village Pusunee, a place of some trade.

The river Dust, or Dustee Nuddee, or Bhugwur, is a small river at its mouth, but it is supposed that it runs a distance of six or seven degrees of latitude in a direct line to the coast, and that the water from its northern extremity traverses little less than a thousand miles. It seems to be the same river, which, under the name of Boodoor, traverses the desert of Beloochistan, and in Sarawan is called Bale.

Kedge, which is considered the principal town of Mukran, is a little place on the Dust river, with a small fortress on a high rock.

At the western extremity of Mukran stands an extensive mass of mountain-ridges, which seem to rise to a considerable elevation, and to enclose high and cold valleys. They are not fit for agriculture, and are inhabited only by herdsmen. This mountain-district is called Bushkurd.

The mountains of Kohistan, which occupy the northern corner of Beloochistan, are connected with those of Bushkurd by a range, which attains a considerable height and divides the plain of Mukran (more especially that of Kussurkund, which is twenty-five miles long and nearly as broad), from that of Lushar and Bunpoor, which form the plain (or Mygadee) of Kohistan. These plains are similar to those of Mukran, and produce dates in abundance. The sandy desert of Bunpoor, which extends westward, divides these plains and the mountains of Bushkurd from the Persian province of Kirman.

The northern half of the province of Kohistan and the contiguous districts of Mukran constitute another mountain-system, called the Surhud Mountains (or cold mountains), on account of their elevation. Between 29° and 30° N. lat., they are visible at the distance of eighty or ninety miles. Their declivities and lateral branches towards the desert of Beloochistan are covered with trees, and contain many fertile districts and valleys, with a black loamy soil; and even some of the loftiest mountains have fine earth to their very summits. But the western declivities and branches are commonly nothing but a black rock destitute of verdure. These mountains are rich in mineral productions. There are several brooks of brine, and some pools of water are covered with a scum similar to naphtha. Iron, copper, and other metals are plentiful, and worked enough to supply the consumption of the inhabitants. Sal-ammoniac is the native product of a mountain called Koh i-Noushadir (or the hill of sal-ammoniac), and found in the fissures of the rock. Brimstone is plentiful.

The climate of this mountain-tract resembles in some measure that of Sarawan and Jhalawan, but is much milder. It partakes of the rains of the south-west monsoon, but these rains, which in Mukran are always regular, are here often partial, and at other times so heavy as to destroy the crops; in either case they are followed by a famine. The Kohukee, or hilly part of Kohistan, contains no place of note. In the Mydanee or plain, the town of Puhra, which contains 400 houses, is the largest.

The desert of Beloochistan extends to the north of the Wushutee range, between the provinces of Sarawan and Kohistan, and measures, E. and W., about 200 miles. No northern boundary can be assigned to it, since it continues northward to the banks of the Hilmend river, where it is called the desert of Sejestan. Nearly in the middle it is traversed from N. to S. by a river called Boodoor, which flows southward towards the coast, and on both sides of it the desert presents a different aspect. On the east the surface is covered by a very light and red sand. This sand is thrown by the wind into an irregular mass of waves running principally E. and W., and varying in height from ten to twenty feet. Most of these waves rise perpendicularly on the opposite side to that on which the prevailing wind blows, and when seen from a distance they resemble a new brick wall. The side facing the wind slopes off with a gradual declivity to the base of the next windward wave, or near to it, and a hollow or path is thus formed between the waves. It is difficult, and in some cases impossible, to ascend the leeward or perpendicular face, even for camels Only two plants have been observed growing on this sand. To the west of the river Boodoor the surface is covered with a hard black gravel, on which no trace of verdure is seen; nor even the most trifling irregularity in the surface. The bed of the river is covered with a thick jungle of different kinds of trees and brushwood, the haunt of wolves, jackals, and other wild animals. The sultry air on this desert is frequently refreshed by tornados, accompanied by torrents of rain, which fall in extremely large drops, but are immediately absorbed. Without these tornados it would be impossible to pass through the desert at any season; and from June to September it cannot be traversed, notwithstanding the prevalence of these gusts, for in this season the winds are so scorching and destructive as to kill both animals and vegetables. They are called *Julot* or *Julo*, 'the flame,' or Badé Sumoom, 'the pestilential wind.' This description reminds us of the difficulties experienced by the army of Alexander in traversing the sandy deserts of Gedrosia. (Arrian, vi. 23, &c.)

It is difficult to guess what portion of Beloochistan is available for agricultural purposes: it is however certain that not one-hundredth part is actually under cultivation. The districts fit for pasture are much more extensive, but both together do not probably amount to one-tenth of the whole surface, even if the desert is not taken into the account. Yet the inhabitants display ingenuity and industry in some branches of agriculture.

All kinds of grain known in India are cultivated in Beloochistan, as rice, wheat, barley, bajree (*holcus spicatus*), jawaree, moong (*phaseolus mungo*), maize or Indian corn, dal (vetch), mutter (a kind of pea), til (*sesamum*), and chunna (*cicer arietinum*). Rice will not grow in Gundava.

About Kelat a great variety of vegetables are cultivated, turnips, carrots, cabbages, lettuces, cauliflowers, peas, beans, radishes, onions, celery, parsley, garlic, egg-fruit, cucumbers. Madder is cultivated with great care in the districts north and east of Kelat, cotton in great abundance in Kutch Gundava, and indigo in different places. The sugar-cane grows chiefly on the plains of Luss.

The upland country about Kelat abounds in all fruits grown in the countries of Europe, as apricots, peaches, grapes of various kinds, almonds, apples, pears, plums, currants and cherries, figs, pomegranates, mulberries, melons, to which pistachio-nuts, plantains, and guaivas are to be added. The water-melons attain such a size, that one man is unable to raise them. The almonds are excellent in the northern districts of Shawl and Moostoong. The lower countries have other kinds of fruits, especially the date, which is cultivated with great care in Mukran, where it is considered as the best gift of heaven; the value of these trees is much enhanced by their thriving best in a gravelly and barren soil.

The numerous herds of cattle require much fodder, and the culture of artificial grass is not neglected. It does not, however, extend farther than to the culture of oushpoosh, or camel grass, a peculiar kind of clover, which grows with a stalk a foot or two high, and has leaves like shamrock.

The sides of some mountains are covered with trees, and they are also found in the jungle, which generally covers the wide bed of the rivers. The best timber is produced by hetupoors (a species of *Zizyphus Jujuba*) and the tamarind trees. The former resemble teak, and are very hard. Most of the trees of this country are not known in Europe, and many of our trees, as the oak, ash, fir, &c. are unknown there.

The domestic animals consist of horses, mules, asses, camels, dromedaries, buffaloes, sheep, goats, dogs, and cats. The horses are strong, well boned, and large, especially to the south of Kelat, and in Kutch Gundava; in Luss and Mukran they are small, and deficient in spirit. Sheep are mostly of the flat-tailed kind. Among the domestic animals the camel and dromedary are most highly prized, especially the dromedaries, on account of their fitness for the long and remote marauding expeditions to which the inhabitants are so prone. Camels are not found in the lowland countries.

Of wild animals there are lions, tigers, leopards, hyenas, wolves, jackals, tiger-cats, wild dogs, foxes, hares, mongooses, mountain-goats, antelopes, elks, red and moose deer, wild asses, &c. The wild-dogs are numerous and ferocious. They frequently hunt in packs of twenty or thirty, and will seize a bullock and kill him in a few minutes; but being timid, they keep in the most impenetrable jungles. Lions and tigers are rare. The hyena alone attacks man, but only when urged by severe hunger, or when irritated.

Of domestic birds only fowls and pigeons occur: there are no geese, turkeys, or ducks. Of wild birds almost every kind known in Europe and India is met with, and the bustards, jungle-fowls, and black partridges are very numerous. Hawking is a favourite pastime with some of the chiefs in the western districts, and they pay great attention to the instruction of their birds.

In some of the larger rivers, especially in the Poorally, fish are plentiful at some places: and the few inhabitants of the sea-coast gain their chief subsistence by fishing: but it does not seem that fish are abundant along the shore.

Gold and silver are found in Jhalawan, in the mines near the town of Nal, not far from Khozdur, where these metals have been discovered in working for iron and lead. They are not, however, extracted from the ore at the place, but are sent in their native state to the Punjaub. Lead, iron, copper, tin, antimony, brimstone, alum, and many kinds of mineral salts and saltpetre, occur in various places. Saltpetre is dug up in some places in a native state, but at Kelat is extracted from the earth, and is preferred to that which is found pure. Rock-salt is very common in Kohistan.

As many parts of Beloochistan have never been visited by observing travellers, we are very imperfectly acquainted with the races of men that inhabit this extensive country. We know only those which live in the eastern and northern districts, the Belooches and the Brahooes, who differ considerably in their figure and language, and partly also in manners and character.

The Belooches are a tall, active race of men, not possessing great physical strength, but adapted and inured to changes of climate and season, and accustomed to undergo every species of fatigue. They have a long face and prominent features, a dark complexion, and black hair. The Brahooes are short and strong-boned; their faces are round, and their lineaments flat: numbers of them have brown hair and beards. Their external appearance reminds us of the Mongol race. In activity, strength, and hardiness, few people surpass them; and they are both inured to the cold of the mountainous regions of Beloochistan and the hot plains of Kutch Gundava.

The Beloochee language partakes considerably of the idiom of modern Persia, and at least one-half of the words are borrowed from that language, but greatly disguised under a corrupt pronunciation. Lieutenant Pottinger, after travelling for some time among them, was enabled, by his knowledge of the Persian language, to understand almost every sentence spoken by the Belooches in their own tongue. The language of the Brahooes is quite different from the Persian; but it contains a great number of Hindoostanee words, and strongly resembles as to sound the Punjaubee, or the dialect spoken in the Punjaub.

The Belooches are subdivided into three principal tribes, the Nharooes, Rhinds, and Mughsees, of which the first are the most distinguished. They inhabit the mountains of Kohistan exclusively, and are settled in considerable numbers in the eastern upland country to the north and south of Kelat. The other two tribes have settled in Kutch Gundava, where they are incorporated with the Juths, or cultivators of the soil. The Belooches, but especially the Nharooes, consider private theft dishonourable and disgraceful, but the plunder and devastation of a country are viewed as highly honourable actions; and accordingly they are much addicted to predatory incursions, which they execute with surprising activity and quickness. Their manners are pastoral. They usually reside in ghedans or tents, made of black felt or coarse blanket, stretched over a frame of wickerwork. An assemblage of such ghedans is called a toomun, or village, and its inhabitants constitute a kheil, or society. Like all other pastoral nations, they are hospitable, indolent, and fond of hunting. Unless occupied by some favourite amusement, they will spend whole days in lounging from one ghedan to another, smoking and gambling. They have commonly two wives, and sometimes more. They treat their women with attention and respect, and are not so scrupulous about their being seen by strangers as most Mohammedans, although they by no means allow them to appear in public at all times. They are avaricious, revengeful, and cruel.

The Brahooes, who principally inhabit the province of Jhalawan, and are also dispersed towards the north as far as the desert, are a still more unsettled wandering nation, always residing in one part of the country during the summer, and emigrating to another during the winter season: they likewise change their immediate places of abode many times every year in quest of pasturage for their flocks, a practice which is rare among the Belooches. But many of them are husbandmen, and laborious hard-workers. On the plains to the south of Kelat they till large tracts of land, and sell grain, cheese, and ghee, with a few coarse blankets, carpets, and felts. They are not less hospitable, nor less faithful in adhering to their promises, than the Belooches; but they are more quiet and industrious; less inclined to rapine and violence, though at least equal in bravery; and their manners are mild and inoffensive, though uncivilized and uncouth. They are grateful and faithful, and exempt from revenge, cruelty, and avarice. The task of the family is divided among both sexes, nearly as in most countries in Europe. The men tend the flocks and till the ground: the women are occupied in milking, making butter, cheese, and ghee, and working carpets, felts, and coarse white cloth. Both sexes mingle more together than is usual in the countries of western Asia. Both nations are Soonee Musulmans, and consequently many of their usages are regulated according to the precepts of the Koran.

The Dewars and Juths live dispersed among these two nations, the former about Kelat, the latter in Kutch Gundava. The Dewars, or Dehkans (*i. e.* the villagers), are agriculturists, and do not migrate. They speak the common pure Persian. In stature they are below the middle size, with blunt features, high cheek-bones, and full cheeks. They are quiet and harmless in their disposition, and civil and obliging to strangers, but not given to hospitality.

The Juths, who form the great bulk of the population of Kutch Gundava, show, by their manners, appearance, and customs, that they are descended from the aboriginal Hindoos. The Juths, like the Dewars, have been converted to the Mohammedan faith.

The inhabitants of Luss speak a language similar to that of Sinde, and strongly resemble the Hindoos, especially in their apathy and the want of energy in their countenances.

The inhabitants of the sea-coast of Mukran are a puny and delicate race, when compared with the Belooches and Brahooes. Their blacker complexion may probably be attributed to their frequent intermarriages with the Arabs of the opposite coast. In the interior of Mukran some pastoral tribes wander about, but we hardly know anything of them, as well as of the pastoral inhabitants of Bushkurd. In the towns and places of commerce a great number of Hindoos are settled as merchants, and they are commonly the wealthiest inhabitants.

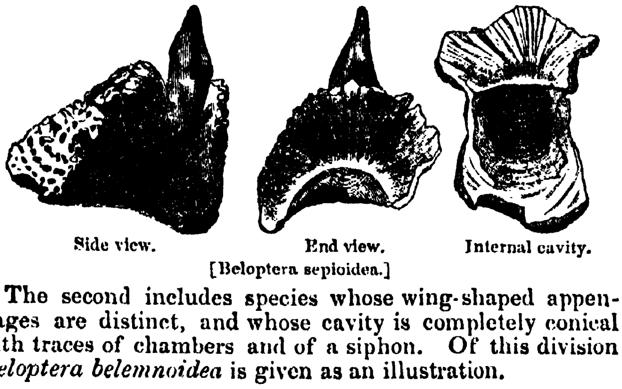
The commerce of Beloochistan is not of much importance. It exports grain from Kutch Gundava and Luss, dates from Mukran, and horses from Kelat and Gundava. The imports consist principally of some metals, spices, and manufactured goods of silk and cotton; to which salt from Moultan may be added.

The government of Kelat is despotic, but limited by a feudal system. The sirdars or chiefs of the tribes are bound to furnish their quota of soldiers, and to attend the court. They are partly hereditary, and partly chosen by the tribes themselves. In the western districts the authority of the khan is only nominal; and government is in the hands of the sirdars, who are commonly chosen by the people, but do not enjoy extensive authority. The tribes here are, properly speaking, a number of petty republics, in which every member feels that he has a right of revenging his own wrongs, and of giving his vote on all matters of public interest. (Pottinger, *Travels in Beloochistan and Sinde;* Conolly's *Journey to the North of India,* &c.; Burnes's *Travels to Bokhara; Map of Central Asia,* by Arrowsmith.)

BELOPOL or BYELO-POLYE, the capital of a circle in the province of Charkoff, in European Russia, at the confluence of the Vira and Kriga, tributaries of the Seim; it is of modern date and surrounded by a rampart of earth and a moat. It contains eight churches of wood, nearly 800 houses, besides forty-six wooden storehouses, had in 1783 a population of 9050 souls, mostly of the agricultural class, which has now increased to about 10,000: it has extensive distilleries of brandy, and has yearly markets, but it is not a place of much trade or of any note for operative industry. It is about 140 miles (212 versts according to Georgi) to the N.W. of Charkoff, in 51° 5′ N. lat., and 34° 35′ E. long.

BELO'PTERA, in zoology, a fossil genus established by Deshayes and described by Blainville as an animal entirely unknown, containing in the back part of its muscular envelope a symmetrical calcareous or bony shell, formed of a thick solid summit very much loaded behind, and a front tube more or less complete, the cavity of which is conical and annular, the shell or bone having wing-shaped appendages without any anterior shield-like prolongation.

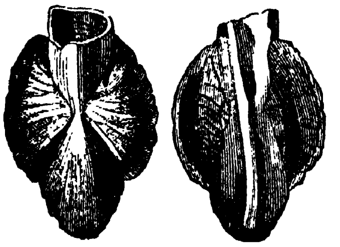
De Blainville divides the genus into two sections. The first consists of species whose wing-shaped appendages are united below the summit, and whose cavity is somewhat in the shape of a scuttle (*hotte*); of this section *Beloptera sepioidea* is given as an example.



Side view. End view. Internal cavity.

[Beloptera sepioidea.]

The second includes species whose wing-shaped appendages are distinct, and whose cavity is completely conical with traces of chambers and of a siphon. Of this division *Beloptera belemnoidea* is given as an illustration.



[Beloptera belemnoidea.]

De Blainville observes that this genus ought to be placed at the end of the *sepiacea* or *cuttles;* and that the first of the species is evidently very much allied to the bones of those animals, while the second approaches the *belemnites.*

After all, the probability is, that these bodies are only portions of the bones of some of the cuttle-fishes; and this appears to have been the opinion of Cuvier.

If a perfect bone of the common species of our coasts be closely examined, a structure very analogous to the conical circularly-grooved cavity of *Beloptera,* although in a more expanded form, will be observed. These fossils have been found in the London clay, and other beds above the chalk.

Voltz, in his memoir on Belemnites, makes *Beloptera sepioidea* a distinct genus under the name of *Belosæpia.*

BELOSÆPIA. [See BELOPTERA.]

BELSHAM, THOMAS, a dissenting minister of the Unitarian persuasion, was born at Bedford, April 15, 1750, O.S. On his mother's side he was descended from the Earl of Anglesey: his father, the Rev. James Belsham, was a man of classical attainments. Two of his Latin poems, *Mors Triumphans* and *Canadia,* have been praised by competent judges. This gentleman, intending to bring up his son Thomas to his own profession, placed him under the care of eminent schoolmasters until he was of an age to be sent to the Dissenting Academy at Daventry, then under the superintendence of Dr. Ashworth, where he was a student for five years. By the time his studies were completed, his talents and acquirements attracted such notice that he was appointed assistant tutor, an office which he continued to fill for seven years. Being then desirous of entering upon the duties of his profession, he spent three years, in connexion with a congregation of Protestant Dissenters, at Worcester, where he was greatly esteemed for his learning and urbanity, and was so much attached to the society of the place, that he yielded with reluctance to the importunity of his friends who were desirous of placing him at the head of the academy at Daventry. He returned to this place in 1781, in the capacity of theological tutor and head of the institution, which situation he held till 1789. In addition to the labours which devolved upon him in the institution, he became the minister of the Society of Protestant Dissenters in the town, and in both capacities he was so eminently successful, that he might probably have continued in them during the remainder of his life, but for a change which took place in his religious opinions. He had been educated in the doctrines of Calvinism, but having embraced Unitarianism, he relinquished his connexion both with the academy and with his congregation. About this time, a new college being established at Hackney by those Dissenters who were friendly to unrestrained religious inquiry, it was placed under the direction of Mr. Belsham, but, in a few years, it sunk for want of funds to support it. Before this event took place he was chosen to the vacant pulpit of Dr. Priestley, by the Gravel Pit congregation, where he again entered upon those exertions which were most congenial to his tastes. Eleven years afterwards, in 1805, on the death of Dr. Disney, the colleague and successor of Mr. Lindsey, Mr. Belsham removed to Essex Street Chapel, London, of which he continued the pastor during the rest of his life.

From the time that Mr. Belsham avowed his conversion to the doctrines held by the Unitarians, he espoused their cause with great zeal, and advanced it by applying his talents and learning to its defence. One of his earliest publications was *A Review of Mr. Wilberforce's Treatise, entitled A Practical View of the prevailing Religious System of Professed Christians*, &c., 1798, in which it was the writer's design to place the theological doctrines maintained by the amiable and eloquent author of the 'Practical View,' in contrast with those professed by Unitarians. In 1811 he gave to the public the results of his investigations on the most important subject that had ever occupied his mind, in a work entitled *A Calm Inquiry into the Scripture Doctrine concerning the Person of Christ*. His single sermons, on subjects chiefly suggested by public events, would make up several volumes, and his controversial writings are numerous. There is hardly any branch of theology, or of the doctrines or evidences of revelation, on which Mr. Belsham has not published his thoughts. His *Evidences of the Christian Revelation* is a powerfully argumentative and sometimes eloquent work, which had a large sale, and was perhaps the most popular of his performances. His last work, and that, perhaps, on which his reputation must rest, was *A Translation of the Epistles of Paul the Apostle, with an Exposition and Notes*. He had been previously employed on a work of which he is now known to have been the editor,—*The Improved Version of the New Testament*. But Mr. Belsham's literary works were not exclusively theological. In 1801 he published *Elements of the Philosophy of the Human Mind and of Moral Philosophy*. As a follower of Hartley, he resolved all mental phenomena into the association of ideas. His theory of morals supposes the ultimate happiness to harmonize with the greatest general good, and he concludes that 'self-love and benevolence can only be reconciled by religion.' Besides his numerous obituary sermons, he published *Memoirs of the late Rev. Theophilus Lindsey, M.A., including a Brief Analysis of his Works, &c.*, 1812, a piece of biography both interesting and useful. In the same tomb which contains the remains of this venerable pastor rests Mr. Belsham, whose proudest boast it was to be, as he is described on the stone which covers it, 'the friend, associate, and successor of Priestley and Lindsey.'

(See *Memoirs of the late Rev. Thomas Belsham*, by John Williams, 8vo. 1833.)

BELSHAM, WILLIAM, an active writer on politics and history, brother of Thomas Belsham, was born in 1752, and died November 17th, 1827, at Hammersmith. He resided at one period at Bedford, and was intimately acquainted with several of the most celebrated public men belonging to the Whig party, to whose politics he was strongly attached. His literary career commenced in 1789, by the publication of a series of 'Essays, Historical, Political, and Literary,' in 2 vols. 8vo. These were followed by Letters and Essays, published at various periods, on the Test Laws, the French Revolution, the Distinction between the Old and New Whigs, Parliamentary Reform, and the Poor Laws. In 1793 he published, in 2 vols. 8vo., 'Memoirs of the Kings of Great Britain of the House of Brunswick-Lunenberg.' In 1795 he again appeared as an historical writer, by the publication of 'Memoirs of the Reign of George III., to the Session of Parliament ending 1793,' in 4 vols. 8vo. To these were added the 5th and 6th volumes, in 1801. In 1798 he published, in 2 vols. 8vo., a 'History of Great Britain from the Revolution to the Accession of the House of Hanover;' and in 1806 his historical works were published in a uniform edition in twelve 8vo. volumes, under the title of 'History of Great Britain to the Conclusion of the Peace of Amiens in 1802.' He was also the author of the following miscellaneous works. In 1797 'Two Historical Dissertations: 1. On the Means of the Ministerial Secession in 1717. 2. On the Treaty of Hanover, 1725,' being a reply to some animadversions contained in Coxe's Memoirs of Sir Robert Walpole. In 1798 'Two Historical Dissertations on the Silesian War, and on the Character and Conduct of Louis XVI.' In 1800 a 'Reply to Herbert Marsh's Vindication of the History of the Politics of Great Britain and France;' and in 1801 'Remarks on a late publication, styled "The History of the Politics of Great Britain and France."' In 1802 'Remarks on the Peace of Amiens.' He was also the author of a volume on the 'Philosophy of the Mind,' 'Letters to Wilberforce,' and a 'Chronology of the Reigns of George III. and IV.' (Watt's *Bibliotheca Britannica*.)

BELSHAZZAR (בֵּלְשַׁאצַּר or בֵּלְאשַׁצַּר, Βαλτάσαρ) was the last king of Babylon of the Chaldæan dynasty. He is the Nabonnedus of Berosus, Nabenadius of the Canon Ptolemæi, Nabodenus of Alexander Polyhist., Nabonnidochus of Megasthenes Abydenus in Euseb. Chron. Arm., Labynetus of Herodotus, Naboandelus of Josephus. Belshazzar was the son of queen Nitocris. He perished 538 or 539 before Christ, in the seventeenth year of his reign, in the night when Babylon was stormed by Cyrus whilst the attention of the court was engaged by a splendid festival.

According to Berosus, as quoted by Josephus, Belshazzar being defeated in battle against Cyrus, escaped to Borsippa, where he surrendered and was graciously received by Cyrus, who sent him to Carmania, where he lived to the end of his days. But this account of Berosus, who makes various incredible statements, is inconsistent with the testimony of the Bible. Herodotus, who describes the capture of Babylon by Cyrus, says nothing of the death of Belshazzar: the account of Xenophon in his *Cyropædia*, which is not of course considered as historical authority, says that the king was killed, but he does not mention his name.

According to יוסיפון בן גוריון (ed. Breithaupt, p. 26), one of the eunuchs having heard Daniel's interpretation of the MENE MENE TEKEL UPHARSIN, Dan. v. 25, in the following night cut off Belshazzar's head and brought it to Cyrus and Darius, who besieged Babylon. Cyrus adored God, and resolved to restore the Jews to their country and to rebuild the temple at Jerusalem.

(See Dan. chap. v. and vii.: Is. xiii. 14: Comp. Jer. v. 31, 41; Josephi *Ant.* x. 11, 2; Apion. i. 20; Eusebii, *Chron. Armen.* i. p. 45, and pp. 60, 61, 72; Eusebii *Præparatio Evangelica*, ix. 41; Herodotus, i. 77, 188, 191; Xenophon, *Cyropædia*, vii. 5; Bernholdi *Dissertatio in Dan.* v. Altorf. 1740, 4to.; Opferhaus Spicil. *Hist. Chron.* 263, &c.; Usserii *Annales* to the year 3448; Hartmann *Syst. Chron.* 342, seq.; Jahn's Einleitung ii. i. 216; Berthold 4, *Exc. zum Daniel*, pp. 848, 856.)

Marsham took Belshazzar for Evilmerodach. (*Can. Chron.* 597.) Gatterer (*Handbuch der Universalgeschichte*, i. p. 293) took him for Laborosoarchod, the son and successor of Neriglissar. George Syncellus took him for Neriglissar himself. (*Chron.* pp. 223, 230; comp. Cedren. *Hist.* p. 113.

The history of Belshazzar has been a favourite subject for poets and artists: the painting of Belshazzar's Feast by Martin, and the dramas of Milman and Hannah More on this subject, are well known.

The Assyrio-Babylonic name given to Daniel at the court of Nebuchadnezzar was בֵּלְטְשַׁאצַּר, Beltshazzar. (Dan. i. 7, ii. 26, iv. 5, vi. 15, x. 1.) The names of the sovereign and the favourite indicate the esteem in which Bel was held, and mean the *Prince of Bel*, i. e. *Prince whom Bel favours*.

BELSK or **BYELSK**, the chief town of a circle of that name in the province of Bialystok in western Russia, and formerly the capital of the Polish voyvodeship of Podlachia, is a neat, well-built, paved town on the Biala, a small stream which traverses the fertile country that lies around it. It has two Roman Catholic churches and a united Greek and Carmelite monastery; but the population, which is once said to have been 5000, is at present reduced to about 1800 souls, among whom are but few Jews, to whom Belsk has, among other privileges, that of refusing a settlement within its jurisdiction. 52° 40′ N. lat. and 20° 2′ E. long.; about twenty-three miles (thirty-five versts) south of Bialystok.

BELT, which in Danish, as in English, signifies a girdle, is the name given to two of the three straits by which the Baltic Sea is joined to the Cattegat. They are distinguished by the addition of Great and Little.

The *Great Belt*, which is the middle one of the three straits, and the widest outlet for the waters of the Baltic, begins on the south, about 54° 50′ N. lat., between the southern extremity of the island of Langeland and the western shores of Laaland, and terminates on the north between Rees Ness on the island of Zealand, and the southern extremity of Samsoe. Its length may be about seventy miles.

The narrowest part of the strait is at its southern extremity, where it is, properly speaking, divided into two straits by the island of Langeland; for the narrow sea between that island and those of Arröe, Taasing, and Fionia is comprehended under the name of Great Belt, and is hardly more than four miles in breadth. The principal branch between Langeland and Laaland is rather more than eight miles wide. To the north of the northern extremity of Langeland the breadth of the strait varies between sixteen and twenty-four miles.

Except near the shores the depth of the water is considerable, but very irregular, varying from five to twenty-five fathoms. But some small and low islands and many shoals render the navigation difficult and dangerous, and on that account the passage of the Sound is preferred. In the last war, however, English men-of-war commonly passed through the Belt. The merchant-vessels which pass through it are obliged to pay the customary duties at Nyborg or Nyeborg, on the island of Fionia. The shores on both sides of the strait, being low and irregular, form many good harbours and anchorages.

Between Nyborg in Fionia and Corsöer in Zealand, where the strait is only sixteen miles across, a regular communication is established by steam-boats and smacks. In the good season the passage is not difficult; but in the latter part of the autumn and in winter it is difficult and dangerous, especially on account of the pieces of floating ice which in severe weather become very numerous, and are sometimes cemented together by hard frost. It is then sometimes necessary to make one part of the passage in a sledge and the other in a boat. When in such circumstances snow begins to fall, the small island of Sprogöe, which lies in the strait, but considerably nearer to the coast of Fionia than to that of Zealand, offers a place of refuge. The Danish government has erected a building on this island for the reception of travellers.

The *Little Belt*, the most western of the three straits, begins on the south between the islands of Arröe and Alsen, and extends, between the island of Fionia and Jutland, to the Capes called Oger Ness on Fionia, and Bicornsknudde on Jutland. Its length is upwards of eighty miles, but its width varies considerably. Towards the southern extremity, between the islands Arröe and Alsen, it is generally above ten miles across. At Assens, a town of Fionia, it narrows suddenly to about five, and farther north it grows by degrees narrower, so that between the town of Middelfart on Fionia, and the opposite coast at Snoghöe, the distance hardly amounts to three-quarters of a mile. At Fredericia, where the vessels which pass the strait pay the customary duties, the strait is little more than a mile wide.

The depth of the water is considerable, varying from four to twenty-seven fathoms; but the navigation is dangerous, on account of the low islands (Aaröe, Baagöe, and Fanöe), the numerous shoals, and the violent currents which constantly run through the strait from south to north.

The shores of the island of Fionia are low; but on the mainland they rise in a few places, though nowhere to any considerable height. Regular places of passage are between Fredericia and Striib, and Snoghöe and Middelfart.

(Catteau, *Tableau de la Mer Baltique; Gliemann, Geograph. Description of Denmark;* and Pauly's *Topography of Denmark;* Gliemann's *Map*.)

BELTEIN, or **BELTANE**, the name of a kind of festival, formerly and probably still observed in Ireland and Scotland, in most places on the 1st of May. In some parts of the west of Scotland it is observed on St. Peter's day, June 29. In Ireland we find two belteins, one on the 1st of May, the other on the 21st of June. To the beltein, also, in all probability, the fires which were formerly and are perhaps yet lighted in many parts of England on Midsummer Eve, are to be referred.

Beltein signifies the fire of Baal, the worship of whom is supposed to have existed in England, Scotland, and Ireland in the remotest period of druidical superstition. The Phœnician Baal probably denoted the Sun [see Baal], as Ashtaroth did the Moon. Beltein was therefore the fire lighted in honour of the Sun, whose return and visible influence upon the productions of the earth was thus celebrated. *La na Beal tina*, and *neen na Beal tina*, in the Irish language, are the day and eve of Beal's fire. (*Fairy Legends and Traditions of the South of Ireland;* and MacCurtin's *English-Irish Dict.*, 4to. Par. 1732, p. 451.)

The following account of the beltein is given in *Focalóir Gaoidhilge-Sax-Bhéaria*, or an Irish-English Dictionary (by O'Brien), printed at Paris, 4to. 1768: '*Beiltine*, or *béil-tine*, ignis Beli Dei Asiatici: i. e. *tine-Beil*. May-day, so called from large fires which the Druids were used to light on the summits of the highest hills, into which they drove four-footed beasts, using at the same time certain ceremonies to expiate the sins of the people. This pagan ceremony of lighting these fires in honour of the Asiatic god Belus, gave its name to the entire month of May, which is to this day called *mi na Beal-tine* in the Irish language. Dr. Keating, speaking of this fire of Beal, says, that the cattle were driven through it and not sacrificed, and that the chief design of it was to keep off all contagious disorders from them for that year; and he also says, that all the inhabitants of Ireland quenched their fires on that day, and kindled them again out of some part of that fire. The above opinion about the cattle is confirmed by the following words of an old glossary, copied by Mr. Edward Lhuyd: *Da tene soinmech do guitis na drufthe contincet laib moraib foraib agus do berdis na ceatra entra or teomanduib cecha bliadna* the main sense of which is, that the Druids lighted two solemn fires every year, and drove all four-footed beasts through them in order to preserve them from all contagious distempers through the current year.'

In Sir John Sinclair's *Statistical Account of Scotland*, vol. xi. 8vo. Edinb. 1794, p. 620, the minister of Callander in Perthshire, speaking of 'peculiar customs,' says, 'Upon the first day of May, which is called Beltan or Beltein-day, all the boys in a township or hamlet meet in the moors. They cut a table in the green sod, of a round figure, by casting a trench in the ground of such circumference as to hold the whole company. They kindle a fire, and dress a repast of eggs and milk in the consistence of a custard. They knead a cake of oatmeal, which is toasted at the embers against a stone. After the custard is eaten up, they divide the cake into so many portions, as similar as possible to one another in size and shape, as there are persons in the company. They daub one of these portions all over with charcoal, until it be perfectly black. They put all the bits of cake into a bonnet. Every one, blindfold, draws out a portion. He who holds the bonnet is entitled to the last bit. Whoever draws the black bit is the devoted person who is to be sacrificed to Baal, whose favour they mean to implore, in rendering the year productive of the sustenance of man and beast. There is little doubt,' the writer adds, 'of these inhuman sacrifices having been once offered in this country as well as in the East, although they now pass from the act of sacrificing, and only compel the *devoted* person to leap three times through the flames, with which the ceremonies of this festival are closed.'

The minister of Logerait, in Perthshire, gives a similar account (*Ibid.* vol. v. p. 84) of the celebration of the beltein in his parish. He says, 'On the 1st of May, O. S. a festival called Beltan is annually held here. It is chiefly celebrated by the cow-herds, who assemble by scores in the fields to dress a dinner for themselves, of boiled milk and eggs. These dishes they eat with a sort of cakes baked for the occasion, and having small lumps, in the form of nipples, raised all over the surface. The cake might, perhaps, be an offering to some deity in the days of Druidism.'

Mr. Pennant's account of this rural sacrifice is more minute. He tells us, that on the 1st of May, in the Highlands of Scotland, the herdsmen of every village hold their Bel-tein. 'They cut a square trench in the ground, leaving the turf in the middle; on that they make a fire of wood, on which they dress a large caudle of eggs, butter, oatmeal, and milk, and bring, besides the ingredients of the caudle, plenty of beer and whiskey: for each of the company must contribute something. The rites begin with spilling some of the caudle on the ground, by way of libation; on that, every one takes a cake of oatmeal, upon which are raised nine square knobs, each dedicated to some particular being, the supposed preserver of their flocks and herds, or to some particular animal, the real destroyer of them. Each person then turns his face to the fire, breaks off a knob, and, flinging it over his shoulders, says, "This I give to thee, preserve thou my horses;" "This to thee, preserve thou my sheep;" and so on. After that they use the same ceremony to the noxious animals: "This I give to thee, O fox! spare thou my lambs;" "This to thee, O hooded crow!" "This to thee, eagle!" When the ceremony is over, they dine on the caudle; and, after the feast is finished, what is left is hid by two persons deputed for that purpose; but on the next Sunday they re-assemble, and finish the reliques of the first entertainment.' (Pennant's *Tour in Scotland*, 8vo. Chester, 1771, p. 90.)

General Vallancey, in his *Essay on the Antiquity of the Irish Language*, 8vo. Dublin, 1772, p. 19, noticing the 1st of May, says, 'On that day the Druids drove all the cattle through the fires, to preserve them from disorders the ensuing year. This pagan custom is still observed in Munster and Connaught, where the meanest cottager worth a cow and a wisp of straw practises the same on the first day of May, and with the same superstitious ideas. (See also the *Survey of the South of Ireland*, p. 233.)

Jamieson, in his *Etymological Dictionary of the Scottish Language*, vol. i. in voce, says, 'In Ireland Beltein is celebrated on the 21st of June, at the time of the solstice.' This is beyond a doubt a second festival of Beltein. He adds, 'There, as they make fires on the tops of hills, every member of the family is made to pass through the fire; as they reckon this ceremony necessary to ensure good fortune through the succeeding year.' Beltein, he says, is also observed in Lancashire. Hutchinson, in his *History of Cumberland*, vol. i. p. 77, speaking of the parish of Cumwhetton, says, 'They hold the wake on the eve of St. John, with lighting fires, dancing, &c. The old Belteing.'

In Sir John Sinclair's *Statistical Account of Scotland*, 8vo. Edinb. 1792., vol. iii. p. 105, the minister of Loudoun in Ayrshire says that the custom amongst the herds and young people to kindle fires in the high grounds in honour of Beltein is now kept there on St. Peter's day, that is June 29th.

The practice of lighting fires on Midsummer eve in England, in honour of the summer solstice, is fully illustrated by Brand, in his *Popular Antiquities*, vol. i. p. 238, et seq.

Jamieson says, 'Although the name of Beltein is unknown in Sweden, yet on the last day of April, i. e. the evening preceding our Beltein, the country people light great fires on the hills, and spend the night in shooting. This with them is the eve of Walburg's Mess. The first of May is also observed.'

BELTIRS, THE, a small horde of Tartar extraction, who dwell along the banks of Abakan, in the Russian province of Tomsk, in Siberia. In features and dialect they most resemble the Sagay-Tartars; like them they are heathens, and only differ from them in the custom they have of never burying their dead, whose bodies they suspend to large trees: for this purpose they select the most secluded and unfrequented spot they can find, and hang up the corpse in a deal coffin, after placing the most valuable garments of the deceased, as well as his household utensils, some victuals, and a saddle, in the coffin. In general they have two wives, and their refusal to abandon this habit is said to be the only bar to their conversion to Christianity. They bring their tribute to the Russian government, to the fortified town of Kuznezk, where all differences that may arise between them are adjusted. Their numbers do not exceed 150 bows and arrows, or males of mature age; at least, this is the quota for levy of the tribute. (Georgi and Vsevolovsky.)

BELTS, JUPITER'S. [See JUPITER.]

BELTURBET, in the barony of Loughtea, and county of Cavan, on the river Erne, sixty-one miles N.W. by W. from Dublin. The town formerly returned two members to the Irish parliament. It is a corporate town, governed by a provost, and is chiefly the property of the Lanesborough family. There is extensive commonage in the environs, and turbary attached to each holding. Here is a good market-house, with sessions-house above; and a spacious church, in the church-yard of which there are the remains of an extensive fortification. The water communication to Ballyshannon is complete, and might be opened to the sea at comparatively little cost, and with immense advantage to both the county Cavan and Fermanagh. In 1821 the population of Belturbet was a little above 2000: it does not seem to have increased within the last ten years. In 1824 there were in the town four schools, and altogether in the parish eleven, educating 310 males and 238 females. (*Stat. Surv. of County Cavan*; Pettigrew and Oulton's *General Register*; *Commissioners' Reports.*)

BELU'GA. [See STURGEON.]

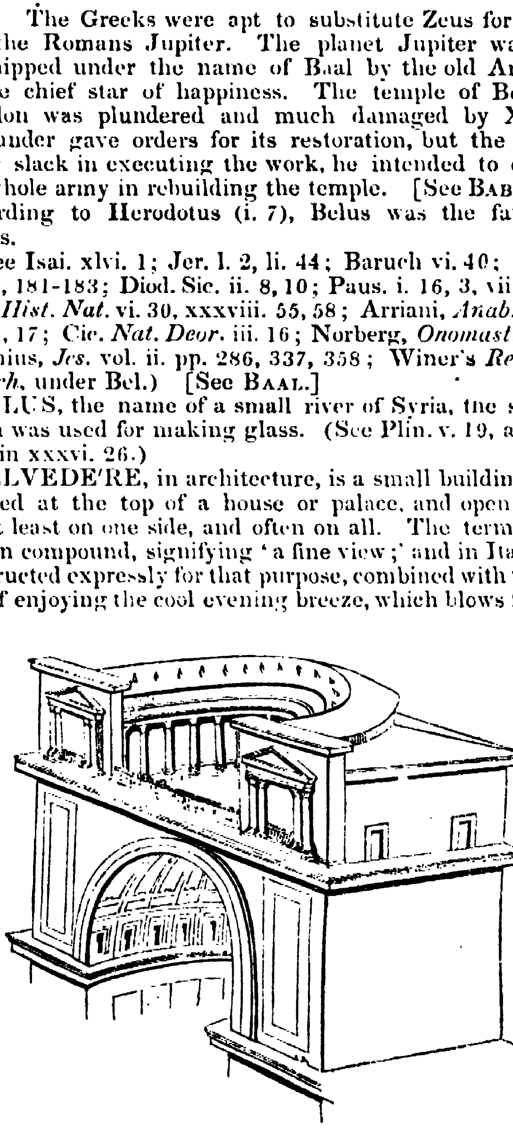
BELUR TAGH. [See BOLOR TAGH.]

BELUS (בֵּל or בְּעֵל, βῆλος) was the name of the chief deity of the Babylonians and Assyrians. The Chaldee *Bel* (בְּעֵל), as well as the Hebrew *Baal* (בַּעַל), means *Lord.* The Greeks were apt to substitute Zeus for Belus, and the Romans Jupiter. The planet Jupiter was also worshipped under the name of Baal by the old Arabians as the chief star of happiness. The temple of Belus at Babylon was plundered and much damaged by Xerxes. Alexander gave orders for its restoration, but the priests being slack in executing the work, he intended to employ the whole army in rebuilding the temple. [See BABYLON.] According to Herodotus (i. 7), Belus was the father of Ninus.

(See Isai. xlvi. 1; Jer. l. 2, li. 44; Baruch vi. 40; Herod. i. 178, 181-183; Diod. Sic. ii. 8, 10; Paus. i. 16, 3, viii. 33, 1; Plin. *Hist. Nat.* vi. 30, xxxviii. 55, 58; Arriani, *Anab.* iii. 16, vii. 16, 17; Cic. *Nat. Deor.* iii. 16; Norberg, *Onomast.* p. 28; Gesenius, *Jes.* vol. ii. pp. 286, 337, 358; Winer's *Realwörterbuch*, under Bel.) [See BAAL.]

BELUS, the name of a small river of Syria, the sand of which was used for making glass. (See Plin. v. 19, and the story in xxxvi. 26.)

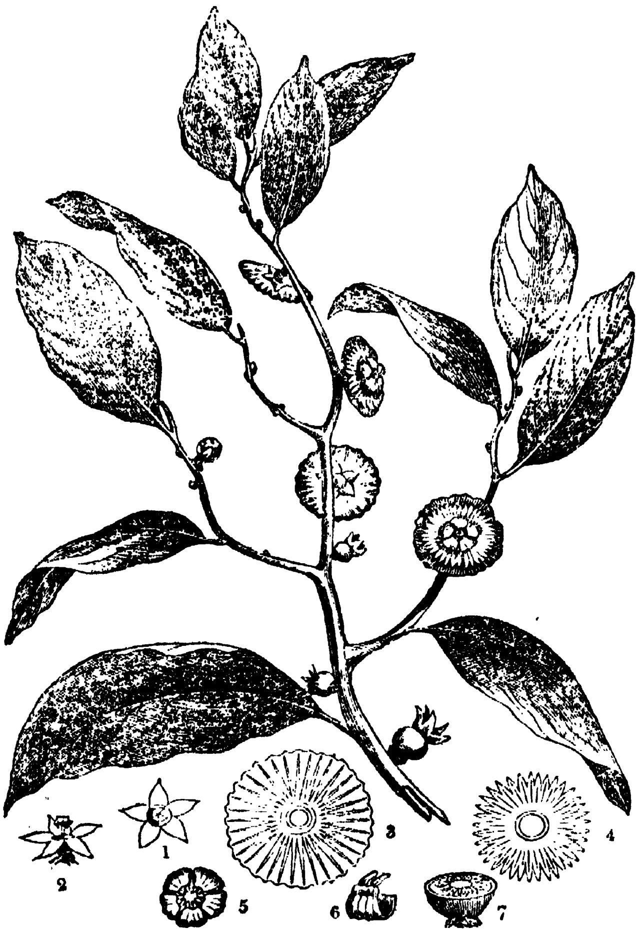
BELVEDE'RE, in architecture, is a small building constructed at the top of a house or palace, and open to the air, at least on one side, and often on all. The term is an Italian compound, signifying 'a fine view;' and in Italy it is constructed expressly for that purpose, combined with the object of enjoying the cool evening breeze, which blows fresher



[View of the Belvedere of the Vatican, from a print in the British Mu on the house-top than in the confined streets. Many houses in Rome have belvederes, for the most part of a simple form. The most celebrated construction of this kind at Rome, which is in the Vatican, was built by Bramante in that part called the court of the Belvedere. The form of this building is semicircular, and it stands over an enormous niche, a remarkable feature in the façade, of which the belvedere makes a part. From this belvedere the view is one of the finest that can be imagined, extending over the whole city of Rome and the Campagna, bounded by the distant Apennines, the tops of which are covered with snow for a large part of the year. Belvederes are not uncommon in France; but the term is applied rather to a summer-house in a park or garden, than to the constructions on the tops of houses, although small edifices, similar to those in Italy, are sometimes constructed on the tops of buildings for the purpose of commanding a fine view. There is a small building in Windsor Great Park which is called a Belvedere.

It is not improbable that the wooden trellice-work, so common in the painted representations of buildings at Pompeii, was a construction similar in its purpose to the belvedere of the modern Italians. (*Plans and Elevations, in MSS. of the Vatican*, 3 vols. fol., *and a View of the Vatican in the King's Library, Brit. Mus.; Encyclopédie Méthodique*, art. '*Architecture;*' Gell's *Pompeii, plates.*)

BELVISIA'CEÆ, a little-known natural order of plants, comprehending one genus only, discovered in the kingdom of Oware, by Palisot de Beauvois, who called it *Napoleona;* it was subsequently named *Belvisia* after its discoverer. [See BEAUVOIS.] It has been figured under the name of *Napoleona imperialis* in the Flora of Oware and Benin, where we find the only account of it. It was discovered in the neighbourhood of the town of Oware, growing to the height of seven or eight feet, and loaded with large broad bright blue flowers, sitting close upon the branches. They are remarkable for having a superior calyx of five pieces, together with a double monopetalous corolla, of which the outer forms a flat crènelled disc, and the interior is divided into a great number of regular narrow segments. The stamens are only five, or rather perhaps ten, united by pairs into five parcels, resembling so many petals. The stigma is peltate with five angles, and covers over the anthers. The fruit is said to be a berry, with a single cell, containing a parcel of seeds lying in pulp. From such an account it will be evident to the botanical reader that this must be one of the greatest curiosities in the vegetable kingdom.



[Belvisia cœrulea.]

1, calyx viewed from above; 2, the same in profile; 3, the outer corolla; 4, the inner corolla; 5, the stamens seen from above; 6, one of the stamens separate; 7, an ovary cut through.

Palisot de Beauvois, its discoverer, considered it the type of a new natural order allied to the gourds; Brown, we believe, suspects its relation to the passion-flowers; Lindley originally stationed it near Styraceæ, but, in his *Nixus*, places it near the Campanulas. It is probable that it has been inaccurately described, and that no exact opinion can be formed about it until it has been examined in a fresh state. In the mean while we give a figure of it, copied from the Flora of Oware, in the hope that this notice may fall into the hands of some traveller visiting the remote country in which it grows.

BE'LYTA, in entomology, a genus of the order *Hymenoptera*, and family *Proctotrupidæ.* The species of this genus are minute four-winged flies, having the antennæ fourteen or fifteen-jointed, filiform in the males, and thickened towards their extremity in the females. They frequent sandy situations.

BELZO'NI, GIOVA'NNI, was a native of Padua, but of a family originally from Rome, as he himself states in the preface to his work on Egypt. He passed his early youth at Rome, where he intended to enter the monastic life, but the French invasion of that city in 1798 altered his purpose, and in the year 1800 he left Italy, and visited in succession several parts of Europe. His family supplied him occasionally with remittances, but as they were not rich, Belzoni exerted himself to gain a living by his own talents. He turned his attention chiefly to hydraulics, which he had studied at Rome. In 1803 he arrived in England, where he soon after married; and after nine years' residence in England, during part of which he gained his living by exhibiting feats of strength, he set off with his wife for Portugal and Spain, from whence he proceeded to Malta, and from Malta to Egypt, where he arrived in 1815. His object in going to Egypt was to construct an hydraulic machine for irrigation, which should raise the water quicker and in greater quantity than the clumsy engines then used in that country. He proposed his plan to Mehemet Ali Pacha, by whom it was approved. Belzoni constructed a machine in the pacha's garden at Zubra, near Cairo, and the experiment proved successful, but owing to the prejudices and opposing interests of the natives, it was abandoned before it was completed. Belzoni then decided upon visiting Thebes, and his intention becoming known to Mr. Burckhardt, the latter gentleman prevailed upon Mr. Salt, the British consul, to employ Belzoni to remove the colossal bust, commonly, but incorrectly, called the Young Memnon, which he accomplished with great ingenuity, shipped it in a barge, which sailed down to Rosetta, and thence to Alexandria, where it was shipped for England. This head, now in the British Museum, is one of the finest specimens of Egyptian colossal sculpture. Belzoni, on his return to Cairo, received a present through Burckhardt, half of which was paid by Mr. Salt. For the whole particulars of this transaction, see Belzoni's *Travels*, and also a compressed narrative of the same in vol. i. of the *Egyptian Antiquities, British Museum*, in the *Library of Entertaining Knowledge.* Before embarking the colossus, Belzoni made an excursion higher up the country, visited the great temple of Edfu, and the islands of Elephantine and of Philæ, and proceeded into Nubia as far as the second cataract. He was the first to open the great temple of Abousambul, or Ipsambul, which is cut in the side of a mountain, and the front of which was so much encumbered by the accumulated sand, that only the upper part of it was visible. He succeeded in partly clearing the sand which stopped the entrance, and thus made the interior of this antient rock-cut temple known to the world. In 1817 Belzoni made a second journey into Upper Egypt and Nubia, during which he made excavations at Carnak, on the eastern side of the Nile, and found there a colossal head of granite, several statues, an altar with basso-rilievi, sphinxes, &c. The colossal head and an arm ten feet in length, both belonging to one colossus, are now in the British Museum. But one of the greatest discoveries of this enterprising traveller was the opening of a splendid tomb in the Beban el

Molouk, or Valley of the Tombs of the Kings. He found out by guess the right entrance, which had been blocked up for many centuries, had it cleared, and at last made his way into the sepulchral chambers cut in the calcareous rock, and richly adorned with pictures in low relief, and hieroglyphics painted in the brightest colours. Belzoni made drawings of the chambers, took impressions in wax of the figures and hieroglyphics, noting carefully the various colours, and thus constructed a perfect fac-simile of this magnificent tomb, which was afterwards exhibited in London. He also brought to England a sarcophagus of arragonite (commonly called an alabaster sarcophagus), which he found in a chamber of the great tomb. Mr. Salt paid Belzoni's expenses in these undertakings, besides giving him a remuneration, and received for his share part of the antiquities which Belzoni collected, and among the rest the sarcophagus, which he afterwards sold to Mr. (now Sir John) Soane the architect for 2000*l*. (See the *Life and Correspondence of Salt*, by J. Halls.) Belzoni also opened numerous other sepulchres excavated in the ridge of rocks at Gournou, at the foot of the Libyan mountains, near western Thebes. The difficulties and labour he had to encounter are described in his own plain but forcible style. 'The entrance to the tombs of Gournou is roughly cut in the rocks, and the sand nearly chokes up the passage. In some places there is not more than a vacancy of a foot left, which you must pass through creeping like a snail. Some of these passages are 200 or 300 yards in length, and at the end you find yourself in a more convenient place, perhaps high enough to sit in it. But what a place of rest! You are surrounded in all directions by heaps of mummies; the black walls, the faint light given by the candles or torches, the naked Arabs holding the torches, all covered with dust, and looking like living mummies, all this forms a scene that cannot be described. A vast quantity of dust arises, so fine that it enters the throat and nostrils, and a great strength of lungs is required to withstand the strong effluvia from the mummies. When I attempted to sit, my weight bore on the body of an embalmed Egyptian, and it crushed it as if it had been a band-box. I sunk altogether among the broken mummies, with a crash of bones, wooden cases and rags, which raised such a dust as kept me motionless for a quarter of an hour till it subsided.' (Belzoni's *Narrative*.)

Belzoni's next undertaking was the removal of an obelisk from the island of Philæ, the shaft of which was twenty-two feet long, and two wide at the base, which he accomplished with no other aid than poles, rotten palm ropes, and a few ignorant Arab peasants. He placed it in a boat, and contrived to pass it safely down the falls of Assouan. The obelisk was landed at Alexandria, and is now in the possession of Mr. William Bankes, at whose expense it was removed, and who has since erected it at Kingston Hall in Dorsetshire. The removal of this obelisk was attended with some unpleasant occurrences. Some persons, employed or bribed by Drovetti, a Piedmontese, formerly a consul, and now a collector of antiquities, endeavoured by violence to prevent Belzoni from effecting the removal of the obelisk, which they wished to secure for their master. On Belzoni's return to Thebes, he was assailed by two Italians in Drovetti's service, and many Arabs: a scuffle ensued, in which Belzoni was in danger of his life. He, however, with his usual boldness, surmounted all difficulties. His high stature and robust frame, great strength, and commanding mien, gave him great influence over the Arabs, who, like all semi-barbarous people, pay great respect to physical superiority.

Belzoni discovered also the entrance into the second great pyramid of Jizeh, and penetrated into the central chamber, the existence of which was before unknown, though it appeared, from an inscription found there, that it had been entered by the Arabs. In September, 1818, he again left Cairo, went to Esné, and thence struck across the Desert to the shore of the Red Sea. He there discovered the ruins of the antient town of Berenice, and visited likewise the emerald mines of Mount Zabarah. In the following year (1819) he went on another excursion to Lake Mœris, and from thence to the smaller Oasis, which lies due west of it. No European was known to have visited the spot before him. Belzoni erroneously supposed it to be the Oasis of Jupiter Ammon. At last, in September, 1819, he left Egypt, after a residence of five years, during which he made numerous and important discoveries, in which there was more novelty, as well as difficulty, than in those made by the French during their occupation of the country.

Belzoni returned to Italy, and visited his native town, Padua, the citizens of which had a medal struck, with the date of that year, 1819, in commemoration of his discoveries. On his arrival in England, he published his *Narrative of the Operations and recent Discoveries within the Pyramids, Temples, Tombs, and Excavations in Egypt and Nubia*, 4to. London, 1820, with an Atlas. In 1823 he set off once more for Africa, with the intention of penetrating to the city of Timbuctoo, the object of so many unsuccessful attempts. He undertook this journey on his own account, unassisted by any government or society. He landed at Tangier, accompanied by his wife, and thence proceeded to the city of Fez, whence he intended to proceed to Tafilelt, and join the great caravan which assembles there to cross the Desert into Soudan. Messrs. Briggs of Alexandria contributed 200*l*. towards the funds for the expedition: but the jealousy of the Moorish or Jewish traders prevented his obtaining the requisite permission from the emperor, and he then repaired to Mogadore, and embarked for Cape Coast, whence he proceeded to the Bight of Benin, which he seems to have guessed was the most direct way to reach the Niger. He there met with a negro from Kashna, who had been a sailor on board the Owen Glendower frigate, and who was returning to his own country. Belzoni and he agreed to travel together to Houssa. Belzoni was well received by the king of Benin, who gave him much useful information for his journey. Every thing seemed favourable to his undertaking, when he was attacked by a dysentery, which, after a few days, terminated his life on the 3rd of December, 1823, at a place called Gato, in the kingdom of Benin. He was buried there under a large tree, and a simple inscription was placed on his tomb. The day before his death he wrote to his friend Mr. Hodgson, who was on board the brig Swinger in the Bight of Benin, intrusting him with some directions concerning his property, and with his last affectionate farewell to his wife. Belzoni was frank and kind-hearted, trusty and honourable, and to great simplicity of manners united intelligence, firmness, and perseverance. He was certainly one of the most enterprising and sagacious of modern explorers, but he appears to have been apt to take offence, and to have been too prone to suspect the intentions of those with whom he came in contact. The reader will find in Hall's *Life of Salt* an account of the transactions between the British consul and Belzoni as to making collections, together with the history of the sale of the valuable sarcophagus, which is now (1835) in the possession of Sir John Soane.

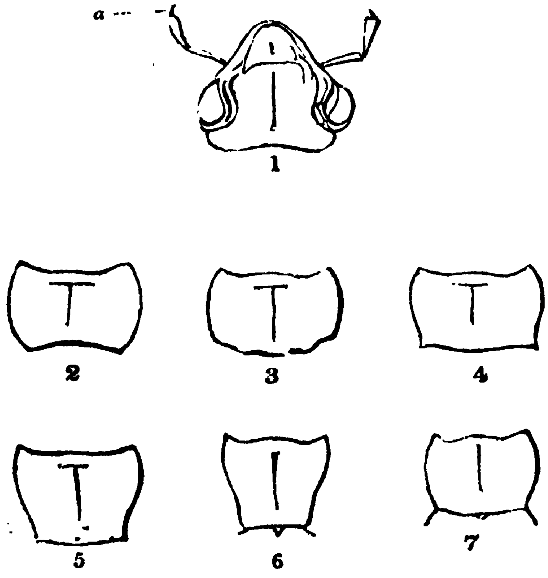
BE'MBEX, a genus of hymenopterous insects, forming the typical group of the *Bembicidæ* of Leach, a family of the *Fossores*. The chief generic characters are as follows:—Palpi very short; maxillary palpi four-jointed; labial two-jointed; mandibles with a single tooth internally; the anterior wings have three submarginal cells (the third extending to the apex of the marginal), and two recurrent nervures both springing from the second submarginal; labium and mandibles prolonged into a rostrum, or beak; body smooth, nearly conical, but rather flat beneath: in the male frequently furnished with two or more spines at the apex. Legs, in the female spinose, anterior tarsi strongly ciliated. This genus connects *Monedula* with *Philanthus*. the species are peculiar to hot climates, and, in some instances, very much resemble wasps, both in size and colour. The female forms oblique cylindrical burrows in sandy banks, with a cell at the end of each; her next object is to collect flies, such as the species of syrphidæ and muscidæ, as food for her young: in the excursions made for this purpose, she is exceedingly rapid in her motions, and produces a loud buzz in flying. Having furnished a cell with five or six flies, she deposits a single egg in it, and, after having carefully closed its mouth, proceeds in the same manner with another cell. When hatched from the egg, the larva devours these flies, and changes into the pupa state, and shortly after to the perfect insect. Although these insects are not strictly social, as the bees and wasps, yet generally the burrows of many of the same species are formed in the immediate neighbourhood of each other.

Upon leaving her burrow, the female takes great precaution to secure its entrance from her enemies, by stopping the mouth with sand. No precaution, however, is sufficient to protect it from the intrusion of its parasites. Among others, the beautiful Panorpes carnea is enabled, by the spined structure of its legs, to make its way through the sand-protected entrance—which it takes the opportunity of..

doing during the absence of the female Bembex: entering with the tail foremost, it deposits an egg, which hatches in the following spring; the larva of the Bembex then becomes food for that of the Panorpes.

BEMBIDI'IDÆ, among coleopterous insects, a family of the division *Geodephaga* of MacLeay. These are minute carnivorous beetles, which generally frequent damp situations, such as the margins of rivers, ponds, and ditches: they are usually of a bright blue or green metallic colour, having two or four pale yellow spots on the elytra. It is doubtful whether this family can hold the same rank in the Geodephaga as those of the Carabidæ, Harpalidæ, &c.: the species, however, may be easily distinguished by the minute terminal joint to the palpi. The characters of the several genera contained in this group are as follows:—

A. Body depressed and linear.	
a. Antennæ with the third and fourth joints equal.	*Lymnæum.*
b. Antennæ with the fourth joint longer than the third. . .	*Cillenum.*
B. Body rather ovate.	
a. Thorax transverse, not truncate, heart-shaped:	
a. Posteriorly rounded:	
1. Whole.	*Tachys.*
2. Emarginate. . . .	*Philocthus.*
b. Posteriorly acute. . . .	*Ocys.*
b. Thorax truncated, heart-shape: .	
a. The posterior angles very acute and prominent: .	
1. Antennæ with the third, fourth, and fifth joints long. . .	*Peryphus.*
2. Antennæ with the third, fourth, and fifth joints short. . .	*Notaphus.*
b. The posterior angles slightly acute-deflexed:	
1. Eyes moderate.	
*Thorax rather remote from the abdomen at the base. . .	*Lopha.*
**Thorax closely united to the abdomen.	*Tachypus.*
2. Eyes large.	*Bembidium.*



1. Head of one of the Bembidiidæ, showing the form of the palpi—*a*. the terminal joint; 2. Thorax of Tachys; 3. Thorax of Philocthus; 4. Thorax of Ocys; 5. Thorax of Peryphus; 6. Thorax of Lopha; 7. Thorax of Tachypus.

BE'MBO, PIE'TRO, was born at Venice in 1470. His father was a patrician of Venice, and a man of considerable taste for elegant literature. Being sent by the senate in 1483 as prætor or governor of Ravenna, he restored and embellished the sepulchral monument erected in that city to the memory of Dante, by Guido della Polenta. His son, who showed an early disposition for learning, studied at Padua and at Ferrara, and afterwards went to Sicily, where he learned Greek from Agostino Lascaris at Messina. On his return to his native country, he repaired to the little town of Asolo, near Treviso, which had become the residence of Caterina Cornaro, the widow of James Lusignano, the last king of Cyprus, who having resigned her kingdom to the Venetian senate, was enjoying a splendid income, with the title of queen, and holding a sort of little court in that pleasant retirement. She was a woman of elegant taste and refined education. In September, 1496, she gave some splendid entertainments on the occasion of the marriage of her favourite lady in waiting, to which she invited many persons of distinction, and among others young Bembo, whose family was related to hers. According to the usages of chivalry still in fashion in that age, some of the hours of leisure between the banquets, tournaments, and other pageants, were employed in learned or witty conversations, and especially in speculative discussions on the subject of love, some praising it as the source of human happiness, others blaming it as the cause of much misery, &c. From these disquisitions Bembo derived the plan of a work, which he styled *Gli Asolani*, from the name of the place. It is, or rather pretends to be, a collection of what was said in those entertainments by the several disputants on the nature, qualities, and effects of love, distinguishing the pure sentiment from the grossness of the passion that goes by that name, and ending in a moral strain on the contemplation of divine love, or the love between the Creator and his creatures. The metaphysical part of the reasoning is derived from Plato's philosophy, which was in high favour at that time among the learned of Italy. This work of Bembo was received with considerable applause, and the book is still esteemed as a specimen of good Italian prose.

Bembo's father wished him to devote himself to the civil service of his country, by entering on some official employment, in which his noble birth and connexions would have enabled him to aspire in course of time to the highest dignities of the republic. Bembo, however, preferred going to Rome, and becoming a candidate there for ecclesiastical preferment, as better suited to his taste for study. His father opposing his design, Bembo resolved to devote himself to the monastic life, and he cast his eyes on the abbey of la Croce dell' Avellana, situated in the mountains near Urbino. Having repaired to the town of Urbino previous to shutting himself up in his intended retirement, he was so kindly received by the then Duke Guidobaldo di Montefeltro and Elizabetha Gonzaga, his consort, that he changed his mind, and took up his residence at their court, which was distinguished both for the personal character of the sovereigns and for the encouragement which they gave to the learned. At Urbino Bembo began to write Italian poetry, in which he imitated the style and the harmony of Petrarch; and here also he became intimately acquainted with Giuliano de Medici, third son of the great Lorenzo, and afterwards Duke of Nemours, who was then residing at Urbino. After the death of Duke Guidobaldo, which was soon followed by that of his duchess, Bembo and Giuliano agreed to proceed to Rome; but previous to his departure from Urbino, Bembo left a token of his gratitude for the two amiable sovereigns in an affectionate eulogium: *De Guidobaldo Feltrio, deque Elisabetha Gonzaga, Urbini Ducibus.* It is in the form of a conversation between Bembo, Sadoleto, Beroaldo, and Sigismondo da Foligno, and is really interesting from being written with sincerity and true feeling, and in praise of two deserving persons. The sketch of the Duchess Elizabeth is a touching specimen of real pathos. Like her relative Lucrezia Gonzaga, Elizabeth was a bright specimen of Italian female character in the midst of a most corrupt age.

Soon after Bembo had arrived at Rome, Cardinal de' Medici, brother to his friend Giuliano, was raised to the pontifical chair under the name of Leo X. This was to Bembo a most fortunate event. Leo appointed him his secretary, together with the learned Sadoleto. The briefs, letters, and other official acts which the two secretaries wrote in the name of the pontiff, were distinguished for their classical style, carried almost to fastidiousness. Rome was at that time the seat of dissipation and licentiousness, as well as of learning. Bembo shared in the common propensity, and several of the Latin verses which he then wrote are stained by indecent images and expressions. His elegy on Galatea is one of the best specimens of his Latin poetry. After Leo's death in 1521, he went to Padua, where he fixed his residence. Leo had amply provided him with ecclesiastical benefices; and Bembo, who was now enabled to gratify his taste for literature and the arts, became a munificent patron of learning, and collected a rich library and a cabinet of rare medals. At Padua he completed his work on the Italian language, at which he had laboured assiduously for many years: *Prose di M. Pietro Bembo, nelle quali si ragiona della Volgar Lingua, divise in trè libri*, Venezia, 1525. This work was dedicated to Cardinal de' Medici, afterwards Pope Clement VII. It is one of the earliest works on the rules of the Italian language: it has gone through many editions, and is still much esteemed. Bembo's Italian poems were published some years after, *Rime di M. Pietro Bembo*, Venezia, 1530. In 1530, the Council of Ten commissioned Bembo to write the history of the Venetian republic, beginning from the year 1487, where Sabellico had left it. Bembo wrote it in Latin, and carried it to the year 1513, *Historiæ Venetæ* libri xii. He afterwards wrote an Italian translation of his work: *Historia Viniziana, volgarmente scritta*, which was published after his death at Venice, in 1552, with a life of the author. This translation was long after republished, in 1790, by Morelli, the librarian of St. Mark, in two vols. 4to. with many corrections from Bembo's autograph, and with a fine likeness of the author, engraved by Bartolozzi from a painting by Titian.

Bembo had been for many years settled at Padua in studious retirement, after renouncing the licentiousness of his early years, as well as all prospects of ambition, when in 1539, Pope Paul III. unexpectedly sent him a cardinal's hat. Bembo, more perplexed than pleased at his promotion, took time to consider whether he should accept of it; he had as yet taken only the minor orders, which are not binding for life. He however accepted it, and at Christmas, 1539, he was ordained presbyter, when he received the insignia of the cardinalship, and proceeded to Rome, where he chiefly resided for the remainder of his life. He died at Rome in 1547, in his 78th year, and was buried in the church of Santa Maria super Minervam. His friend Girolamo Quirini raised a splendid monument to his memory in the church of St. Anthony of Padua. Of Bembo's three illegitimate children, whom he had during his residence at Rome in the pontificate of Leo X., one died young; another, called Tommaso, became a churchman; his daughter Elena married Pier Gradenigo, a Venetian nobleman. Bembo was intimate with Della Casa, Castiglione, Sadoleto, and most of the Italian literati of his age. His epistolary correspondence, both Latin and Italian, was published in parts, and at different times. *Epistolarum Familiarum libri VI. et Epistolarum Leonis X. Pont. Max. nomine scriptarum, libri XVI.*, 8vo. Venetiis, 1552; *Bembi et Sadoleti Epistolarum liber unus*, Florentiæ, 1524; *Lettere di Pietro Bembo*, 4 vols. 8vo. Venezia, 1552. Bembo's Italian verses were published in 1530, *Rime di M. Pietro Bembo*, and afterwards frequently reprinted.

BEN (בֵּן, constructed* בֶּן or בִּן, *son*) is the first syllable in many Hebrew names, which may be compared with our forms of names like Morrison, Johnson, Robertson, &c.: for instance, בֶּן־הֲדַד, *Benhadad*, is *the son* or the *worshipper of Hadad*, or Adod, the chief idol of the Syrians. בֶּן־אוֹנִי, *Benoni*, is *son of my pain*: בִּנְיָמִין, *Benjamin*, is *son of the right* (hand), *i.e.* son of happiness. These examples show that not only literal sonship but also metaphysical relation is expressed by Ben.

BEN, BEIN, or BHEIN, is a word which exists in the Scottish dialect of the Gaelic language, and has been adopted in our language to indicate the most elevated summits of the mountain-ranges which traverse that part of our island to the north of the Firths of Clyde and of Forth. The corresponding term in some parts of Europe is Pen, which occurs in the names of several places in Cornwall and Wales, in the Penine Alps, in the word Apennines, and probably in the Cevennes of France. The number of mountains to the proper names of which this word is prefixed is very considerable. We shall only notice here the most important and best known.

Ben Nevis, in Inverness-shire, 55° 50′ N. lat., and 5° W. long., rises abruptly from a narrow and low plain by which it is separated from Loch Eil, the northern portion of Loch Linnhe, and attains an elevation of 4368 feet above the level of the sea, and is perhaps the highest mountain of Great Britain, though its summit rises to little more than one-third of the height of Mont Blanc. The lower portion consists of granite and schistose rocks, and the upper is a mass of porphyry. This extensive mass of rocks is on the north bounded by the deep valley of the Spean and on the south by that of Glen Nevis. On the east it is connected by a much lower range of hills with the Grampians. The lower parts of the mountain, especially towards the south and south-west, are usually covered with rich grass, which is generally saved for winter consumption. The green pasture extends upwards, gradually growing thinner to the middle of the mountain, where it is succeeded by some mosses intermixed with stones for a short way, after which nothing appears above but an immense heap of loose stones. The summit is an extensive flat plain, strewed with loose rocks. In a few hollows near the summit patches of snow usually lie all the year round, and in one of these hollows facing the north, a little below the highest point, snow always remains during the whole year.

Ben Mac Dhu, the highest summit of the Cairn-Gorum Mountains, is second only to Ben Nevis. The Trigonometrical Survey, whose results however have not yet been published, has determined it to be 4305 feet above the level of the sea. This mountain summit may be considered as the centre of the Cairn-Gorum range, situated where the counties of Aberdeen, Banff, and Inverness meet, and extending on both sides of the meridian 3° W., and between 57° 5′ and 57° 10′ N. lat. It overhangs the southern extremity of Loch Avon, which is so deeply embedded in this range, that during several of the winter months the sun never shines on the surface of the lake.

Ben Lawers, in Perthshire, extends between 56° 30′ and 56° 35′ N. lat. near the meridian of 4° 15′, and occupies with its declivities a considerable part of the northern banks of Loch Tay. It is, according to the Ordnance Survey, 3948 feet in height, and rises more than 1000 feet above all the hills that immediately surround it. This mountain is of very easy ascent.

Ben Cruachan, in Argyleshire, is formed by an extensive mountain mass, whose circumference is supposed to be upwards of twenty miles, and extends along the northern extremity of Loch Awe and the northern banks of the water of Awe, between 56° 25′ and 56° 30′ N. lat., and westwards of the fifth meridian of Greenwich. It is composed of grey granite, and its descent towards the north-east and the shores of Loch Etive is steep and bare, mixed with pastures of a subdued brown colour. Towards Loch Awe and the river Awe its declivities are comparatively gentle, and at its foot a narrow tract of low land extends along the lake and river. The Ordnance Survey states its height at 3669 feet; its highest parts form two steep cones of which the most northern is the higher.

Ben Vorlich, in Perthshire, extends between 56° 20′ and 56° 25′ N. lat. west of the meridian 4° along the southern side of Loch Earn, and terminates at the junction of the Earn and the Ruchil, forming one continuous and lofty wall. With the exception of Ben Venu, the leading feature of Loch Cateran (Katherine), says M'Culloch, no mountain in Scotland presents a declivity so wild and various, such a continual succession of bold precipices and deep hollows, of ravines and torrents, and of woods dispersed in every mode of picturesque distribution.

Ben Ledi, in Perthshire, extends on the western side of Loch Lubnaig, where it rises with a steep and rocky declivity immediately from the lake to a height of nearly 3000 feet above the level of the sea.

Ben Venu extends along the southern shores of Loch Katherine in Perthshire, and presents the most striking features in the picturesque scenery by which that lake is distinguished. The Trossachs, celebrated for their beauty, extend on its lower slopes and at its foot. [See TROSSACHS.]

Ben Lomond, in Stirlingshire, at no great distance to the south-west of Ben Venu, is the best known of the mountains of Scotland on account of its forming the southern extremity of the Highlands, and its situation near the banks of Loch Lomond, whose eastern shores are formed by the gentle slope of the mountain. It is of easy ascent and distinguished among the mountains of North Britain by being covered with vegetation up to the very summit. This mountain rises to 3197 feet above the level of the sea, and affords from its western slopes a fine view over Loch Lomond and its islands.

Ben Wevis or Wyvis, though probably not the highest summit to the north of Glenmore, is the best known, because it forms the western boundary of the plains of Dingwall and Cromarty. It rises between 57° 40′ and 57° 45′ N lat., and near the meridian of 4° 30′, and has been found by the Ordnance Trigonometrical Survey to be 3000 feet above the sea. It does not, however, attain that height abruptly, but by numerous steep slopes interrupted by narrow and sloping plains. (M'Culloch's *Highlands and Western Islands;* Sinclair's *Statistical Account of Scotland;* Sir Thomas Dick Lauder's *Account of the Great Floods*, &c.)

---

* The construct state or regimen of a Shemitic noun is that shortening by which is expressed that it governs a following genitive, as in the examples given.

BENARES, one of the eight districts into which the province of Allahabad is divided, lies between 25° and 26° N. lat., and 82° and 84° E. long. This district, or zamindary, formerly constituted an appanage of the dominions of Oude, by whose vizier, Asoph-ud-Dowlah, it was ceded in 1775 to the East India Company, as a compensation for the aid which had been granted to him in the preceding year, and by which he was enabled to reduce to subjection the tributary chief of the Rohillas. In the following year, 1776, this zamindary was granted to the Rajah Cheyt Singh of Benares, subject to the payment of an annual tribute to the company. The violation of this agreement on the part of Mr. Hastings, then governor-general of India, formed one of the charges brought against him on the memorable occasion of his impeachment by the House of Commons.

In August, 1781, Mr. Hastings repaired in person to Benares, and placed the rajah under arrest in his own palace, whence he was rescued by his subjects. The natives being unable, however, to make a successful stand against the English troops, the Rajah Cheyt Singh was deposed, and his nephew, a minor, set up in his stead, a larger amount of tribute being exacted from him, and the government of the district being placed under officers who were made directly responsible to the governor-general and council. The tribute, which was originally fixed at 22,66,180 Sicca rupees (about 280,000*l.*), was raised on this occasion to 40 lacs of rupees (about 500,000*l.*) per annum. The consequences of this measure are thus described by its author, who passed through the country in February, 1784: 'From the confines of Buxar,' says Mr. Hastings, 'to Benares, I was followed and fatigued by the clamours of the discontented inhabitants. The distresses which were produced by the long-continued drought unavoidably tended to heighten the general discontent, yet I have reason to fear that the cause existed principally in a defective, if not a corrupt and oppressive administration. I am sorry to add, that from Buxar to the opposite boundary, I have seen nothing but traces of complete devastation in every village.'

The rajah has since become a mere stipendiary of the company's government, which, in 1795, took entire possession of the revenues, and proceeded to administer the affairs of the district, making an annual allowance of about 12,000*l.* to the rajah for his personal support. On the occasion just mentioned the British government passed a regulation, enacting that the last decennary assessment for the land revenue, which had been made under its sanction, should be considered as a permanent settlement. At the same time the courts of judicature which were superintended by native judges were abolished; and in lieu of them were established one city and three zillah courts, together with a provincial court of appeal, all similar in their constitution and jurisdiction to the corresponding tribunals in the provinces of Bengal, Bahar, and Orissa. By another regulation the powers of the Sudder Dewanny Adawlut, and Nizamut Adawlut, the supreme courts of the Company at Calcutta, were extended over the district of Benares.

The collectorate of Benares includes the three districts of Benares, Ghazeepore, and Juanpore, of which Benares is the least in extent, but the most important with regard to revenue, as appears from the following statement, given to the Committee of the House of Commons which sat in 1832:—

	Square miles.	Assessment. 1829-30.	
Benares	350	16,96,899	rupees.
Ghazeepore	2,850	13,23,449	„
Juanpore	1,820	10,82,391	„
	5,020	41,02,739	„

The district of Benares has Ghazeepore on the north and east, Juanpore on the west, and Mirzapore on the south. The land is, for the most part, rich and well cultivated. Barley, wheat, and a species of peas are the principal vegetables cultivated for the food of the inhabitants. Flax is raised only for the oil expressed from its seeds. A considerable quantity of sugar is made in the district, but its most profitable productions are indigo and opium.

The district is well watered by the Ganges and the Goomty rivers, as well as by several small tributaries to those streams, and having now enjoyed a long period of peace and security, the inhabitants have realised the advantages offered by its soil and climate, and the district exhibits many signs of prosperity. For about nine months in the year the climate is temperate, and sometimes during the winter fires are found agreeable in the houses. During the three months from April to June hot winds prevail, and for a time destroy the verdure.

The number of inhabitants in the district is not known. The population of the three districts which form the collectorate has been estimated variously at from three to five millions, but all authorities appear to agree as to the fact of its having rapidly increased of late years.

(Rennell's *Memoir of a Map of Hindustan;* Mill's *History of British India; Letter from B. S. Jones, Esq., to the Chairman of the Select Committee on East India Affairs*, inserted in the *Report* of that committee in 1832.)

BENARES, the capital of the district of that name, is built on the north bank of the Ganges, which here makes a fine sweep; the convex side of the curve is that on which the city is built: 25° 30′ N. lat., and 83° 1′ E. long.

Benares is celebrated as having been in antient times the seat of Brahminical learning. According to Major Rennell, 'its antient name was Kasi, but there are no notices concerning it in the works of the antient geographers.' Dr. Robertson speaks of the city as having been, 'from time immemorial, the Athens of India, the residence of the most learned Brahmins, and the seat both of science and literature.' Sir Robert Barker, who visited Benares in 1772, has described an observatory there, in which he found instruments for astronomical observations of very large dimensions, and constructed with great skill and ingenuity: tradition attributes the building of this observatory to the Emperor Akbar.

The streets of the city are, for the most part, only a few feet broad, and the houses, which are built of stone and lofty, are so close together that the sun's rays can hardly penetrate to the pavement. The streets are described as being covered with every kind of filth, which renders the place highly disagreeable as a residence to Europeans. When seen from the river the appearance of the city is beautiful. The eye is pleased with the great variety of the buildings, some of which are highly ornamented, and have terraces on their summits; the view is greatly improved by the numerous flights of stone steps which lead from the banks of the river to Hindu temples and other public buildings. The number of brick and stone dwellings is said to exceed 12,000, besides which there are above 16,000 houses built of mud.

Many of the houses are of large dimensions. It is customary for each story to be rented by a separate family, and some of the buildings are thus said to contain each 200 inhabitants. The more wealthy Hindus live in detached houses, with open courts, and surrounded by walls.

Almost in the centre of the city is a large mosque, built by Aurungzebe on the site of a magnificent Hindu temple, which he destroyed for the purpose of erecting the present building: the mosque has two minarets, the height of which is 232 feet from the level of the Ganges.

The dwellings of the European residents are at Secrole, about three miles from the city. This place was the scene of a tragical event in January, 1799, when the deposed nabob of Oude, irritated by the British government requiring him to transfer his residence from Benares to Calcutta, proceeded with a body of armed attendants to the house of the Company's resident, Mr. Cherry, whom they assassinated, together with four other European gentlemen. The nabob, Vizier Ally, made his escape with about 400 followers to Azimghur, but was taken in the December following and imprisoned in Calcutta.

The native population of Benares is at all times very great. In 1803 the resident inhabitants were estimated to amount to 582,000, and the number is now supposed to be even greater. Nine-tenths of the population are Hindus, and the remainder Mohammedans.

The sacredness of the city in the estimation of Hindus makes it the constant resort of pilgrims from all parts of Hindustan, and a great number of these devotees, being exceedingly poor, subsist upon charity, and are consequently often reduced to a state of the greatest misery. According to Mr. Tennant, 'hunger, wretchedness, and disease seem to meet your eye in every direction.' A considerable number of Turks, Persians, and Armenians are constantly in the city. Several of the natives are men of great wealth, who act as bankers, and have been accustomed to facilitate the money operations of the East India Company. Some also are dealers in diamonds and other precious gems, which are brought to Benares from Bundelcund.

A great part of the instruction formerly given at Benares was gratuitous, from the prevailing idea that all the religious merit of the act would be lost if any payment were taken from the pupils. It does not appear, however, that the teachers had any scruples about receiving donations from pilgrims or from Hindu princes. At the time of the establishment of the British empire in India, the schools of Benares were in a declining condition. The Hindu Sanscrit College of this city was established by the English resident, Mr. Duncan, in 1791. This institution has since been principally supported by the Company's government: some of the scholars contribute towards the expenses. An English class was added to this college in 1827, when the number of students was 259; in 1830 the number was increased to 287. Other schools have been established in Benares during the present century, and have been partly endowed by native inhabitants. In one of these schools nearly 200 children are instructed in the English, Persian, and Hindustannee languages, as well as in writing, arithmetic, general history, geography, and astronomy.

The government of the city, as well as of the district of which it is the capital, has been virtually exercised by the British since 1775. The rajah of Benares holds merely a nominal authority, and is a stipendiary of the Company. His residence is at Ramnaghur, about a mile from the city on the opposite side of the river.

Benares is 83 miles travelling distance from Allahabad, 460 miles from Calcutta, 130 from Oude, 189 from Lucknow, 950 from Bombay, and 1103 from Madras.

(Rennell's *Memoir of a Map of Hindustan*; Mill's *History of British India*; Tennant's *Indian Recreations*; Hodge's *Travels in India*; *Report of Committee of the House of Commons on the Affairs of India*, 1832, public and political sections.)

BENAVI'DES was a native of Quirihue, in the province of Concepcion, in Chili. Himself and a younger brother entered the patriot army at the beginning of the revolution. The elder brother attained the rank of a serjeant in a Buenos Ayres battalion. In 1814 both brothers were found guilty of some capital offence, and sentenced to death. Being placed in the condemned cell, they contrived to make their escape, set fire, as it is supposed, to the field depôt, and went over to the royalists, in whose service they were the scourge of Chili for four years. At the battle of Maypo, in 1818, they were made prisoners, but not being recognised till the Chilian general had offered a general amnesty to all military offenders, they escaped unpunished. The supreme director, however, desiring to rid the country of them, sent them with a strong escort to the province of La Plata. Not far from Santiago, the officer of the escort discovering that the prisoners had attempted to bribe the men to let them escape, ordered them both to be executed. The two brothers, tied together, were made to kneel on the ground, and a volley was fired upon them. The younger Benavides was shot dead. The elder received two balls, one of which passed through his right shoulder, and the other through his left side. The serjeant of the detachment also gave him a cut with his sword in revenge for the loss of his family, whom Benavides had destroyed, and the soldiers, after throwing some earth and stones upon the bodies, withdrew. Benavides, when he found that his executioners had left him, with great difficulty threw off the earth and stones, and having untied the cords with which he was fastened, he stripped his dead brother of his shirt, in order to bind his wounds with it. Notwithstanding the acute pain of his wounds, he reached the hut of a poor old man, where, without any other cure than washing his wounds every day with water, in little more than two weeks he found himself strong enough to undertake his journey. He set out accordingly towards Santiago, and contrived to enter the city secretly. His wife solicited, through a great patriot, her relative, and a particular friend of General San Martin, an interview between that general and her husband; and Benavides engaged himself again to serve in the patriot army, the general having first given him a written promise that he would keep his name secret. San Martin sent Benavides, under the charge of one of his officers, who did not know him, to General Valcarce, then commanding the republican forces near Concepcion, with an order to place him on his staff, and, while keeping a sharp eye over him, to avail himself of Benavides's knowledge of the country, of his great influence over the Araucanian Indians, and of his former connexion with the Spaniards. To Benavides's advice and counsel the patriots were indebted for the conquest of the district of Lajas, and of the Fort del Nacimiento. Unfortunately General Valcarce made Colonel Freire, then governor of Concepcion, acquainted with the secret, and that officer, in a warm discussion with Benavides, had the imprudence to tell him that a man of his character was not to be trusted. Irritated at the insult, Benavides disappeared two days after, and went over to the Spaniards. General Sanchez, who commanded at that time the Spanish forces on the frontier of Chili near Concepcion, gave him a commission in Arauco, and from that moment Benavides commenced the most cruel and desolating war against the independent Chilians. In the space of two years, with the help of the Araucanian Indians, he committed cruelties upon the patriots too revolting to relate. In 1821 the Chilians armed an expedition against him, and Benavides being abandoned by all his followers, sailed for Arica, with the intention of joining the Spaniards in Peru. His launch having entered a cove near Valparaiso in quest of water, one of his own men betrayed him. He was taken and executed at Santiago on the 23rd of February, 1823. (*Memoirs of General Miller*.)

BENBOW, VICE-ADMIRAL, was born in 1650. His whole life, from boyhood to his death, was spent in active service at sea; and though he was by no means a very successful or brilliant commander, he was distinguished throughout his career for his courage and professional enterprise. He early attracted the favourable notice of James II., the great reformer of our naval service; and after the revolution was much employed by King William. An anecdote, involving a punning play upon words, which was by no means a frequent pastime of the last-named monarch, is told with reference to Benbow, which well illustrates the estimation in which he was held by him. It was proposed to send out a naval expedition to the West Indies, to watch the proceedings of the French in that quarter; and after several names were proposed for the command of the expedition, William exclaimed, 'No; these are all fresh-water *beaus*; but the service requires a *beau* of another sort—therefore we must send Admiral Ben*bow*.'

The service by which Benbow is best known in our naval history was his last. On the 11th of July, 1702, he left Port Royal in Jamaica, in quest of a French squadron, commanded by M. du Casse, a very brave and skilful officer. On the 19th of August, Benbow came up with the French force, and though inferior in number and weight of metal, immediately attacked them. A running fight was kept up for four days; but owing to the cowardice or treachery of the officers under his command, the brunt of the engagement was thrown upon Benbow's own vessel. On the morning of the fifth day he renewed the chase and fight, but was wounded by a chain-shot, which broke his right leg to pieces. He was carried below, but very soon ordered his cradle to be brought upon the quarter-deck, so as to command a view of the action as he lay there. The engagement lasted till it was dark; but so far from receiving any assistance from his officers, they addressed a written remonstrance to him, in which they declared the inability of the English force to contend with that under Du Casse. Thus counteracted, he sailed back to Jamaica, had the officers immediately put under an arrest, and tried by court-martial. They were condemned on the clearest evidence; two of the captains were shot, and the rest were visited with various degrees of punishment. Benbow survived just long enough to hear his own conduct vindicated and applauded. He died of the wound in his leg, on the 4th of November, 1702. (*Biographia Britannica*; Tindal, *Continuation of Rapin's Hist. of England*.)

BENCH. [See BANK.]

BENCHER. [See INNS OF COURT.]

BENCOOLEN, a settlement in the possession of the Dutch on the west coast of the island of Sumatra, in 4° 10′ S. lat., and 102° 50′ E. long.

In order to carry on the pepper trade with advantage, the English East India Company formed an establishment at Bencoolen in 1685, to which they afterwards gave the name of Fort Marlborough. This settlement did not at first fulfil the promise of advantage which led to its formation. In 1687 Mr. Ord, the head of the establishment, was poisoned, and we learn from the early records of the Company that they entertained in that year serious thoughts of abandoning the station, and transferring their officers to Priaman or Atcheen. In 1694 the factory was, however, described as being very prosperous, and in the following year the Company obtained by grant from the rajah an addition to their settlement, which in consequence included the town of Sillibar. During the next twenty-five years the English settlers were much harassed in consequence of disputes between rival chiefs, in which the settlers were compelled to take a part, and in 1719 the English were nearly all destroyed by the natives.

Bencoolen, with the other English settlements on the coast of Sumatra, was nearly destroyed by a French force under Count D'Estaing in 1760, but the town was soon rebuilt. This settlement had long ceased to be of any political or commercial importance to the East India Company. Pepper, the produce for obtaining which the factory was originally established, was procured on better terms from Prince of Wales' Island and from the Malabar coast. Attempts were made in 1796 to cultivate the nutmeg and clove, but the quality of these spices proved so inferior to the produce of Amboyna as to give little encouragement for persevering. The small importance of the Company's trade to Bencoolen is shown by the fact that the average annual cost of the consignments sent there from Europe in the ten years between 1814 and 1824 did not amount to 3000*l.* The expense of the establishment was, on the other hand, very considerable, and far exceeded the revenue: the latter, during the five years from 1819 to 1824, did not average more than 7133*l.* per annum, while the average amount of charges during the same time was 92,322*l.* per annum.

The East India Company made no sacrifice therefore in delivering up Bencoolen to the Dutch government. This cession was made in 1825, at which time all the other British settlements in Sumatra were also given up in exchange for the Dutch settlements on the continent of India, including the town and fortress of Malacca.

The district or province of Bencoolen has, since its cession to the Dutch, been made dependent upon their settlement at Padang. Bencoolen district is now described as being bounded to the north and west by the district of Indrapoor, and on the east and south by Lampung. The total population is said (rather vaguely) to amount to 100,000 souls. During the occupancy of the English, the numbers were estimated at only 20,000, but the district was then not so extensive as it has since been made. Since 1825 the Dutch settlers are said to have discovered coal-mines in the interior, which produce fuel of a quality little inferior to the coal of Europe. This discovery, if the means of transport to the shore are not too costly, and if the favourable report as to quality should be confirmed, will prove of much value in the probable event of the extension of steam navigation in the eastern seas.

The town of Bencoolen is small but tolerably well built and of a pleasing appearance. It has a bad character with respect to healthiness. Fort Marlborough, which stands only a short distance inland, is said to be more healthy.

The population of Bencoolen town is of a very mixed description, including Europeans, Dutch, and English, and their descendants; Chinese, Malays, settlers from Pulo Neas, an island lying off Tapanooly Bay on the western coast of Sumatra, and some negroes.

The cultivation of the spice plantations is kept up by the Dutch, the labour being performed by slaves, who are principally brought from Pulo Neas and from the island of Bally. Debtors are likewise considered as slaves, being obliged to work for the benefit of their creditors.

Bencoolen trades with Batavia, Bengal, the Coromandel coast, and the more northern ports of Sumatra. The imports are chiefly cloths, rice, salt, opium, tobacco, sugar, and some European manufactures, part of which are re-exported, with the produce of the district, to other parts on the island, or are sent into the interior. (*Early Records of the East India Company*, inserted in the Report of the Committee of the House of Lords on the Foreign Trade of the Country in 1820 and 1821; *Report of Select Committee of the House of Commons on the Affairs of the East India Company*, 1832; Marsden's *History of Sumatra*; Count Hogendorp's *Coup d'Œil sur l'Ile de Java et les autres Possessions Néerlandaises dans l'Archipel des Indes.*)

BEND-EMIR (also written *Bandamîr* or *Bundemeer*), is the name of a river in Farsistan, or Persia Proper, the Araxes, Coros, or Cyrus of the antient Greek and Roman geographers, and sometimes called *Kur* by oriental writers. Strabo (xv. c. 3, p. 729, Casaub.) says that the founder of the Persian monarchy was originally called Agradates, but that he assumed (μετέλαβε) the name Cyrus from this river: the passage is thus read in all the MSS.; but most editors (altering μετέλαβε into μετέβαλε) make the author say that Cyrus gave the river his own name, its previous appellation being Agradates: Groskurd, the most recent German translator of Strabo, and A. F. Pott (*Etymologische Forschungen*, Introduct. p. xliv.) have given the preference to the reading of the MSS., which is doubtless the right reading. According to the map accompanying Sir William Ouseley's Travels, it has its origin in the hills towards the north of Shiraz, and flows in a direction to the S.E.E. towards the lake Bakhtegan. In its course it traverses the beautiful and productive valley of Marvdasht, or Merdesht, where it is joined by a small tributary stream from the north, the Palwâr, (according to Kinneir, the Shamier,) and passes by the celebrated ruins of Persepolis, which are situated on its left or northern side; farther on it flows through the district of Kurbâl, where it is divided into numerous channels to fertilize the ground. The part of the water which is not spent in the irrigation of the ground, falls into lake Bakhtegan, at a distance of about fifty miles towards the east from Shiraz. Niebuhr, who crossed the Bend-Emir in his way from Shiraz to Persepolis, describes it as a very rapid river, and says that a bridge of bricks, 300 feet long, was built across it. Bend-Emir is also the name of a village situated on the river. The name of both the village and the river alludes to the extensive mounds or dykes constructed here in the tenth century by the emir Azad-al-daulah, by which a tract of country of considerable extent was fertilized. (See BAND; Ouseley's *Travels*, vol. ii. p. 180, seq.; Niebuhr's *Voyage en Arabie, &c.* vol. ii. p. 98; Kinneir, *Geographical Memoir of the Persian Empire*, p. 59; Strabon's *Erdbeschreibung von* Groskurd, vol. iii. p. 187, 188, Berlin, 1833, 8vo.)

BENDER (formerly Teckin or Tigine, called by the Russians Bendery, and by the natives Tigino), a fortified place, and the chief town of the circle of Bendersko-Kdoukansk, in Bessarabia, which is the most south-western province of the Russian dominions in Europe. The town is situated in 46° 50′ N. lat., and 29° 35′ E. long. It lies on the right bank of the Dniester, and is built on the land-side in the shape of a crescent. Up to the commencement of the present century it belonged to Turkey, and was considered a post of such high military importance, that its fortifications were strengthened and enlarged by that power at various times. It is still inclosed by a wall and deep broad ditch, and retains its citadel, which is constructed on an eminence; the defences, however, have of late years been used for the erection of soldiers' quarters, magazines, &c. The streets are narrow, gloomy, and kept in a filthy state; the mosques, twelve in number, have been mostly converted to other purposes; and there are likewise an Armenian and Greek church, as well as a synagogue in the town. Bender has seven gates, and two suburbs, which are inhabited by natives, whose occupation is mostly agriculture and grazing. Its population, which in former times was 20,000, is at present reduced to less than 5000: the chief source of their support is a salt-petre work, some tanneries, iron-smithies, and three paper-mills. Its celebrity dates from the early part of the last century, when Achmet III. granted an asylum in his dominions to Charles XII. of Sweden, after he had lost his army in the battle of Pultawa, on the 8th of July, 1709, and had fled to Bender. He was permitted to take up his residence in the adjoining village of Varnitza on the Dniester, where he lived for the next four years; but by his offensive conduct, maliciously aggravated in the eyes of the Turks by the intrigues of Catherine of Russia, ultimately brought upon himself the hostility of his host, whom he had the temerity to brave by resisting several thousand men with a handful of followers in a barricaded house. His generous enemy, however, allowed his royal prisoner to escape, and make his way peaceably back to his native country. Bender was twice taken by assault in Catherine's time. On the last of these occasions, in 1771, General Panin stormed it, put the garrison and inhabitants, to the number of 30,000, to the sword, and then burnt the town. Russia, in dictating the subsequent treaty of Kutshuk-Kainardshy, (21st July, 1774,) restored the ruins of the place to the Turks. In the campaign of 1809, the Russians again assailed and captured it without much effort, but restored it to Turkey at the peace of Jassy; and it once more fell into their hands two years afterwards, in the campaign which terminated with the treaty of Bucharest, in 1812, by the terms of which Bender and the surrounding districts were ceded to Russia.

BENEDICT, SAINT, the founder of the order of Benedictine monks, was born at Nursia in the dukedom of Spoletto in Italy, about the year 480. He was sent to Rome when very young, and there received the first part of his education; when fourteen years of age he removed to Sublaco, a desert place about forty miles distant, where he was concealed in a cavern; his place of retirement, for a considerable time, being known only to his friend St. Romanus, who is said to have descended to him by a rope, and supplied him daily with provisions. The monks of a neighbouring monastery subsequently chose him for their abbot: their manners, however, not agreeing with those of Benedict, he returned to his solitude, whither many persons followed him and put themselves under his direction, and in a short time he was enabled to build no fewer than twelve monasteries. About the year 528 he retired to Monte Cassino, where idolatry was still prevalent, and where a temple to Apollo yet existed. Having converted the people of the adjacent country to the true faith, he broke the statue of Apollo, overthrew the altar, and built two oratories on the mountain, one dedicated to St. Martin, the other to St. John. Here St. Benedict also founded a monastery, and instituted the order of his name, which in time became so famous and extended all over Europe. It was here too that he composed his 'Regula Monachorum;' which does not, however, seem to have been confirmed till fifty-two years after his death, when Pope Gregory the Great gave his sanction to it.

Authors are not agreed upon the place where St. Benedict died; some say at Monte Cassino, others affirm it to have been at Rome, whither he had been sent by Pope Boniface. Stevens, in the 'Continuation of Dugdale's Monasticon,' places his death about the year 543, others in 547: the day, however, stands in the calendar fixed to March 21. Gregory the Great, in the second 'Book of his Dialogues,' has written a 'Life of St. Benedict,' and given a long detail of his supposed miracles. Dupin says that the 'Regula Monachorum' is the only genuine work of St. Benedict. Other tracts are, however, ascribed to him, particularly a 'Letter to St. Maurus,' a 'Sermon upon the Decease of St. Maurus,' a 'Sermon upon the Passion of St. Placidus and his Companions,' and a 'Discourse de Ordine Monasterii.' (See the Life by St. Gregory, already mentioned, reprinted in the *Acta Sanctorum* of the Bollandists, for the month of March, tom. iii. fol. Antv. 1658; Butler's *Lives of the Saints*, 8vo. Dubl. 1779, vol. iii. p. 231; Chalmers's *Biograph. Dictionary*, vol. iv. p. 433.) St. Gregory states that he received his account of St. Benedict from four abbots, the saint's disciples, namely Constantine, his successor at Monte Cassino, Simplicius, the third abbot of that house, Valentinian, the first abbot of the monastery of Lateran, and Honoratus, who succeeded St. Benedict at Sublaco.

BENEDICTINE ORDER. The exact year when the monks who followed the rule of St. Benedict were first established as an Order is unknown. The essence of the rule was that they were to live in a monastery subject to an abbot. The 'Histoire des Ordres Monastiques,' tom. v. 4to. Paris, 1718, upon Mabillon's authority, places the date of the monastery of Piombarole, near Monte Cassino, at least as early as the year 532, anterior to St. Benedict's death. The progress which this order made in the west, in a short time, was rapid. In France its interests were promoted by St. Maur or Maurus, in Sicily by St. Placide, in Italy by St. Gregory the Great, and in Frisia, at a later period, by St. Wilbrod. The reciprocal protection afforded to the interests of the papal see by the Benedictine Order and to the interests of the Benedictine Order by the Roman pontiffs, sufficiently account for the Order's advancement. There were nuns of this Order as well as monks; but the time and original institution of the Benedictine nuns is quite uncertain. (See Stevens's *Contin. of the Monasticon*, vol. i. p. 168.)

The Benedictine Order is said by many (see *Monast. Angl.* old edition, vol. i. p. 12, Reyner, *Apostol*, tr. i. p. 202, Stevens, vol. i. p. 164) to have been brought into England by St. Augustine and his brethren, A.D. 596, and to have continued from thence to the Dissolution under several improvements; but others (as Marsham in his *Propulaion* prefixed to the Monasticon, Patrick in his Additions to Gunton's *History of Peterborough*, pp. 234, 246, Hickes, *Dissert. Epistolaris*, pp. 67, 68, &c.) consider that the Benedictine rule was but little known in England till King Edgar's time, and never perfectly observed till after the Conquest. In the *Decem Scriptores*, col. 2232, it is said that St. Wilfrid brought it into England A.D. 666, and in the *Quindecem Scriptores*, and by Patrick in his Additions to Gunton, p. 247, with greater probability, that he improved the English church by it. It is expressly mentioned in King Kenred's charter (*Mon. Angl.* old edition, tom. i. p. 145) to the monks of Evesham, A.D. 709, and in the bull of pope Constantine granted in the same year to that monastery. (See *Mon. Angl.* ut supr., Wilkins, *Concil.* vol. i. p. 71, Spelm. vol. i. p. 213.) But Bede, who has given us a very accurate account of the state of religion in this island till A.D. 731, has nothing of it: nor is there any mention of it in the first regulation of the monks in England by Archbishop Cuthbert in the great synod at Cloveshoe. (Wilkins, *Concil.* vol. i. p. 94, Spelm. vol. i. p. 245, A.D. 747.) If Wilfrid really advanced this rule, it was not over all England, but in Kent only. (See Patrick's Additions to Gunton's *Peterborough*, p. 247.) And if the charter of King Kenred and the bull of pope Constantine be genuine (for all the antient grants produced by the monks are not so), this rule, which is there prescribed to the monks of Evesham, is said in the bull to 'have been at that time but little used in those parts.' So that, instead of the Saxon monks being all Benedictines, there were probably but few such till the restoration of monasteries under King Edgar, when St. Dunstan and St. Oswald (who had been a Benedictine monk at Fleury in France) not only favoured the monks against the secular clergy, but so much advanced the Benedictines that William of Malmesbury (*De Gestis Pontif.* l. iii.) says this order took its rise here in England from St. Oswald. The Ely historian (whose work is printed in Wharton's *Anglia Sacra*, vol. i. p. 604) says, that King Edgar gave Ethelwold the manor of Suthborne, now Sudborn, in Suffolk, to translate the rule of St. Benedict into English, which seems to confirm the opinion of its being then but little known.

All our cathedral priories were of this order, except Carlisle, and most of the richest abbeys in England. Reyner (*Apostolat.* vol. i. p. 217) says, that the revenues of the Benedictines were almost equal to those of all the other orders. Tanner (*Notit. Monast.* edit. Nasm. pp. li. lii.) enumerates one hundred and thirteen abbeys, priories, and cells of this order in England, the sum of whose revenues, at the time of the Dissolution, amounted to 57,892*l.* 1*s.* 11*d.*, besides seventy-three houses of Benedictine nuns, whose revenues amounted to 7985*l.* 12*s.* 1*d.*, making a total of 65,877*l.* 14*s.*

The Benedictines, says Tanner, were much against all new orders of religious. By the second Lateran council they were obliged to hold triennial chapters, which those of this nation generally held at Northampton. (See Widmore, *Hist. Westm. Ab.* pp. 79, 82.)

Fosbrooke, in his *British Monachism*, 4to. London, 1817, p. 109, has given an abstract of the Benedictine rule, chiefly from the *Sanctorum Patrum Regulæ Monasticæ*, 12mo. Louv. 1571. It evidently received enlargements at different times, the whole of which were consolidated in the concord of rules promulgated by Dunstan in the reign of Edgar. (See the 'Concordia Regularum S. Dunstani Cantuariensis Archiepiscopi,' printed by Reyner in his *Apostolatus Benedictinorum in Anglia*, Append. P. iii. p. 77, and republished in the first volume of Dugdale's *Monasticon.*) This concord of rules regulated the practice of the English monks till the year 1077. The Clugniacs, Cistercians, Grandmontines, Premonstratensians, and Carthusians, were, in reality, branches only of the Benedictine order, living under the rule of St. Benedict, but observing a different discipline. For a notice of the learning of the Benedictines, see St. Maur.

The habit of the Benedictine monks was a black loose coat, or a gown of stuff reaching down to their heels, with a cowl or hood of the same, and a scapulary; and under that another habit, white, as large as the former, made of flannel; with boots on their legs. From the colour of their outward habit the Benedictines were generally called Black Monks. (See Tann. *Notit. Monast.*, pref. p. viii.; and Fosbrooke, *Brit. Monach.* p. 382.) Stevens, in his *Continuation of the Monasticon*, vol. i. p. 164, says, the form of the habit of these monks was at first left to the discretion of the abbots, and that St. Benedict did not determine the colour of it. Dugdale, both in the *Monasticon* and in his *History of Warwickshire*, vol. i. p. 156, has given a representation of the Benedictine monk in his habit.

The habit of the Benedictine nuns consisted of a black robe, with a scapulary of the same, and under that robe a tunic of white or undyed wool. When they went to the choir, they had, over all, a black cowl, like that of the monks. Dugdale, in the *Monasticon*, has given an engraving of a Benedictine nun with her cowl: and Stevens, *Contin.* vol. i. p. 169, an engraving of another without her cowl.

BENEDICT I. succeeded John III. in the see of Rome, in the year 575. His name was Bonosus, and he was a native of Rome. Little is known of him except that he was on friendly terms with the Emperor Tiberius II., and that Rome in his time was threatened both by the Longobards and by the Vandals. He died in 578, and was succeeded by Pelagius II. (Platina, *Vitæ Pontificum.*)

BENEDICT II. succeeded Leo II. in 684. He waited nearly a year before his nomination, which took place in 683, was confirmed by the Emperor Constantine IV., without which confirmation he could not be consecrated. Constantine, however, exempted the Roman see from the customary tribute which was paid at the election of every new bishop, and he is said also to have ordered that in future the new bishops elected by the Roman clergy and people should be ordained, without waiting for the imperial confirmation. He also sent to Rome some locks of the hair of his two sons, Justinian and Heraclius, as a token of homage to the Roman see, which were received with great ceremony by the clergy and the people. Benedict is reported to have been pious and charitable, and well learned in the scriptures. He restored and adorned several churches at Rome, namely, those of St. Peter, Sta. Maria ad Martyres, &c. Benedict died in 685, and was succeeded by John V.

BENEDICT III. succeeded Leo IV. in 855. Between these two popes some writers, and Platina among the rest, have placed the famous female Pope Joan, whose story is now acknowledged by all parties to have been a fable first promulgated, not by Protestant writers, as is often imagined, but by one Martinus, a Pole, and a Cistercian monk, who was penitentiary to Pope Innocent IV. in the thirteenth century, and who wrote a *Chronicon Summorum Pontificum*, and another work on the antiquities of Rome, which is full of absurdities. (See Panvinio's able discussion of this much controverted point in a note to Platina's work.)

The election of Benedict III. was violently opposed by a party among the clergy of the Roman provinces, who nominated Anastasius, a Roman priest. The Emperor Louis II. being appealed to, sent his *missi* or deputies to inquire into the matter; but the deputies meeting first with the partizans of Anastasius, decided in his favour, and Anastasius making his solemn entrance into Rome, occupied the Lateran Palace, stripped Benedict of his pontifical garments, and put him in prison. The clergy of the city, however, persisted in their election of Benedict, and the people loudly supporting the same, the imperial deputies, probably better informed of the merits of the question, drove Anastasius away, and confirmed Benedict, who forgave his adversaries, except the bishop of Porto, who would not give up Anastasius, and was consequently superseded. During Benedict's pontificate, Rome suffered a great inundation from the river Tiber, which was followed by a destructive epidemic disease. The Saracens at the same time were ravaging Apulia and Campania. Benedict died in 858, and was succeeded by Nicholas I. Some particulars of this pope's life are found in Garampi's dissertation *De Nummo Argenteo Benedicti III.*

BENEDICT IV. succeeded John IX. about the year 900. The crown of Italy, after the extinction of the Carlovingian dynasty, was disputed between Berengarius Duke of Friuli, and Louis, son of Boson King of Arles or Provence. Louis, having obtained the advantage, came to Rome in 901, and was crowned Emperor and King of Italy by Benedict. But in the following year Berengarius, who had taken refuge in Germany, returned and defeated Louis at Verona, and took him prisoner. After this event, Benedict died in 903, and was succeeded by Leo V.

BENEDICT V. was elected in 964 by the Romans, in opposition to Leo VIII., while the latter was gone to the north of Italy to ask the Emperor Otho's support against his predecessor John XII., who, after being deposed by an assembly of the Roman clergy for his irregular conduct, had returned to Rome, and driven Leo from his see. John, after putting to death or cruelly mutilating several of his opponents, died suddenly, and the Romans, regardless of their previous election of Leo VIII., nominated Benedict. Otho quickly appeared before Rome with an army, and reduced the city by famine. A new assembly of the clergy was convoked, Benedict's election was declared null, and Leo was reinstated in his see. Benedict was exiled by Otho to Germany, and he died soon after at Hamburgh in 965. By several writers he is considered only as an intruder, but in the late Papal chronologies published in Italy we find him placed among the regular popes.

BENEDICT VI. succeeded John XIII. in 972. The Emperor Otho I. soon after dying in Germany, the Romans, released from the fear of that powerful sovereign, broke out into their wonted tumults, imprisoned Benedict, and a cardinal of the name of Boniface, surnamed Francone (Platina says a patrician of the name of Cincio or Cenci), caused him to be strangled in the castle of St. Angelo in 974. Cardinal Boniface assumed the papal dignity, but was shortly afterwards expelled, and fled to Constantinople. Donus II. is mentioned by some writers as the next pope, but nothing is known of him, except that he died after a few months, and was succeeded by

BENEDICT VII. of the family of Conti, who was elected in 975. He was bishop of Sutri at the time of his election. On being chosen pope, he assembled a council, and excommunicated the anti-pope Boniface. During his pontificate the Emperor Otho II. came repeatedly to Rome, while he was engaged in the war against the Greeks of Apulia and the Saracens of Calabria. Otho died at Rome in 983, and was buried in the vestibule of St. Peter's church. Benedict died about the same time, and was succeeded by John XIV. The chronology of the popes in the tenth century is rather confused, and the dates are not exactly ascertained.

BENEDICT VIII., of the family of Conti, who succeeded Sergius IV. in 1012, was a native of Tusculum. A rival candidate of the name of Gregory, after losing the election, raised a faction against Benedict, whom he drove out of Rome. Benedict, however, being supported by the Emperor Henry II., returned soon after, and in the following year, 1013, Henry and his consort Kunegund came to Rome, where they received the imperial crown from the hands of the pope. In 1016 the Saracens from Sardinia having landed on the coast of Tuscany, took the town of Luni, where they committed great ravages. Benedict assembled a force by sea and by land, attacked the Saracens, and defeated them: their chief Musat, or rather Musa, had time to escape, but his wife, whom the chroniclers call the queen, was killed, and the valuable jewels that adorned her head were sent by the pope to the Emperor Henry. This event led to the conquest of Sardinia by the Pisans, who were urged to it by the pontiff. In 1020 Benedict undertook a journey to Germany, for the purpose of inducing Henry to send an army into Italy to oppose the Greeks, who had become masters of Capua, Ascoli, and other places, and threatened to subjugate Rome itself. Henry came in the following year: he obtained several successes over the Greeks, and took Capua and Troja, and other towns of Campania and Apulia. Benedict died in 1024, and was succeeded by his brother, who assumed the name of John XIX.

BENEDICT IX., a relative, some say a nephew, of the two preceding popes, succeeded John XIX. in 1034. He was a boy at the time of his election, some say ten years old, but this is doubted by Muratori, who however, as well as Baronius, acknowledges that his election was irregular, owing to his youth, and that it was obtained through his family interest and through money, which was profusely lavished for the purpose by his father Alberico, a powerful baron. Benedict was distinguished by his licentiousness and profligacy, and by the state of anarchy in which Rome was plunged during his pontificate. The Romans at last expelled him in 1044, and chose in his stead John Bishop of Sabina, who took the name of Silvester III.; but six months afterwards Benedict returned at the head of a party, drove away his competitor, and excommunicated him. Perceiving, however, that he was held in detestation by the clergy and the people, he sold his dignity to John Gratianus, who assumed the name of Gregory VI. The Emperor Henry III., in order to put an end to these scandals, assembled a council at Sutri, which deposed all the three popes. Baronius says that Gregory VI. voluntarily renounced his claims for the peace of the church, and he places him in the series of legitimate popes. (See F. Hardouin's *History of the Councils*, concerning this of Sutri.) The original name both of Silvester and of Gregory being John, has led some writers into the error of inserting here a John XX. as another Antipope. Henry III. having entered Rome, accompanied by the fathers of the Council of Sutri, the latter, in conjunction with the clergy of Rome, elected Suidger Bishop of Bamberg, who took the name of Clement II., and was consecrated at Christmas, 1046. But in October of the following year Clement fell suddenly ill and died, and, as some suspected, of poison administered to him by the deposed Benedict, who immediately after forced himself again into the papal see, where he remained till the following July, 1048, when the Emperor Henry, at the request of the Romans, sent them Poppo Bishop of Brixen, who, on arriving at Rome, was consecrated, and assumed the name of Damasus II. But twenty-three days after his consecration he died at Palestrina, upon which the see of Rome remained vacant for more than half a year, until Bruno Bishop of Toul in Lorraine was elected in 1049, and assumed the name of Leo IX.. What became of Benedict afterwards is not clearly ascertained, nor the epoch of his death, but it is generally believed that he died in some convent. (See Muratori, *Annali d'Italia;* Peter Damianus, Baronius, and Pope Victor III.'s dialogue in the 18th vol. of the Lyons *Bibliotheca Patrum.*) The last, who was a contemporary, says positively that Benedict's first election was obtained through bribery; that he followed the steps of Simon Magus instead of those of Simon Petrus; that his conduct while pontiff was detestable; and that he sold the pontificate to Gregory VI. for a considerable sum of money. Gregory, after being deposed, went into exile to Germany, where he died in a convent. He was accompanied by the monk Hildebrand, who became afterwards known as Gregory VII.

BENEDICT X. (John Bishop of Velletri), a native of Capua, was elected by a faction after the death of Stephen IX., in 1058, but Hildebrand, Peter Damianus Bishop of Ostia, and other prelates, supported by the Empress Agnes, assembled a council at Siena, which nominated Gerard Bishop of Florence, who took the name of Nicholas II. Benedict did not submit till the following year, when Nicholas made his entrance into Rome. Panvinius and other writers do not place Benedict among the legitimate popes, but we find him in the chronological tables published in Italy.

BENEDICT XI. (Nicholas, Cardinal of Ostia) was a Dominican and native of Treviso. He was elected in 1303, after the death of Boniface VIII. He excommunicated those who had laid violent hands upon Boniface at Anagni, but he soon after forgave the Colonna family, and arranged the disputes of his predecessor with Philip the Fair, King of France. He sent Cardinal di Prato to Florence, to act as mediator between the factions which distracted that city. After a short pontificate of nine months, Benedict died at Perugia in 1304. The contemporary historians, and Dino Compagni in particular, speak highly of his character and virtues. He was succeeded by Clement V., after an interregnum of nearly eleven months.

BENEDICT XII. (Jacques Fournier, a native of France) succeeded John XXII. in 1334. The popes at that time resided at Avignon. Benedict laboured in earnest to reform the abuses and corruptions of the church, that had grown to an alarming extent under his predecessor. He was also inclined to accede to the entreaties of the Romans, and transfer the papal see again to Rome, but was prevented by the policy of the French King, Philip de Valois, supported by the influence of the numerous French cardinals at the papal court. His strictness in enforcing discipline among the monastic orders excited many enemies against him, who endeavoured to cast aspersions upon his character. He died at Avignon in 1342, and was succeeded by Clement VI. Several biographies of Benedict XII. are found in Baluze's *Lives of the Avignon Popes,* and in Muratori, *Rer. Ital. Scriptores.*

BENEDICT XIII. (Cardinal Orsini, Archbishop of Benevento) succeeded Innocent XIII. in 1724. He was simple in his habits and manners, strict in his morality, generous and charitable, and although zealous for maintaining the prerogatives of his see, yet conciliating and unwilling to resort to extremes. Unfortunately he bestowed his confidence upon Cardinal Coscia, a man of some abilities, but covetous and ambitious, and who became hateful to the Romans through his avarice and his abuse of the pope's favour. The people, however, knew how to distinguish between the favourite and his master, whom they respected for his virtues, his good intentions, his disinterestedness, and for the acts of beneficence and justice which he [illegible] The old dispute about the Bull *Unigenitus* still [illegible] the Church of France. [See CLEMENT XI.] Benedict [illegible]ceeded in reconciling in some measure the dispute[illegible] vailing on the Cardinal de Noailles, Archbishop of *Paris,* to accept the Bull, and by issuing another Bull, called *Pretiosus,* from its first word, in which he gave an explanation of the former, and an exposition of the doctrine of grace. In this pontificate King John V. of Portugal insisted on a cardinal's hat being bestowed on the Nuncio Bichi, who had been residing a long time at his court, but the congregation of cardinals being unfavourable to the grant, John broke off all correspondence with the court of Rome, drove away the subjects of the pope from his dominions, and forbade the remittance of the usual fees and tithes to Rome. The ecclesiastical affairs of Sicily also were in a state of great confusion, owing to the disputes between the *Tribunal de Monarchia* and the court of Rome on matters of jurisdiction. Benedict, by timely concessions, put an end to the quarrel. He also exerted himself to settle the controversy with the king of Sardinia respecting the right of nomination to several abbacies and other benefices in Piedmont, which, however, was not finally arranged till after his death. But he settled the dispute concerning the island of Sardinia, by waiving the pretensions of the papal investiture which had been put forth by Clement XI. He also obtained of the Emperor Charles VI. the restoration of Comacchio and its territory to the papal state. Lastly, Benedict showed himself anxious for the preservation of peace in Europe: he favoured, by means of his nuncios, the negotiations of Paris and Soissons in 1727-8, which led afterwards to the treaty of Seville in 1729 between France, Spain, England, and Holland, in which the successions of Tuscany and Parma were finally settled. Benedict increased the pension settled by his predecessors on the Pretender James Stuart, who had fixed his residence at Bologna. He died at the beginning of 1730, and was succeeded by Clement XII. Benedict XIII.'s works, including sermons written by him before his exaltation, were published at Rome in 3 vols. folio, 1728.

BENEDICT XIV. (Cardinal Prospero Lambertini of Bologna) succeeded Clement XII. in August, 1740. He was already favourably known for his extensive learning and for the suavity of his temper and manners. He began his pontificate by finally adjusting the long disputes with the court of Sardinia concerning the nomination to several abbacies and other benefices, besides certain ecclesiastical fiefs in Piedmont, which he gave up to the house of Savoy. (Botta, *Storia d'Italia,* lib. 41.) He restored likewise the good understanding between Rome and Portugal, and with the kingdom of the two Sicilies, which had been interrupted under his predecessors. He saw that the times were changed, and that the court of Rome could no longer enforce the obsolete pretensions of Gregory VII., or Innocent III.; he therefore, in his intercourse with foreign powers, assumed a tone moderate yet dignified, by which he won general confidence and respect. During the war of the Austrian succession he remained strictly neutral, and although he could not prevent the Spaniards and the Austrians, who were disputing the possession of the kingdom of Naples, from marching through his territories, on which they even fought a battle at Velletri, they stipulated not to enter his capital, and to spare, as far as it lay in the power of the respective commanders, the lives and properties of his subjects. Peace being at length restored to southern Italy, Benedict was enabled to turn his chief attention to the improvement of his own dominions. He encouraged learning, and was generous towards the learned. Rome became again in his time the seat of science and of the arts. The mathematicians Boscovich and Le Maire, the Cardinals Valenti, Querini, and Passionei, the philologist Quadrio, the architects Vanvitelli and Polani, and other distinguished men, were employed or encouraged by this pope. He embellished Rome, repaired churches, among others the splendid one of Santa Maria Maggiore, constructed magnificent fountains, that of Trevi among the rest, built the vast granaries near the Thermæ of Diocletian, and dug out the obelisk of the Campus Martius, which was afterwards raised by Pius VI., founded chairs of physics, chemistry, and mathematics in the University of Rome, added to the collection in the Capitoline Museum, established a school of drawing, enlarged the great hospital of S. Spirito, established academies for the instruction of the prelates of his court, in ecclesiastical history, in the canon law, in the knowledge of the rites and discipline of the church, &c. Nor did he neglect his native town Bologna, to whose Institute of Sciences he contributed by donations.

He instituted at Rome a congregation or board for the purpose of examining the character, morals, and other qualifications of candidates for vacant sees; and he was also very anxious for the maintenance of correct morals among his clergy. He found the treasury poor and encumbered, but, by reductions and economy, he re-established a balance in the finances of the state. He did nothing for his own family; and he is said to have forbidden his nephew, who was a senator of Bologna, coming to Rome. During the eighteen years of his reign Rome enjoyed peace, plenty, and prosperity, and half a century after his death the pontificate of Lambertini was still remembered and spoken of at Rome as the last period of unalloyed happiness which the country had enjoyed. Nor was Benedict careless of the welfare of other countries. He wrote, in 1746, to the Empress Maria Theresa in favour of the Genoese, who were subject to the most cruel exactions from the Austrian commanders; and he afterwards showed a like sympathy in favour of the poor Corsicans, who were in their turn oppressed by the Genoese. Benedict had a strong sense of moral justice, which made him hostile to violence and oppression. His tolerance is well known, and it exposed him to the censure of the rigorists among the College of Cardinals. Without exhibiting anything like indifference to the doctrines of the church of which he was the head, he showed urbanity and friendliness towards all Christians, of whatever denomination, whether kings or ordinary travellers, who visited his capital. His correspondence with the great Frederic concerning the ecclesiastical affairs of the province of Silesia, which that sovereign had conquered from Austria, was carried on by him in the most conciliatory and liberal spirit. The Protestants of Germany revered Benedict. With regard to France he carefully avoided every thing that could in the least encourage the fanatical party in that country in reviving the persecution against the Protestants of Languedoc. Seeing France distracted by quarrels between the Jesuits and the Jansenists, the court and the parliament, the priests and the philosophers, and lamenting amidst all this the licentiousness of Louis XV. and his courtiers, and the weakness and incapacity of the ministers, he used to exclaim that 'France ought indeed to be the best governed country in the world, for its government seemed to be left entirely to the care of Providence.' (Botta, *Storia d'Italia*, lib. 46.) He signed, in 1741, a concordat with Charles King of Naples, by which he checked the abuse of church immunities and *asyla*, allowed church property to be subject to taxation, restricted the ordination of priests, whose number in the kingdom was excessive, circumscribed the jurisdiction of the ecclesiastical courts, and established a mixed tribunal of churchmen and laymen for deciding on all contested questions in the interpretation of the concordat. This was the beginning of the great ecclesiastical reform which was effected in the kingdom of Naples by Charles III. and his son Ferdinand. (Colletta, *Storia del Reame di Napoli*.) He abolished the patriarchate of Aquileia, which was a source of disputes between the Venetians and the House of Austria; and he reduced the number of holidays, *feste di precetto*, which working-people were obliged to observe. Benedict was no favourer of the Jesuits, or rather of their worldly policy, and he is said to have given that society hints which, if followed, might have averted the catastrophe which overtook it after his death. Benedict was learned, not only in theology, but in history, in the classical writers, and in elegant literature, and he had a taste for the fine arts. Some of his numerous repartees, which he loved to utter in his own vernacular Bolognese dialect, are still familiar at Rome; and others may be found scattered in the various accounts of him given by contemporary travellers, especially by the Abbé Richard, in his *Voyage en Italie*. Lambertini may be said to have introduced a new system of temperate and conciliatory policy into the court of Rome, especially in its transactions with foreign powers, which has been in great measure followed by his successors. His works were published at Rome in 12 vols. 4to. The most remarkable are his treatise *De Servorum Dei Beatificatione et Beatorum Canonizatione*, in four books, a work full of historical and theological learning; *De Synodo Diocesana*, which is also much esteemed; *Institutiones Ecclesiasticæ*; *De Missæ Officio*, libri iii.: besides his *Bullarium*, or collection of bulls, issued by him, and several letters and dissertations in Italian; among others, a disquisition concerning the expediency of curtailing the number of holidays, which last, together with several controversial letters upon the same subject, were also published separately at Lucca, 1748, under the title of *Raccolta di Scritture concernenti la Diminuzione delle Feste di Precetto.* Benedict XIV. died on the 2nd of May, 1758, being past eighty years of age, and was succeeded by Clement XIII. See an account of the numerous academies he founded at Rome: *Notizia delle Academie erette in Roma per ordine della Santità di N. S. Papa Beneditto XIV.* Roma, 1740.

BENEDICT, ANTIPOPE (Pedro de Luna), a native of Aragon, was made a cardinal by Gregory XI. After the death of that pope, when the great schism broke out between Urban VI. and Clement VII., De Luna attached himself to the latter. After Clement's death in Avignon in 1394, the cardinals of his party elected De Luna as his successor, in opposition to Boniface IX., who had succeeded Urban at Rome, and he assumed the name of Benedict XIII. France and several other states which had acknowledged Clement, now acknowledged Benedict, with the understanding that he should renounce his dignity whenever required for the peace of the church. But De Luna had no intention of fulfilling his part of the engagement. Meantime, both Boniface and his successor Innocent VII. died at Rome, and the king of France and other sovereigns were anxious to put an end to the schism. The cardinals at Rome, however, elected Gregory XII., and he and Benedict excommunicated each other. France now renounced the cause of Benedict, and the cardinals of both parties agreed to assemble a council at Pisa, which deposed both popes in 1409, and elected Alexander V. Gregory, however, was still acknowledged by Ladislaus, king of Naples, and Benedict was acknowledged in Spain. Alexander V. died soon after, and the conclave assembled at Bologna, elected John XXIII. Soon after the council of Constance met, which assembly deposed John for his irregular conduct, and confirmed also the deposition of Gregory and Benedict. Martin V. was elected pope. Gregory submitted to the decision of the council, John was obliged to submit by force, but Benedict, who was in Spain, remained as tenacious as ever of his assumed dignity, and excommunicated all his antagonists. Alfonso, king of Aragon, acknowledged him, and Benedict resided at Peniscola with a few cardinals of his own appointment. At last, in 1424, Benedict died at the age of ninety. Some of his cardinals elected as his successor an obscure individual, whom they styled Benedict XIV., of whom nothing is known; while others appointed another successor, who called himself Clement VIII., but soon after made his submission to Martin V., who was at length acknowledged by the whole western church. (Dupin, *Histoire du Schisme*, and the histories of the Councils of Pisa and of Constance.)

BENEDICTION, the act of invoking the favour of God, prosperity, long life, and other blessings upon individuals. The word is derived from the Latin, *benedicere*, which originally meant 'to speak well,' or 'to praise or commend,' and was afterwards employed for 'to wish well,' (see Ducange's *Glossarium*.) The ceremony of blessing is of a very remote antiquity. We find in the Scriptures, that the patriarchs before they died, solemnly bestowed their blessing on their sons. Isaac giving by mistake to his younger son Jacob the blessing which he intended for his elder son Esau (Genesis xxvii.) is an interesting instance of this custom. In Numbers vii. 23-6, the words are specified in which the high priest was to bless the people of Israel. Aaron blessed the people, 'lifting his hand towards them.' (Leviticus ix.) Christ after his resurrection, and before parting from his disciples at Bethany, 'lifted up his hands and blessed them.' (St. Luke xxiv. 50.) In the early church, the bishop gave his blessing to the people with his hands extended towards them. In the Roman Catholic church it is the custom for the bishop to lift up his right hand towards the people with the fingers extended, and with it to describe the sign of the cross, in commemoration of the Redemption. This benediction, 'Benedictio super populum,' is also given by the bishop from the altar in the mass service, with the words 'Benedicat vos Omnipotens Deus.' The priests also give the benediction, but with some difference in the form and words, and they can only give it at mass, or while administering the sacrament, or in other solemn ceremonies; but the bishop has the power of giving it any where or upon any occasion he may think fit. In the Roman Pontificale are found the various forms of benediction. One of the most impressive instances of this ceremony is that of the pope in full pontificals, attended by the cardinals and prelates, giving his benediction 'Urbi et Orbi' on Easter Sunday after mass, from the great gallery in the front of St. Peter's church, while the vast area beneath is filled with kneeling spectators.

The benediction forms an essential part of many ceremonies of the Catholic church, such as the coronation of kings and queens, the confirmation of abbots and abbesses, the consecration of churches, altars, and sacramental vases. These are all performed by the bishop, and are accompanied by different ceremonies, such as anointing, imposing of hands upon the head of the person consecrated, &c. The benediction of church utensils, of bells, of sacerdotal garments, of churchyards, &c. may be performed by priests. The nuptial benediction, which is an essential part of the marriage ceremony, is given by the parish clergyman. The priests also in some instances give benediction to houses, fields, horses, cattle, &c., by sprinkling them with holy water. This custom of blessing those things which are for the use or support of men is of great antiquity. It is found in St. Gregory's 'Sacramentale,' and, before him, in that of Pope Gelasius I., who lived in the fifth century. The 'benedictio mensæ et ciborum,' was a general practice among all Christians before sitting down to dinner: the English custom of saying grace is a continuation of it.

There is also in Catholic churches a service which is commonly called, in Italy at least, 'the Benediction,' and is performed on particular days, and generally in the evening: after certain prayers being said or sung, the consecrated host is raised up by the officiating priest, who describes with it the sign of the cross towards the congregation.

The benedictorium is the vase containing the holy water, which is placed at the entrance of Catholic churches for the use of the people, who dip their fingers into it and cross themselves as they go in and out. The water is blessed by the priest, and is mixed with salt.

The pope begins his bulls and other communications addressed to Catholic individuals with the greeting 'Salutem et apostolicam benedictionem.' (See the Dictionary of Jurisprudence, art. *Benediction*, in the *Encyclopédie Methodique*, and also the Dictionary of Theology in the same collection.)

BENEER. A subdivision of the district of Sewad in the province or kingdom of Caubul, in Afghanistan. Beneer is separated from Sewad by steep hills, and is thinly inhabited by a tribe of Afghans. The district of Beneer, the modern boundaries of which are ill-defined, occupies a position about the 34th degree of north latitude, and the 70th degree of east longitude. It is described in the Ayîn-i-Akbari, under the name of Bembher, in the following manner. 'The length of Bembher is sixteen, and the breadth twelve coss,' (the coss varies considerably in different parts of India, being sometimes as little as one English mile, and in others places double that measure.) 'On the east lies Puckely, on the north Kinore and Cashghur, on the south Attock Benaris, and Sewad is the western extremity. There are two roads to it from Hindustan, one by the heights of Surkhaby, and the other by the Molondery hills.'

The river Burindroo, which traverses the centre of Beneer, enters the Indus about twenty miles above Torbela. A strip of land about one mile broad on each side of this river is of fertile quality, and being favourably circumstanced for irrigation, produces rice. The remainder of the country is rugged, yielding generally only a species of millet, but there are many small valleys, in which superior kinds of corn are produced. The slopes of hills are formed for the purpose of cultivation into terraces one over another. In these situations the plough cannot be introduced, neither is irrigation practicable. The principal agricultural implement used in these situations is the hoe, and as rain is the sole dependance of the cultivator for watering his fields, the harvests are precarious. (*Ayîn-i-Akbari*, by Abul Fazl; Elphinstone's *Embassy to Caubul.*)

BENEFICE, from the Latin *Beneficium*, a term applied both by the canon law and the law of England to a provision for an ecclesiastical person. In its most comprehensive sense it includes the temporalities as well of archbishops, bishops, deans and chapters, abbots and priors, as of parsons, vicars, monks, and other inferior spiritual persons. But a distinction is made between benefices attached to communities under the monastic rule (sub regulâ), which are called *regular* benefices, and those the possessors of which live in the world (in sæculo), which are thence called *secular* benefices. The writers on the canon law distinguish, moreover, between simple or sinecure benefices, which do not require residence, and to which no spiritual duty is attached but that of reading prayers and singing (as chaplainries, canonries, and chantries), and *sacerdotal* benefices, which are attended with cure of souls.

Lord Coke says, 'Beneficium is a large word, and is taken for any ecclesiastical promotion whatsoever.' (2 *Inst.* 29.) But in modern English law treatises the term is generally confined to the temporalities of parsons, vicars, and perpetual curates, which in popular language are called livings. The legal possessor of a benefice attended with cure of souls is called the incumbent. The history of the origin of benefices is involved in great obscurity. The property of the Christian church appears, for some centuries after the apostolic ages, to have been strictly enjoyed in common. It was the duty of the officers called deacons (whose first appointment is mentioned in *Acts*, cap. vi.) to receive the rents of the real estates, or *patrimonies* as they were called, of every church. Of these, as well as of the voluntary gifts in the shape of alms and oblations, a sufficient portion was set apart, under the superintendence of the bishop, for the maintenance of the bishop and clergy of the diocese; another portion was appropriated to the expenses of public worship (in which were included the charge for the repairs of the church), and the remainder was bestowed upon the poor. This division was expressly inculcated by a canon of Gelasius, pope or rather bishop of Rome, A.D. 470. (See Father Paul's *Treatise on Ecclesiastical Benefices*, cap. 7.) After the payment of tithes had become universal in the west of Europe, as a means of support to the clergy, it was enacted by one of the capitularies of Charlemagne, that they should be distributed according to this division. When the bishopricks began to be endowed with lands and other firm possessions, the bishops, to encourage the foundation of churches, and to establish a provision for the resident clergy, gave up their portion of the tithes, and were afterwards by the canons forbidden to demand it, if they could live without it. Although the revenues of the church were thus divided, the fund from which they were derived remained for a long time entirely under the same administration as before. But by degrees every minister, instead of carrying the offerings made in his own church to the bishop, for the purpose of division, began to retain them for his own use. The lands also were apportioned in severalty among the resident clergy of each diocese. But these changes were not made in all places or all at one time, or by any public edict, but by insensible degrees, as all other customs are introduced. (See Father Paul's *Treatise on Benefices*, cap. 9 and 10.) 'Some writers have attributed the origin of parochial divisions to a period as early as the fourth century; and it is not improbable that this change took place in some parts of the Eastern Empire, either in that or the succeeding age. Some of the constitutions of Justinian seem to imply that in his time (the beginning of the sixth century) the system of ecclesiastical property, as it existed in the East, was very similar to that which has prevailed in Catholic countries in modern times.' The churches, monasteries, and other pious foundations, possessed landed and other property (slaves among the rest), which, by the constitutions of Justinian, they were restrained from alienating, as they had been in the habit of doing to the detriment of their successors. (See *Authenticorum Collatio*, ii. 'on not alienating ecclesiastical lands.')

The general obscurity that hangs over the history of the Middle Ages prevents us from ascertaining, with precision, at what period the changes we have alluded to were introduced into the west of Europe. This, however, seems clear, that after the feudal system had acquired a firm footing in the west of Europe, during the ninth and tenth centuries, its principles were soon applied to ecclesiastical as well as lay property. Hence, as the estates distributed in fief by the sovereigns of France and Germany among their favoured nobles, were originally termed *beneficia* [see **Beneficium**], this name was conferred, by a kind of doubtful analogy, upon the temporal possessions of the church. Thus, the bishopricks were supposed to be held by the bounty of the sovereigns (who had by degrees usurped the right originally vested in the clergy and people of filling them up when vacant), while the temporalities of the inferior ecclesiastical offices were held of the bishops, in whose patronage and disposal they for the most part then were. The manner of investiture of benefices in those early times was probably the same as that of lay property, by the delivery of actual possession, or of some symbols of possession, as the ring and crozier, which were the symbols of investiture appropriated to bishopricks.

Benefices being thus endowed, and recognised as a species of private property, their number gradually multiplied during the ages succeeding that of Charlemagne. In England especially several causes contributed to the rise of parochial churches. 'Sometimes' (says Dr. Burn, *Eccles. Law*, title *Appropriation*) 'the itinerant preachers found encouragement to settle amongst a liberal people, and by their assistance to raise up a church and a little adjoining manse. Sometimes the kings, in their country vills and seats of pleasure or retirement, ordered a place of worship for their court and retinue, which was the original of royal free chapels. Very often, the bishops, commiserating the ignorance of the country people, took care for building churches as the only way of planting or keeping up Christianity among them. But the more ordinary method of augmenting the number of churches depended on the piety of the greater lords; who, having large fees and territories in the country, founded churches for the service of their families and tenants within their dominion. It was this that gave a primary title to the patronage of laymen; it was this made the bounds of a parish commensurate to those of a manor: and it was this distinct property of lords and tenants that by degrees allotted new parochial bounds, by the adding of new auxiliary churches.' [See ADVOWSON.]

It appears, however, from the last-mentioned author, that if there were any new fee erected within a lordship, or there were any people within the precinct not dependent on the patron, they were at liberty to choose any neighbouring church or religious house, and to pay their tithes and make their offerings wherever they received the benefits of religion. This by degrees gave rise to the arbitrary appropriation of tithes, which, in spite of positive enactment, continued to prevail till the end of the twelfth century, when Pope Innocent III. by a decretal epistle to the archbishop of Canterbury, enjoined the payment of tithes to the ministers of the respective parishes where every man dwelt. This injunction, though not having the force of a law, has been complied with ever since, so that it is now a universal rule of law in England, that tithes are due of common right to the parson of the parish, unless there be a special exemption. [For the nature of these special exemptions, see TITHES.]

The twelfth century was also the æra of an important change in the manner of investiture of ecclesiastical benefices in England. (See Blackstone, vol. ii. p. 23; Father Paul, c. 24.) Up to this time the simple donation of the patron was sufficient to confer a legal title to a benefice, provided the person to whom it was given was in holy orders, for otherwise he must be first presented to the bishop, who had power to reject him in case of unfitness; but the popes, who had in the eleventh and twelfth centuries successfully contended against every other species of ecclesiastical investiture being exercised by laymen, now procured that the presentation of the patron should not be of itself sufficient to confer an ecclesiastical benefice, even though qualified by the discretionary power of rejection (in case the benefice was given to a layman), which was already vested in the bishop. This was the origin of the ceremonies of *institution*, which is the mode of investiture of the spiritualities; and *induction*, which is the mode of investiture of the temporalities of a benefice. Where the bishop was the patron of the benefice, the two forms of *presentation* and *institution* were united in that of *collation*.

For the origin and nature of ecclesiastical patronage in England as a subject of property, the rules of law which apply to it as such, the limitations within which and the forms according to which it must be exercised, and the mode by which it may be vindicated; together with the respective rights of the bishop or ordinary, the archbishop, and the crown, in the case of lapse, see ADVOWSON; and also Burn's *Ecclesiastical Law*, art. *Advowson*, *Benefice*. But it may be mentioned in this place, that a recent stat. (3 & 4 Will. IV. c. 27) has made some important alterations in the law on this subject. 1. By the old law, suits for recovery of advowsons were not within the statutes of limitations; but the 30th sect. of the abovementioned act subjects them to a period of limitation of three successive incumbencies or sixty years, during which the enjoyment of the benefice has been by virtue of a title adverse to that of the person instituting the suit. By the 33rd section the utmost period within which an advowson can be recovered, is limited to a hundred years from the time of an adverse presentation, without any intermediate exercise of the right of patronage by the person instituting the suit, or by any persons from whom he derives his title. The 36th section of the act abolishes certain antient remedies for the disturbance of the right of patronage; so that except in certain cases, specified in the 37th and 38th sections of the act, the sole method of vindicating the right now is by writ of *Quare Impedit*. [See QUARE IMPEDIT.]

Although the popes, in denying to laymen the right of ecclesiastical investiture, had still left them in possession of the substantial part of the patronage of benefices, even this privilege was for some centuries not only very much questioned, but in many instances entirely wrested from them by papal encroachment. (Father Paul, c. 30, *et seq.*; Hallam's *Middle Ages*, vol. ii. c. 7.)

The first attacks by the popes upon the rights of private patrons (which took place towards the latter end of the twelfth century) assumed the form of letters of request called 'mandates' or 'expectatives,' praying that benefices might be conferred on particular individuals. What was first asked as a favour was soon after claimed as a right, and rules were laid down as to grants and revocations of expectatives. The popes next proceeded to claim the patronage of all benefices *vacantia in curiâ*, i. e. which fell vacant by the incumbents dying at the court of Rome. The number of these, through the management of that court, which contrived on various pretences to draw ecclesiastics of all ranks to Rome from different parts of Europe, became by degrees very considerable. But Clement V. in the beginning of the fourteenth century went beyond all his predecessors, by laying it down broadly as a maxim, that the full and free disposition of all ecclesiastical benefices belonged to the pope. (Clementines, lib. ii. tit. 5. c. 1; F. Paul, c. 35.) It followed as a consequence from this principle, that the pope could make reversionary grants or *provisions*, as they were called, during the lives of the incumbents; and that he could reserve such benefices as he thought fit for his own peculiar patronage. At the same time, dispensations from the canons against non-residence and pluralities, and permissions to hold benefices in commendam were freely granted, so that by these and similar means in some instances fifty or sixty preferments were held by the same person at once. The evils of this system were felt all over Europe. The best benefices were everywhere filled with Italian priests, ignorant alike of the language and habits of the people to whose spiritual wants they were bound to minister. England in particular suffered so much from papal encroachments during the reign of Henry III., that the English deputies at the Council of Lyons (about A.D. 1245) complained to the pope that the foreign clergy drew annually from England upwards of 70,000 marks. This remonstrance produced no effect, but the system at length became so intolerable, that a determined plan of opposition to it was gradually formed in the principal nations of western Europe. In this opposition our own ancestors took the lead, and their efforts were in the end completely successful. The parliament, assembled at Carlisle in the 35th year of Edward I., wrote a strong remonstrance to Pope Clement V. against the papal encroachments on the rights of patronage and the numerous extortions of the court of Rome. This remonstrance appears to have produced no effect, but it may be cited as a proof of the spirit of the times. The government of Edward II. was too feeble to act upon this spirit. The first prince who was bold enough to assert the power of the legislature to restrain the papal encroachments was Edward III. After complaining ineffectually to Clement VI. of the abuse of papal reservations, he (A.D. 1350) procured the famous Statute of Provisors (25 Ed. III. stat. 6) to be passed. This act provided that all elections and collations should be free according to law, and that in case any provision, collation, or reservation should be made by the court of Rome of any archbishoprick, bishoprick, dignity, or other benefice, the king should for that turn have the collation of such archbishoprick or other dignities elective, &c.

This statute was fortified by several others in this and the succeeding reigns, 27 Ed. III. stat. 1. c. 1; 38 Ed. III. stat. 1. c. 4; 3 Rich. II. c. 3; 7 Rich. II. c. 12 (which enacts that no alien shall be capable of being presented to any ecclesiastical preferment); 12 Rich. II. c. 15; 13 Rich.

II. stat. 2. c. 2 and 3; 16 Rich. II. c. 5; 2 Hen. IV. c. 3; 7 Hen. IV. c. 8; 3 Hen. V. c. 4. These statutes, which inflict very severe penalties on persons endeavouring to enforce the authority of papal bulls and provisions in England, are sometimes called, from the initial words of the writ issued in execution of the process under them, the statutes of *præmunire*; and the offence of maintaining the papal power is itself (according to Blackstone, vol. iv. p. 112) called by the name of *præmunire*. [See PRÆMUNIRE.] The statutes against papal provisions (though not very strictly enforced) remained unrepealed, in spite of the attempts of the popes and their adherents to obtain their abrogation.

The rights of ecclesiastical patronage having been thus solemnly vindicated by the English parliament, have, in their fundamental principles, remained unaltered to the present time. The ceremonies of *presentation* and *institution* in the case of lay patrons, and of *collation* where the bishop is patron, are still necessary to give a title to all benefices with cure of souls, except those which are technically called perpetual curacies and donatives; and the title so given is incomplete without corporal induction into possession of the temporalities of the benefices. There are, also, certain acts enjoined either by the canon law or statute, the non-performance of which will subject the incumbent to deprivation of the benefice into which he has been lawfully inducted.

There is no difference between institution and collation as to the action itself, but they differ somewhat in their respective consequences. Thus, by institution, the church is said to be full against all persons but the king, and if it has been full for the space of six months, this is a sufficient answer to any action by private persons, or even by the king, where he claims as a private patron and not by royal prerogative, as in case of lapse, or otherwise. But, by collation, the church is not full, so as to render a plea to that effect available in the temporal courts, except against the collator. Every clerk before institution or collation is required by the canon law to take the oath against simony, and the oath of canonical obedience to the bishop, and to declare by subscription his assent to the doctrine of the king's supremacy, to the Book of Common Prayer, and the Thirty-nine Articles. The subscription to the Thirty-nine Articles is also imposed by statute 13 Eliz. c. 12, upon all persons to be admitted to any benefice with cure of souls. Moreover, the statutes 1 Eliz. c. 1, and 1 Will. and Mary, c. 8, sec. 5, require that every person collated or promoted to any ecclesiastical benefice shall, before he takes upon himself to supply or occupy the same, take the oaths of allegiance and supremacy; and by statute 13 and 14 Car. II. c. 4 (commonly called the Act of Uniformity), every parson and vicar shall, before his admission to be incumbent, subscribe a declaration of conformity to the Liturgy of the Church of England as by law established.

The acts of institution or collation so far confer a right to the temporalities of the benefice, that the clerk may enter upon the glebe land and take the tithes, but he cannot sue for them or grant them until induction. By induction the church becomes full, even against the king, and the clerk is seised of the temporalities of the benefice, and invested with the full rights and privileges of a parson, *persona ecclesiæ*; but by the Act of Uniformity he must, within two months after he is in actual possession of his benefice, upon some Sunday, openly before his congregation, read the morning and evening prayers, and declare his assent to the Book of Common Prayer, on pain, in case of neglect or refusal, of being *ipso facto* deprived of his benefice. The same statute obliges him, on pain of deprivation, to read publicly, within three months after his subscription to the declaration of conformity to the Liturgy, the bishop's certificate of his having made such subscription, together with the declaration itself; but the statute 23 Geo. III. c. 28 makes an exception where the incumbent is prevented by some lawful impediment, to be allowed and approved of by the ordinary of the place. The same penalty of deprivation is imposed by 13 Eliz. c. 12, in case of an incumbent failing, within two months after induction, to read publicly in the church the Thirty-nine Articles, and to declare his assent to them. The 23 Geo. III. c. 28, provides, that, in case of sickness or other lawful impediment, it shall be deemed a sufficient compliance with the statute of Elizabeth if the incumbent reads the Articles, and declares his assent to them at the same time that he declares his assent to the Book of Common Prayer. Finally, by statute 1 Geo. I. sess. 2, c. 13, the parson must, within six months after his admission to the benefice, *take* the oaths of allegiance and abjuration in one of the courts at Westminster, or at the general quarter-sessions of the peace, on pain of being incapacitated to hold the benefice, and of incurring certain other disabilities therein specified. Such are the means by which a clerk's legal title as parson, rector, or vicar is acquired and maintained.

Every parson or rector of a parish with cure of souls, and where the parsonage is appropriated, every vicar, or perpetual curate, though in his natural capacity an individual, is in contemplation of law a body corporate, with perpetuity of succession. The rector or parson is entitled to the freehold of the parsonage house and glebe lands, as well as the tithes of the parish, except where a special exemption from the payment of tithes exists by prescription or otherwise; but owing to the practice of appropriation, which formerly prevailed to a great extent in England, and has been attended with very remarkable consequences, these are frequently vested in laymen, who have vicars or curates under them to perform the spiritual duties. [See ADVOWSON.] This custom was not confined to spiritual corporations aggregate, but deans and other officers in cathedrals, and in some places even parish priests, procured the privilege of appointing a vicar to perform the spiritual duties of the church, while its revenues were appropriated to themselves and their successors. Hence it happens that in some places a rector and vicar are instituted to the same church; in which case the rector is excused from duty, and the rectory is called a sinecure benefice, as being *sine curâ animarum*. (Burn's *Eccles. Law*. tit. Appropriation.) In order to effectuate an appropriation it was necessary that the patron should obtain the consent of the king and the bishop, as each of these had an interest in the patronage of the church in case of lapse, which, as a corporation never dies, could not take place after the appropriation; and upon the making an appropriation, an annual pension was reserved to the bishop and his successors, called an indemnity, and payable by the body to whom the appropriation was made. In an antient deed of appropriation preserved in the registry of the archbishop of Canterbury, the ground of the reservation is expressed to be for a recompense of the profits which the bishop would otherwise have received during the vacancy of the benefice. (Burn, *ibid.*)

After the appropriation the appropriators and their successors became perpetual parsons of the church; but if the corporation were dissolved, the perpetuity of persons being gone, the appropriation ceased, and the church recovered its rights.

This principle would have come into extensive operation at the time of the dissolution of the monasteries in England, if the legislature had not expressly provided against it. By the statutes 27 Henry VIII. c. 28, and 31 Henry VIII. c. 13, the possessions of these religious houses, and by a subsequent statute, 32 Henry VIII. c. 24, those of the Knights of St. John of Jerusalem, were all vested in the crown. In each of these statutes parsonages and tithes are expressly included, and the first two confirm the royal grants made or hereafter to be made of this property. Tithes are also included in two subsequent statutes, 37 Henry VIII. c. 4, and 1 Edward VI. c. 14, by which the possessions of chantries and religious fraternities are given to the crown. The last of these statutes empowers the king's commissioners, therein referred to, to ordain and sufficiently endow vicars in perpetuity in parish churches annexed to the religious fraternities whose possessions were confiscated by that act; and also to endow in perpetuity a schoolmaster or preacher in such places where the religious fraternities or incumbents of chantries were bound by the original foundation to keep a schoolmaster or priest. The property acquired by the crown from the above-mentioned sources, and from the dissolution of alien priories in the reign of Henry V., was freely bestowed by the kings of England, especially Henry VIII., not only upon spiritual persons and corporations, but upon laymen. Hence it is that there are so many instances in England at the present time of not merely the right to tithes, but the property of entire rectories being vested in laymen. These benefices are sometimes called lay but more commonly impropriate rectories, as being (according to Spelman) improperly in the hands of laymen. The rector is, in that case, termed the impropriator; but this appellation is now indiscriminately applied not only to lay individuals and corporations, but to all spiritual persons and corporations, who, either by virtue of antient appropriations, or by grants from the crown since the dissolution of the religious fraternities, are entitled to the tithes and other revenues of the church, without performing any spiritual duties. By statute 32 Henry VIII. c. 7, the remedies which the law had provided in the ecclesiastical courts for the subtraction of tithes are communicated to laymen, and their title to tithes is put on the same footing with that to land, by giving them the same or similar actions for vindicating their estates in those and other ecclesiastical profits against all adverse claimants whatsoever. In short, tithes and other fruits of benefices when vested in laymen, are liable to the same process of execution for debt, and subject to the same incidents of alienation, descent, escheat, and forfeiture as all other incorporated real property. Moreover, by statute 43 Eliz. c. 2, tithes impropriate are made liable to poor-rates. They are also included in the Land-tax Acts; and by the late statute of Limitations, 3 and 4 Will. IV. c. 27, actions and suits for their recovery are subject to the same periods of limitation as those for the recovery of land.

Another consequence of appropriation in England, besides the vesting the possessions of the church in laymen, was the endowment of vicarages. The appropriating corporations at first used to depute one of their own body to reside and officiate in the parish churches by turns or by lot, and sometimes by way of penance; but as this practice caused scandal to the church, especially in the case of monastic orders whose rules were thereby violated, the monks by degrees ceased to officiate personally in the appropriated churches, and this duty was committed to stipendiary vicars or curates, who were, however, removable at the will of the appropriators. One of the numerous pretexts urged by the monastic bodies for obtaining appropriations had been that they might be the better enabled to keep up hospitality in their respective houses, and that they might relieve the poor. These duties, however, were so far neglected as to give rise to general discontent. In addition to which the officiating priests were very poorly paid, and oppressed with hard service, and consequently unable to answer the calls of hospitality and charity. At length the legislature, by way of a partial remedy to these evils, enacted (15 Richard II. c. 6), 'That in every licence for the appropriation of a parish church it should be expressed that the diocesan bishop should ordain, in proportion to the value of the church, a competent sum to be distributed among the poor parishioners annually, and that the vicarage should be sufficiently endowed.' Still, as the vicar was removable at pleasure, he was not likely to insist too strictly on the legal sufficiency of the endowment. Therefore, to establish the total independence of vicars upon the appropriators, the statute 4 Henry IV. c. 12, provided, 'That from thenceforth in every church appropriated there should be a secular person ordained vicar perpetual, canonically instituted and inducted, and covenably (fitly) endowed by the discretion of the ordinary, to do divine service, and to inform the people, and to keep hospitality there; and that no religious, *i. e.* regular priest, should in anywise be made vicar in any church appropriated.' From the endowments made in pursuance of this statute have arisen all the vicarages that exist at the present day. The title of the vicar to tithes and other ecclesiastical dues, such as Easter offerings (which are said to be due to the parson or vicar of common right), and customary payments for marriages, burials, and baptisms, depends primarily upon the deed of endowment. As, however, the rector and vicar are persons equally capable in law of holding such property, the deed is not always conclusive evidence in any question that may arise between these parties as to their respective rights; but it is said, that where either of them has for a long time had undisputed enjoyment of any particular portion of the tithes or other fruits of the benefice, which is not consistent with the terms of the original deed, a variation of that deed by some subsequent instrument may be presumed in favour of such long enjoyment. The endowments of vicarages have generally consisted of a part of the glebe-land of the parsonage, and what are technically called the small tithes of the parish. In some places, also, a portion of the great tithes has been added to the vicarages. [For the legal distinction between great and small tithes, see TITHES.]

A vicarage by endowment becomes a distinct benefice, of which the patronage is vested in the impropriator or sinecure rector, and is said to be appendant to the rectory. It follows that the vicar, being endowed with separate revenues, is enabled to recover his temporal rights without the aid of the patron.

The loss of the original Act of Endowment is supplied by prescription; *i. e.* if the vicar has enjoyed any particular tithes or other fruits by constant usage, the law will presume that he was legally endowed with them.

If the impropriator, either by design or mistake, presents the vicar to the parsonage, the vicarage will be dissolved, and the person presented will be entitled to all the ecclesiastical dues as rector. [On the subject of the dissolution of vicarages, see VICARAGE.]

It is to be observed that the statute 4 Henry IV. c. 12, did not extend to appropriations made before the first of Richard II. Hence it happens that in some appropriated churches no vicar has ever been endowed. In this case the officiating minister is appointed by the impropriator, and is called a perpetual curate. He enters upon his official duties by virtue of the bishop's licence only, without institution or induction. It appears, moreover, from Dr. Burn (*Eccles. Law*, tit. 'Curate'), that there were some benefices which, being granted for the purpose of supporting the hospitality of the monasteries (*in mensas monachorum*), and not appropriated in the common form, escaped the operation of the statute of Henry IV. In this case, according to the same author, the benefices were served by temporary curates belonging to the religious houses, and sent out as occasion required; and sometimes the liberty of not appointing a perpetual vicar was granted by dispensation, in benefices not annexed to tables of the monasteries. When such appropriations, together with the charge of providing for the cure, were transferred (after the dissolution of monasteries) from spiritual societies to single lay persons (who, being incapable of serving them themselves, were obliged to nominate a person to the bishop for his licence to serve the cure), the curate by this means became so far perpetual as not to be removable at the pleasure of the impropriator, but only for such causes as would occasion the depriving of a rector or vicar, or by the revocation of the bishop's licence. (Burn, *ibid.*) Though the form of licences to perpetual cures expresses that they last only during the bishop's pleasure, the power of revocation, thus reserved to the bishop, has seldom, if ever, been exercised.

There is another kind of perpetual curacy which arises from the erection in a parish of a chapel of ease subject to the mother church. But the curacies of chapels of ease are not benefices in the strict legal sense of the word, unless they have been augmented out of the fund called Queen Anne's Bounty. The officiating ministers are not corporations in law with perpetuity of succession, as parsons, vicars, and other perpetual curates. Neither are chapels of ease subject to lapse, although the bishop may, by process in the ecclesiastical courts, compel the patrons to fill them up. But the statute 1 Geo. I. sess. 2. c. 10, provides that all churches, curacies, or chapels, which shall be augmented by the governors of Queen Anne's Bounty, shall be from thenceforth perpetual cures and benefices, and the ministers duly nominated and licensed thereunto shall be in law bodies politic and corporate, and have perpetual succession, and be capable to take in perpetuity: and that if suffered to remain void for six months they shall lapse in like manner as presentative livings. [See CHAPEL; CURATE.]

The district churches built in pursuance of several recent acts (as 58 Geo. III. c. 45; 59 Geo. III. c. 134; 3 Geo. IV. c. 72; 5 Geo. IV. c. 91; 7 and 8 Geo. IV. c. 72; 1 and 2 Will. IV. c. 38; 2 and 3 Will. IV. c. 61) are made perpetual cures, and the incumbents corporations.

A donative is a spiritual preferment, whether church, chapel, or vicarage, which is in the free gift of the patron, without making any presentation to the bishop, and without admission, institution, or induction by mandate from the bishop or any other; but the donee may by the patron, or by any other authorised by the patron, be put into possession. Nor is any licence from the bishop necessary to perfect the donee's title to possession of the donative, but it receives its full effect from the single act and sole authority of the donor. The chief further peculiarity of donatives is their exemption from episcopal jurisdiction.

The manner of visitation of donatives is by commissioners appointed by the patron. If the patron dies during the vacancy of a donative benefice, the right of nomination descends to his heir-at-law, and does not belong to his executors, as is the case with the patronage of presentative livings. Donatives, if augmented by Queen Anne's Bounty, become liable to lapse, and also to episcopal visitation. (Statute 1 Geo. I. sess. 2, c. 10.) But no donatives can be so augmented without the consent of the patron in writing, under his hand and seal. Both perpetual curates and incumbents of donatives are obliged to declare their assent to the Thirty-nine Articles and the Book of Common Prayer, in the manner prescribed by the statute 13 Eliz. c. 12, and the Act of Uniformity above-mentioned, and must also take the oaths of allegiance, supremacy, and abjuration, according to the provisions of statutes 1 Geo. I. sess. 2, c. 13, and 9 Geo. II. c. 26; and the right of patronage, both of perpetual curacies and donatives, is to be vindicated by writ of *Quare Impedit*. (Burn's *Eccles. Law*, tit. 'Donative.')

Neither the augmentation nor the alienation of benefices with cure of souls has ever been favoured by the policy of the English law. To prevent the former was one of the objects of the statutes of Mortmain, one of which (23 Hen. VIII. c. 10) expressly makes void all assurances of lands in favour of parish churches, chapels, &c.

It might have been reasonably expected that, at the time of the dissolution of monasteries, the clergy would have received back those revenues which, being originally vested in them for religious purposes, had been subsequently appropriated by the monks. Such a measure, however, was not agreeable to the temper either of King Henry VIII. or his parliaments. When that king came to a rupture with the pope, he resolved to free his dominions from the payment of first fruits and tenths to the papal treasury. The first of these taxes consisted of one year's whole profits of every spiritual preferment, according to a valuation of benefices made by the pope's authority: the second, of the tenth part of the annual profit of each benefice, according to the same valuation. The payment of these to the pope was prohibited by statute 25 Henry VIII. c. 20: and the next year by statute 26 Henry VIII. c. 3, the whole of the revenue arising therefrom was annexed to the crown. The last-mentioned statute directed these taxes to be paid according to a new valuation of ecclesiastical benefices to be made by certain commissioners appointed for the purpose. This valuation is what is still called the valuation of the king's books. The statute 26 Henry VIII. c. 3, was confirmed by statute 1 Eliz. c. 4. [See First Fruits and Tenths.]

The subsequent proceedings of Henry VIII., after the appropriation of the possessions of the monasteries, tended rather to enrich the collegiate and other corporations aggregate with the revenues of the church, than to revest them in their antient possessors. Nor was the latter object the aim of his successors, until more than a century after his death; but after the restoration of Charles II., the scandal of lay impropriations gave rise to some relaxation of the statutes of mortmain. Thus by statute 17 Car. II. c. 3, power was given to lay impropriators of tithes to annex such tithes to, or settle them in trust for, the parsonage or vicarage of the parish church to which they belonged, or for the perpetual curate, if there was no vicarage endowed: and by the same statute, in cases where the settled maintenance of the parsonage or vicarage, with cure, did not amount to the full sum of 100*l.* a year, clear of all charges and reprizes, the incumbent was empowered to purchase for himself and his successors, lands and tithes, without license of mortmain. Another statute of the same reign (29 Car. II. c. 8) confirms, for a perpetuity, such augmentations of vicarages and perpetual curacies as had been already made for a term of years by ecclesiastical corporations, on granting leases of impropriatory rectories. The act also confirms future augmentations to be made in the same manner, subject to a limitation which has since been taken off by statute 1 and 2 Will. IV. c. 45, by which the provisions of 29 Car. II. c. 8 have been considerably extended. But the principal augmentation of the revenues of the church was made under the provisions of the statute 2 and 3 Anne, c. 11. By this act, and by the queen's letters-patent made in pursuance of it, all the revenue of the first fruits and tenths was vested in trustees, for the augmentation of small benefices. This fund is what is usually called Queen Anne's Bounty, and has since been further regulated by statutes 5 Anne, c. 24; 6 Anne, c. 27; 1 Geo. I. sess. 2, c. 10; 3 Geo. I. c. 10.

The trustees, who are certain dignitaries of the church, and other official personages for the time being, are incorporated by the name of 'the governors of the Bounty of Queen Anne, for the augmentation of the maintenance of the poor clergy,' and have authority to make rules for the distribution of the fund, which rules are to be approved of by the king under his sign manual. Every person having any estate or interest in possession, reversion, or contingency, in lands or personalty, is empowered to settle such estate or interest, either by deed enrolled or will, upon the corporation, without licence of mortmain; and the corporation are empowered to admit benefactors to the fund into their body. (For the principal rules established by the corporation, with respect to augmentations and the operation of these rules, see Burn's *Eccles. Law*, tit. 'First Fruits and Tenths.')

The 1 Geo. I. sess. 2, c. 10, renders valid agreements made with benefactors to Queen Anne's Bounty, concerning the right of patronage of augmented churches in favour of such benefactors, where the agreements are made by persons or bodies corporate having such an interest in the patronage of such churches as the act renders necessary; but an agreement by a parson or vicar must be made with consent of his patron and ordinary. The governors are also empowered by the same statute to make agreements with patrons of donatives or perpetual cures for an augmented stipend to the ministers of such benefices when augmented, to augment vacant benefices, and with the concurrence of the proper parties, to exchange lands settled for augmentation.

It should be observed that a modern statute of mortmain, the Statute of Charitable Uses, 9 Geo. II. c. 36, imposed certain forms, a strict compliance with which was necessary in all gifts to Queen Anne's Bounty, whether by deed or will. But these restrictions have been removed by statute 43 Geo. III. c. 107, as far as respects gifts of real property for augmentation of the bounty; and a recent provision for the augmentation of benefices not exceeding 150*l.* per annum is made by 46 Geo. III. c. 133, which discharges all such benefices from the land-tax, without any consideration being given for the discharge, with a proviso that the whole annual amount thus remitted shall not exceed 6000*l.*

The alienation of the temporalities of benefices, even in perpetuity, was not forbidden by the common law, provided it were made with the concurrence of the principal parties interested, viz. the parson, patron, and ordinary. Thus, at the common law, lands might have become exempt from the payment of tithe by virtue of an agreement entered into between the tithe-payer and the parson or vicar, with the necessary consent, for the substitution of land in lieu of tithe. But the statute 13 Eliz. c. 10 prohibits, among other bodies corporate, parsons and vicars from making any alienation of their temporalities beyond the life of the incumbent, except by way of lease for twenty-one years, or three lives, 'whereupon the accustomed yearly rent or more shall be reserved and payable yearly during the said term.' Further restrictions are imposed by the stat. 18 Eliz. c. 11, which requires that where any former lease for years is in being, it must be expired, surrendered, or ended within three years next after the making of the new lease, and all bonds and covenants for renewing or making leases contrary to this and the last-mentioned statute are made void. The stat. 14 Eliz. c. 11, as to houses in towns, extends the term specified in the 13 Eliz. c. 10 to forty years, but prohibits leases of such houses in reversion, and allows of absolute alienation by way of exchange. But the consent of patron and ordinary is still necessary in order to make the leases of parsons and vicars binding upon their successors. It is said that about the time when these statutes were passed, it was a practice for patrons to present unworthy clergymen to their vacant benefices, on condition of having leases of those benefices made to themselves at a very low rate. The consequences of this were not unlike what ensued from the appropriation of benefices by monastic corporations: the incumbents did not reside, and the churches were indifferently served by stipendiary curates. To remedy this evil, it was provided by stat. 13 Eliz. c. 20 (made perpetual by 3 Car. I. c. 4), that no lease of a benefice with cure should endure longer than while the lessee should be ordinarily resident and serving the cure, without absence for more than eighty days in any one year, but should immediately, upon non-residence, become void; and that the incumbent should forfeit one year's profits of the benefice, to be distributed among the poor: but the statute contains an exception of the case where a parson, allowed by law to have two benefices, demises the one, upon which he is not most ordinarily resident, to his curate. The 18 Eliz. c. 11, provides that process of sequestration shall be granted by the ordinary to obtain the profits so forfeited. By stat 14 Eliz.

c. 11, bonds and covenants, and by stat. 43 Eliz. c. 9, judgments entered into or suffered in fraud of the stat. 13 Eliz. c. 20, are made void.

The 13 Eliz. c. 20, also renders void all charges upon ecclesiastical benefices by way of pension or otherwise. This last provision has been held to extend to mortgages and annuities, even if made only for the life or incumbency of the mortgager. But the strictness of the laws prohibiting all alienations by or in favour of ecclesiastical persons, has in modern times been somewhat relaxed by the legislature for purposes of public convenience. Thus the General Inclosure Act, 41 Geo. III. c. 109, and the Land-tax Redemption Act (42 Geo. III. c. 116, amended by 45 Geo. III. c. 77, 50 Geo. III. c. 58, 53 Geo. III. c. 123, 54 Geo. III. c. 17, and 57 Geo. III. c. 100) confer ample powers of purchase and alienation for such purposes.

Other acts, as 17 Geo. III. c. 53 (amended by 21 Geo. III. c. 66, and 5 Geo. IV. c. 89), empower ecclesiastical incumbents, with consent of patron and ordinary, to raise money by sale or mortgage of the profits of the benefice, for a term, for the purpose of building and repairing parsonage houses; and the governors of Queen Anne's Bounty are permitted to advance money for the same object. (See also 43 Geo. III. c. 108, and 51 Geo. III. c. 115.)

Again, the stat. 55 Geo. III. c. 147 (amended by 1 Geo. IV. c. 6, 6 Geo. IV. c. 8, and 7 Geo. IV. c. 66) empowers incumbents, with consent of patron and ordinary, and according to the forms prescribed by the act, to exchange their parsonage houses and glebe lands, and to purchase and annex to their benefice other parsonage houses and glebe lands. (See also 56 Geo. III. c. 141.) And by the above-mentioned stat. 1 and 2 Will. IV. c. 45, rectors and vicars are enabled to charge their benefices in favour of chapels of ease within their cures.

Although an ecclesiastical benefice cannot be alienated for the satisfaction of the incumbent's debts, the profits may be sequestrated for that purpose, even where the debt arises from an annuity which the incumbent has attempted to charge upon the benefice. (Vide 2 Barn. and Adolp. 734.) And this is the ordinary practice upon a judgment against a clergyman in one of the temporal courts. The writ of *fieri facias* issues against him as in the case of a layman, but the sheriff returns that he is a beneficed clerk, having no lay fee: upon which a writ of *levari facias* issues to the bishop of the diocese, by virtue of which the profits of the benefice are sequestrated until the whole debt is satisfied. (See SEQUESTRATION.)

In case of a beneficed clergyman seeking his discharge under the insolvent act, the assignees of his estate must apply for a sequestration, in order to render the profits of the benefice available for the payment of his debts. (See 7 Geo. IV. c. 57, s. 28.)

The duties and liabilities of spiritual persons come more properly under the head of CLERGY, but it is not inconsistent with the subject of the present article to mention the non-residence of spiritual persons upon their benefices, which (besides being cognizable in the ecclesiastical courts) is visited with severe penalties by different acts of parliament. The principal of the old enactments on the subject is stat. 21 Hen. VIII. c. 13 (amended and enlarged by 25 Hen. VIII. c. 16; 28 Hen. VIII. c. 13, and 33 Hen. VIII. c. 28), which imposes certain penalties upon persons wilfully absenting themselves from their benefices for one month together, or two months in the year.

But this act excepts the chaplains to the king and royal family, those of peers, peeresses, and certain public officers, during their attendance upon the household of such as retain them; and also all heads of colleges, magistrates, and professors in the universities, and all students under a certain age residing there *bonâ fide* for study. And the king may grant dispensations for non-residence to his chaplains, even when they are not attending his household. The residence intended by the law must be in the parsonage house, if there be one; but if there be no house of residence, the incumbent must reside within the limits of the benefice, or of the city, town, or parish where the benefice is situate, provided such residence be within two miles from the church or chapel of the benefice; and in all such cases a residence may be appointed by the bishop, even without the limits of the benefice. These acts (which extend also to archdeaconries, deaneries, and dignities in cathedral and collegiate churches) have been consolidated and amended by stat. 57 Geo. III. c. 99. By this act, every incumbent absenting himself from a benefice with cure, without licence, for the period of three months consecutively, or at several times for so many days as are equal to this period, and abiding elsewhere than at some other benefice, forfeits for an absence exceeding three months, but not above six months, one-third of the annual value of the benefice, clear of all outgoings except the curate's salary. Absences of a longer duration are subjected to proportional penalties, and the whole of the penalty in each case is given to the party suing, together with such costs as are allowed by the practice of the court where the action is brought. All who were exempt from residence before the last statute are still exempt, and the exemption is extended to several others, including public officers in either of the two universities, and tutors and public officers in any college. Students in the university are exempted till they are thirty years of age; and the king's prerogative to grant dispensations for non-residence to his chaplains is not affected by the statute. But no person can have the benefit of an exemption, unless he make a notification of it every year, within six weeks from the 1st of January, to the bishop of the diocese. Besides the exemptions, the bishop may grant a licence for non-residence for the illness or infirmity of an incumbent, his wife, or child, and for other causes specified in the act; and if the bishop refuses a licence, the incumbent may appeal to the archbishop. The bishop may also grant licences for non-residence for causes not specified in the act, but in that case the licences must be allowed by the archbishop. Licences may be revoked, and no licence can continue in force above three years from the time of its being granted, or after the 31st of December in the second year after that in which it is granted. The act also contains directions with respect to the lists of exemptions and licences for non-residence, which are to be kept in the registry of each diocese for public inspection.

The act 57 Geo. III. c. 99 provides also for the appointment of licensed curates in benefices, the incumbents of which are absent with or without licence or exemption, and regulates the salaries of such curates upon a scale proportioned to the value of each benefice, and the number of the population within its precincts; and in all cases of non-residence from sickness, age, or other unavoidable cause, the bishop may fix smaller salaries at his discretion.

There are other liabilities which parsons, vicars, and other spiritual persons necessarily incur in respect of their benefices. Thus, by 43 Eliz. c. 2, they are rateable in respect of their benefices for the relief of the poor; and, although the burden of the repairs of the body of the church falls upon the parishioners, the rector (and, where the parsonage is appropriated, the impropriator) is liable for the repairs of the chancel. And the stat. 35 Ed. I. sess. 2, the object of which was to prohibit rectors from cutting down trees in churchyards, contains an express exception of the case where such trees are wanted for the repair of the chancel.

Besides the liability implied in the last-mentioned prohibition, all ecclesiastical incumbents are liable for dilapidations. A dilapidation is said to be the pulling down or destroying in any manner any of the houses or buildings belonging to a spiritual living, or suffering them to run into ruin or decay, or wasting or destroying the woods of the church, or committing or suffering any wilful waste in or upon the inheritance of the church. Such proceedings may be prevented by the spiritual censures of the ordinary; and the profits of the benefice may be sequestered until the damage be repaired; and the Court of Chancery will, at the suit of the patron, grant an injunction to restrain this as well as every other species of waste. Or the next incumbent may recover damages for dilapidations either in the Spiritual Court, or in an action on the case at common law against his predecessor, or, if he be dead, against his personal representatives.

The remedies for the subtraction of tithes given by the law of England to the clergy are sufficiently ample. Thus stat. 2 and 3 Ed. VI. enables them either to recover the tithes themselves in the Spiritual Courts, together with the double value of such tithes in addition, or to recover the treble value in the temporal courts. Some recent statutes, and particularly 53 Geo. III. c. 127, and 7 Geo. IV. c. 15, have also given a summary remedy for the recovery of tithes under a certain amount before two justices of the peace, who are empowered to levy them by distress. But questions of title to tithes belong to the temporal courts only, and are generally determined by a suit on the equity side of the Court of Exchequer. The subject of the different species of defence to suits of this nature will be more properly considered under the head of TITHES; but it should be observed that by the old law, upon the principle of 'nullum tempus occurrit ecclesiæ,' there was no period of limitation to these suits, so that the church could, at any distance of time, recover land or tithes, which it could be proved to have enjoyed within legal memory, *i. e.* since the accession of Richard I. To remedy this with respect to tithes, the stat. 2 and 3 Will. IV. cap. 100, after appointing periods of limitation for tithe suits by the king, by lay persons, and corporations aggregate, whether spiritual or temporal, provides that in all such suits by spiritual persons or corporations sole, a claim of discharge from the payment of tithes by the customary commutation called a *modus*, or of a total exemption by prescription, shall be indefeasible upon evidence showing that the *modus* was paid or exemption had for the whole time that two persons in succession may have held the benefice in respect of which tithes are claimed, and for not less than three years after the appointment, institution, or induction of a third person thereto. And it is further provided, that if the period of the holding of such two persons be less than sixty years, it shall be necessary, in order to establish the *modus* or the exemption, to show its existence for so long a time as with that period shall make up the full period of sixty years; and also for the further period of three years from the appointment, institution, or induction of a third person to the same benefice. The statute contains an exception for the cases where it shall be proved that the *modus* was paid, or the exemption had, by consent evidenced by some deed or writing.

And with respect to actions and suits for recovery of lands or rents by parsons, vicars, or other spiritual corporations sole, the 29th sect. of 3 and 4 Will. IV. c. 27 subjects them to the period of limitation of two successive incumbencies, together with six years after the appointment of a third person to the benefice, or in case of this period not amounting to sixty years, then to the full period of limitation of sixty years.

Having thus shown how possession of the different kinds of benefices in England is acquired and maintained, and what are the principal legal incidents of such possession, it remains to consider how benefices may be vacated or avoided. And this may happen several ways: 1. By the death of the incumbent; 2. By resignation, which is made into the hands of the ordinary, except in the case of donatives, which must be resigned into the hands of the patron, who alone has jurisdiction over them. The resignation must be absolute, unless it be for the purpose of exchange, in which case it may be made on the condition that the exchange shall take full effect. Where two parsons wish to exchange benefices, they must obtain a licence from the ordinary to that effect; and if the exchange is not fully executed by both parties during their lives, all the proceedings are void. (See Burn, *Eccles Law*, tit. *Exchange*.) 3. A benefice may be avoided by the incumbent's being promoted to a bishoprick; but the avoidance in this case does not take place till the actual consecration of the new prelate. The patronage of the benefice so vacant belongs for that turn to the king, except in the case of a clergyman, beneficed in England, accepting an Irish bishoprick: for no person can accept a dignity or benefice in Ireland until he has first resigned all his preferments in England; so that in this case the patron, and not the king, has the benefit of the avoidance. The avoidance may be prevented by a licence from the crown to hold the benefice in commendam. Grants in commendam may be either temporary or perpetual. They are said to be derived from an antient practice in the Roman Catholic church, whereby, when a church was vacant, and could not be immediately filled up, the care of it was commended by the bishop or other ecclesiastical superior to some person of merit, who should take the direction of it until the vacancy was filled up, but without meddling with the profits. This practice, however, in process of time being abused for the purpose of evading the provisions of the canon law against pluralities, became the subject of considerable complaint, and of some restraints, by the authority of popes and councils, and particularly of the celebrated Council of Trent in the sixteenth century. (Vide Father Paul's *Treatise on Benefices*.) A benefice may be granted in commendam to a bishop after consecration, but then the patron's consent must be obtained, in order to render the commendam valid. [See COMMENDAM.] If the incumbent of a donative be promoted to a bishoprick, no cession takes place, but it seems that he may retain the donative without a commendam. (See Viner's *Abr.* tit. *Presentation*, K. 6.)

4. If an incumbent of a benefice with cure of souls accepts a second benefice of a like nature without procuring a dispensation, the first, by the provisions of the canon law, is so far void, that the patron may present another clerk, or the bishop may deprive; but till deprivation no advantage can be taken by lapse. And the stat. 21 Hen. VIII. c. 13 provides, that where a person, having a benefice of the value of 8*l.* per annum or upwards, according to the valuation of the king's books, accepts any other, the first shall be adjudged void, unless he obtains a dispensation in conformity with the provisions of the statute. And dispensations not in conformity with the statute are declared void, and heavy penalties are imposed upon persons endeavouring to procure them. But by virtue of such dispensations, spiritual persons of the king's council may hold three benefices with cure, and the other persons qualified by the statute to receive dispensations may each hold two such benefices.

The persons who may receive dispensations are the king's chaplains, those of the queen and royal family, and other persons who are allowed by the statute to retain a certain number of chaplains, and also the brethren and sons of all temporal lords, the brethren and sons of knights, and all doctors and bachelors of divinity and law, admitted to their degrees in due form by the universities. The privilege is not extended to the brethren and sons of baronets, as the rank of baronet did not exist at the time when the statute was passed. [See CHAPLAIN.]

The statute expressly excepts deaneries, archdeaconries, chancellorships, treasurerships, chanterships, prebends, and sinecure rectories. Donatives are within the statute, if a donative is the first living; but if a donative is the second living taken without a dispensation, the first is not made void by the statute, the words of which are 'instituted and inducted to any other,' words not applicable to donatives. But it seems that both in the cases excepted by the statute, and in the case where the second living is a donative, a dispensation is equally necessary in order to hold both preferments, as otherwise the first would be voidable by the canon law.

The stat. 36 Geo. III. c. 83 has brought chapels and churches, augmented by Queen Anne's bounty, within the Statute of Pluralities, by enacting that such churches and chapels shall be considered as presentative benefices, and that the license to serve them shall render other livings voidable in the same manner as institution to presentative benefices. It appears that both by the common law, and by the provisions of stat. 37 Hen. VIII. c. 21, and 17 Char. II. c. 3, a union or consolidation of two benefices into one might with consent of patrons, ordinaries, and incumbents, be made in such a manner as not to be affected by the Statute of Pluralities. (See CHURCH, and Burn's *Eccles. Law*, tit. *Union*.)

For the manner of obtaining dispensations from the archbishop, and for the form of such dispensations, and of the confirmation thereof by the lord chancellor, and the provisions which the canon law requires to be inserted in such dispensations, see Burn's *Eccles. Law*, title *Plurality*.

5. Another mode of avoidance of a benefice, is by deprivation under a sentence of an ecclesiastical court. The principal causes on which sentence of deprivation is usually founded, are heresy, blasphemy, gross immorality; or conviction of treason, murder, or felony.

6. A benefice may be avoided by act of the law; as where the incumbent omits or refuses to subscribe the Thirty-Nine Articles, or declaration of conformity to the Liturgy, or to read the Articles or Book of Common Prayer, in pursuance of the statutes which render those acts necessary. But the most remarkable mode of avoidance which is to be classed under this head, is that for simony, in pursuance of the stat. 31 Eliz. c. 6. By this statute for the avoiding of simony, it is among other things enacted, that if any patron, for any sum of money, reward, profit, or benefit, or for any promise, agreement, grant, bond, of or for any sum of money, reward, gift, profit, or benefit, shall present or collate any person to an ecclesiastical benefice with cure of souls or dignity, such presentation or collation shall be utterly void, and the crown shall present to the benefice for that turn only. The statute also imposes a penalty upon the parties to the simoniacal contract to the amount of double the value of a year's profit of the benefice, and for ever disables the person corruptly procuring or accepting the benefice from

enjoying the same. And by stat. 12 Anne, sess. 2. c. 12, a purchase by a clergyman, either in his own name or that of another, of the next presentation *for himself*, is declared to be simony, and is attended with the same penalties and forfeiture as are imposed by the statute of Elizabeth. Upon the construction of this statute of Elizabeth it has been held, that if the next presentation can be shown to have been purchased with the intention of presenting a particular person, who, upon a vacancy taking place, is presented accordingly, this fact is sufficient to render the transaction simoniacal. An exception has indeed been made in the case of a father providing for his son by the purchase of a next presentation, but the principle of this exception has lately been denied. (Vide 2 B. & C. 652.)

The circumstance of the incumbent being at the point of death at the time of the contract, may also vitiate the transaction; except where the fee simple of the advowson is purchased, in which case it has been decided that the knowledge of the state of the incumbent's health does not make the purchase simoniacal.

It has been a question much agitated in our courts, whether a presentation is valid where the person presented enters into a bond or agreement, either generally to resign the benefice at the patron's request, or to resign it in favour of a particular person specified in the instrument. After several contrary decisions in the courts below, it was finally decided by the House of Lords towards the latter end of the last century, that general bonds of resignation were simoniacal and illegal. A similar decision has lately been made by the same tribunal with respect to bonds of resignation in favour of specified persons. As there is no objection on the grounds of public policy to the last-mentioned instruments, if restrained within due limits, the interference of the legislature has been thought necessary in order to regulate transactions of this nature. On this account, after a retrospective act (7 & 8 Geo. IV. c. 25) had been passed, to remedy the hardships that might otherwise have been occasioned by the last-mentioned judgment of the House of Lords, it was finally enacted by the 9 Geo. IV. c. 94, that every engagement, *bonâ fide* made for the resignation of any spiritual office or living, in favour of a person, or one of two persons to be specially named therein, being such persons as were mentioned in a subsequent section of the act, should be valid and effectual in the law, provided such engagement were entered into before the presentation of the party entering into the same. By the section referred to, where two persons are specially named in the engagement, each of them must be, either by blood or marriage, an uncle, son, grandson, brother, nephew, or grandnephew of the patron (provided the patron is not a mere trustee), or of the person for whom the patron is a trustee, or of the person by whose direction the presentation is intended to be made, or of any married woman whose husband in her right is patron, or of any other person in whose right the presentation is intended to be made. The deed containing the engagement to resign must be deposited for inspection with the registrar of the diocese wherein the benefice is situated, and every resignation made in pursuance of such an engagement must refer to the same, and state the name of the person for whose benefit it is made and becomes void, unless that person is presented within six months. The statute is limited in its operation to cases where the patronage is strictly private property.

There are certain benefices of which the patronage is either by custom or act of parliament vested in certain public officers or corporations. Thus, the lord chancellor has the absolute patronage of all the king's livings which are valued at 20*l*. per annum or under in the king's books. It is not known how this patronage of the chancellor was derived; but it appears from the rolls of parliament in the 4th Ed. III., that the chancellor at that time had the patronage of all the king's livings of the value of 20 marks or under, and it is not improbable that at the time of making the new valuation of benefices in the reign of Henry VIII., a new grant was made to the chancellor by the crown, in consideration of the altered value of ecclesiastical property. By stat. 3 James I. c. 5, popish recusants are disabled from exercising any right of ecclesiastical patronage, and the patronage of livings in the gift of such persons is vested in the two universities, according to the several counties in which the livings are situate. This disability was confirmed by the subsequent statutes 1 Will. & Mary, c. 26, 12 Ann. sess. 2. c. 14, and extended to cases where the right of patronage was vested in a trustee for a papist; and is not removed (along with the other disabilities affecting Roman Catholics) by stat. 10 Geo. IV. c. 7. But the last-mentioned act provides, that where any ecclesiastical patronage is connected with any office in the gift of the crown, which office is held by a Roman Catholic, the patronage, so long as the office is so held, shall be exercised by the archbishop of Canterbury.

Though the stat. 10 Ann. c. 12 restored the rights of patronage in Scotland (which had been abolished by the act of the Scotch parliament which established the presbyterian form of church government at the beginning of Will. III.'s reign), this law was so unpopular that it was for a long time resisted, and became almost nugatory. The people gradually assumed to themselves the privilege of approving of their pastors before they were inducted; and this popular sanction, which was denominated a *call*, was regarded as indispensable, and as possessing more authority than the presentation of the patron. The General Assembly of the Church of Scotland in 1752 (chiefly through the influence of the historian Robertson) passed a vote censuring this practice, and vindicating the rights of patronage as established by the legislature. (See Stewart's *Life of Robertson*.) It seems, however, to have been the occasional though not uniform practice of that church subsequently (notwithstanding positive law) to require a certain concurrence of the people before the person presented to a benefice was invested with the cure of souls. (See Smith's *Wealth of Nations*, book v. chap. 1.) This concurrence appears, however, to have been, in a great measure, a matter of form, until a recent determination of the General Assembly declared that a call should be indispensable in all cases. The Scotch law upon this subject is quite unsettled, and obviously requires the interference of the legislature. The church of Ireland being the same with that of England, the ecclesiastical polity of each is in its main principles the same. The same law of ecclesiastical patronage, the same classification of benefices, the same circumstances of lay impropriations, and in short, the same ecclesiastical privileges and disabilities may prevail in each country. But a most important alteration in the distribution of the revenues of the Irish church was effected by the 3 & 4 Will. IV. c. 37, amended by 4 & 5 Will. IV. c. 90. By this act certain ecclesiastical commissioners are established as a corporation, for the augmenting of small livings out of the funds, which come into their hands by virtue of the act, and for other ecclesiastical purposes. The funds in question are to arise, partly from the revenues of certain bishopricks which are abolished, and the surplus revenues of the rest above certain limits fixed by the act; partly from the money paid by the tenants of lands held under bishops' leases renewable for ever, for a conversion of such leasehold interest into a perpetuity; and partly from a tax levied on all ecclesiastical dignities and benefices, according to a scale of taxation specified in a schedule to the act; in consideration of which tax all first fruits are abolished. The commissioners are invested with extraordinary powers by the act. Thus, they have authority to disappropriate benefices united to dignities, and to unite them to vicarages in lieu thereof. They have also the power of suspending the appointment to benefices which are in the gift either of the crown, of archbishops, bishops, or other dignitaries, or of ecclesiastical corporations, where it appears that divine service has not been performed within such benefices for three years before the passing the act. The subject of the better regulation of the revenues and discipline of the Irish church still (1835) engages the attention of the legislature.

We have already mentioned the attempts of the popes to acquire the right of patronage to all ecclesiastical benefices in Europe, and the successful measures that were taken in England for resisting their pretensions. After ineffectual attempts had been made at the councils of Constance and Basle in 1414 and 1433 to check the papal encroachments, each of the principal European governments seems to have asserted in some measure its own ecclesiastical independence, either by entering into concordats with the pope, or assuming the right of controlling his pretensions by national legislation. The latter course seems to have been adopted by Spain towards the end of the fifteenth century. (See Hallam's *Middle Ages*, vol. ii. p. 361.) The emperor of Germany in 1448 entered into a concordat at Aschaffenburg with the pope, which is said to be still the law of the Catholic states of Germany. By this treaty the pope ob tained the right of collation to all benefices that fell vacant during six alternate months of the year. By the Pragmatic Sanction of Charles VII. of France, published in 1438, all mandates and reservations with respect to benefices in that country were abolished for the future. This ordinance was followed, in the beginning of the sixteenth century, by the concordat of Francis I. and Leo X., which remained till the time of the French revolution a fundamental law of the Gallican church. By this treaty the pope gave up his indefinite claims to the patronage of benefices, and received a small stipulated patronage in return; and the substantial part of the patronage of bishoprics was vested in the crown. The modern concordat of Pius VII. with Napoleon, though destructive of the liberties of the Gallican church, does not appear, so far as respects the right of the pope to interfere with the patronage of benefices, to be a material innovation upon the concordat of Francis I. [See CONCORDAT.]

For the numerous abuses with respect to the patronage, acquisition, and transmission of benefices that prevailed in the Roman Catholic Church, especially in Italy, during the fifteenth and sixteenth centuries, see Father Paul's *Treatise on Benefices*, cap. 44-46.

The Council of Trent in 1547 attempted to reform some of these evils, as that of pluralities and commendams, hereditary succession to benefices, and non-residence: but left the great abuse of papal reservations untouched. The consequence of this, according to Father Paul (cap. 50), was that in his time (at the beginning of the seventeenth century) the reservations were multiplied to such a degree, that the pope had five-sixths of the benefices in Italy at his disposal, with very reasonable hopes that the remaining sixth would go the same way. In confirmation of this statement, the same author gives a list of the benefices which at that time came under the pope's patronage by reservations; and concludes with saying, 'Whoever shall put these reservations together will be found to have done the pope no wrong in the calculation, and that he hath at least five times as many collations as all the other collators put together.'

The following Table is abstracted partly from a Parliamentary Return presented to the House of Commons in 1834, and partly from the Report of the Commissioners appointed to inquire into the Ecclesiastical Revenues of England and Wales, published June, 1835:—

Total Number of Parishes, 11,077; of Churches and Chapels, 11,825; Population, 13,897,187.

A. Diocese and Number of Benefices in each returned to the Commissioners, including sinecure Rectories, but exclusive of Benefices annexed to other Preferments. Total Number of Benefices, 10,517. B. Aggregate Amount of the gross Incomes of Incumbents in each Diocese, exclusive as before mentioned. Total, 3,193,498*l.* C. Number of Curates in each Diocese. Total, 5,227. D. Amount of Stipends to Curates in each Diocese. Total, 424,519*l.* E. Number of Benefices in each Diocese not returned to the Commissioners. Total 178.

The Annual Average for each person upon the Total Gross Income returned is 303*l.*; and the Annual Average upon the Total Net Income returned is 285*l.* The Annual Average of the Curates' Stipends is 81*l.*

The Total Number of Benefices in England and Wales, including those not returned to the Commissioners, but exclusive of those annexed to other Preferments (21 in number), is 10,718. Of these Benefices 297 are under 50*l.*; 1629 from 50*l.* to 100*l.*; 1602 from 100*l.* to 150*l.*; 1354 from 150*l.* to 200*l.*; 1979 from 200*l.* to 300*l.*; 1326 from 300*l.* to 400*l.*; 830 from 400*l.* to 500*l.*; 954 from 500*l.* to 750*l.*; 323 from 750*l.* to 1000*l*; 134 from 1000*l.* to 1500*l.*; 32 from 1500*l.* to 2000*l.*; 18 from 2000*l.* and upwards. Of these last, one is the rectory of Stanhope in the diocese of Durham, of the net annual value of 4843*l.*; and another is the rectory of Doddington in the diocese of Ely, of the net annual value of 7306*l.* The diocese of Sodor and Man is included in the total number of benefices.

The Total Gross Income of the Benefices in England and Wales, including those not returned, and calculated upon the Average of those returned, is 3,251,159*l.*; and the Total Net Income of the same is 3,055,451*l.*

If the amount of the Curates' Stipends, which is included in the Income of the Incumbents, is subtracted therefrom, the Net Income returned will be reduced to 2,579,961*l.*, giving an Average of 241*l.* to each Incumbent.

Table classing the Patronage of Benefices, and showing the Number possessed by each Class.

The above classification comprises only the patronage *returned* to the Commissioners. There are 178 non-returns, and 86 returned omitting the patronage.

As the patronage is frequently divided between different classes of patrons, and is included under each, it is obvious that the aggregate total of the above numbers will not agree with the total number of benefices.

* This includes the patronage or nomination exercised by rectors and vicars.

† This number does not comprise the livings in the patronage of the dean and canons of Christ Church, which is included among the deans and chapters; and it is further to be observed, that united livings, and livings with chapels annexed, have in either case been treated as single benefices.

Table, classing the Appropriations and Impropriations; showing the Number possessed by each Class, and the Number of Cases in each Diocese in which the Vicarage is partly or wholly endowed with the Great Tithes.

The number of vicarages of which the impropriations have not been returned to the Commissioners, is 223.

Where the impropriation or appropriation of the great tithes is shared between owners of different classes, it is included under each class.

There are some few cases of rectories in which the rector has only a portion of the great tithes, the remainder being the property of a spiritual person or body, or of a lay-impropriator; and in Jersey and Guernsey the benefices are merely nominal rectories, the incumbent not being entitled in any case to more than a portion (generally one-third) of the great tithes, the Crown or governor taking the residue; and in some cases the whole goes to the Crown or governor.

BENEFI'CIUM, a Latin word, literally 'a good deed;' also 'a favour,' 'an act of kindness.' This word had several technical significations among the Romans.

When a proconsul, proprætor, or quæstor, returned to Rome from his province, he first gave in his accounts to the treasury; after which he might also give in the names of such persons as had served under him in the province, and by their conduct had deserved well of the state. To do this was expressed by the phrase, 'in beneficiis ad ærarium deferre,'—'to give in to the treasury the names of deserving persons;' and in the case of certain officers and persons, this was to be done within thirty days after the proconsul, &c. had given in his accounts. The object of this practice was apparently to recommend such individuals to public notice and attention, and in many cases it would be a kind of introduction to future honours and emoluments. It does not seem quite certain, if money was given to those thus recommended, in the time of Cicero. (Cicero, *ad Divers.* V. 20. *Pro Archia,* 5.) Beneficium, in another sense, means some honour, promotion, or exemption from certain kinds of service, granted by a Roman governor or commander to certain of his soldiers, hence called Beneficiarii. (Cæsar, *de Bello Civili,* i. 75. iii. 88; Sueton. *Tiber.* 12.) Numerous inscriptions given in Gruter show how common this practice was: in some of them the title is represented by the initial letters B.F., only; Beneficiarius Legati Consularis (li. 4); B.F. Proconsulis (cxxx. 5.) &c. Under the emperors, beneficia appear to have signified any kind of favours, privileges, or emoluments granted to a subject by the sovereign; and Suetonius observes (*Titus,* 8.) that all the Cæsars, in conformity with a regulation of Tiberius, considered that, on their accession to the supreme power, all the grants (beneficia) of their predecessors required confirmation; but Titus by one edict, without solicitation, confirmed all grants of previous emperors. The grants made by the emperors, which were often lands, were entered in a book called the Liber Beneficiorum, which was kept by the chief clerk of benefices, under the care of the Comes Rerum Privatarum of the emperor; or it was kept by a person entitled 'A Commentariis Beneficiorum,' or clerk of the benefices, as we learn from a curious inscription in Gruter (DLXXVIII. 1.) This inscription, which is a monumental inscription, is in memory of M. Ulpius Phædimus, who among other offices held that of clerk of benefices to Trajan: the monument was erected in the reign of Hadrian, A.D. 131, by Valens Phædimianus, probably one of the same family, who styles himself wardrobe-keeper (a veste).

Beneficium, in the civil law, signifies any particular privilege: thus it is said (*Dig.* i. 4. 3.) that the beneficium of the emperor must be interpreted very liberally; and by the Julian law, *de bonis cedendis*, a debtor was said to receive the benefit (beneficium) of not being taken to prison. (Codex vii. Tit. 71.)

Beneficium, among the writers of the middle ages, signified any grant of land from the fiscus, that is, the private possessions of the king or sovereign, or any other person, for life; so called, says Ducange, because it was given out of the mere good will (beneficium) and liberality of the grantor. But it is evident from what we have said, that this kind of grant was so called, after the fashion of the grants of the Roman emperors. A beneficiary grant in the middle ages appears to have been properly a grant for life, that is, a grant to the individual, and accordingly corresponds to *usufructus*, and is opposed to *proprietus*. The name beneficium, as applied to a feudal grant, was afterwards changed for that of feudum; and the terms beneficium and feudum are often used indifferently in writings which treat of feuds. [See Feud.] For further remarks on the term beneficium, see Ducange, *Glossarium, &c.*; and Hotman, *Commentarius Verborum Juris, Opera.* Lugd. fol. 1599.

BENEFIT OF CLERGY. The privilege or exemption thus called had its origin in the regard which was paid by the various sovereigns of Europe to the early Christian Church, and in the endeavours of the popes to withdraw the clergy altogether from secular jurisdiction. In England, these attempts, being vigorously resisted by our earlier kings after the Conquest, only succeeded partially and in two particular instances, namely, in procuring, 1. the exemption of places consecrated to religious purposes from arrests for crimes, which was the origin of sanctuaries [see Sanctuary]; and 2. the exemption of clergymen in certain cases from criminal punishment by secular judges. From the latter exemption came the benefit of clergy, which arose when a person indicted for certain offences pleaded that he was a clerk or clergyman and claimed his *privilegium clericale.* Upon this plea and claim the ordinary appeared and demanded him; a jury was then summoned to inquire into the truth of the charge, and according to their verdict the accused was delivered to the ordinary either as *acquit* or *convict*, to undergo canonical purgation, and then to be discharged or punished according to the result of the purgation. This privilege, however, never extended to high treason nor to offences not capital, and wherein the punishment would not affect the life or limb of the offender (*quæ non tangunt vitam et membrum*). It is singular that previously to the statute 3 and 4 Will. III., which expressly includes them, this privilege of clergy never extended by the English law to women, although it is clear that, by the canon law, nuns were exempted from temporal jurisdiction.

In early periods of the history of this privilege in England, the benefit of clergy was not allowed unless the prisoner appeared in his clerical habit and tonsure to claim it: but in process of time, as the original object of the privilege was gradually lost sight of, this ceremony was considered unnecessary, and the only proof required of the offender's clergy was his showing to the satisfaction of the court that he could read, a rare accomplishment, except among the clergy, previously to the 15th century. The consequence was, that at length all persons who could read, whether clergymen or lay clerks, as they were called in some antient statutes, were admitted to the benefit of clergy in all prosecutions for offences to which the privilege extended. The mode in which this test of reading was applied is thus described by Sir Thomas Smith in his 'Commonwealth of England,' written in 1565. 'The bishop,' says he, 'must send one with authority under his seal to be a judge in that matter at every gaol delivery. If the condemned man demandeth to be admitted to his book, the judge commonly giveth him a Psalter, and turneth to what place he will. The prisoner readeth so well as he can (God knoweth sometime very slenderly), then he (the judge) asketh of the bishop's commissary, *Legit ut clericus?* The commissary must say *legit* or *non legit*, for these be words formal, and our men of law be very precise in their words formal. If he say *legit*, the judge proceedeth no further to sentence of death; if he say *non*, the judge forthwith proceedeth to sentence.'

The clergy, however, do not appear to have universally admitted that the mere fact of a prisoner's ability to read was to be taken as a conclusive proof of his clerical character. A curious case is recorded in the *Year Book*, 34 Hen. VI. 49 (1455), which greatly puzzled the judges. A man indicted of felony claimed the benefit of clergy; upon which the archdeacon of Westminster Abbey was sent for, who showed him a book, in which the felon read well and fluently. Upon hearing this, the court ordered him to be delivered to the archdeacon on behalf of the ordinary; but the archdeacon refused to take him, alleging that the prisoner was not a clerk. This raised a serious difficulty; and the question was one of particular importance to the prisoner, as the judges deliberated whether he must not of necessity be hanged. He was, however, remanded to prison, and the subject was much discussed by the judges for several terms; but, luckily for the culprit, the conscientious archdeacon being removed, his successor heard the prisoner read, and consented to receive him; whereupon he was delivered to the ordinary, the judges saying 'that *in favorem vitæ et libertatis ecclesiæ*, even where a man had once failed to read, and had received sentence of death, they would allow him his benefit of clergy, under the gallows, if he could then read, and was received by the ordinary.' Another case is recorded in the 21st year of Edw. IV. (1481), in which a felon read well and audibly in the presence of the whole court; but the ordinary declared '*non legit ut clericus* for divers considerations.' Upon which judgment was given that he should be hanged; 'And so,' says the reporter, 'he was, *ut audivi*.' (*Year Book*, 21 Edw. IV. 21.) But though a felon might claim the benefit of clergy to the last moment of his life, it was an indictable offence to teach him to read for the purpose of saving him. Thus in the 7th Richard II. (1383), the vicar of Round Church in Canterbury was arraigned and tried, 'for that by the license of the jailer there, he had instructed in reading one William Gore, an approver, who at the time of his apprehension was unlearned;' (*ineruditus in lecturâ.*) (Dyer's *Reports*, p. 206.) It may readily be conceived that questions between the temporal courts and the ordinary would arise as the art of reading became more generally diffused; and it was probably on this account that an express provision was made by the legislature in order in some degree to obviate the occurrence of such difficulties. The statute 4 Henry VII. c. 13 (1488), revived the distinction between actual clergymen and such persons as had accidentally acquired a competent skill in reading, by providing that no person once admitted to the benefit of clergy should a second time be allowed the same privilege, unless he produced his orders; and to mark those who had once claimed the privilege, the statute enacted that all persons, not in orders, to whom it was so allowed, should be marked upon the 'brawn of the left thumb' in the court, before the judge, before such person was delivered to the ordinary. After the offender was thus burned in the hand, he was formerly delivered to the ordinary to be dealt with according to the ecclesiastical canons, and to make purgation by undergoing the farce of a canonical trial. This second trial took place before the bishop or his deputy; there was a jury of twelve persons, who gave their verdict on oath; witnesses were examined on oath; the prisoner answered on oath; and twelve compurgators swore that they believed him. On this occasion, though the prisoner had been convicted at common law by the clearest evidence, or had even confessed his guilt, he was almost invariably acquitted. The whole proceeding before the ordinary is characterised by Chief Justice Hobart, at the beginning of the seventeenth century, 'as turning the solemn trial of truth by oath into a ceremonious and formal lye.' (Hobart's *Reports*, p. 291.) To remove this discreditable abuse of the forms of justice, the statute 18 Eliz. c. 7, enacted that in all cases after an offender had been allowed his clergy, he should not be delivered to the ordinary, but be at once discharged by the court, with a provision that he might be detained in prison for any time, not exceeding a year, at the discretion of the judge before whom he was tried.

By various statutes passed in the course of the last century, the court before which an offender was tried and admitted to his clergy were empowered to commute the burning in the hand for transportation, imprisonment, or whipping; and subsequently to the passing of these statutes it is believed that no instance has occurred of a convict being burned in the hand.

The practice of calling upon a convicted person to read in order to prove to the court his title to the benefit of clergy continued until a comparatively late period. A case is mentioned in Kelynge's *Reports*, p. 51, which occurred in 1666, where the bishop's commissary had deceived the court by reporting, contrary to the fact, that a prisoner could read; upon which Chief Justice Kelynge rebuked him severely, telling him 'that he had unpreached more that day than he could preach up again in many days,' and fined him five marks. At length the statute of the 5th of Anne, c. 6, enacted that the benefit of clergy should be granted to all those who are entitled to it without requiring them to read; and thus the 'idle ceremony of reading,' as Mr. Justice Foster justly terms it, was finally abolished.

The absurd and perplexing distinctions which the continuance of this antiquated and worn-out clerical privilege had introduced, having become extremely detrimental to the due administration of justice, it was enacted by one of the recent statutes for the consolidation and improvement of the criminal law, commonly called Peel's Acts (namely, 7 and 8 Geo. IV. c. 28, s. 6), 'that benefit of clergy with respect to persons convicted of felony shall be abolished.' Since the passing of this statute, the subject is of no practical importance whatever; but those who may be inclined to pursue it as a matter of historical curiosity may find the following references useful:—Blackstone's *Commentaries*, vol. iv. chap. 28; Hale's *Pleas of the Crown*, part ii. c. 45; Barrington's *Observations on Antient Statutes*; Hobart's *Reports*, p. 288.

BENEFIT SOCIETIES. [See FRIENDLY SOCIETIES.]

BENEVE'NTO, a town belonging to the Papal State, though geographically enclosed within the province of Principato Ultra, in the kingdom of Naples. It is situated on a hill at the junction of two valleys, in which the rivers Calore and Sabato flow, and between Mount Taburnus to the west, which separates its territory from the plains of Campania, and the central chain of Apennines to the east, which divides it from the plains of Puglia. The Calore, one or two miles above Benevento, receives the Tamaro which comes from the north from Mount Matese. After winding round the northern side of the town, the Calore receives just below it the Sabato which comes from the south, after which the united streams flow to the Volturno above Cajazzo. Benevento is 30 miles N.E. of Naples, in 41° 7′ N. lat. and 14° 43′ E. long. This town belonged in antient times to the Samnites, and was then called Maleventum, the etymology of which name has been fancifully but not satisfactorily explained by some writers.

The Caudine forks, in which the Roman army on its way from Calatia, the modern Cajazzo, to Maleventum, was obliged to surrender to the Samnites, are generally supposed to have been between Arpaja and Montesarchio, on the direct road from Naples to Benevento, although observing travellers had remarked that the localities did not by any means correspond to the description of that celebrated defile given by Livy. (See Eustace's *Italy*, vol. iii. ch. 3.) Cluverius, however, pointed out a more probable spot, in a narrow defile watered by the river Isclerus, which flows into the Volturno near Ducenta. Late travellers who have examined this defile have confirmed the assertion of Cluverius. The Isclerus, now called the Faienza, a small mountain stream coming from the south-east above Cervinara, crosses the high road between Arpaja and Montesarchio, and then enters a long and narrow defile between Mount Taburnus and a branch of the Tifata ridge, and after passing by Mojano and Santa Agata dei Goti, enters the plain of the Volturno, into which it flows nearly opposite Calatia or Cajazzo. This was the most direct way for the Romans from the banks of the Volturno to Maleventum. This pass has two narrow openings, one near Mojano, and the other near Santa Agata, with a small plain between, formed by the receding sides of Mount Taburnus, while the valley of Arpaja, through which the high road passes, has only one narrow defile, and has three openings instead of two, and moreover has no stream running through it. (See a Memoir on the subject by J. P. Gandy, in Keppel Craven's *Tour*, with a small map of the localities.) The Romans, having afterwards defeated the Samnites, and taken Maleventum, sent a colony there, and changed its name to Beneventum. The Appian road passed through Beneventum. [See ANTONINUS, ITINERARY OF.] The people of Beneventum remained firmly attached to Rome during the second Punic war.

After the fall of the western empire, Benevento was subject to the general vicissitudes of barbarian invasions like the rest of Italy, until it was taken in the sixth century by the Longobards, who established here a dukedom, which included all their conquests in Samnium, Campania, and Apulia. The dukes of Benevento, owing to their vast possessions and their remoteness from the Longobard capital, Pavia, were almost independent. When Charlemagne destroyed the kingdom of the Longobards, the duchy of Benevento maintained itself as an independent state, and its dukes assumed the title of princes. They were often at war with the Greeks, the Franks, and the Saracens, and also with their neighbours of Naples. The principality was afterwards split into three, Capua and Salerno having become independent of Benevento. The Normans took Benevento and gave it up to the pope, who bestowed on the Norman chief the investiture of Apulia and Calabria. The popes, however, allowed the old princes of Benevento to remain as feudatories of the Roman See until 1077, when Landulphus, the last prince of Benevento, died, leaving no heirs. From that time Benevento has remained under the direct dominion of the popes, and although it has been repeatedly seized by various kings of Naples, it has always been restored on making peace. In 1806, Napoleon, having conquered Naples, took Benevento also, and gave it to Talleyrand with the title of prince, but it was restored to the pope in 1815. Benevento is governed by a cardinal sent from Rome, with the title of legate. Near Benevento the famous battle took place between Manfred and Charles of Anjou in 1265, in which Manfred lost his crown and his life. He was buried on the banks of the Calore, under a heap of stones thrown upon him by Charles's soldiers; but his remains were afterwards disinterred by order of the bishop of Cosenza, and carried to the banks of the river Verde on the borders of Abruzzo. (See Dante, *Purgatorio*, canto iii.) Charles's soldiers after the battle pillaged Benevento, which had offered no resistance, murdered most of the people, not sparing old men, children, or priests, violated the women, and partly destroyed the town. (Borgia, *Memorie Istoriche di Benevento.*)

The present territory of Benevento, which belongs to the pope, is limited within narrow boundaries; it extends some seven or eight miles along each of the two valleys of the Sabato and Calore, and contains fourteen villages. The population of the town is reckoned at 16,000, and that of the territory at about 6000 more. The surface of the territory is stated at about 7000 rubbia, a Roman land measure equal to about four English acres. (Calindri, *Saggio Statistico dello Stato Pontificio.*) The country is hilly, but fertile in corn, fruit, and pasture, and it abounds with game. The river Sabato supplies it with fish. The town is surrounded by walls, and has an old castle at its eastern extremity; the streets are narrow and steep; the climate is subject to fogs in winter and oppressive heat in summer.

[From British Museum. Actual size. Copper; weight 100 grains.]

The cathedral is an old and vast building, but disproportionately low; its vault is supported by a number of fluted marble columns, which are believed to belong to the Roman period. The middle gate of the church is of sculptured bronze, of good workmanship, and representing scriptural subjects. A bas relief of a boar adorned for sacrifice, now fixed on the outside wall of the church, is supposed to be of very remote antiquity. Adjoining the cathedral is the archiepiscopal palace. In the square before it stands a small granite obelisk, which, according to Champollion (*Précis*, p. 95), belongs to the reign of Domitian. There are several other churches and convents, a seminary, and a palazzo pubblico or town-house, which is a fine structure. The old monastery of Santa Sofia, now suppressed, was rich in archives, chronicles, and other historical records, which have been lost or dispersed in the vicissitudes of the country. The church adjoining the monastery is an octagon, and is adorned with eight granite columns. In the court of the cloisters is a well, the mouth of which is hewn through a very large capital of the Ionic order. There are also some remains of an amphitheatre and of a Roman bridge, and many inscriptions, rilievi, and other fragments, of which a full account is given in De Vita's *Thesaurus Antiquitatum Beneventanarum*, 2 vols, fol. Rom. 1754-64. But the most interesting monument of antiquity is Trajan's triumphal arch, which forms one of the city gates on the road to Puglia, and is called the Porta Aurea. It is a single arch of Parian marble, and entire with the exception of part of the cornice; both its sides are adorned with four Corinthian pillars raised on high pedestals. The frieze and pannels, as well as the interior of the arch, are covered with rich sculpture, representing Trajan's achievements and his apotheosis. The figures are in alto rilievo, and exquisitely executed; but unfortunately most of them are damaged, and there is hardly one of them entire. De Vita has given an engraving and a description of this arch, which is one of the finest in existence. Benevento is 125 miles E.S.E. of Rome.

BENEVOLENCE, a species of forced loan, or gratuity, and one of the various arbitrary modes of obtaining supplies of money, which, in violation of Magna Charta, were formerly resorted to by the kings of England. The name implies a free contribution, with or without the condition of repayment; but so early as the reign of Edward IV. the practice had grown into an intolerable grievance. That king's lavish liberality and extravagance induced him to levy benevolences very frequently; and one of the wisest and most popular acts of his successor, Richard III., was to procure the passing of a statute (cap. 2) in the only parliament assembled during his reign, by which benevolences were declared to be illegal; but this statute is so expressed as not clearly to forbid the solicitation of voluntary gifts, and Richard himself afterwards violated its provisions. Henry VII. exacted benevolences, which were enforced in a very oppressive way. Archbishop Morton, who solicited merchants and others to contribute, employed a piece of logic which obtained the name of 'Morton's fork.' He told those who lived handsomely, that their opulence was manifested by their expenditure; and those who lived economically, that their frugality must have made them rich: so that no class could evade him. Cardinal Wolsey, among some other daring projects to raise money for Henry VIII., proposed a benevolence, which the citizens of London objected to, alleging the statute of Richard III.; but the answer was, that the act of a usurper could not oblige a lawful sovereign. Elizabeth also 'sent out her privy seals,' for so the circulars demanding a benevolence were termed; but though individuals were committed to prison for refusing to contribute, she repaid the sums exacted. Lord Coke, in the reign of James I., is said to have at first declared that the king could not solicit a benevolence, and then to have retracted his opinion, and pronounced upon its legality.

The subject underwent a searching investigation during the reign of Charles I., as connected with the limitation of the king's prerogative. That king had appointed commissioners for the collection of a general loan from every individual, and they had private instructions to require not less than a certain proportion of each man's property in land or goods, and had extraordinary powers given them. The name of loan given to this tax was a fiction which the most ignorant could not but detect. Many of the common people were impressed to serve in the navy for refusing to pay; and a number of the gentry were imprisoned. The detention of five knights, who sued the Court of King's Bench for their writ of Habeas Corpus, gave rise to a most important question respecting the freedom of English subjects from arbitrary arrest, and out of the discussion which then arose, and the contests respecting the levying of ship-money, &c., came the distinct assertion, and ultimate establishment of the great principle of English liberty. The 13 Car. II. stat. 1, cap. 4, provides for a voluntary present to his majesty, with a proviso, however, that no aids of that nature can be but by authority of parliament. The Bill of Rights, in 1688, repeats what Magna Charta declared in 1215, that levying of money for, or to the use of the crown, by pretence of prerogative, without grant of parliament, for longer time, or in any other manner than the same is or shall be granted, is illegal.

(Hallam's *Constitutional History of England*, and Turner's *History of England*.)

BENGAL, a large province of Hindustan, which derives much importance from the circumstance of its being the seat of the supreme government in British India.

Boundaries.—Bengal is bounded on the south by the Bay of Bengal and the district of Midnapore in Orissa, on the east by the Burmese empire, on the north by Nepaul and Bootan, and on the west by the province of Bahar. It is situated between 21° and 27° N. lat. and 86° and 93° E. long. The length of the province from east to west may be estimated at 350 English miles, and its average breadth from north to south at 300 miles: the area is estimated by Major Rennell at 97,244 square miles, or upwards of 8000 square miles more than Great Britain. It appears from the various surveys that have been made of different parts of the province, that its surface is divided in nearly the following proportions, viz.:—

		Parts.
Rivers and lakes		3
Sites of towns and villages, roads and tanks .		1
Land deemed irreclaimable and barren . .		4
Land in cultivation, or capable of improvement, viz.:—		
Free lands	3	
Lands in tillage, liable to payment of rent to the Company's government . . .	9	
Waste lands	4
